

#### 2-RGB/6-LED LED DRIVER

April 2023

#### **GENERAL DESCRIPTION**

The IS31FL3296 is a 6 LED current sink LED driver with 1MHz I2C compatible programming interface. Each LED can be dimmed individually with 12-bit PWM data and color calibrated with 8-bit DC scaling data, providing 4096 steps of linear PWM dimming and 256 steps of DC current adjustment levels. All channels output current can be further globally adjusted in 64 steps.

The IS31FL3296 operates from 2.7V to 5.5V and features a very low operational and shutdown current.

Each channel of IS31FL3296 can operate in "PWM & Current Level mode" or "Pattern mode" or "Current Level Mode". In "PWM & Current Level mode", the output current is set by PWM and 8-bits current level registers. In "Pattern mode", the timing characteristics for RGB channels output can be individually adjusted to maintain a pre-established pattern sequence without requiring any additional MCU interaction, thus saving valuable system resources. In "Current Level mode", the output current is set by 8-bits current level register.

IS31FL3296 is available in QFN-20 (3mm×3mm) and UTQFN-12 (2mm×2mm) packages. It operates from 2.7V to 5.5V over the temperature range of -40°C to +125°C.

#### **FEATURES**

- Supply voltage range: 2.7V to 5.5V
- 6 current sinks, I<sub>OUT</sub>= 40mA (Max.)
- Ultra-low operational current (200µA Typ. at V<sub>CC</sub>= 3.6V)
- Power-saving mode: 1µA (Typ.) with SDB pulled high and all LEDs off
- Accurate color rendition
  - 12-bit/8+4-bit PWM/channel
  - 8-bit correction current/channel
  - 6-bit global current adjusts
- SDB rising edge reset I2C module
- 1MHz I2C-compatible interface
- Auto breath function:
  - 3 patterns for auto breath
  - Fade IN/ Fade OUT time up to 8s
  - Single pulse/Multi pulse/Manual control modes for auto breath
  - 3 colors pre-configure registers for color breath
- 23kHz PWM frequency (8+4-bit PWM mode)
- QFN-20 (3mm×3mm) and UTQFN-12 (2mm×2mm) packages
- RoHS & Halogen-Free Compliance
- TSCA Compliance

#### **APPLICATIONS**

- Hand-held devices for LED display
- Gaming device (Mouse, Mouse Pad etc.)
- IOT device (Al speaker etc.)

### TYPICAL APPLICATION CIRCUIT

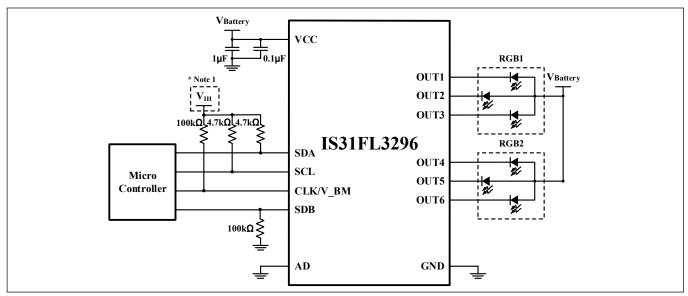

Figure 1 Typical Application Circuit: 2 RGBs

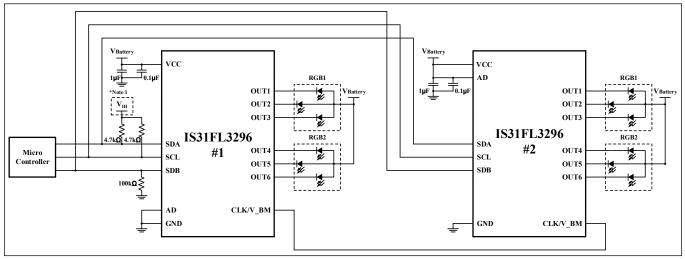

Figure 2 Typical Application Circuit (Cascade Mode, for QFN-20 only)

Note 1:  $V_{DD}$  is the high-level voltage for IS31FL3296, which is usually same as  $V_{CC}$  of Micro Controller, e.g. if  $V_{CC}$  of Micro Controller is 3.3V,  $V_{IH}$ = 3.3V. If  $V_{CC}$ = 5V and  $V_{IH}$  is lower than 2.8V, recommend to add level shift circuit.

#### PIN CONFIGURATION

Package	Pin Configuration (Top View)
QFN-20	OUT2 4 1
UTQFN-12	VCC

## **PIN DESCRIPTION**

No.		Din	Description	
QFN-20	UTQFN-12	Pin	Description	
1	1	VCC	Power supply	
2,10,11,12 ,14,15,17	-	NC	No Connect	
3~6	2~5	OUT1~OUT4	4 Current Sink channels	
7	6	GND	Ground	
8~9	7~8	OUT5~OUT6	Current Sink channels	
13	9	SDB	Shutdown the chip when pulled to low	
16	10	AD	I2C address setting	
18	11	SCL	I2C serial clock	
19	12	SDA	I2C serial data	
20	-	CLK/V_BM	CLK input or output for cascade connection. When breathing mark function is enabled, this pin is V_BM pin.	
		Thermal Pad	Connect to GND.	

