

IS32FL3238

18-CHANNEL LED DRIVER

March 2020

GENERAL DESCRIPTION

IS32FL3238 is an LED driver with 18 constant current channels. Each channel can be pulse width modulated (PWM) by 16 bits for smooth LED brightness control. In addition, each channel has an 8-bit output current control register which allows fine tuning the current for rich RGB color mixing, e.g., a pure white color LED application. The maximum output current of each channel is designed to be 78mA, which can be adjusted by one 8-bit global control register. Proprietary programmable algorithms are used in IS32FL3238 to minimize audible noise caused by the MLCC decoupling capacitor. All registers can be programmed via a high speed I2C (1MHz).

IS32FL3238 can be turned off with minimum current consumption by either pulling the SDB pin low or by using the software shutdown feature.

IS32FL3238 is available in eTSSOP-28 package. It operates from 2.7V to 5.5V over the temperature range of -40°C to +125°C

FEATURES

- 2.7V to 5.5V VCC supply
- 1MHz I2C interface, automatic address increment function with readout function
- Four selectable I2C addresses
- Accurate color rendition
 - Selectable 8-bit/10-bit/12-bit/16-bit PWM
 - 8-bit dot correction
 - 8-bit global current adjust
- Open/short detect function
- 62kHz PWM frequency(8-bit PWM)
- Temperature detect function
- EMI/Noise reduction technology
 - Spread spectrum
 - Selectable phase delay
 - Selectable 180 degree clock phase
- -40°C to +125°C temperature range
- eTSSOP-28 package
- AEC-Q100 Qualified

