IS22TF16G/32G/64G/128G

16GB/32GB/64GB/128GB eMMC
With eMMC 5.1 Interface & TLC NAND

DATA SHEET

16GB/32GB/64GB/128GB eMMC with eMMC 5.1 Interface & TLC NAND**FEATURES**

- Packaged NAND flash memory with eMMC 5.1 interface
 - IS21/22TF16G: 16Gigabyte
 - IS21/22TF32G: 32Gigabyte
 - IS21/22TF64G: 64Gigabyte
 - IS21/22TF128G: 128Gigabyte
- Compliant with eMMC Specification Ver.4.3, 4.4, 4.41,4.5, 4.51, 5.0, 5.1
- Device can be converted to eMMC 4.3, 4.41, 4.51, 5.0 via initializing
- Bus mode
 - High-speed eMMC protocol
 - Clock frequency: 0-200MHz.
 - Ten-wire bus (clock, 1 bit command, 8 bit data bus) and a hardware reset.
- Supports three different data bus widths : 1 bit(default), 4 bits, 8 bits
 - Data transfer rate: up to 52Mbyte/s (using 8 parallel data lines at 52 MHz)
 - Single data rate : up to 200Mbyte/s @ 200MHz (HS200)
 - Dual data rate : up to 400Mbyte/s @ 200MHz (HS400)
- Operating voltage range :
 - VCCQ = 1.8 V/3.3 V (Automotive A2 Grade only supports 1.8V VCCQ)
 - VCC = 2.7 – 3.6V
- Error free memory access
 - Internal error correction code (ECC) to protect data communication
 - Internal enhanced data management algorithm
 - Solid protection from sudden power failure, safe-update operations for data content
- Security
 - Support secure erase and trim commands
 - Enhanced write protection with permanent and partial protection options
- Key Features :
 - HS400, Field Firmware Update (FFU), Power Off Notification, Pre EOL information, Enhanced Device Life time, Optimal Size
- eMMC 5.1 Features:
 - Command Queuing, Enhanced Strobe, Cache Flushing Report, BKOPS Control, Cache Barrier, RPMB Throughput Improve, Secure Write Protection.
- Temperature range
 - Industrial Grade (I): -40 °C ~ 85 °C
 - Automotive Grade (A1): -40 °C ~ 85 °C
 - Automotive Grade (A2): -40 °C ~ 105 °C (The Surface Temperature of Tc cannot be over 115 °C)
- Package
 - 153 FBGA (11.5mm x 13mm x 1.0mm)
 - 100 FBGA (14.0mm x 18.0mm x 1.4mm)

GENERAL DESCRIPTION

ISSI *eMMC* products follow the JEDEC *eMMC* 5.1 standard. It is ideal for embedded storage solutions for Industrial application and automotive application, which require high performance across a wide range of operating temperatures.

eMMC encloses the TLC Mode NAND and *eMMC* controller inside as one JEDEC standard package, providing a standard interface to the host. The *eMMC* controller directly manages NAND flash, including ECC, wear-leveling, IOPS optimization and read sensing.

1. PERFORMANCE SUMMARY

1.1 Typical Sequential Burst Performance (PSA Pseudo-SLC Burst Status)

Speed Mode & Operation			16GB	32GB	64GB	128GB	Unit
HS400	Write Cache On	Read	320	320	320	320	MB/s
		Write	135	135	255	265	MB/s
	Write Cache Off	Read	320	320	320	320	MB/s
		Write	130	125	205	215	MB/s
HS200	Write Cache On	Read	175	175	175	175	MB/s
		Write	130	135	155	155	MB/s
	Write Cache Off	Read	175	175	175	175	MB/s
		Write	120	120	140	140	MB/s

Notes:

1. Values for an 8-bit bus width, running ISSI proprietary tool, $V_{CC}=3.3V$, $V_{CCQ}=1.8V$.
2. Performance numbers might be subject to changes without notice.
3. The write cache size is 1536KB.

1.2 Typical Sequential Sustained Performance (Normal Status)

Speed Mode & Operation			16GB	32GB	64GB	128GB	Unit
HS400	Write Cache On	Read	310	310	320	320	MB/s
		Write	15	15	30	65	MB/s
	Write Cache Off	Read	315	310	320	320	MB/s
		Write	15	15	25	45	MB/s
HS200	Write Cache On	Read	175	175	175	175	MB/s
		Write	15	15	30	60	MB/s
	Write Cache Off	Read	175	175	175	175	MB/s
		Write	15	15	25	45	MB/s

Notes:

1. Values for an 8-bit bus width, running HS400 mode, $V_{CC}=3.3V$, $V_{CCQ}=1.8V$.
2. Performance numbers might be subject to changes without notice.
3. The write cache size is 1536KB.

1.3 Typical Random Burst Performance (PSA Pseudo-SLC Burst Status)

Speed Mode & Operation			16GB	32GB	64GB	128GB	Unit
HS400	Write Cache On	Read	21,000	21,000	42,000	59,000	IOPS
		Write	20,000	20,000	44,000	47,000	IOPS
	Write Cache Off	Read	21,000	21,000	43,000	58,000	IOPS
		Write	2,100	2,100	2,900	2,900	IOPS
HS200	Write Cache On	Read	21,000	21,000	40,000	42,000	IOPS
		Write	20,000	20,000	34,000	35,000	IOPS
	Write Cache Off	Read	21,000	21,000	40,000	43,000	IOPS
		Write	2,100	2,100	2,800	2,900	IOPS

Notes:

1. Values for an 8-bit bus width, running ISSI proprietary tool, $V_{CC}=3.3V$, $V_{CCQ}=1.8V$.
2. Performance numbers might be subject to changes without notice.
3. The write cache size is 1536KB.

