#### 1. Presentation

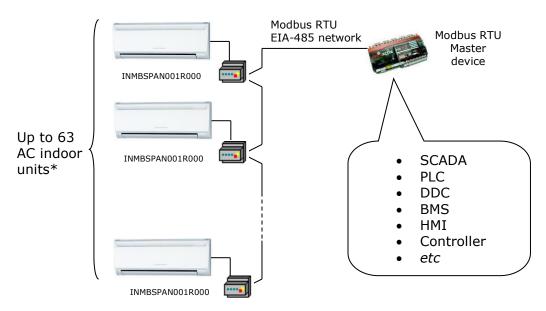

The INMBSPAN001R000 interfaces allow a complete and natural integration of *Panasonic* and *Sanyo* air conditioners into Modbus RTU (EIA-485) networks.

Compatible with all models of ECOi and PACi line

Reduced dimensions. 93 x 53 x 58 mm // 3.7" x 2.1" x 2.3"

- Quick and easy installation.

  Mountable on DIN rail, wall, or even inside the indoor unit of AC.
- External power not required.
- Direct connection to Modbus RTU (EIA-485) networks. Up to 63 INMBSPAN001R000 devices can be connected in the same network.
   INMBSPAN001R000 is a Modbus slave device.
- Direct connection to the AC indoor unit. Up to 16 AC indoor units can be connected to INMBSPAN001R000, controlling them as one (not individually).
- Configuration from both on-board DIP-switches and Modbus RTU.
- Total Control and Supervision.
- Real states of the AC unit's internal variables.
- Allows simultaneous use of the AC's remote controls and Modbus RTU.

\* Up to 63 Intesis devices can be installed in the same Modbus RTU bus. However, depending on the configured speed, the installation of Modbus Repeaters may be required

#### 2. Connection

The interface comes with a plug-in terminal block of 2 poles to establish direct connection with the AC indoor unit. It comes as well with a plug-in terminal block of 2 poles to establish direct connection with the Modbus RTU EIA-485 network.

#### 2.1 Connect to the AC indoor unit

The INMBSPAN001R000 connects directly to the Panasonic R1R2 Bus, which is not provided within the interface. The recommended connection' methods are the following ones (details in Figure 2.1):

- Wired remote control available. It is not recommended to install more than 1 Remote Controller in the bus R1R2.
- No remote control available

Maximum R1R2 bus length is 500 meters / 1,640.42 ft. The bus has no polarity sensitivity.

Important: If a wired remote controller of the AC manufacturer is connected in the same bus, communication may shut down.

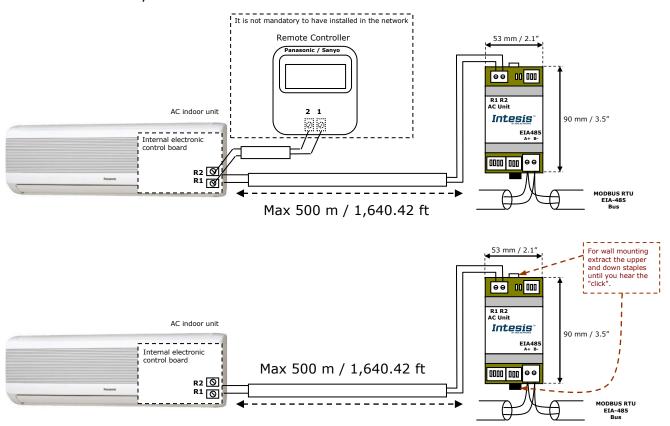

Figure 2.1 INMBSPAN001R000 connection diagram

#### 2.2 Connection to the EIA-485 bus

Connect the EIA-485 bus wires to the plug-in terminal block of INMBSPAN001R000 and keep the polarity on this connection (A+ and B-). Make sure that the maximum distance to the bus is 1,200 meters (3,937 ft). Loop or star typologies are not allowed in the case of the EIA-485 bus. A terminator resistor of  $120\Omega$  must be present at each end of the bus to avoid signal reflections. The bus needs a fail-safe biasing mechanism (see section 4.6 for more details).

# 3. Quick Start Guide

- 1. Disconnect the air conditioning from the Mains Power.
- 2. Attach the interface next to the AC indoor unit (wall mounting) following the instructions of the diagram below or install it inside the AC indoor unit (respect the safety instructions given).
- 3. Connect the R1R2 bus between the interface and the AC indoor unit following the instructions of the diagram. Screw each bare cable end in the corresponding R1R2 terminals of each device.
- 4. Connect the EIA-485 bus to the connector EIA485 of the interface.
- 5. Close the AC indoor unit.
- 6. Check the DIP-Switch configuration of the Intesis interface and make sure it matches the current installation's parameters:

By default, the interface is set to:

Modbus Slave Address → 1

Modbus baud rate → 9600 bps

SW3 SW4

These parameters can be modified from SW4 and SW3 DIP-Switches.