**ORDERING INFORMATION** 

Industrial Range: -40°C to +125°C

Order Part No.	Package	QTY/Reel
IS31FL3296-QFLS4-TR	QFN-20, Lead-free	2500
IS31FL3296-UTLS4-TR	UTQFN-12, Lead-free	3000

### **ABSOLUTE MAXIMUM RATINGS**

Supply voltage, Vcc	-0.3V ~+6.0V
Voltage at any input pin	-0.3V ~ V <sub>CC</sub> +0.3V
Maximum junction temperature, T <sub>JMAX</sub>	+150°C
Storage temperature range, T <sub>STG</sub>	-65°C ~+150°C
Operating temperature range, T <sub>A</sub> =T <sub>J</sub>	-40°C ~ +125°C
Package thermal resistance, junction to ambient (4-layer standard test PCB	56.6°C/W (QFN)
based on JESD 51-2A), θ <sub>JA</sub>	126.1 °C/W (UTQFN)
ESD (HBM)	±2kV
ESD (CDM)	±750V

Note 2: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### **ELECTRICAL CHARACTERISTICS**

The following specifications apply for V<sub>CC</sub>= 5V, T<sub>A</sub>= 25°C, unless otherwise noted.

Symbol	Parameter	Conditions	Min.	Тур.	Max.	Unit	
Vcc	Supply voltage		2.7		5.5	V	
		$V_{CC}$ = 3.6V, $V_{SDB}$ = $V_{CC}$ , ALL channels PWM= 0x00, 12-bit mode, PFS = 220Hz		0.2	0.24		
	Quiescent power supply	V <sub>CC</sub> = 5V, V <sub>SDB</sub> = V <sub>CC</sub> , ALL channels PWM= 0x00, 12-bit mode, PFS = 220Hz		0.26	0.29	A	
Icc	current	V <sub>CC</sub> = 3.6V, V <sub>SDB</sub> = V <sub>CC</sub> , ALL channels PWM= 0x00, 8+4-bit mode, PFS = 23kHz		0.4	0.47	mA	
		V <sub>CC</sub> = 5V, V <sub>SDB</sub> = V <sub>CC</sub> , ALL channels PWM= 0x00, 8+4-bit mode, PFS = 23kHz		0.55	0.6		
	Shutdown current	V <sub>CC</sub> = 5V, V <sub>SDB</sub> = 0V		0.4	2		
		V <sub>CC</sub> = 3.6V, V <sub>SDB</sub> = 0V		0.3	1	μA	
I <sub>SD</sub>		V <sub>SDB</sub> = V <sub>CC</sub> =5V, Configuration Register written "0000 0000		0.4	2		
		V <sub>SDB</sub> = V <sub>CC</sub> =3.6V, Configuration Register written "0000 0000		0.3	1		
	Constant current of channel	GCC=0x3F, CL=0xFF, IMAX=0	27.5	30	32.5	mA	
Іоит	Constant current of channel	GCC=0x3F, CL=0xFF, IMAX=1		40		mA	
		OSC= 1.8MHz, PFS= 00, PWM Resolution= 12-bit	200	220	240	Hz	
f <sub>оит</sub>	PWM frequency of output	OSC= 1.8MHz, PFS= 01, PWM Resolution= 12-bit	400	440	480	Hz	
		OSC= 6MHz, PFS= 10, PWM Resolution= 8+4-bit	21	23	25.3	kHz	
$\Delta I_MAT$	Between channels	I <sub>OUT</sub> = 30mA (Note 3)	-6.5		6.5	%	
$\Delta I_{ACC}$	Between device to device	I <sub>OUT</sub> = 30mA (Note 4)	-6.5		6.5	%	
$\Delta I_MAT$	Between channels	I <sub>OUT</sub> =3mA (LCAI=1) (Note 3)	-7		7	%	
$\Delta I_ACC$	Between device to device	I <sub>OUT</sub> =3mA (LCAI=1) (Note 4)	-7		7	%	
$V_{HR}$	Current sink headroom voltage	I <sub>OUT</sub> = 30mA		250	330	mV	

### **ELECTRICAL CHARACTERISTICS (CONTINUE)**

The following specifications apply for V<sub>CC</sub>= 5V, T<sub>A</sub>= 25°C, unless otherwise noted.

Symbol	Parameter	Conditions	Min.	Тур.	Max.	Unit	
$T_{SD}$	Thermal shutdown	(Note 5)		165		°C	
T <sub>SD_HY</sub>	Thermal shutdown hysteresis	(Note 5)		18		°C	
Logic Ele	Logic Electrical Characteristics (SDA, SCL, SDB, AD)						
VIL	Logic "0" input voltage	V <sub>CC</sub> = 2.7V ~ 5.5V	GND		0.4	V	
ViH	Logic "1" input voltage	V <sub>CC</sub> = 2.7V ~ 5.5V	1.4		Vcc	V	
I <sub>IL</sub>	Logic "0" input current	V <sub>INPUT</sub> = 0V (Note 5)		5		nA	
Iн	Logic "1" input current	V <sub>INPUT</sub> = V <sub>CC</sub> (Note 5)		5		nA	