1.4 Typical Random Sustained Performance (Normal Status)

Speed Mode & Operation			16GB	32GB	64GB	128GB	Unit
HS400	Write Cache On	Read	15,000	14,000	24,000	29,000	IOPS
		Write	4,400	3,200	8,100	14,000	IOPS
	Write Cache Off	Read	15,000	14,000	24,000	29,000	IOPS
		Write	1,500	1,400	1,600	1,800	IOPS
HS200	Write Cache On	Read	15,000	15,000	24,000	28,000	IOPS
		Write	4,500	3,300	7,800	13,000	IOPS
	Write Cache Off	Read	14,000	14,000	24,000	43,000	IOPS
		Write	1,500	1,400	1,600	1,700	IOPS

Notes:

1. Values for an 8-bit bus width, running ISSI proprietary tool, $V_{CC}=3.3V$, $V_{CCQ}=1.8V$.
2. Performance numbers might be subject to changes without notice.
3. The write cache size is 1536KB.

1.5 Device Power Consumption RMS V_{CC}/V_{CCQ} ($T_A = 25\text{ }^\circ\text{C}$ @ 3.3V/1.8V)

Speed Mode & Operation			16GB	32GB	64GB	128GB	Unit
HS400	Read	I _{CC}	55	55	60	60	mA
		I _{CCQ}	220	220	230	245	mA
	Write	I _{CC}	50	50	90	160	mA
		I _{CCQ}	90	90	100	105	mA
HS200	Read	I _{CC}	35	35	35	35	mA
		I _{CCQ}	165	160	165	175	mA
	Write	I _{CC}	50	50	90	160	mA
		I _{CCQ}	90	90	100	105	mA

Notes:

1. The measurement for RMS current is done as average RMS current consumption over a period of 100ms.
2. Current numbers might be subject to changes without notice.

1.6 Device Power Consumption Standby V_{CC}/V_{CCQ} ($T_A = 25\text{ }^\circ\text{C}$ @ 3.3V/1.8V)

Speed Mode & Operation			16GB	32GB	64GB	128GB	Unit
HS400	CMD5 Sleep		190	190	210	250	uA
	Standby I _{CCQ}		240	240	245	250	uA
	Standby I _{CC}		30	30	45	80	uA
HS200	CMD5 Sleep		190	190	210	250	uA
	Standby I _{CCQ}		240	240	245	250	uA
	Standby I _{CC}		30	30	45	80	uA

Notes:

1. The current is measured at $V_{CC} = 3.3V \pm 5\%$, $V_{CCQ} = 1.8V \pm 5\%$, 8-bit bus width without clock frequency..
2. Current numbers might be subject to changes without notice.

1.7 BOOT PARTITION AND RPMB (REPLAY PROTECTED MEMORY BLOCK)

Option	Boot partition 1	Boot partition 2	RPMB
J	4,096 KB	4,096 KB	4,096 KB
B	16,384 KB	16,384 KB	4,096 KB