All other switch positions are set at low level (Off position  $\square$ ) by default.

NOTE: All changes on the DIP-Switch configuration require a system power cycle to be applied.

7. Connect the AC system to Mains Power.

**IMPORTANT:** The Intesis interface requires to be connected to the AC unit (powered) to start communicating.

## 4. Modbus Interface Specification

## 4.1 Modbus physical layer

INMBSPAN001R000 implements a Modbus RTU (Slave) interface, to be connected to an EIA-485 line. It performs 8N2 communication (8 data bits, no parity and 2 stop bit) with several available baud rates (2400 bps, 4800 bps, 9600 bps -default-, 19200 bps, 38400 bps, 57600 bps, 76800 bps and 115200 bps). It also supports 8N1 communication (8 data bits, no parity and 1 stop bit).

#### 4.2 Modbus Registers

All registers are type "16-bit unsigned Holding Register" and they use the *Modbus big endian* notation.

#### 4.2.1 Control and status registers

| Register Address<br>(protocol address) | Register Address<br>(PLC address) | R/W | Description  |
|--|-----------------------------------|-----|--|
| 0                                      | 1                                 | R/W | AC unit On/Off  O: Off 1: On   |
| 1                                      | 2                                 | R/W | AC unit Mode <sup>1</sup>  |
| 2                                      | 3                                 | R/W | AC unit Fan Speed <sup>1</sup>   |
| 3                                      | 4                                 | R/W | AC unit Vane Position <sup>1</sup> 0: Auto     1: POS1 (Horizontal)     2: POS2 (Horizontal)     3: POS3 (Med)     4: POS4 (Vert)     5: POS5 (Vert)     10: Swing |
| 4                                      | 5                                 | R/W | AC unit Temperature Setpoint <sup>1,2,3</sup> - 32768 (Initialization value)  1632°C (°C/x10°C)  6190°F  |

<sup>&</sup>lt;sup>1</sup> Available values will depend on the AC unit mode. Check the AC unit model functions in its user manual to know the possible values for this register.

<sup>&</sup>lt;sup>2</sup> Magnitude for this register can be adjusted to Celsius x 1°C, Celsius x 10°C (default) or Fahrenheit. See section 0 for more information.

<sup>&</sup>lt;sup>3</sup> It is not possible turn to x10 the value shown in Fahrenheit.

| Register Address<br>(protocol address) | Register Address (PLC address) | R/W | Description  |
|--|--------------------------------|-----|--|
| 5                                      | 6                              | R/W | AC unit Temperature reference 1,2,3,4  - 32768: Initialization value. Value invalid, which comes from the IU's sensor. If the value that is shown in register 22 (23 PLC) is valid, the address is going to take this value.  Ranges are specific from Manufacturer (°C/x10°C/°F)  |
| 6                                      | 7                              | R/W | Window Contact  • 0: Closed (Default)  • 1: Open   |
| 7                                      | 8                              | R/W | INMBSPAN001R000 Disablement <sup>5</sup> • 0: INMBSPAN001R000 enabled (Default) • 1: INMBSPAN001R000 disabled  |
| 8                                      | 9                              | R/W | AC Remote Control Disablement <sup>5</sup> • 0: Remote Control enabled (Default) • 1: Remote Control disabled  |
| 9                                      | 10                             | R/W | AC unit Operation Time <sup>5</sup> • 065535 (hours). Counts the time the AC unit is in "On" state.  |
| 10                                     | 11                             | R   | AC unit Alarm Status  O: No alarm condition I: Alarm condition   |
| 11                                     | 12                             | R   | O: No Error active     O: So Error active     O: No Error in the communication of INMBSPAN001R000 with the AC unit     Any other error present, see the table at the end of this document.   |
| 22                                     | 23                             | R/W | Indoor unit's ambient temperature from external sensor (at Modbus side) 4,7  - 32768: Initialization value. No temperature is being provided from an input sensor. There's no input sensor.  Other: (°C/x10°C/°F)  |
| 23                                     | 24                             | R   | AC setpoint temperature 1,2,3,4,7  When no external temperature is provided, this read-only register will have the same value as register 5 (PLC addressing). In all cases, it will show the current setpoint in the indoor unit.  Ranges specific from Manufacturer (°C/x10°C/°F) |
| 24                                     | 25                             | R   | Current AC max setpoint <sup>1,2,3,4</sup> - 32768 (Initialization value)  Ranges are specific from Manufacturer (°C/x10°C/°F)   |
| 25                                     | 26                             | R   | Current AC min setpoint <sup>1,2,3,4</sup> - 32768 (Initialization value)  Ranges are specific from Manufacturer (°C/x10°C/°F)   |