#### **DIGITAL INPUT I2C SWITCHING CHARACTERISTICS (NOTE 5)**

Cumbal	Parameter		Fast Mode			Fast Mode Plus		
Symbol	Parameter	Min.	Тур.	Max.	Min.	Тур.	Max.	Units
fscL	Serial-clock frequency	-		400	-		1000	kHz
t <sub>BUF</sub>	Bus free time between a STOP and a START condition			-	0.5		-	μs
t <sub>HD,</sub> STA	Hold time (repeated) START condition	0.6		-	0.26		-	μs
tsu, sta	Repeated START condition setup time	0.6		-	0.26		-	μs
t <sub>su, sto</sub>	STOP condition setup time	0.6		-	0.26		-	μs
t <sub>HD, DAT</sub>	Data hold time	-		-	-		-	μs
tsu, dat	Data setup time	100		-	50		-	ns
t <sub>LOW</sub>	SCL clock low period	1.3		-	0.5		-	μs
t <sub>HIGH</sub>	SCL clock high period	0.7		-	0.26		-	μs
t <sub>R</sub>	Rise time of both SDA and SCL signals, receiving (Note 6)	-		300	-		120	ns
t⊧	Fall time of both SDA and SCL signals, receiving (Note 6)	-		300	-		120	ns

Note 3:  $I_{OUT}$  mismatch (bit to bit)  $\triangle I_{MAT}$  is calculated:

$$\Delta I_{MAT} = \left(\frac{I_{OUTn}(n=1 \sim 6)}{\left(\frac{I_{OUT1} + I_{OUT2} + I_{OUT3} + I_{OUT4} + I_{OUT5} + I_{OUT6}}{6}\right)} - 1\right) \times 100\%$$

$$\Delta I_{ACC} = \begin{pmatrix} \frac{I_{OUT1} + I_{OUT2} + I_{OUT3} + I_{OUT4} + I_{OUT5} + I_{OUT6}}{6} - I_{OUT(IDEAL)} \end{pmatrix} \times 100\%$$

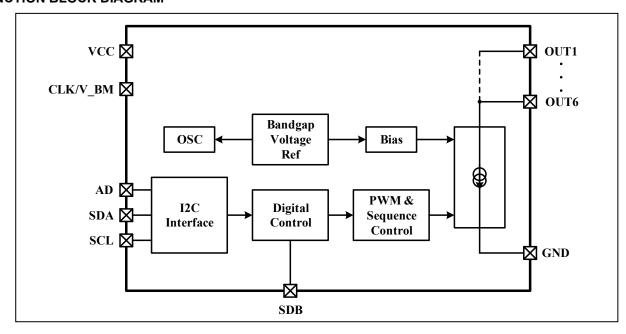

Where  $I_{OUT(IDEAL)}$ = 30mA or 3mA.

Note 5: Guaranteed by design.

Note 6:  $C_b$  = total capacitance of one bus line in pF.  $I_{SINK} \le 6mA$ .  $t_R$  and  $t_F$  measured between  $0.3 \times V_{CC}$  and  $0.7 \times V_{CC}$ .

## **FUNCTION BLOCK DIAGRAM**

#### **DETAILED DESCRIPTION**

#### **12C INTERFACE**

IS31FL3296 uses a serial bus, which conforms to the I2C protocol, to control the chip's functions with two wires: SCL and SDA. The IS31FL3296 has a 7-bit slave address (A7:A1), followed by the R/W bit, A0. Set A0 to "0" for a write command and set A0 to "1" for a read command. The value of bits A1 and A2 are decided by the connection of the AD pin.

**Table 1 Slave Address** 

AD	A7:A3 A2:A1		A0
GND		00	
SCL	1110 1	01	0/4
SDA		10	0/1
VCC		11	

AD connected to GND, A2:A1=00;

AD connected to VCC, A2:A1=11;

AD connected to SCL, A2:A1=01;

AD connected to SDA, A2:A1=10;

The SCL line is uni-directional. The SDA line is bi-directional (open-drain) with a pull-up resistor (typically 400kHz I2C with 4.7k $\Omega$ , 1MHz I2C with 2k $\Omega$ ). The maximum clock frequency specified by the I2C standard is 1MHz. In this discussion, the master is the microcontroller and the slave is the IS31FL3296.

The timing diagram for the I2C is shown in Figure 3. The SDA is latched in on the stable high level of the SCL. When there is no interface activity, the SDA line should be held high.

The "START" signal is generated by lowering the SDA signal while the SCL signal is high. The start signal will alert all devices attached to the I2C bus to check the incoming address against their own chip address.

The 8-bit chip address is sent next, most significant bit first. Each address bit must be stable while the SCL level is high.

After the last bit of the chip address is sent, the master checks for the IS31FL3296's acknowledge. The master releases the SDA line high (through a

pull-up resistor). Then the master sends an SCL pulse. If the IS31FL3296 has received the address correctly, then it holds the SDA line low during the SCL pulse. If the SDA line is not low, then the master should send a "STOP" signal (discussed later) and abort the transfer.

Following acknowledge of IS31FL3296, the register address byte is sent, most significant bit first. IS31FL3296 must generate another acknowledge indicating that the register address has been received.

Then 8-bit of data byte are sent next, most significant bit first. Each data bit should be valid while the SCL level is stable high. After the data byte is sent, the IS31FL3296 must generate another acknowledge to indicate that the data was received.