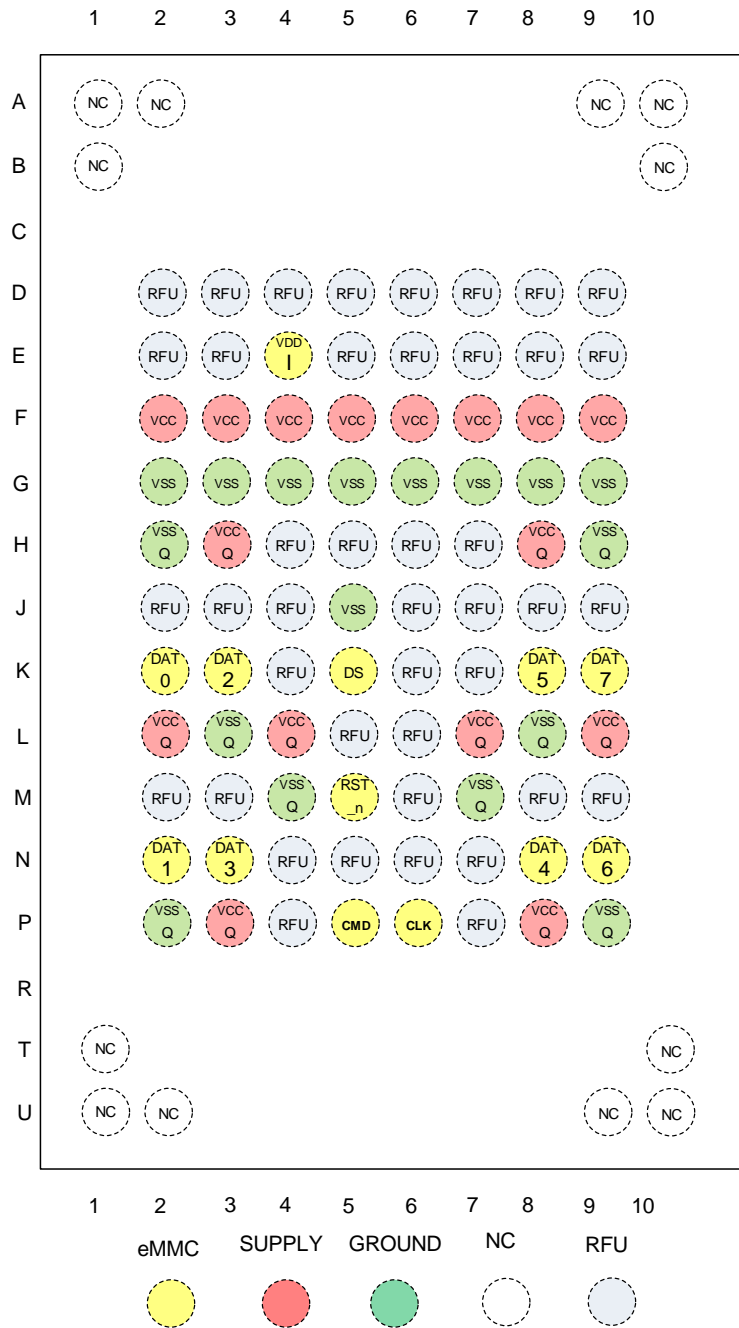

1.8 USER DENSITY

Total user density depends on device type (Flash Mode).

Part Number	Capacity	Flash Mode	User Density Size
IS21/22TF16G	16GB	TLC	15,634,268,160 Bytes
IS21/22TF32G	32GB	TLC	31,268,536,320 Bytes
IS21/22TF64G	64GB	TLC	62,537,072,640 Bytes
IS21/22TF128G	128GB	TLC	125,074,145,280 Bytes

2. PIN CONFIGURATION and DDESCRIPTIONS
153 FBGA Top View (Ball Down)

Note:

1. H5 (DS), A6 (VSS) and J5 (VSS) can be left floating if HS400 mode is not used.

100 FBGA Top View (Ball Down)

Note:

1. K5 (DS) and J5 (VSS) can be left floating if HS400 mode is not used.

**PIN DESCRIPTIONS**

Pin Name	Description
CLK	Clock Signal
DAT0~DAT7	Data Bus
CMD	Command Signal
RST#	Hardware Reset Signal
DS	Data Strobe Signal, used in HS400 mode.
VDDI	Connect capacitor from VDDI to GND for stabilize internal power.
VCC	Supply voltage for controller and Flash memory power.
VCCQ	Supply voltage for controller and Flash memory I/O power.
VSS	Supply voltage ground for controller and Flash memory. Can be short with VSSQ.
VSSQ	Supply voltage ground for controller and Flash memory I/O. Can be short with VSSQ.
RFU	Reserved For Future Use. Left it floating for future use.
NC	In eMMC chip is no connect. Left it floating.

Note:

1. I: input; O: output; PP: push-pull; OD: open-drain; NC: Not connected (or logical high); S: power

3. OPERATING and STORAGE TEMPERATURE

Grade	Condition	Temperature
Industrial	Minimum and Maximum Ambient Temperature ⁽¹⁾	-40 °C to 85 °C
	Maximum Case Temperature ⁽¹⁾	95 °C
	Minimum and Maximum Non-operating Temperature ⁽²⁾	-40 °C to 85 °C
Auto (A1)	Minimum and Maximum Ambient Temperature ⁽¹⁾	-40 °C to 85 °C
	Maximum Case Temperature ⁽¹⁾	95 °C
	Minimum and Maximum Non-operating Temperature ⁽²⁾	-40 °C to 85 °C
Auto (A2)	Minimum and Maximum Ambient Temperature ⁽¹⁾	-40 °C to 105 °C
	Maximum Case Temperature ⁽¹⁾	115 °C
	Minimum and Maximum Non-operating Temperature ⁽²⁾	-40 °C to 105 °C

Notes:

1. To achieve optimized and performance, case temperature should not exceed maximum ambient operating temperature.
2. After being soldered onto PCBA.

4. eMMC Device and System

eMMC consists of a single chip MMC controller and NAND flash memory module. The micro-controller interfaces with a host system allowing data to be written to and read from the NAND flash memory module. The controller allows the host to be independent from details of erasing and programming the flash memory.