APPLICATIONS

- Ambient lighting
- Roof lighting
- Display backlight
- Functional lighting

IS32FL3238

TYPICAL APPLICATION CIRCUIT

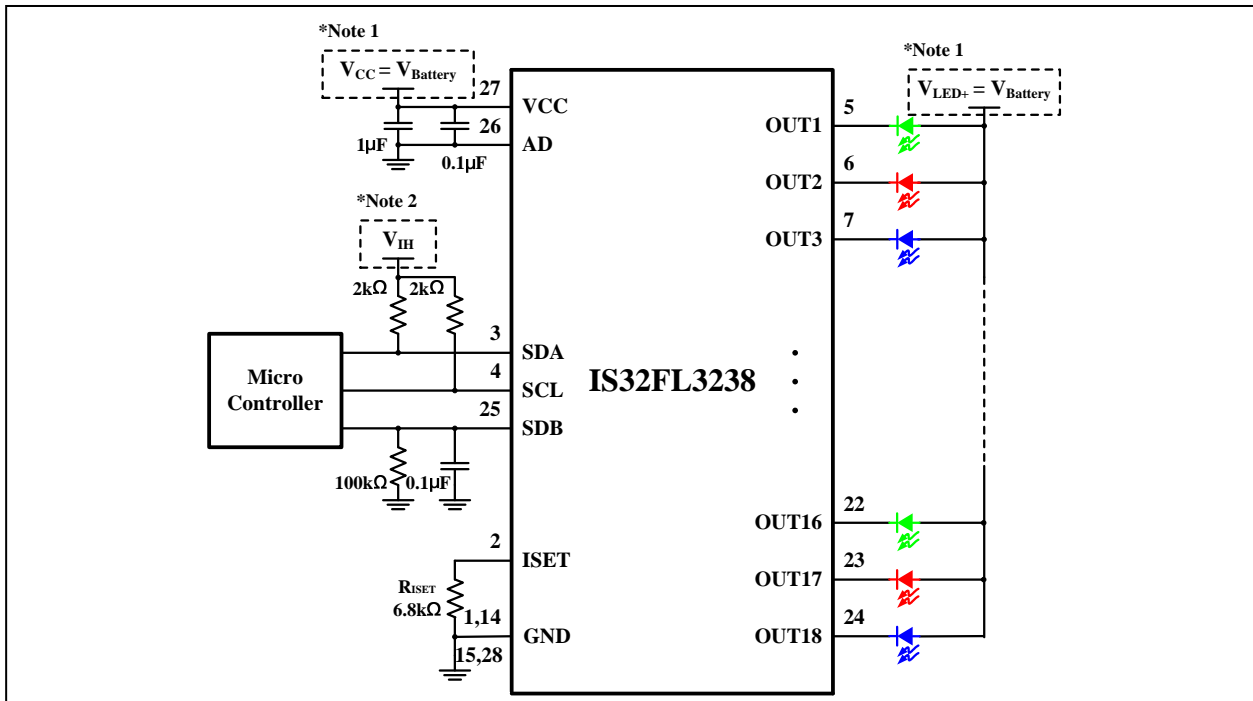

Figure 1 Typical Application Circuit

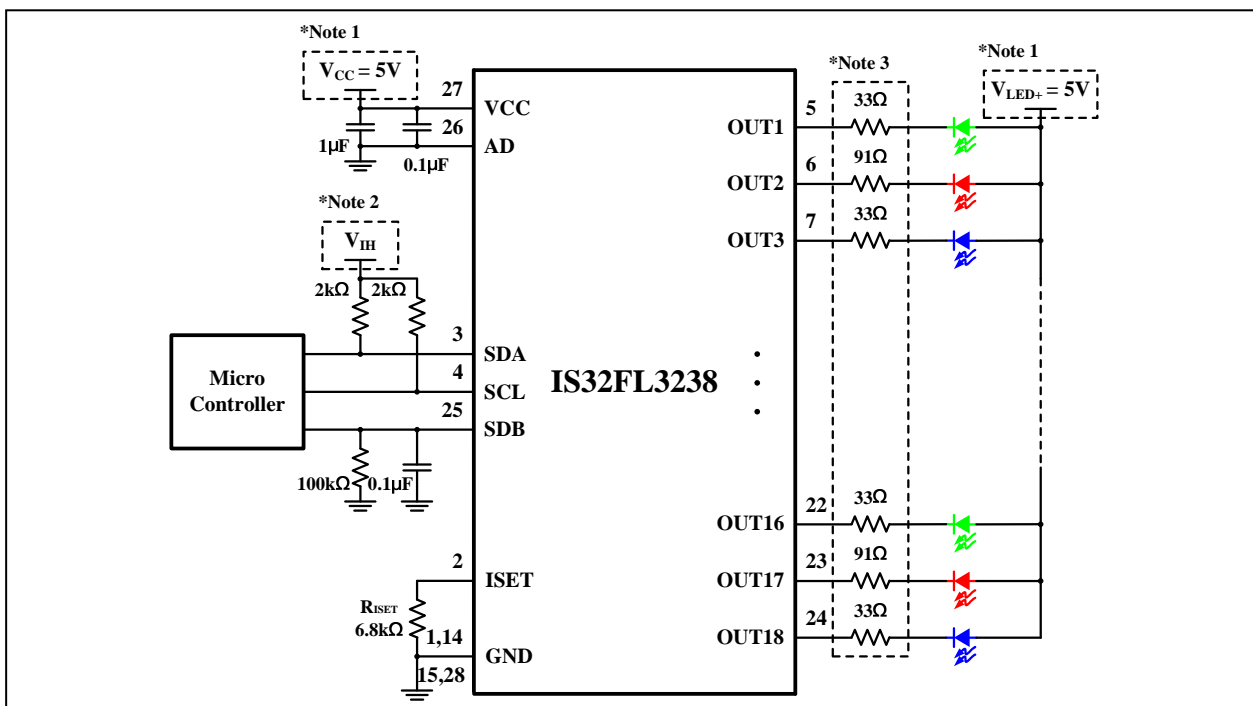

Figure 2 Typical Application Circuit ($V_{CC} = 5V$)

Note 1: V_{LED+} should be same as V_{CC} voltage.

Note 2: V_{IH} is the high level voltage for IS32FL3238, which is usually same as V_{CC} of Micro Controller, e.g. if V_{CC} of Micro Controller is 3.3V, $V_{IH}=3.3V$. If $V_{CC}=5V$ and V_{IH} is lower than 2.8V, recommend to add a level shift circuit.

Note 3: These optional resistors are for offloading the thermal dissipation ($P=i^2R$) away from the IS32FL3238.

Note 4: The output current is set up to 78mA when $R_{ISET} = 2k\Omega$. The maximum global output current can be set by external resistor, R_{ISET} . Please refer to the detail application information in R_{ISET} section.

Note 5: The IC and LED should be placed far away from the antenna in order to prevent the EMI.

IS32FL3238

PIN CONFIGURATION

PIN DESCRIPTION

No.	Pin	Description
1,14,15,28	GND	Ground.
2	ISET	Input terminal used to connect an external resistor. This regulates the global output current. When $R_{ISET} = 6.8k\Omega$, $I_{OUT} = 23mA$.
3	SDA	I2C serial data.
4	SCL	I2C serial clock.
5~7	OUT1~OUT3	Output channel 1~3 for LEDs.
8~13	OUT4~OUT9	Output channel 4~9 for LEDs.
16~21	OUT10~OUT15	Output channel 10~15 for LEDs.
22~24	OUT16~OUT18	Output channel 16~18 for LEDs.
25	SDB	Shutdown the chip when pulled low.
26	AD	I2C address setting.
27	VCC	Power supply.
	Thermal Pad	Connect to GND.

IS32FL3238

ABSOLUTE MAXIMUM RATINGS

Supply voltage, V_{CC}	-0.3V ~ +6.0V
Voltage at SCL, SDA, SDB, AD, OUT1 to OUT18	-0.3V ~ $V_{CC}+0.3V$
Maximum junction temperature, T_{JMAX}	+150°C
Storage temperature range, T_{STG}	-65°C ~ +150°C
Operating temperature range, $T_A=T_J$	-40°C ~ +150°C
Package thermal resistance, junction to ambient (4 layer standard test PCB based on JESD 51-2A), θ_{JA}	32.3°C/W
Package thermal resistance, junction to thermal PAD (4 layer standard test PCB based on JEDEC standard), θ_{JP}	11.08°C/W
ESD (HBM)	±2kV
ESD (CDM)	±750V

