

# MAXIM

## Low Power, 3½ Digit A/D Converter

ICL7137

### General Description

The Maxim ICL7137 is a monolithic analog to digital converter with all the necessary active devices to directly interface with a light emitting diode (LED) display. Excluding the LED display current, the ICL7137 supply current is under 200 $\mu$ A, making it suitable for battery operation.

Versatility and accuracy are inherent features of this converter. The dual-slope conversion technique automatically rejects interference signals common in industrial environments. The true differential input and reference are particularly useful when making ratio-metric measurements (ohms or bridge transducers), and the zero-integrator phase in Maxim's ICL7137 eliminates overrange hangover and hysteresis effects. Finally, this device offers high accuracy by lowering rollover error to less than one count and zero reading drift to less than 1 $\mu$ V/°C.

### Applications

These devices can be used in a wide range of digital panel meter applications. Most applications, however, involve the measurement and display of analog data:

Pressure	Conductance
Voltage	Current
Resistance	Speed
Temperature	Material Thickness