 <sup>&</sup>lt;sup>4</sup> The temperature's value shown has decimal precision(x0,5°C)
 <sup>5</sup> This value is stored in non-volatile memory
 <sup>6</sup> See section 7 for possible error codes and their explanation
 <sup>7</sup> See section 4.2.3 for more information

<sup>&</sup>lt;sup>8</sup> If the register is configured as "0:Non-blocked", all commands received from Modbus will be sent to the AC system. If "1: Blocked", commands from Modbus will only be sent to the AC system if they differ from the previous value.

<sup>9</sup> This register applies on firmware version 2.3 onwards

<sup>&</sup>lt;sup>10</sup> Check Section 4.2.4 to know more about the applications of Master/Slave on indoor units.

 $<sup>^{11}</sup>$  Once window contact is open, a count-down to switch off the AC Unit will start from this configured value.  $^{12}$  This value is shown as portions of 100%. Check the explanation in Section 4.2.4 of this document

#### 4.2.3 Considerations on Temperature Registers

#### AC unit temperature setpoint (R/W)

(register 4 – in Protocol address / register 5 – in PLC address): This is the adjustable temperature setpoint value that must be required by the user.

This register can be read (Modbus function 3 or 4) or written (Modbus functions 6 or 16).

A remote controller connected to the Panasonic/Sanyo indoor unit will report the same temperature setpoint value as this register.

#### AC unit temperature reference (R)

(register 5 - in Protocol address / register 6 - in PLC address):

This register reports the temperature that is currently used by the Panasonic/Sanyo indoor unit as the reference of its own control loop.

If the value on the register 22 is valid (different from 0x8000), it will report the value from this register. If not, it will show the indoor unit reference's temperature.

It is a read-only register (Modbus functions 3 or 4).

#### AC unit external temperature reference (R/W)

(register 22 – in Protocol address / register 23 – in PLC address): This register reports the temperature from an external sensor in the Modbus side. If valid value is received, the Modbus register will indicate a 0x8000 value.

This register can be read (Modbus function 3 or 4) or written (Modbus functions 6 or 16).

#### Current setpoint in AC indoor unit (R)

(register 23 - In Protocol address / register 24 - in PLC address):

This register will show the same value as in register 4 (protocol address). The reference temperature from the remote controller is sent directly to the AC unit to be applied in the control loop.

It is a read-only register (Modbus functions 3 or 4).

Moreover, notice that temperature's values of all these four registers are expressed according to the temperature's format configured through its onboard DIP-Switches (See Section 4.3)These following formats are possible:

- Celsius value: Value in Modbus register is the temperature value in Celsius (i.e. a value "22" in the Modbus register must be interpreted as 22°C).
- Decicelsius value: Value in Modbus register is the temperature value in decicelsius (i.e. a value "220" in the Modbus register must be interpreted as 22.0°C).
- Fahrenheit value: Value in Modbus register is the temperature value in Fahrenheit (i.e. a value "72" in the Modbus register must be interpreted as 72°F (~22°C).

#### 4.2.4 Special behavior - Outdoor demand rate

This feature is related to a kind of control that allows to obtain a more accurate feedback of supply air's temperature based on the current system's performance and condition. It is as well a feature related to the integration in the smart building control's system with the gateway. (For example, in case that it could exist already some smart electric price's schedules, when the electricity's price varies during all day).

The feature of the Outdoor demand rate is related as well to the feature Master/Slave of the AC system from Panasonic/Sanyo.

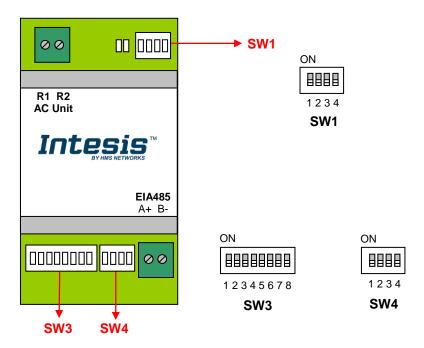

The roles Master/Slave of the indoor units are related to the features Back Up and Rotation Function. To apply these functions properly, two independent indoor units (each one belongs to a different AC system) must be connected together (in pairs) and name one indoor unit as Master and the other one as Slave.