Note 6: Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

Typical values are $T_A = 25^\circ\text{C}$, $V_{CC} = 5V$.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
V_{CC}	Supply voltage		2.7		5.5	V
I_{OUT}	Maximum output current	$V_{CC} = 5V$, $V_{OUT} = 0.8V$, $R_{ISET} = 2k\Omega$, $GCC = 0xFF$, $Scaling = 0xFF$ (Note 7)		78		mA
	Output current	$V_{CC} = 5V$, $V_{OUT} = 0.4V$, $R_{ISET} = 6.8k\Omega$, $GCC = 0xFF$, $Scaling = 0xFF$		23		mA
ΔI_{MAT}	I_{OUT} mismatch in chip	$R_{ISET} = 6.8k\Omega$, $GCC = 0xFF$, $Scaling = 0xFF$, $I_{OUT} = 23mA$	-8		8	%
ΔI_{OUT}	I_{OUT} mismatch between chip	$R_{ISET} = 6.8k\Omega$, $GCC = 0xFF$, $Scaling = 0xFF$, $I_{OUT} = 23mA$	-8		8	%
V_{HR}	Headroom voltage	$R_{ISET} = 6.8k\Omega$, $GCC = 0xFF$, $Scaling = 0xFF$, $I_{OUT} = 23mA$		0.2	0.35	V
I_{CC}	Quiescent power supply current	$V_{CC} = 5V$, $R_{ISET} = 6.8k\Omega$, $GCC = 0xFF$, $Scaling = 0xFF$, $I_{OUT} = 23mA$, $PWM = 0x00$		5	10	mA
		$V_{CC} = 3.6V$, $R_{ISET} = 6.8k\Omega$, $GCC = 0xFF$, $Scaling = 0xFF$, $I_{OUT} = 23mA$, $PWM = 0x00$		4	7	mA
I_{SD}	Shutdown current	$V_{CC} = 5V$, $R_{ISET} = 6.8k\Omega$, $V_{SDB} = 0V$ or software shutdown		2	3	μA
		$V_{CC} = 3.6V$, $R_{ISET} = 6.8k\Omega$, $V_{SDB} = 0V$ or software shutdown		1	2	μA
I_{OZ}	Output leakage current	$V_{SDB} = 0V$ or software shutdown, $V_{OUT} = 5.5V$			0.1	μA
f_{OUT}	PWM frequency of output	$OSC = 8MHz$, $PWM \text{ Resolution} = 8bit$	29	31.5	34	kHz
T_{SHDN}	Thermal shutdown	(Note 8)		165		°C
$T_{SHDNHYS}$	Hysteresis	(Note 8)		20		°C
V_{OD}	OUTx pin open detect threshold	$R_{ISET} = 6.8k\Omega$, $I_{OUT} \geq 0.1mA$, measured at OUTx	0.08	0.18	0.26	V
V_{SD}	LED short detect threshold	$R_{ISET} = 6.8k\Omega$, $I_{OUT} \geq 0.1mA$, measured at ($V_{CC} - V_{OUTx}$)	0.7	1.3	1.5	V

IS32FL3238

ELECTRICAL CHARACTERISTICS (CONTINUE)

Typical values are $T_A = 25^\circ\text{C}$, $V_{CC} = 5\text{V}$.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
Logic Electrical Characteristics (SDA, SCL, SDB, AD)						
V_{IL}	Logic "0" input voltage	$V_{CC} = 2.7\text{V} \sim 5.5\text{V}$			0.4	V
V_{IH}	Logic "1" input voltage	$V_{CC} = 2.7\text{V} \sim 5.5\text{V}$	1.4			V
I_{IL}	Logic "0" input current	$V_{INPUT} = 0\text{V}$ (Note 8)		5		nA
I_{IH}	Logic "1" input current	$V_{INPUT} = V_{CC}$ (Note 8)		5		nA

DIGITAL INPUT SWITCHING CHARACTERISTICS (NOTE 8)