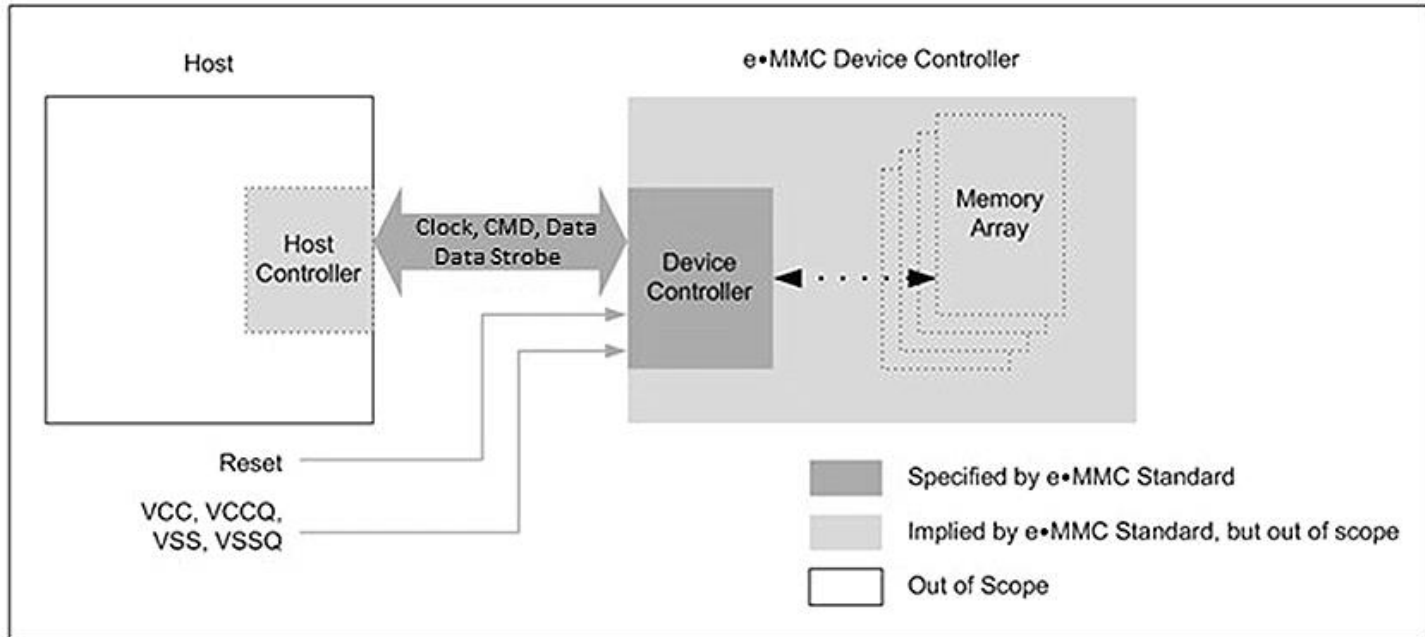

Figure 4.1 eMMC System Overview

4.1 Memory Addressing

Previous implementations of the eMMC specification are following byte addressing with 32-bit field. This addressing mechanism permitted for eMMC densities up to and including 2 GB.

To support larger density, the addressing mechanism was update to support sector addresses (512 B sectors). The sector addresses shall be used for all devices with capacity larger than 2 GB.

To determine the addressing mode, use the host should read bit [30:29] in the OCR register.

5. REGISTER SETTINGS

Within the Device interface six registers are defined: OCR, CID, CSD, EXT_CSD, RCA and DSR. These can be accessed only by corresponding commands (see Section 6.10 of JESD84-B51).

5.1 OCR Register

The 32-bit operation conditions register (OCR) stores the VDD voltage profile of the Device and the access mode indication. In addition, this register includes a status information bit. This status bit is set if the Device power up procedure has been finished. The OCR register shall be implemented by all Devices.

Table 5.1 OCR Register

VCCQ Voltage Window	Width (Bits)	OCR Bit	OCR Value
Device power up status bit (busy) (1)	1	[31]	Note 1
Access Mode	2	[30:29]	10b (sector mode)
Reserved	5	[28:24]	0 0000b
VCCQ: 2.7 – 3.6V	9	[23:15]	1 1111 1111b
VCCQ: 2.0 – 2.6V	7	[14:8]	000 0000b
VCCQ: 1.7 – 1.95V	1	[7]	1b
Reserved	7	[6:0]	000 0000b

Note:

1. This bit is set to LOW if the device has not finished the power up routine.

5.2 CID Register

The Card Identification (CID) register is 128 bits wide. It contains the Device identification information used during the Device identification phase (eMMC protocol).

Table 5.2 CID Register

Name	Field	Width (Bits)	CID Bits	CID Value
Manufacturer ID	MID	8	[127:120]	9Dh
Reserved	-	6	[119:114]	0h
Device/BGA	CBX	2	[113:112]	1h
OEM/application ID	OID	8	[111:104]	1h
Product Name	PNM	16GB	[103:56]	IS016G
		32GB		IS032G
		64GB		IS064G
		128GB		IS128G
Product Revision	PRV	8	[55:48]	51h
Product Serial Number	PSN	32	[47:16]	Random by Production
Manufacturing Date	MDT	8	[15:8]	Month, Year
CRC7 Checksum	CRC	7	[7:1]	- (1)
Not used, always "1"	-	1	[0]	1h

Note:

1. The description is same as e.MMC™ JEDEC standard.

5.3 CSD Register

The Card-Specific Data (CSD) register provides information on how to access the contents stored in eMMC. The CSD registers are used to define the error correction type, maximum data access time, data transfer speed, data format...etc. For details, refer to section 7.3 of the JEDEC Standard Specification No. JESD84-B51.

Table 5.3 CSD Register

Name	Field	Width	Cell Type	CSD-slice	Value

5.4 Extended CSD Register

The Extended CSD register defines the Device properties and selected modes. It is 512 bytes long. The most significant 320 bytes are the Properties segment, which defines the Device capabilities and cannot be modified by the host. The lower 192 bytes are the Modes segment, which defines the configuration the Device is working in. These modes can be changed by the host by means of the SWITCH command.

Table 5.4 ECSD Register

Notes:

1. Reserved bits should read as "0".
2. Obsolete values should be don't care.
3. This field is 0 after power-on, H/W reset or software reset, thus selecting the backwards compatible interface timing for the Device. If the host sets 1 to this field, the Device changes the timing to high speed interface timing (see Section 10.6.1 of JESD84-B50). If the host sets value 2, the Device changes its timing to HS200 interface timing (see Section 10.8.1 of JESD854-B50). If the host sets HS_TIMING [3:0] to 0x3, the device changes it's timing to HS400 interface timing (see 10.10).
4. It is set to "0" (1bit data bus) after power up and can be changed by a SWITCH command.
5. Could be changed by Firmware release note.

