

18-CHANNEL LED DRIVER EVALUATION BOARD GUIDE

DESCRIPTION

IS31FL3207 is an LED driver with 18 constant current channels. Each channel can be pulse width modulated (PWM) by 8 bits for smooth LED brightness control. In addition, each channel has an 7-bit output current control register which allows fine tuning the current for rich RGB color mixing, e.g., a pure white color LED application. The maximum output current of each channel can be adjusted by one 8-bit global control register. Proprietary programmable algorithms are used in IS31FL3207 to minimize audible noise caused by the MLCC decoupling capacitor. All registers can be programmed via a high speed I2C (1MHz).

IS31FL3207 can be turned off with minimum current consumption by either pulling the SDB pin low or by using the software shutdown feature.

FEATURES

- I2C interface
- Four selectable I2C addresses
- 256 steps current adjustment for each channel
- Modulate LED brightness with 256/1024/4096/65536 steps PWM for each channel
- Up to 62kHz, selectable PWM frequency
- Group Phase delay
- 180D Phase shift
- Spread Spectrum
- -40°C to +125°C temperature range
- QFN-28 (4mm × 4mm) package

QUICK START

Figure 1: Photo of IS31FL3207-QFLS4 Evaluation Board

RECOMMENDED EQUIPMENT

- 5.0V, 2A power supply

ABSOLUTE MAXIMUM RATINGS

- ≤ 5.5V power supply

Caution: Do not exceed the conditions listed above, otherwise the board will be damaged.

PROCEDURE

The IS31FL3207 evaluation board is fully assembled and tested. Follow the steps listed below to verify board operation.

Caution: Do not turn on the power supply until all connections are completed.

- 1) Short P1 (OPEN=EXT CTRL) to enable the control of on board MCU (default status).
- 2) Connect the 5V DC power to VCC (TP1) / GND (TP2), or plug in the USB power input to micro-USB (CON1).
- 3) Turn on the power supply, pay attention to the supply current. If the current exceeds 1A, please check for circuit fault.

EVALUATION BOARD OPERATION

The IS31FL3207 evaluation board has six display modes. Toggling the MODE button (K1) can switch the modes.

- 1) (Default mode) Two groups single color LEDs chasing each other-A.
- 2) Two groups single color LEDs chasing each other-B.
- 3) Three groups single color LEDs chasing after each other.
- 4) Chasing cycle.
- 5) RGB LEDs (D19-D24) are breathing effect A-mixed color.
- 6) RGB LEDs (D19-D24) are breathing effect B.

Note: IS31FL3207 solely controls the FxLED function on the evaluation board.

ORDERING INFORMATION

Part No.	Temperature Range	Package
IS31FL3207-QFLS4-EB	-40°C to +125°C (Industrial)	QFN-28, Lead-free

18-CHANNEL LED DRIVER EVALUATION BOARD GUIDE

SOFTWARE SUPPORT

EXT CTRL (P1) default setting is close circuit. If it is set to open, the on-board MCU will configure the I2C pins and SDB pin are set to High Impedance. External I2C and SDB signals can be connected to TP4 to control the IS31FL3207 LED driver. During external control mode, toggling the MODE button (K1) can switch the power of single blue color LED and power of RGB LED.

Figure 2: Photo of Arduino UNO connected to Evaluation Board

The steps listed below are an example using the Arduino for external control.

The Arduino hardware consists of an Atmel microcontroller with a bootloader allowing quick firmware updates. First download the latest Arduino Integrated Development Environment IDE (1.6.12 or greater) from www.arduino.cc/en/Main/Software. Also download the Wire.h library from www.arduino.cc/en/reference/wire and verify that pgmspace.h is in the directory ...program Files(x86)/Arduino/hardware/tools/avr/avr/include/avr/. Then download the latest IS31FL3207 test firmware (sketch) from the Lumissil website <http://www.lumissil.com/products/led-driver/fxled>.

- 1) Open EXT CTRL (P1).
- 2) Connect the 5 pins from Arduino board to IS31FL3207 EVB:
 - a) Arduino 5V pin to IS31FL3207 EVB VCC.
 - b) Arduino GND to IS31FL3207 EVB GND.
 - c) Arduino SDA (A4) to IS31FL3207 EVB SDA.
 - d) Arduino SCL (A5) to IS31FL3207 EVB SCL.
 - e) If Arduino use 3.3V MCU VCC, connect 3.3V to IS31FL3207 EVB SDB, if Arduino use 5.0V MCU VCC, connect 5.0V or 3.3V to EVB SDB.
(Arduino UNO MCU VCC is 5V, so SDB can be 5V or 3.3V)
- 3) Use the test code in appendix I or download the test firmware (sketch) from the Lumissil website, a .txt file and copy the code to Arduino IDE, compile and upload to Arduino.
- 4) Run the Arduino code for desired mode setting by Arduino code.
- 5) During external control mode, toggling the MODE button (K1) can switch the power of single color LEDs and power of RGB LEDs.

Please refer to the datasheet to get more information about IS31FL3207.