The "STOP" signal ends the transfer. To signal "STOP", the SDA signal goes high while the SCL signal is high.

#### ADDRESS AUTO INCREMENT

To write multiple bytes of data into IS31FL3296, load the address of the data register that the first data byte is intended for. During the IS31FL3296 acknowledge of receiving the data byte, the internal address pointer will increment by one. The next data byte sent to IS31FL3296 will be placed in the new address, and so on. The auto increment of the address will continue as long as data continues to be written to IS31FL3296 (Figure 6).

#### **READING OPERATION**

Most of the registers can be read.

To read the register, after I2C start condition, the bus master must send the IS31FL3296 device address with the  $R/\overline{W}$  bit set to "0", followed by the register address which determines which register is accessed. Then restart I2C, the bus master should send the IS31FL3296 device address with the  $R/\overline{W}$  bit set to "1". Data from the register defined by the command byte is then sent from the IS31FL3296 to the master (Figure 7).

A Division of [551]

Table 3 01h Shutdown Control Register

	Tailor of the Children Control of the group									
Bit	D7	D6	D5	D4	D3:D2	D1	D0			
Name	LCAI	IMAX	MS	SYNC	PFS	SLE	SSD			
Default	0	0	1	0	00	0	0			

The Shutdown Control Register sets software shutdown and sleep modes of IS31FL3296.

When SLE bits are set to "1", IS31FL3296 puts itself in Sleep Mode if all OUTx outputs are off for >20s. MCU command to the IS31FL3296 will wake it up and disable the sleep mode. In Sleep Mode, all OUTx are off without any bias. I\_SLEEP= 1µA (Typ.). The PFS bit sets the PWM resolution. PWM mode can operate at 220Hz (12-bit, 8+4-bit mode), 440Hz (12-bit, 8+4-bit mode) and 23kHz (8+4-bit mode).

MS and SYNC bit control the CLK pin status. When MS and SYNC are both set to "1", the CLK pin will have a clock output to support cascade connection between 2 or more IS31FL3296.

SSD	Software	Shutdown	<b>Enable</b>
-----	----------	----------	---------------

0 Software shutdown mode

1 Normal operation

#### SLE Sleep Mode Enable

0 Sleep mode disable

Sleep mode enable (20s after no output 1 current)

#### **PFS PWM Frequency Select**

00 220Hz (Force 220Hz in Pattern Mode or PWM mode)

440Hz (12-bit PWM mode) 01

23kHz (8+4-bit PWM mode, 23kHz) 1x

#### LCAI **Low Current Accuracy Improve**

Default maximum 30mA

1/3 output current, and improve low current accuracy

#### IMAX Enable Iout(MAX)=40mA

Default 30mA 1 I<sub>OUT(MAX)</sub>=40mA

#### MS **Master Slave**

Slave, CLK is input 0

1 Master, CLK is clock output or Hi-Z status

#### **SYNC Enable Synchronization Clock**

0 Disable, CLK pin is Hi-Z status 1 Enable, CLK is clock output.

Table 4 02h Output Enable Register 1

Bit	D7:D5	D4	D3	D2	D1	D0
Name	-	EN5	EN4	EN3	EN2	EN1
Default	000	1	1	1	1	1

Table 5 03h Output Enable Register 2

Bit	D7:D4	D0
Name	-	EN6
Default	0000	1

The Output Enable Register enables/disables the outputs independently. The ENx is only effective when SSD= "1".

#### **Output Enable Control EN**x

Output disable

1 Output enable

Table 6 04h Operating Configure Register 1

Bit	D7	D6	D5:D4	D3:D2	D1:D0

Default	0	0	00	00	00

Table 7 05h Operating Configure Register 2

Bit	D7:D6	D5:D4	D3:D2	D1:D0
Name	-	MOD6	MOD5	MOD4
Default	00	00	00	00

The MODx  $(x=1\sim6)$  bits sets output operation modes of IS31FL3296.

When RGB= "1", RGB Mode enable, OUT1~OUT6 running in Pattern Mode, the MODx (x=1~6) bits are invalid. When RGB= "0", OUT1~OUT6 are controlled by the MODx ( $x=1\sim6$ ) bits.

#### **Enable RGB Mode RGB**

0 Disable 1 Enable

#### MODx OUT1~OUT6 LED Mode

00 PWM & Current Level Mode

01 Pattern Mode

**Current Level Mode** 1x

When the OUTx works in PWM & Current Level Mode, it means the output current is controlled by PWM Registers (40h~4Bh).

When the OUTx works in Pattern Mode, it means the output current is controlled by Color Setting Registers.

Level Register.

When the OUTx works in Current Level Mode, means the output current is controlled by Current

Table 9 07h Global Current Control Register

Bit	D7:D6	D5:D0
Name	-	GCC
Default	00	11 1111

GCC registers control  $I_{OUT}$  as shown in Formula (1). If GCC= 0x3F, CL= 0xFF,  $I_{OUT}$ =  $I_{OUT(MAX)}$ 

$$I_{OUT} = 30mA \times \frac{GCC}{64} \times \frac{CL}{256} \tag{1}$$

$$GCC = \sum_{n=0}^{7} D[n] \cdot 2^n$$
 (2)

When IMAX="1", the 30mA will become 40mA.