Once each indoor unit had been named, it's necessary to verify that each one of the two indoor units match with the Modbus registers properly. The registers with Master category belong to the indoor unit named as Master and the registers with Slave category belong to the indoor unit named as Slave.

The three registers related to the Outdoor Demand Rate can be read and written. These ones are configurable thanks to a Remote Controller from Panasonic/Sanyo with Back Up and Rotation Function.

### 4.3 DIP-switch Configuration Interface

All the configuration values on INMBSPAN001R000 can be written and read from Modbus interface. Otherwise, some of them can also be setup from its on-board DIP-switch interface. The device has DIP-switches SW1, SW3 and SW4 on the following locations:

The following tables apply to the interface's configuration through DIP-switches:

SW1 - AC indoor unit's features

| SW1-P14 | Description                                       |
|---------|---|
| ON      | Outdoor Demand rate not activated (Default value) |
| ON      | Outdoor Demand rate activated                     |
| ON      | Not used (Default value)                          |
| on      | Not used  |
| ON III  | Not used (Default value)                          |
| ON .    | Not used  |
| ON      | Not used (Default value)                          |
| ON      | Not used  |

Table 4.1 SW1: AC indoor unit's features

#### **SW3/SW4** – Baud rate configuration

Table 4.4 SW3: Modbus slave address

#### 4.4 Implemented Functions

INMBSPAN001R000 implements the following standard Modbus functions:

- 3: Read Holding Registers
- 4: Read Input Registers
- 6: Write Single Register
- 16: Write Multiple Registers (Despite this function is allowed, the interface does not allow to write operations on more than 1 register with the same request, this means that length field should be always be 1 when this function is being used in case of writing)

#### 4.5 Device LED indicator

The device includes two LED indicators to show all the possible operational states. In the following table there are written the indicators which can be performed and their meaning.

L1 (green LED)

| Device status   | LED indication | ON / OFF Period       | Description  |  |
|---|----------------|-----------------------|--|--|
| During not normal operation LED blinking 500ms ON / 500ms OFF |                | Communication error   |  |  |
| During normal operation                                       | LED flashing   | 100ms ON / 1900ms OFF | Normal operation (configured and working properly) |  |

#### L2 (red LED)

| Device status               | LED indication | ON / OFF Period | Description   |
|-----------------------------|----------------|-----------------|---------------|
| During not normal operation | LED Pulse      | 3sec ON / OFF   | Under voltage |

L1 (green LED) & L2 (red LED)

| <b>Device status</b>        | LED indication             | ON / OFF Period      | Description     |
|-----------------------------|----------------------------|----------------------|-----------------|
| During normal operation     | LED Pulse                  | 5sec ON / OFF        | Device Start-up |
| During not normal operation | LED alternatively blinking | 500ms ON / 500ms OFF | EEPROM failure  |

#### Termination resistors and Fail-Safe 4.6 EIA-485 bus. Biasina mechanism

EIA-485 bus requires a  $120\Omega$  terminator resistor at each end of the bus to avoid signal reflections.

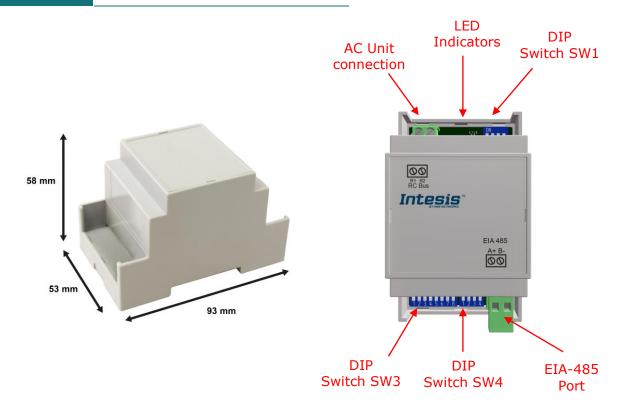

In order to prevent fail status detected by the receivers, which are "listening" the bus, when all the transmitters' outputs are in three-state (high impedance), it is also required a fail-safe biasing mechanism. This mechanism provides a safe status (a correct voltage level) in the bus when all the transmitters' outputs are in three-state. This mechanism must be supplied by the Modbus Master.

The INMBSPAN001R000 device includes an on-board terminator resistor of  $120\Omega$  that can be connected to the EIA-485 bus by using DIP-switch SW4.

Some Modbus RTU EIA-485 Master devices can provide also internal  $120\Omega$  terminator resistor and/or fail-safe biasing mechanism (Check the technical documentation of the Master device connected to the EIA-485 network in each case).