6. The eMMC BUS

The eMMC bus has ten communication lines and three supply lines:

- CMD : Command is a bidirectional signal. The host and Device drivers are operating in two modes, open drain and push/pull.
- DAT0-7 : Data lines are bidirectional signals. Host and Device drivers are operating in push-pull mode
- CLK : Clock is a host to Device signal. CLK operates in push-pull mode
- Data Strobe: Data Strobe is a Device to host signal. Data Strobe operates in push-pull mode.

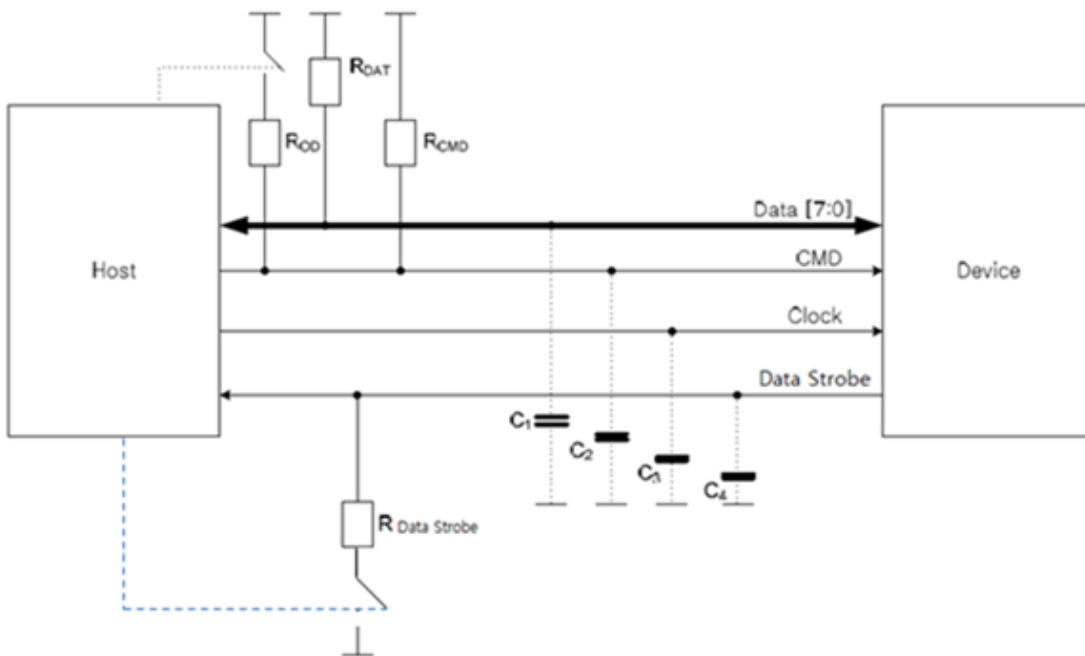

Figure 6.1 BUS Circuitry Diagram

The R_{OD} is switched on and off by the host synchronously to the open-drain and push-pull mode transitions. The host does not have to have open drain drivers, but must recognize this mode to switch on the R_{OD} . R_{DAT} and R_{CMD} are pull-up resistors protecting the CMD and the DAT lines against bus floating device when all device drivers are in a high-impedance mode.

A constant current source can replace the R_{OD} by achieving a better performance (constant slopes for the signal rising and falling edges). If the host does not allow the switchable R_{OD} implementation, a fixed R_{CMD} can be used). Consequently the maximum operating frequency in the open drain mode has to be reduced if the used R_{CMD} value is higher than the minimal one given in.

$R_{Data\ strobe}$ is pull-down resistor used in HS400 device.

7. eMMC Device Overview

The eMMC device transfers data via a configurable number of data bus signals. The communication signals are:

7.1 Clock (CLK)

Each cycle of this signal directs a one-bit transfer on the command and either a one bit (1x) or a two bits transfer (2x) on all the data lines. The frequency may vary between zero and the maximum clock frequency.

7.2 Data Strobe

This signal is generated by the device and used for output in HS400 mode. The frequency of this signal follows the frequency of CLK. For data output each cycle of this signal directs two bits transfer(2x) on the data - one bit for positive edge and the other bit for negative edge. For CRC status response output and CMD response output (enabled only HS400 enhanced strobe mode), the CRC status is latched on the positive edge only, and don't care on the negative edge.

7.3 Command (CMD)

This signal is a bidirectional command channel used for Device initialization and transfer of commands. The CMD signal has two operation modes: open-drain for initialization mode, and push-pull for fast command transfer. Commands are sent from the eMMC host controller to the eMMC Device and responses are sent from the Device to the host.

7.4 Input/Outputs (DAT0-DAT7)

These are bidirectional data channels. The DAT signals operate in push-pull mode. Only the Device or the host is driving these signals at a time. By default, after power up or reset, only DAT0 is used for data transfer. A wider data bus can be configured for data transfer, using either DAT0-DAT3 or DAT0-DAT7, by the eMMC host controller. The eMMC Device includes internal pull-ups for data lines DAT1-DAT7. Immediately after entering the 4-bit mode, the Device disconnects the internal pull ups of lines DAT1, DAT2, and DAT3. Correspondingly, immediately after entering to the 8-bit mode the Device disconnects the internal pull-ups of lines DAT1-DAT.