Table 10 08h Color Hold Function Register

Bit	D7:D6	D5	D4	D3	D2	D1	D0
Name	-	CHF3	HT3	CHF2	HT2	CHF1	HT1
Default	00	0	0	0	0	0	0

The Color Hold Function Register configures hold time for each output in Pattern Mode.

#### HT Hold Time Selection

O Hold at end of T4 when color loop done (always off)

1 Hold at end of T2 when color loop done (always on)

#### **CHF** Hold Function Enable

0 hold function disable1 hold function enable

Table 11 09h V\_BM Function Register

Bit	D7	D6	D5:D4	D3:D2	D1:D0
Name	VPE	BME	ME PAMF CMF		TP
Default	0	0	00	00	00

The V\_BM stores the V\_BM pin function, PAT select the pattern and TP select the T1-T4 to have interrupt

### VPE V\_BM Pull high EN

0 Disable, V BM is open drain

1 Enable, V\_BM is pull to VCC by  $100k\Omega$ 

#### BME Breath mark function enable

Disable, CLK/V\_BM is clock functionEnable, CLK/V BM is V BM function

#### PAMF Pattern mark function

#### **CMF** Color Mark Function

00	Color 1
01	Color 2
10	Color 3

### TP Time point

	•
00	End of T1
01	End of TP

End of T4

1x

### **0Bh PWM Frequency Adjust Unlock Register**

Write "0xA5" to 0Bh to unlock the PWM Frequency Adjust Register (0Ch).

Table 12 0Ch PWM Frequency Adjust Register

		<u> </u>
Bit	D7:D3	D2:D0
Name	-	PFA
Default	000	000

Before access to 0Ch, the 0Bh need to be written with 0xA5 to unlock it.

The PFA bits adjust the PWM Frequency, for example, if PWM frequency is 23kHz at 8+4-bit PWM mode, if PFA is "000", the PWM frequency is 23kHz, if PFA is "001", the PWM frequency is 28.08kHz (+22.07%).

#### PFA PWM Frequency Adjust

000	0%
001	+22.07%
010	+36.29%
011	+57.04%
100	-51.58%
101	-44.48%
110	-30.89%
111	-15.22%

Table 13 0D~0Fh Pattern State Register (Read Only)

Bit	D7	D6	D5	D4	D3	D2:D0
Name	PS	CS3	CS2	CS1	-	TS
Default	0	0	0	0	0	000

The Pattern State Register stores the pattern status. PS is the pattern enabled or not, CSx is the color enable or not, TS will show the running position of Pattern.

TS	Time State
000	Running at TS
001	Running at T1
010	Running at T2
011	Running at T3
100	Running at TP
101	Running at T4

Table 14 10h~15h OUT1~OUT6 Current Level Register

3.5.5.5		
Bit	D7:D0	
Name	CL	
Default	0000 0000	

The output current may be computed using the Formula (1):

$$I_{OUT} = 30mA \times \frac{GCC}{64} \times \frac{CL}{256}$$
 (1) 
$$CL = \sum_{n=0}^{7} D[n] \cdot 2^{n}$$
 (3) 
$$I_{LED} = 30mA \times \frac{GCC}{64} \times \frac{CL}{256} \times \frac{PWM}{4096}$$
 (4)

Where D[n] stands for the individual bit value, 1 or 0, in location n, PWM is the value in 40h~4Bh, lout is the peak current of the outputs. ILED is the average current of the outputs.

When IMAX= "1", the 30mA will become 40mA. When IS31FL3296 operates in Current Level Mode, PWM = 4096 in above equation.

For example: in Current Level node only, if D7:D0 = 10110101,

 $I_{OUT} = 30 \text{mA} \times (2^7 + 2^5 + 2^4 + 2^2 + 2^0)/256$ 

When IS31FL3296 operates in PWM & Current Level Mode, the value of CL and PWM will decide the output current together.

When IS31FL3296 operates in Pattern Mode, PWM changes to make the auto breathing effect.

Table 15-1 10h~15h Color 1 Setting Register of Pattern (OUT1~OUT6)

attern (OOT)		
Bit	D7:D0

Name	COL2_Oy
Default	0000 0000

Table 15-3 30h~35h Color 3 Setting Register of Pattern (OUT1~OUT6)

(0011)		
Bit	D7:D0	
Name	COL3_Oy	
Default	0000 0000	

Color Setting Registers store the color setting for each output in Pattern Mode. Check Pattern Color Setting section for more information about the color setting registers.

When IS31FL3296 operates in Pattern Mode, the value of Color Registers will decide the output current of each output in 256 levels.

The output current may be computed using the Formula (4):

$$I_{OUT} = 30 \, mA \times \frac{\text{COLx\_Oy}}{256}$$

$$\text{COLx\_Oy} = \sum_{n=0}^{7} D[n] \cdot 2^{n}$$
(6)

Where D[n] stands for the individual bit value, 1 or 0, in location n.

For example: if D7:D0 = 10110101,

 $I_{OUT} = 30 \text{mA} \times (2^7 + 2^5 + 2^4 + 2^2 + 2^0)/256$ 

I<sub>OUT</sub> is the peak current of the outputs.