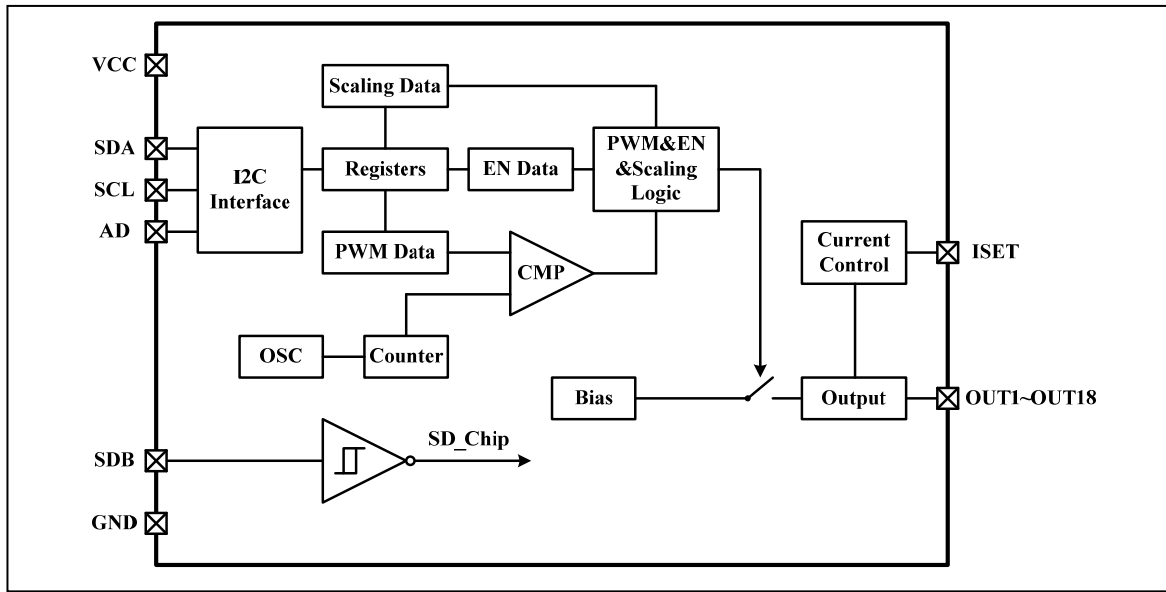

Symbol	Parameter	Fast Mode			Fast Mode Plus			Units
		Min.	Typ.	Max.	Min.	Typ.	Max.	
f_{SCL}	Serial-clock frequency	-		400	-		1000	kHz
t_{BUF}	Bus free time between a STOP and a START condition	1.3		-	0.5		-	μs
$t_{HD, STA}$	Hold time (repeated) START condition	0.6		-	0.26		-	μs
$t_{SU, STA}$	Repeated START condition setup time	0.6		-	0.26		-	μs
$t_{SU, STO}$	STOP condition setup time	0.6		-	0.26		-	μs
$t_{HD, DAT}$	Data hold time	-		-	-		-	μs
$t_{SU, DAT}$	Data setup time	100		-	50		-	ns
t_{LOW}	SCL clock low period	1.3		-	0.5		-	μs
t_{HIGH}	SCL clock high period	0.7		-	0.26		-	μs
t_R	Rise time of both SDA and SCL signals, receiving	-		300	-		120	ns
t_F	Fall time of both SDA and SCL signals, receiving	-		300	-		120	ns

Note 7: The recommended minimum value of R_{SET} is $2\text{k}\Omega$.

Note 8: Guaranteed by design.

IS32FL3238

FUNCTIONAL BLOCK DIAGRAM

IS32FL3238

DETAILED DESCRIPTION

I2C INTERFACE

The IS32FL3238 uses a serial bus, which conforms to the I2C protocol, to control the chip's functions with two wires: SCL and SDA. The IS32FL3238 has a 7-bit slave address (A7:A1), followed by the R/W bit, A0. Set A0 to "0" for a write command and set A0 to "1" for a read command. The value of bits A1 and A2 are decided by the connection of the AD pin. The complete slave address is:

Table 1 Slave Address

Bit	A7:A3	A2:A1	A0
Value	01101	AD	0/1

AD connected to GND, AD = 00;
 AD connected to VCC, AD = 11;
 AD connected to SCL, AD = 01;
 AD connected to SDA, AD = 10;

The SCL line is uni-directional. The SDA line is bi-directional (open-drain) with a pull-up resistor (typically 2kΩ). The maximum clock frequency specified by the I2C standard is 1MHz. In this discussion, the master is the microcontroller and the slave is the IS32FL3238.

The timing diagram for the I2C is shown in Figure 3. The SDA is latched in on the stable high level of the SCL. When there is no interface activity, the SDA line should be held high.

The "START" signal is generated by lowering the SDA signal while the SCL signal is high. The start signal will alert all devices attached to the I2C bus to check the incoming address against their own chip address.

The 8-bit chip address is sent next, most significant bit first. Each address bit must be stable while the SCL level is high.

After the last bit of the chip address is sent, the master checks for the IS32FL3238's acknowledge. The master releases the SDA line high (through a pull-up resistor).

Then the master sends an SCL pulse. If the IS32FL3238 has received the address correctly, then it holds the SDA line low during the SCL pulse. If the SDA line is not low, then the master should send a "STOP" signal (discussed later) and abort the transfer.

Following acknowledge of IS32FL3238, the register address byte is sent, most significant bit first. IS32FL3238 must generate another acknowledge indicating that the register address has been received.

Then 8-bit of data byte are sent next, most significant bit first. Each data bit should be valid while the SCL level is stable high. After the data byte is sent, the IS32FL3238 must generate another acknowledge to indicate that the data was received.

The "STOP" signal ends the transfer. To signal "STOP", the SDA signal goes high while the SCL signal is high.

ADDRESS AUTO INCREMENT

To write multiple bytes of data into IS32FL3238, load the address of the data register that the first data byte is intended for. During the IS32FL3238 acknowledge of receiving the data byte, the internal address pointer will increment by one. The next data byte sent to IS32FL3238 will be placed in the new address, and so on. The auto increment of the address will continue as long as data continues to be written to IS32FL3238 (Figure 6).

READING OPERATION

Most of the registers can be read.

To read the register, after I2C start condition, the bus master must send the IS32FL3238 device address with the R/\bar{W} bit set to "0", followed by the register address which determines which register is accessed. Then restart I2C, the bus master should send the IS32FL3238 device address with the R/\bar{W} bit set to "1". Data from the register defined by the command byte is then sent from the IS32FL3238 to the master (Figure 7).

Table 3 00h Control Register

Bit	D7	D6:D4	D3	D2:D1	D0
Name	-	OSC	-	PMS	SSD
Default	0	000	0	00	0

The Control Register sets software shutdown mode, internal oscillator clock frequency and PWM resolution. The internal oscillator clock frequency and the PWM resolution will decide the output PWM frequency. Recommend using lower than 500Hz option or higher than 20kHz options to avoid the MLCC's audible noise as shown in Table 4.

SSD Software Shutdown Enable
 0 Software shutdown mode
 1 Normal operation

PMS PWM Resolution
 00 N=256, 8-bit
 01 N=1024, 10-bit
 10 N=4096, 12-bit
 11 N=65536, 16-bit

OSC Oscillator Clock Frequency Selection
 000 16MHz
 001 8MHz
 010 1MHz
 011 500kHz
 100 250kHz
 101 125kHz
 110 62kHz
 111 31kHz

Table 4 PWM Frequency

PWM Resolution	16M	8M	1M	500k	250k	125k	62k	31k
8-bit	62k	32k	4k	2k	1k	0.5k	244	122
10-bit	16k	8k	1k	0.5k	244	122	NA	NA
12-bit	4k	2k	244	122	NA	NA	NA	NA
16-bit	244	122	NA	NA	NA	NA	NA	NA

Table 5 01h~48h PWM Register

Reg	02h (04h, 06h...)	01h (03h, 05h...)
Bit	D7:D0	D7:D0
Name	PWMX_H	PWMX_L
Default	0000 0000	0000 0000

X=A or B, Each output has 2 bytes × 2, total 4 registers to modulate the PWM duty in 256/1024/4096/65536 steps. For example, OUT1 use 04h/03h (PWMB), 02h/01 (PWMA) to modulate the PWM, OUT2 use 08h/07h (PWMB), 06h/05 (PWMA) to modulate the PWM, etc., If using the 8 bit PWM resolution, only the PWM_L needs to be set.