Table 5.1 Communication Interface

Name	Type ¹	Description
CLK	I	Clock
DAT0	I/O/PP	Data
DAT1	I/O/PP	Data
DAT2	I/O/PP	Data
DAT3	I/O/PP	Data
DAT4	I/O/PP	Data
DAT5	I/O/PP	Data
DAT6	I/O/PP	Data
DAT7	I/O/PP	Data
CMD	I/O/PP/OD	Command/Response
RST_n	I	Hardware reset
VCC	S	Supply voltage for Core
VCCQ	S	Supply voltage for I/O
VSS	S	Supply voltage ground for Core
VSSQ	S	Supply voltage ground for I/O
DS	O/PP	Data strobe

Note:

1. I: input, O: output, PP: push-pull, OD: open-drain, NC: Not connected (or logical high), S: power supply.

8. eMMC Functional Description

8.1 Pseudo Technology (pSLC)

Each cell in a TLC NAND can be programmed to store 3 bits of data with 8 total voltage states. In Pseudo-SLC mode, the memory cell is used in 1-bit mode, thus resulting in higher endurance, lower error rates and extended temperature range. The firmware optimizes the eMMC device with Pseudo technology to achieve industrial and automotive level reliability. For ISSI eMMC device, Pseudo SLC (pSLC) mode provides one third capacity of TLC mode.

8.2 Field Firmware Update (FFU)

Field Firmware Updates (FFU) enables features enhancement in the field. Using this mechanism, the host downloads a new version of the firmware to the eMMC device and, following a successful download, instructs the eMMC device to install the new downloaded firmware into the device.

In order to start the FFU process the host first checks if the eMMC device supports FFU capabilities by reading SUPPORTED_MODES and FW_CONFIG fields in the EXT_CSD. If the eMMC device supports the FFU feature the host may start the FFU process. The FFU process starts by switching to FFU Mode in MODE_CONFIG field in the EXT_CSD. In FFU Mode host should use closed-ended or open ended commands for downloading the new firmware and reading vendor proprietary data. In this mode, the host should set the argument of these commands to be as defined in FFU_ARG field. In case these commands have a different argument the device behavior is not defined and the FFU process may fail. The host should set Block Length to be DATA_SECTOR_SIZE. Downloaded firmware bundle must be DATA_SECTOR_SIZE size aligned (internal padding of the bundle might be required). Once in FFU Mode the host may send the new firmware bundle to the device using one or more write commands.

The host could regain regular functionality of write and read commands by setting MODE_CONFIG field in the EXT_CSD back to Normal state. Switching out of FFU Mode may abort the firmware download operation. When host switched back to FFU Mode, the host should check the FFU Status to get indication about the number of sectors which were downloaded successfully by reading the NUMBER_OF_FW_SECTORS_CORRECTLY_PROGRAMMED in the extended CSD. In case the number of sectors which were downloaded successfully is zero the host should re-start downloading the new firmware bundle from its first sector. In case the number of sectors which were downloaded successfully is positive the host should continue the download from the next sector, which would resume the firmware download operation.

In case MODE_OPERATION_CODES field is not supported by the device the host sets to NORMAL state and initiates a CMD0/HW_Reset/Power cycle to install the new firmware. In such case the device doesn't need to use NUMBER_OF_FW_SECTORS_CORRECTLY_PROGRAMMED.

In both cases occurrence of a CMD0/HW_Reset/Power occurred before the host successfully downloaded the new firmware bundle to the device may cause the firmware download process to be aborted

8.3 Power Off Notification for Sleep

The host should notify the device before it powers the device off. This allows the device to better prepare itself for being powered off. Power the device off means to turn off all its power supplies. In particular, the host should issue a power off notification (POWER_OFF_LONG, POWER_OFF_SHORT) if it intends to turn off both VCC and VCCQ power or it may use a power off notification (SLEEP_NOTIFICATION) if it intends to turn-off VCC after moving the device to Sleep state.

To indicate to the device that power off notification is supported by the host, a supporting host shall first set the POWER_OFF_NOTIFICATION byte in EXT_CSD [34] to POWERED_ON (0x01). To execute a power off, before powering the device down the host will change the value to either POWER_OFF_SHORT (0x02) or POWER_OFF_LONG (0x03). Host should wait for the busy line to be de-asserted. Once the setting has changed to either 0x02 or 0x03, host may safely power off the device.

The host may issue SLEEP_AWAKE (CMD5) to enter or to exit from Sleep state if POWER_OFF_NOTIFICATION byte is set to POWERED_ON. Before moving to Standby state and then to Sleep state, the host sets POWER_OFF_NOTIFICATION to SLEEP_NOTIFICATION and waits for the DAT0 line de-assertion. While in Sleep (slp) state VCC (Memory supply) may be turned off as defined in 4.1.6. Removing power supplies other than VCC while the device is in the Sleep (slp) state may result in undefined device behavior. Before removing all power supplies, the host should transition the device out of Sleep (slp) state back to Transfer state using CMD5 and CMD7 and then execute a power off notification setting POWER_OFF_NOTIFICATION byte to either POWER_OFF_SHORT or POWER_OFF_LONG.