Need to write Color Update Register (52h) to update the data.

Table 16 40h~4Bh PWM Register

Reg	41h (43h, 45h)		40h (42h, 44h)
Bit	D7:D4 D3:D0		D7:D0
Name	-	PWM_H	PWM_L
Default	0000	0000	0000 0000

When IS31FL3296 operates in PWM & Current Level Mode, each output has 2 bytes to modulate the PWM duty as below table in 4096 steps, in Pattern Mode, the PWM cannot be accessed.

The value of the PWM Registers decides the average current of each LED noted  $I_{\text{LED}}$ .

I<sub>LED</sub> computed by Formula (1):

$$I_{LED} = 30 \text{mA} \times \frac{GCC}{64} \times \frac{CL}{256} \times \frac{PWM}{4096}$$
 (8)

Where  $I_{\text{OUT}}$  is the peak current of the outputs.  $I_{\text{LED}}$  is the average current of the outputs.

$$PWM = \sum_{n=0}^{11} D[n] \cdot 2^n$$

Where D[n] stands for the individual bit value, 1 or 0, in location n.

For example: if PWM\_H = 00001001, PWM\_L = 10110101, N=4096, GCC=63, CL=255,

 $I_{LED} = 30 \text{mA} \times (2^{11} + 2^8 + 2^7 + 2^5 + 2^4 + 2^2 + 2^0)/4096$

## 52h Color Update Register

Write "0xC5" to 52h will update the data of 10h~15h/20h~25h/30h~35h.

#### 53h PWM Update Register

Write "0xC5" to 53h will update the data of 40~4Bh.

#### 54/55/56h Pattern time Update Register

Write "0xC5" to 54/55/56h will update the data of 19h~1Fh/29h~2Fh/39h~3Fh.

#### 5Fh Reset Register

Once user writes "0xC5" to the Reset Register, IS31FL3296 will reset all registers to their default value. On initial power-up, the IS31FL3296 registers are reset to their default values for a blank display.

#### TYPICAL APPLICATION INFORMATION

#### **GENERAL DESCRIPTION**

IS31FL3296 is a 6-channel fun LED driver which auto breathing mode. It has Pattern Mode and Current Lever Mode for RGB lighting effects.

#### **CURRENT SETTING**

The maximum output current is 30mA. When IMAX="1", the 30mA will become 40mA. The Global Current Control register GCC can be used to set a lower current. The 8-bit CL registers (10h~15h) control the individual currents for each of the outputs.

For example, OUT1, OUT2 and OUT3 drive an RGB LED, OUT1 is Red LED, OUT2 is Green LED and OUT 3 is Blue LED. If GCC and CL bits are the same, then the RGB LED may appear a pinkish, or not so white. The CL bits can be used to adjust the IOUTx current so the RGB LED appears closer to a pure white color. We call this CL bit adjustment by another name: white balance register.

### **PWM FREQUENCY SELECT**

The IS31FL3296 output channels operate with a default 12-bit PWM resolution and the PWM frequency of 220Hz. Because all the OUTx channels are synchronized, the DC power supply will experience large instantaneous current surges when the OUTx channels turn ON. These current surges will generate an AC ripple on the power supply which cause stress to the decoupling capacitors. When the AC ripple is applied to a monolithic ceramic capacitor chip (MLCC) it will expand and contract causing the PCB to flex and generate audible hum in the range of between 20Hz to 20kHz, to avoid this hum, there are many countermeasures, such as selecting the capacitor type and value which will not cause the PCB to flex and contract.

An additional option for avoiding audible hum is to set the IS31FL3296's output PWM frequency above the audible frequency range. The Control Register (00h) can be used to set the switching frequency to 220Hz/440Hz/23kHz. Combination settings of the PFS bits will result in different PWM frequency, select a value higher than 20kHz to avoid the audible frequency range.

#### **PWM CONTROL**

The PWM Registers (40h~4Bh) can modulate LED brightness of each channels with 4096 steps. For example, if the data in PWM\_H Register is "0000 0000" and in PWM\_L Register is "0000 0100", then the PWM is 4/4096.

Writing new data continuously to the registers can modulate the brightness of the LEDs to achieve a breathing effect.

#### **CURRENT LEVEL MODE**

The Current Level Registers (10h~15h) are active and can modulate LED peak current IOUT of each output with 256 steps independently. For example, if the data in Current Lever Register is "0000 0100", then the current level is the fourth step, with a current level of 4/256.

In Current Level Mode, user doesn't need to turn on the CEx of 1Ch, a new value must be written to the Current Level registers to change the output current. Writing new data continuously to the registers can modulate the brightness of the LEDs to achieve breathing, blinking, or any other effects that the user defines.

In Current Level Mode, the output current (OUT1~OUT6) is configured by the Current Level Register (10h~15h).

#### **PWM & CURRENT LEVEL MODE**

PWM & Current Level Mode is the combination of PWM and Current Level Mode. In this mode, the Current Level Registers (10h~15h) adjust the peak current (I<sub>OUT</sub>) of the outputs, the PWM Registers (40h~4Bh) adjust the duty cycle of the output current, the finial result is the output average current ILED.