The value of the SL (LED Scaling Register) decides the peak current of each LED noted as I_{OUT}.

I_{OUT} and the value of the PWM Registers decide the average current of each LED noted as I_{LED}.

I_{OUT} computed by Formula (1):

$$I_{OUT} = I_{OUT(MAX)} \times \frac{GCC}{256} \times \frac{SLB + SLA}{512} \quad (1)$$

I_{LED} computed by Formula (2):

IS32FL3238

$$I_{LED} = \frac{PWMB + PWMA}{2N} \times I_{OUT} \quad (2)$$

$$PWMA = \sum_{n=0}^{15} D[n] \cdot 2^n \quad (3)$$

$$PWMB = \sum_{n=0}^{15} D[n] \cdot 2^n \quad (4)$$

Where $I_{OUT(MAX)}$ is the maximum output current decided by R_{ISET} (check R_{ISET} section for more information), GCC is the global current setting (6Eh), and SLB, SLA are the scaling of each output (4Ah~6Dh), $N=256/1024/4096/65536(8/10/12/16$ bits PWM resolution)

For example: $R_{ISET}=6.8k\Omega$, $GCC=0xFF$, $SL=0xFF$, $PMS=“11”$ (16 bits PWM resolution), $PWMA_H=0xFF$, $PWMA_L=0xFF$, $PWMB_H=0xFF$, $PWMB_L=0xFF$,

$I_{OUT(MAX)} = 23mA$

$$I_{OUT} = I_{OUT(MAX)} \times \frac{255}{256} \times \frac{255 + 255}{512} = 23mA \quad (1)$$

$$PWMA = \sum_{n=0}^{15} D[n] \cdot 2^n = 65535 \quad (3)$$

$$PWMB = \sum_{n=0}^{15} D[n] \cdot 2^n = 65535 \quad (3)$$

$N=65536$

$$I_{LED} = \frac{65535 + 65535}{2 \times 65536} \times 23mA = 23mA \quad (2)$$

Where $I_{OUT(MAX)}$ is the maximum output current decided by R_{ISET} (check R_{ISET} section for more information)

The I_{OUT} of each channel is set by the SL bits of LED Scaling Register (4Ah~6Dh). Please refer to the detail information in Table 7.

If $R_{ISET}=6.8k\Omega$, $GCC=0xFF$, $SL=0xFF$, $PMS=“00”$ (8-bit PWM resolution, only use the PWM_L, the PWM_H will be ignored), $PWMA_H=0x77$, $PWMA_L=0xAA$, $PWMB_H=0x77$, $PWMB_L=0xAA$, $I_{OUT(MAX)} = 23mA$

$$I_{OUT} = I_{OUT(MAX)} \times \frac{255}{256} \times \frac{255 + 255}{256 \times 2} = 23mA \quad (1)$$

$$PWMA = \sum_{n=0}^7 D[n] \cdot 2^n = 170 \quad (3)$$

$$PWMB = \sum_{n=0}^7 D[n] \cdot 2^n = 170 \quad (4)$$

$N=256$

$$I_{LED} = \frac{170 + 170}{256 \times 2} \times 23mA \quad (2)$$

Table 6 PWM and Scaling Register Map

IS32FL3238

49h Update Register

When SDB = "H" and SSD = "1", a write of "0000 0000" to 49h will update the PWM Registers (01h~48h) values.

Table 7 4Ah~6Dh LED Scaling Register

Bit	D7:D0
Name	SLx
Default	0000 0000

X=A or B, each output has 8 bits × 2 to modulate DC current in 256 steps, for example, OUT1 use 4Bh and 4Ah to set the DC output current, OUT2 use 4Dh and 4Ch to set the DC output current, etc..

The value of the SLB+SLA Registers decides the DC peak current of each LED noted by I_{OUT}.

I_{OUT} computed by Formula (1):

$$I_{OUT} = I_{OUT(MAX)} \times \frac{GCC}{256} \times \frac{SLA + SLB}{256 \times 2} \quad (1)$$

$$SLA = \sum_{n=0}^7 D[n] \cdot 2^n \quad (5)$$

$$SLB = \sum_{n=0}^7 D[n] \cdot 2^n \quad (5)$$

Where I_{OUT(MAX)} is the maximum output current decided by R_{ISSET}, GCC is the global current setting (6Eh) 4Ah~6Dh don't need to be update by writing to 49h, each register will be updated immediately when it is written.

Table 8 6Eh Global Current Control Register

Bit	D7:D0
Name	GCC
Default	0000 0000

GCC and SL control the I_{OUT} as shown in Formula (1).

$$GCC = \sum_{n=0}^7 D[n] \cdot 2^n \quad (5)$$

If GCC=0xFF, SLA=0xFF, SLB=0xFF, I_{OUT}=I_{OUT(MAX)}

If GCC=0x01, SLA=0xFF, SLB=0x00,

$$I_{OUT} = I_{OUT(MAX)} \times \frac{1}{256} \times \frac{255 + 0}{256 \times 2}$$

Where I_{OUT(MAX)} is the maximum output current decided by R_{ISSET} (check R_{ISSET} section for more information).