If host continues to send commands to the device after switching to the power off setting (POWER_OFF_LONG, POWER_OFF_SHORT or SLEEP_NOTIFICATION) or performs HPI during its busy condition, the device shall restore the POWER_OFF_NOTIFICATION byte to POWERED_ON.

If host tries to change POWER_OFF_NOTIFICATION to 0x00 after writing another value there, a SWITCH_ERROR is generated.

The difference between the two power-off modes is how urgent the host wants to turn power off. The device should respond to POWER_OFF_SHORT quickly under the generic CMD6 timeout. If more time is acceptable, POWER_OFF_LONG may be used and the device shall respond to it within the POWER_OFF_LONG_TIME timeout.

While POWER_OFF_NOTIFICATION is set to POWERED_ON, the device expects the host to host shall:

- Keep the device power supplies alive (both VCC and VCCQ) and in their active mode
- Not power off the device intentionally before changing POWER_OFF_NOTIFICATION to either POWER_OFF_LONG or POWER_OFF_SHORT
- Not power off VCC intentionally before changing POWER_OFF_NOTIFICATION to SLEEP_NOTIFICATION and before moving the device to Sleep state

Before moving to Sleep state hosts may set the POWER_OFF_NOTIFICATION byte to SLEEP_NOTIFICATION (0x04) if aware that the device is capable of autonomously initiating background operations for possible performance improvements. Host should wait for the busy line to be de-asserted. Busy line may be asserted up the period defined in SLEEP_NOTIFICATION_TIME byte in EXT_CSD [216]. Once the setting has changed to 0x04 host may set the device into Sleep mode (CMD7+CMD5). After getting out from Sleep the POWER_OFF_NOTIFICATION byte will restore its value to POWERED_ON. HPI may interrupt the SLEEP_NOTIFICATION operation. In that case POWER_OFF_NOTIFICATION byte will restore to POWERED_ON.

8.4 Enhanced User Data Area

ISSI *eMMC* supports Enhanced User Data Area feature which allows the User Data Area of *eMMC* to be configured as SLC Mode. Therefore, when host set the Enhanced User Data Area, the area will occupy more size of original set up size. The Max Enhanced User Data Area size is defined as - (MAX_ENH_SIZE_MULT x HC_WP_GRP_SIZE x HC_ERASE_GRP_SIZE x 512 KBytes). The Enhanced use data area size is defined as - (ENH_SIZE_MULT x HC_WP_GRP_SIZE x HC_ERASE_GRP_SIZE x 512 KBytes). The host shall follow the flow chart of JEDEC spec for configuring the parameters of General Purpose Area Partitions and Enhanced User Data Area.

8.5 Write Cache

Cache is a temporary storage space in an *eMMC* device. The cache should in typical case reduce the access time and increase the speed (compared to an access to the main nonvolatile storage). The cache is not directly accessible by the host. This temporary storage space may be utilized also for some implementation specific operations like as an execution memory for the memory controller and/or as storage for an address mapping table etc. However, there is data inconsistency risk when using nonvolatile cache. It's recommend only turning on the cache for the application which requires not too high reliability.

The cache shall be OFF by default after power up, RST_n assertion or CMD0. All accesses shall be directed to the nonvolatile storage like defined elsewhere in this specification. The cache function can be turned ON and OFF by writing to the CACHE_CTRL byte (EXT_CSD byte [33]). Turning the cache ON shall enable behavior model defined in this section. Turning the cache OFF shall trigger flushing of the data to the nonvolatile storages

8.6 Cache Enhancement Barrier

Barrier function provides a way to perform a delayed in-order flushing of a cached data. The main motivation for using barrier commands is to avoid the long delay that is introduced by flush commands. There are cases where the host is not interested in flushing the data right away, however it would like to keep an order between different cached data batches. The barrier command enables the host achieving the in-order goal but without paying the flush delay, since the real flushing can be delayed by the device to some later idle time. The formal definition of the barrier rule is as follows:

Denote a sequence of requests R_i , $i=0, \dots, N$. Assuming a barrier is set between requests R_x and R_{x+1} ($0 < x < N$) then all the requests $R_0..R_x$ must be flushed to the non-volatile memory before any of the requests $R_{x+1}..R_N$.

Between two barriers the device is free to write data into the non-volatile memory in any order. If the host wants to preserve a certain order it shall flush the cache or set another barrier at a point where order is important.

The barrier is set by writing to the BARRIER bit of the FLUSH_CACHE byte (EXT_CSD byte [32]). Any error resulted can be read from the status register by CMD13 after the completion of the programming as defined for a normal write request. The error could affect any data written to the cache since the previous flush operation.

The device shall support any number of barrier commands between two flush commands. In case of multiple barrier commands between two flush commands a subset of the cached data may be committed to the non-volatile memory according to the barrier rule. Internally, a device may have an upper limit on the barrier amount it can absorb without flushing the cache. That is, if the host exceeds this barrier amount, the device may issue, internally, a normal flush.

The device shall expose its barrier support capability via the BARRIER_SUPPORT byte (EXT_CSD byte [486]). If a device does not support barrier function this register shall be zero. If a device supports barrier function this register shall be one.

Assuming the device supports barrier function, if the BARRIER bit of the FLUSH_CACHE byte is set, a barrier operation shall be executed.