Table 17 Register of PWM & Current Level Mode

Mode	Register	OUT1	OUT2	OUT3
	PWM_H	41h	43h	45h
	PWM_L	40h	42h	44h
PWM &	CL	10h	11h	12h
Current	Register	OUT4	OUT5	OUT6
Level	PWM_H	47h	49h	4Bh
	PWM_L	46h	48h	4Ah
	CL	13h	14h	15h

#### **RGB MODE**

By setting the RGB bits of the Operating Configure Register 1 (04h) to "1", the IS31FL3296 will operate in One Shot Programming mode. In this mode 6 channels (2 groups RGB) can be modulated breathing cycle independently by TS~TP (Figure 11). Setting different TS~T4 can achieve RGB breathing with auto color changing. OUT1~OUT6 running in Pattern 1 to Pattern 3. The maximum intensity of each RGB can be adjusted independently by the Color Setting Registers (10h~15h/20h~25h/30h~35h) (Table 25).

Note, if IS31FL3296 operates in the One-Shot Programming mode and then enters into the shutdown mode, an 8-bit data write operation to the

Time Update Register is required to restart the LED breathing effect after the IC is re-enabled.

Table 25 Color Register of RGB Mode

Pattern Mode	Color Enable	OUT1	OUT2		OUT6
	CE1(1Ch)	10h	11h	•••	15h
Pattern 1	CE2(1Ch)	20h	21h	•••	25h
	CE3(1Ch)	30h	31h	•••	35h
	CE1(2Ch)	10h	11h	•••	15h
Pattern 2	CE2(2Ch)	20h	21h	•••	25h
	CE3(2Ch)	30h	31h	•••	35h
	CE1(3Ch)	10h	11h	•••	15h
Pattern 3	CE2(3Ch)	20h	21h	•••	25h
	CE3(3Ch)	30h	31h	•••	35h

#### **PATTERN MODE**

By setting the MOD1~MOD6 bits of the Operating Configure Register (04h/05h) to "01", the corresponding output will operate in Pattern Mode. In Pattern Mode, the timing characteristics for output current - current rising (T1), holding (T2), falling (T3) and off time (TS, TP, T4) (Figure 10), can be adjusted individually so that each output can independently maintain a pre-established pattern achieving mixing color breathing or a single-color breathing without requiring any additional interface activity, thus saving valuable system resources. OUT1~OUT3 running in Pattern 1, OUT4~OUT6 running in Pattern 2.

#### **PATTERN COLOR SETTING**

In Pattern Mode, the LED color is defined by  $COLx_Oy$  (x=1, 2, 3, y= 1, 2) bits in Color Setting Registers (10h~15h/20h~25h/30h~35h). There are 3 RGB current combinations to generate 3 pre-defined colors for display. More than one of the 3 pre-defined colors can be chosen by setting CEx bits in Color Enable Register (1Ch/2Ch/3Ch). When CEx is set, the color x is allowed to be displayed in current pattern.

In Pattern Mode, the output current (OUT1~OUT6) is configured by the Color Setting Register of Pattern as Table 26.

**Table 26 Color Register of Pattern Mode** 

Pattern Mode	Color Enable	OUT1	OUT2	OUT3
Pattern 1	CE1(1Ch)	10h	11h	12h
	CE2(1Ch)	20h	21h	22h
	CE3(1Ch)	30h	31h	32h
Pattern Mode	Color Enable	OUT4	OUT5	OUT6
Pattern 2	CE1(2Ch)	13h	14h	15h
	CE2(2Ch)	23h	24h	25h
	CE3(2Ch)	33h	34h	35h

#### **PATTERN TIME SETTING**

User should configure the related pattern time setting registers according to actual timing requirements via I2C interface before starting pattern. The pattern time is including TS, T1~T4 and TP. And the pattern has three continue lighting cycle as Color 1~Color 3. Please check the LED OPERATING MODE section for more about the time setting.

#### **GAMMA CORRECTION**

In order to perform a better visual LED breathing effect, the device integrates gamma correction to the Pattern Mode. The gamma correction causes the change in intensity to appear more linear to the human eye.

Gamma correction, also known as gamma compression or encoding, is used to encode linear luminance to match the non-linear characteristics of display. Since the IS31FL3296 can modulate the brightness of the LEDs with 256 steps, a gamma correction function can be applied when computing each subsequent LED intensity setting such that the changes in brightness matches the human eye's brightness curve.

The IS31FL3296 provides three gamma corrections which can be set by GAM bits of Pattern Registers (1Eh/2Eh/3Eh) for each pattern. The gamma correction is shown as below.

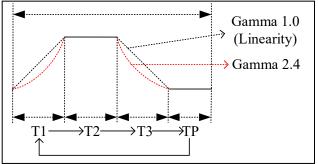

Figure 8 Gamma Correction

#### **SHUTDOWN MODE**

Shutdown mode can either be used as a means of reducing power consumption or generating a flashing display (repeatedly entering and leaving shutdown mode). During shutdown mode all registers retain their data.

### **Software Shutdown**

By setting SSD bit of the Shutdown Register (00h) to "0", the IS31FL3296 will operate in software shutdown mode, wherein it will consume only  $0.4\mu A$  (typ.) current. When the IS31FL3296 is in software shutdown mode, all current sources are switched off.