Table 9 70h Phase Delay and Clock Phase Register

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	PDE	-	PS	PS	PS	PS	PS	PS
Default	0	0	0	0	0	0	0	0

The PDE bit is for enabling channel group delay to minimize peak load current draw from the LED power supply rail.

PDE Phase Delay Enable
 0 Phase delay disable
 1 Phase delay enable

PS[n] Clock Phase Select
 0 All outputs work as scheme of Clock Phase 1
 1 Outputs OUT[2+(n-1)*6], OUT[4+(n-1)*6], OUT[6+(n-1)*6] work as scheme of Clock Phase 2

Phase Delay separates 18 outputs as 6 groups, OUT1~OUT3 as group 1, OUT4~OUT7 as group 2...OUT15~OUT18 as group 6. When the is enabled, group 2 will have a 1/(6*f_{OUT}) time delay than group 1, group 3 will also have a 1/(6*f_{OUT}) time delay than group 2, and so on.

For each group of 6 outputs there is a Clock Phase option PS[n](n=1~6), when PSn is set to "1", half current of each output(current decided by SLA) will keep the phase, phase 1, the turning on edge of the PWM pulse is fixed from starting of PWM cycle, but another half current of each output(current decided by SLB) will change to phase 2, the turning off edge of the PWM pulse is fixed from ending of PWM cycle as below, the rising and falling edges will cancel the power ripple.

Phase Delay feature and Clock Phase options can work together to minimize the voltage ripple of LED power supply(check PHASE DELAY and CLOCK PHASE section for phase 1, phase 2 definition and more information).

Table 10 71h Open Short Detect Enable Register

Bit	D7:D2	D1:D0
Name	-	OSDE
Default	0000 00	00

OSDE enables the open and/or short LED channel detection with the result stored in 72h~76h, note either open or short information is saved not both.

OSDE Open/Short Detect Enable
 00 Detect disable
 01 Detect disable
 10 Short detect enable
 11 Open detect enable

IS32FL3238

Table 11-1 72h~75h LED Open/Short Register

72h	D7:D0
Name	OP/ST[8:1]
Default	x0x0 x0x0

Table 11-2 76h LED Open/Short Register

Bit	D7:D4	D3:D0
Name	-	OP/ST[18:17]
Default	0000	x0x0

Open or short status are stored in 72h to 76h.

Table 12 77h Temperature Sensor Register

Bit	D7:D6	D5	D4	D3:D2	D1:D0
Name	TROF	-	T_Flag	-	TS
Default	00	0	0	00	00

TS stores the temperature/thermal roll-off point. TROF stores percentage of output current of the thermal roll-off function.

Read T_Flag=1 indicates die temperature exceeds the setting point (TS). Before each reading of 77h register, TROF and TS need to be re-written.

TROF Thermal roll off percentage of output current
 00 100%
 01 75%
 10 55%
 11 30%

TS Temperature Point, Thermal roll off start point
 00 140°C
 01 120°C
 10 100°C
 11 90°C

T_Flag Temperature Flag
 0 Temperature point not exceeded
 1 Temperature point exceeded

Table 13 78h Spread Spectrum Register

Bit	D7:D5	D4	D3:D2	D1:D0
Name	DCPWM	SSP	RNG	CLT
Default	000	0	00	00

When DCPWM is set to “0”, the PWM outputs are decided by 01h~48h, and the PWM range is 0/256~255/256(8-bit PWM, 0/1024~1023/1024 for 10 bit PWM, 0/4096~4095/4096 for 12 bit PWM, 0/65536~65535/65536 for 16 bit PWM), still the 1/256(8-bit PWM, 1/1024 for 10 bit PWM, 1/4096 for 12 bit PWM, 1/65536 for 16 bit PWM), can't be turned on. When the DCPWM is set to “1”, PWM dimming is disabled and dimming will be done by current adjust GCC and SLX registers.

Spread spectrum register enable the spread spectrum function, adjust the cycle time and range.

DCPWM Setting the output to work in DC mode
 xx0 Output 1~6 PWM data set by registers 01h~18h
 xx1 Output 1~6 set to turn on (PWM is disabled)
 x0x Output 7~12 PWM data set by registers 19h~30h
 x1x Output 7~12 set to turn on (PWM is disabled)
 0xx Output 13~18 PWM data set by registers 31h~48h
 1xx Output 13~18 set to turn on (PWM is disabled)

SSP Spread Spectrum Enable
 0 Disable
 1 Enable

CLT Spread Spectrum Cycle Time
 00 1980µs
 01 1200µs
 10 820µs
 11 660µs

RNG Spread Spectrum Range
 00 ±5%
 01 ±15%
 10 ±24%
 11 ±34%

7Fh Reset Register

When power on, all registers values are reset to 0x00 (default). A write of “0000 0000” to 7Fh will also reset all registers to their default values.

IS32FL3238

APPLICATION INFORMATION

R_{ISET}

The maximum output current I_{OUT(MAX)} for OUT1~OUT18 can be adjusted by the external resistor, R_{ISET}, as described in Formula (6).

$$I_{OUT(MAX)} = 2x \cdot \frac{V_{ISET} (R_{ISET} (k\Omega) + 283)}{R_{ISET} (k\Omega) \cdot 283} \quad (6)$$

x = 81.28, V_{OUT} = 0.8V, V_{ISET} = 0.945V.