If the cache gets totally full and/or the cache is not able to receive the data of the next access (per block count indicated in CMD23 or per initiated single / open ended multiple block write in general) then it shall still be the responsibility of the *eMMC* device to store the data of the next access within the timeouts that are specified elsewhere in this specification. The actual algorithm to handle the new data and possible flush of some older cached data is left for the implementation.

Note: When issuing a force-programming write request (CMD23 with bit 24 on) or a reliable write request (CMD23 with bit 31 on), the host should be aware that the data will be written to the non-volatile memory, potentially, before any cached data, even if a barrier command was issued. Therefore, if the writing order to the non-volatile memory is important, it is the responsibility of the host to issue a flush command before the force-programming or the reliable-write request.

In order to use the barrier function, the host shall set bit 0 of BARRIER_EN (EXT_CSD byte [31]). The barrier feature is optional for an *eMMC* device.

8.7 Cache Flushing Policy

The host may require the device to flush data from the cache in an in-order manner. From time to time, to guarantee in-order flushing, the host may command the device to flush the device cache or may use a barrier command.

However, if the *eMMC* device flushing policy is to flush data from the cache in an in-order manner, cache barrier commands or flush commands operations (In case goal is to guarantee the flushing order) are redundant and impose a needless overhead to the device and host.

FIFO bit in CACHE_FLUSH_POLICY field (EXT_CSD byte [240]) is used by the device to indicate to the host that the device cache flushing policy is First-In-First-Out; this means that the device guarantees that the order of the flushing of data would be the in same order which data was written to the cache. When the FIFO bit is set it is recommended for the host not to send cache barrier commands or flush operations which goal is to guarantee the flushing order as they are redundant and impose a burden to the system.

However, if the FIFO bit is set to 1b and the device supports the cache barrier mechanism, the host may still send barrier commands without getting an error. Sending these commands will not change the device behavior as device flushes cache in-order anyway.

The CACHE_FLUSH_POLICY field is read-only field and never change its value either by the host or device.

8.8 Command Queuing (Disable by default)

To facilitate command queuing in *eMMC*, the device manages an internal task queue to which the host can queue data transfer tasks.

Initially the task queue is empty. Every task is issued by the host and initially queued as pending. The device controller works to prepare pending tasks for execution. When a task is ready for execution its state changes to “ready for execution”. The exact meaning of “ready for execution” is left for device implementation.

The host tracks the state of all queued tasks and may order the execution of any task, which is marked as “ready for execution” by sending a command indicating its task ID. When the execute command is received (CMD46/CMD47) the device executes the data transfer transaction.

For example, in order to queue a write transaction, the host sends a CMD44 indicating the task's parameters. The device responds and the host sends a CMD45, indicating the start block address.

The device regards the two commands as a single task in the queue and sends a response indicating success if no error is detected. This exchange may be executed on the CMD line while a data transfer, or busy state, is ongoing on the DAT lines. The host tracks the state of the queue using CMD13.

At a later time, when data transfer is not in progress, the host issues a CMD47, ordering the device to execute a task from the queue, providing the Task ID in its argument. The device responds with an R1 response and the data transfer starts.

Note that if hosts need to access RPMB partition, the host should disable the Command Queue mechanism and access RPMB partition not through the command queue.

General Purpose partitions may be accessed when command queuing is enabled.

The queue must be empty when CMD6 is sent (to switch partitions or to disable command queuing).

Sending CMD6 while the queue is not empty shall be regarded as illegal command (as explained 6.6.42.9 Supported Commands).

Prior to enabling command queuing, the block size shall be set to 512B. Device may respond with an error to CMD46/CMD47 if block size is not 512B.

8.9 Production State Awareness (PSA)

eMMC device could utilize the information of whether it is in production environment and operate differently than it operates in the field.

For example, content that was loaded into the storage device prior to soldering might get corrupted, at higher probability, during device soldering. The eMMC device could use “special” internal operations for loading content prior to device soldering that would reduce production failures and use “regular” operations post-soldering.

PRODUCTION_STATE_AWARENESS [133] field in extended CSD is used as a mechanism through which the host should report to the device whether it is pre or post soldering state.

This standard defines two methods, Manual Mode and Auto Mode, to manage the device production state.

The trigger for starting or re-starting the process is setting correctly PRE_LOADING_DATA_SIZE field. Before setting this field the host is expected to make sure that the device is clean and any data that was written before to the device is expected to be erased using CMD35, CMD36 and CMD38.

In case the host erased data, overrode existing data or performed re-partition during production state awareness it should restart the production state awareness process by re-setting PRE_LOADING_DATA_SIZE.

9. PACKAGE TYPE INFORMATION

9.1 100-ball FBGA Package (Q)

9.2 153-BALL FBGA Package (C)

10. ORDERING INFORMATION – Valid Part Numbers

IS 22 T F 16G _ - J C L A2

TEMPERATURE RANGE

I = Industrial Grade (-40°C to +85°C)

 Q = 100-ball FBGA

OPTION

J = Standard (Boot Partition Size: 4MB)
 B = Boot Partition Size: 16MB

Generation.

Blank = 1st Gen.

eMMC Density

16G = 16 GB
 32G = 32 GB
 64G = 64 GB
 128G = 128 GB

INTERFACE

F = eMMC 5.1

Flash Cell Technology

T = ISSI eMMC with TLC NAND

Product Family

21 = Managed NAND
 22 = Automotive Managed NAND

BASE PART NUMBER

IS = Integrated Silicon Solution Inc.