#### **Hardware Shutdown**

The chip enters hardware shutdown mode when the SDB pin is pulled low, wherein they consume only  $0.4\mu A$  (Typ.) current. When set SDB high, the rising edge will reset the I2C module, but the register information retains.

### **LED OPERATING MODE**

The IS31FL3296 has three operating modes which can be chosen by the MODx bits of Operating Configure Register (04h/05h).

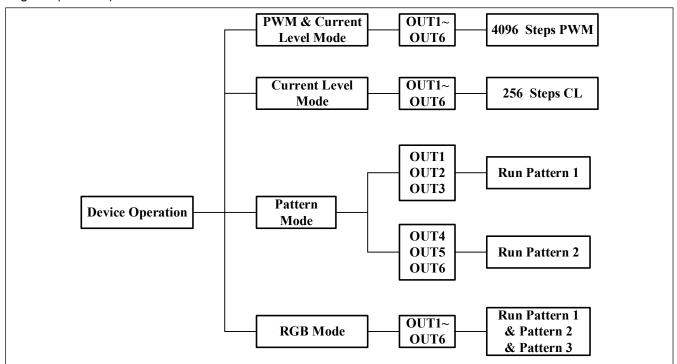

Figure 9 Operating Mode Map

#### **Pattern Mode**

If MODx= 10 (Pattern Mode), OUT1~OUT3 can operate in Pattern Mode only and run the pattern 1, OUT4~OUT6 run the pattern 2.

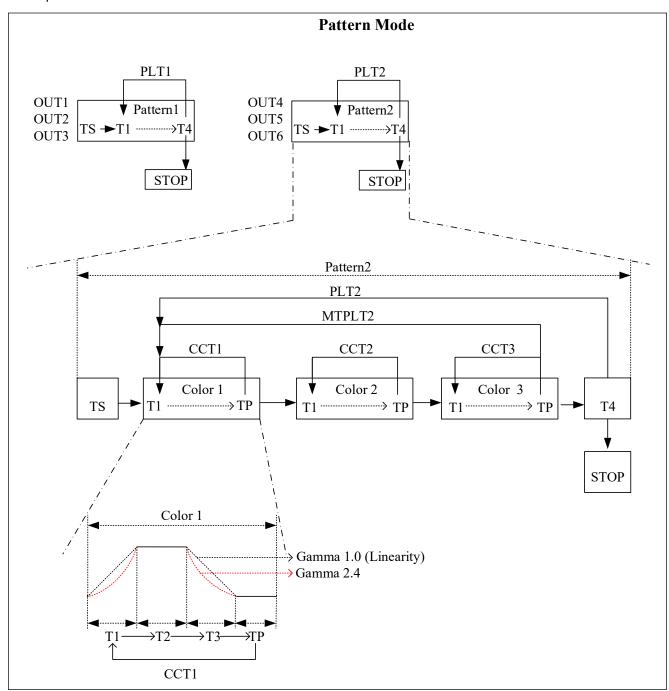

Figure 10 Pattern Mode

#### **Pattern Mode**

If RGB= 1 (RGB Mode), OUT1~OUT6 can operate in Pattern Mode only and run the pattern 1 and pattern 2 and pattern 3.

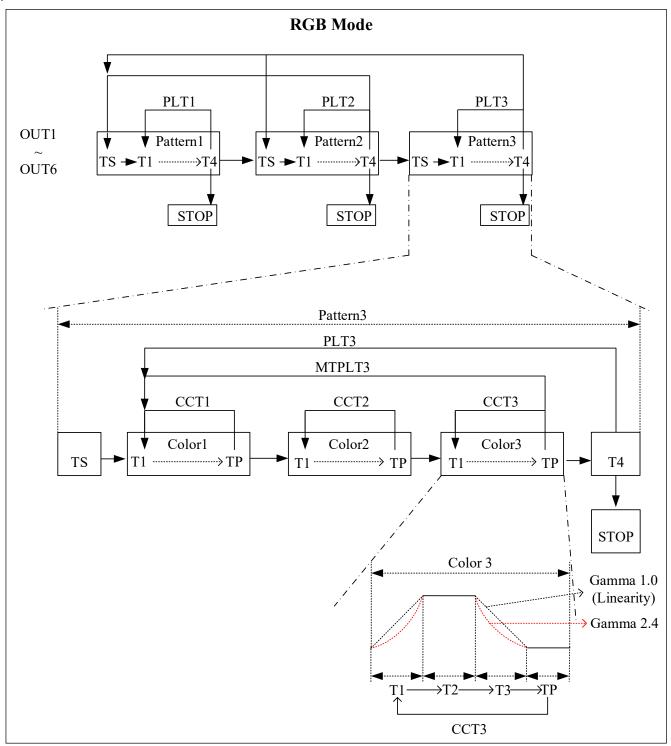

Figure 11 RGB Mode

- 1. Land pattern complies to IPC-7351.
- 2. All dimensions in MM.
- 3. This document (including dimensions, notes & specs) is a recommendation based on typical circuit board manufacturing parameters. Since land pattern design depends on many factors unknown (e.g.. User's board manufacturing specs), user must determine suitability for use.