The recommended minimum value of R_{ISET} is 2kΩ.

When R_{ISET}=6.8kΩ, I_{OUT(MAX)}=23mA

When R_{ISET}=3.3kΩ, I_{OUT(MAX)}=47mA

When R_{ISET}=2kΩ, I_{OUT(MAX)}=78mA

R_{ISET} should be close to the chip and the ground side should well connect to the GND plane.

CURRENT SETTING

The maximum output current is set by the external resistor R_{ISET}. The Global Current Control register GCC can be used to set a lower current than set by R_{ISET}. The 8-bit SL registers (4Ah~6Dh) control the individual currents for each of the outputs.

Some applications may require the I_{OUT} of each channel to be adjusted independently. For example, if OUT1 drives 1 LED and OUT2 drives 2 parallel LEDs, and they should have the same average current like 18mA, we can set the I_{OUT(MAX)} to 36mA, and GCC=0xFF, 4Ah=0x80, 4Bh=0x80, 4Ch=0xFF, 4Dh=0xFF, the OUT1 sinks about 18mA and OUT2 sinks 36mA which can have two LEDs in parallel.

Another example, OUT1, OUT2 and OUT3 drive an RGB LED, OUT1 is Red LED, OUT2 is Green LED and OUT 3 is Blue LED. If GCC and SL bits are the same, then the RGB LED may appear a pinkish, or not so white. The SL bits can be used to adjust the I_{OUTx} current so the RGB LED appears closer to a pure white color. We call this SL bit adjustment by another name: white balance registers.

PWM CONTROL

The PWM Registers (01h~48h) can modulate LED brightness of 18 channels with 256/1024/4096/65536 steps. For example, if the data in PWM_H Register is "0000 0000" and in PWMA_L Register is "0000 0100", then the PWM is the fourth step (total is 512 steps).

Writing new data continuously to the registers can modulate the brightness of the LEDs to achieve a breathing effect.

PWM FREQUENCY SELECT

The IS32FL3238 output channels operate with a default 8 bits PWM resolution and the PWM frequency of 62kHz (the oscillator frequency is 16MHz). Because

all the OUTx channels are synchronized, the DC power supply will experience large instantaneous current surges when the OUTx channels turn ON. These current surges will generate an AC ripple on the power supply which cause stress to the decoupling capacitors. When the AC ripple is applied to a monolithic ceramic capacitor chip (MLCC) it will expand and contract causing the PCB to flex and generate audible hum in the range of between 20Hz to 20kHz. To avoid this hum, there are many countermeasures, such as selecting the capacitor type and value which will not cause the PCB to flex and contract.

An additional option for avoiding audible hum is to set the IS32FL3238's output PWM frequency above/below the audible range. The Control Register (00h) can be used to set the switching frequency to 122Hz~62kHz as shown in Table 4, some combine setting of the OSC and PMS bits will get different output PWM frequency, and higher than 20kHz is out of the audible range.

PHASE DELAY and CLOCK PHASE

To reduce audible noise due to PWM switching, the IS32FL3238 features Phase Delay and Clock Phase schemes. When Phase Delay and Clock Phase are disabled (default) all of the outputs turn on simultaneously causing large current draw from the ceramic capacitors and pausable audible noise.

Figure 8 Phase Delay and Clock Phase Disable

The PDE bit of register 70h will enable the Phase Delay function so at power-on the OUTx channel will not all turn on at the same time to minimize peak load current, resulting in reduced voltage ripple on the LED power supply rail. Phase Delay separates the 18 outputs as 6 groups, OUT1~OUT3 as group 1, OUT4~OUT6 as group 2...OUT15~OUT18 as group 6, when Phase Delay is enabled, group 2 will have a 1/(6×f_{OUT}) time delay than group 1, group 3 will also have a 1/(6×f_{OUT}) time delay than group 2, and so on.

IS32FL3238

Figure 9 PDE= "1" Phase Delay Enable

Also in each group of outputs, there is a Clock Phase option PS[n](n=1~6), when PSn of 71h register is set to "0" (default), all outputs in group n keep the phase 1.

Figure 10 PSn= "0" Clock Phase Disable

When PSn is set to "1", OUT[1+(n-1)×6], OUT[2+(n-1)×6], OUT[3+(n-1)×6], half of the current (current decide by SLA) will keep the phase 1, the turning on edge of the PWM pulse is fixed from starting of PWM cycle as below, but OUT[1+(n-1)×6], OUT[2+(n-1)×6], OUT[3+(n-1)×6] another half of the current (current decide by SLB) will change to phase 2, the turning off edge of the PWM pulse is fixed from ending of PWM cycle as below, the rising and falling edges will cancel the power ripple.

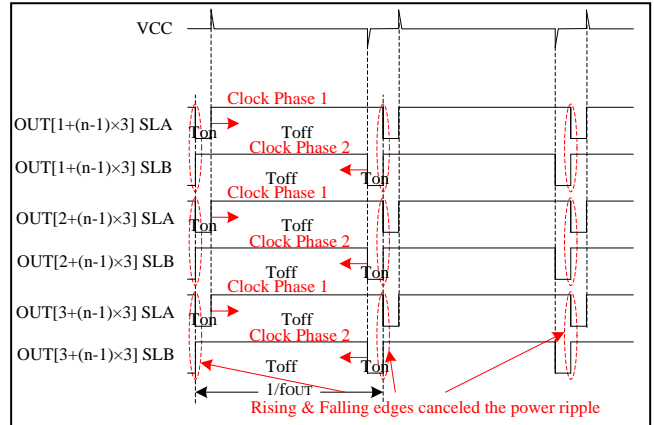

Figure 11 PSn= "1" Clock Phase Enable

Phase Delay feature and Clock Phase options can work together to minimize the voltage ripple of LED power supply.

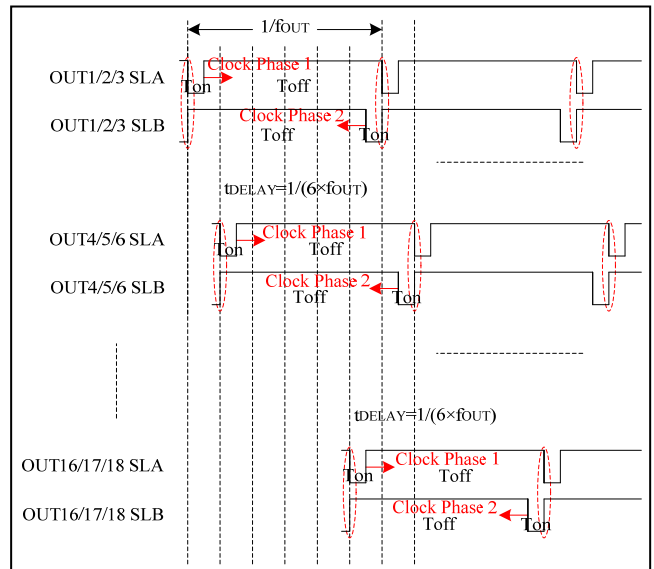

Figure 12 PDE= "1" Phase Delay Enable, PSn= "1" (n=1~6) Clock Phase Enable

OPEN/SHORT DETECT FUNCTION

IS32FL3238 has open and short detect bit for each LED. See Open (VOD) and Short (VSD) detection thresholds in the Electrical Characteristics table.

By setting the OSDE bit of Open Short Detect Enable Register (71h) from "00" to "10" (store short information) or "11" (store open information), the LED Open/Short Register will store the open/short information immediately the MCU can get the open/short information by reading the 72h~76h.

SPREAD SPECTRUM FUNCTION

A switch mode controller can be particularly troublesome for application when the EMI is concerned. To optimize the EMI performance, the IS32FL3238 includes a spread spectrum function. By setting the RNG bit of Spread Spectrum Register (78h), Spread Spectrum range can be choose from ±5% /±15% /±24% /±34%. The spread spectrum can

IS32FL3238

spread the total electromagnetic emitting energy into a wider range that significantly degrades the peak energy of EMI. With the spread spectrum, the EMI test can be easy to be passed with smaller size and lower cost filter circuit.

OPERATING MODE

IS32FL3238 can operate in PWM Mode. The brightness of each LED can be modulated with 256/1024/4096/65536 steps by PWM registers. For example, if $N=256$, the data in PWMA Register are "0000 0100", PWMB Register are "0000 0000", then the PWM is the fourth step (total is $256+256=512$ steps).

Writing new data continuously to the registers can modulate the brightness of the LEDs to achieve a breathing effect.

SHUTDOWN MODE

Shutdown mode can be used as a means of reducing power consumption. During shutdown mode all registers retain their data.

Software Shutdown

By setting the SSD bit of the Control Register (00h) to "0", the IS32FL3238 will operate in software shutdown mode. When the IS32FL3238 is in software shutdown, all current sources are switched off, so the LEDs are OFF but all registers remain accessible. Typical current consumption is $1\mu\text{A}$ ($V_{CC}=3.6\text{V}$).

Hardware Shutdown

The IS32FL3238 enters hardware shutdown when the SDB pin is pulled low. All analog circuits are disabled during hardware shutdown, typical current consumption is $1\mu\text{A}$ ($V_{CC}=3.6\text{V}$).

The chip releases hardware shutdown when the SDB pin is pulled high. The rising edge of SDB pin will reset the I2C module, but the register information is retained. During hardware shutdown the registers are accessible.

If the VCC supply drops below 1.75V but remains above 0.1V while SDB is pulled low, please re-initialize all Function Registers before SDB pulled high.

LAYOUT

As described in external resistor (R_{ISET}), the chip consumes lots of power. Please consider below factors when layout the PCB.

1. The VCC capacitors need to close to the chip and the ground side should well connect to the GND of the chip.
2. R_{ISET} should be close to the chip and the ground side should well connect to the GND of the chip.
3. The thermal pad should connect to ground pins and the PCB should have the thermal pad too, usually this pad should have 16 or 25 via thru the PCB to other side's ground area to help radiate the heat. About the thermal pad size, please refer to the land pattern of each package.

IS32FL3238

CLASSIFICATION REFLOW PROFILES

Profile Feature	Pb-Free Assembly
Preheat & Soak Temperature min (T _{smin}) Temperature max (T _{smax}) Time (T _{smin} to T _{smax}) (t _s)	150°C 200°C 60-120 seconds
Average ramp-up rate (T _{smax} to T _p)	3°C/second max.
Liquidous temperature (T _L) Time at liquidous (t _L)	217°C 60-150 seconds
Peak package body temperature (T _p)*	Max 260°C
Time (t _p)** within 5°C of the specified classification temperature (T _c)	Max 30 seconds
Average ramp-down rate (T _p to T _{smax})	6°C/second max.
Time 25°C to peak temperature	8 minutes max.
