

ISL1557

xDSL Differential Line Driver

FN7522  
Rev.5.00  
Nov 7, 2019

The [ISL1557](#) is a dual operational amplifier designed for VDSL2 and ADSL line driving in DMT based solutions. This device features a high drive capability of 750mA while consuming only 6mA of supply current per amplifier and operating from a single 4.5V to 12V supply. The driver achieves a typical distortion of -80dBc at 150kHz into a 25Ω load.

The ISL1557 is available in the thermally-enhanced 16 Ld QFN and 10 Ld HMSOP package and is specified for operation across -40°C to +85°C (IRZ, IUEZ) or -40°C to +125°C (FRZ) temperature ranges. The ISL1557 has control pins C0 and C1 for controlling the bias and enable/disable of the outputs. These controls allow for lowering the power to fit the performance/power ratio for the application.

The ISL1557 is ideal for ADSL2+, SDSL, HDSL2, and VDSL line driving applications, including both 14.5dBm and 21dBm applications.

**Features**

- Full-range industrial temperature (FRZ only): -40°C to +125°C
- 21dBm output power capability
- Drives up to 750mA from a +12V supply
- 20V<sub>P-P</sub> differential output drive into 21Ω
- -80dBc typical driver output distortion at full output at 150kHz
- -75dBc typical driver output distortion at 4MHz
- -71dBc typical driver output distortion at 10MHz
- -75dBc typical driver output distortion at 17MHz
- Low quiescent current of 6mA per amplifier
- Supply range
  - ISL1557IRZ, ISL1557FRZ . . . ±2.25V to ±6V, 4.5V to 12V
  - ISL1557IUEZ . . . . . 4.5V to 12V
- 300MHz bandwidth
- Thermal shutdown
- Pb-free (RoHS compliant)

**Applications**

- VDSL2 line drivers
- Power line communications line drivers
- ADSL2+ CPE line driving
- G.SHDSL and HDSL2 line drivers

### NOTES:

1. Refer to [TB347](#) for details about reel specifications.
2. These Pb-free plastic packaged products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate PLUS ANNEAL - e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), refer to the [ISL1557](#) product information page. For more information about MSL, refer to [TB363](#).

## Pin Configurations

## Applications Information

### Product Description

The ISL1557 is a dual operational amplifier designed for line driving in DMT ADSL2+ and VDSL solutions. It is a dual current mode feedback amplifier with low distortion while drawing moderately low supply current. It is built using the Renesas proprietary complimentary bipolar process and is offered in industry standard pinouts. Due to the current feedback architecture, the ISL1557 closed-loop 3dB bandwidth is dependent on the value of the feedback resistor. First, select the desired bandwidth by choosing the feedback resistor,  $R_F$ , then set the gain by choosing the gain resistor,  $R_G$ . The curves at the beginning of the “Typical Performance Curves” section, on [page 6](#), show the effect of varying both  $R_F$  and  $R_G$ . The 3dB bandwidth is somewhat dependent on the power supply voltage.

### Power Supply Bypassing and Printed Circuit Board Layout

As with any high frequency device, good printed circuit board layout is necessary for optimum performance. Ground plane construction is highly recommended. Lead lengths should be as short as possible (below 0.25”). The power supply pins must be well bypassed to reduce the risk of oscillation. A 4.7 $\mu$ F tantalum capacitor in parallel with a 0.1 $\mu$ F ceramic capacitor is adequate for each supply pin. During power-up, it is necessary to limit the slew rate of the rising power supply to within 1V/ $\mu$ s. If the power supply rising time is undetermined, a series 10 $\Omega$  resistor on the power supply line can be used to ensure the proper power supply rise time.

For good AC performance, parasitic capacitances should be kept to a minimum, especially at the inverting input. This implies keeping the ground plane away from this pin. Carbon resistors are acceptable, but avoid using wire-wound resistors because of their parasitic inductance. Similarly, capacitors should be low inductance for best performance.

### Capacitance at the Inverting Input

Due to the topology of the current feedback amplifier, stray capacitance at the inverting input will effect the AC and transient

performance of the ISL1557 when operating in the non-inverting configuration.

In the inverting gain mode, added capacitance at the inverting input has little effect because this point is at a virtual ground and stray capacitance is therefore not “detected” by the amplifier.

### Feedback Resistor Values

The ISL1557 has been designed and specified with  $R_F = 750\Omega$  for  $A_V = +5$ . This value of feedback resistor yields extremely flat frequency response with 1dB peaking out to 250MHz. As with all current feedback amplifiers, wider bandwidth, at the expense of slight peaking, can be obtained by reducing the value of the feedback resistor. Inversely, larger values of feedback resistor will cause rolloff to occur at a lower frequency. See the curves in the “Typical Performance Curves” section, beginning on [page 6](#), which shows 3dB bandwidth and peaking vs frequency for various feedback resistors and various supply voltages.

### Bandwidth vs Temperature

Whereas many amplifier's supply current and consequently 3dB bandwidth drop off at high temperature, the ISL1557 is designed to have little supply current variations with temperature. An immediate benefit is the 3dB bandwidth does not drop off drastically with temperature.

### Supply Voltage Range

The ISL1557IRZ is designed to operate with supply voltages from  $\pm 2.25V$  to  $\pm 6V$  nominal. Optimum bandwidth, slew rate, and video characteristics are obtained at higher supply voltages.

### Single Supply Operation

If a single supply is desired, values from +4.5V to +12V nominal can be used as long as the input common mode range is not exceeded. When using a single supply, be sure to either:

- DC bias the inputs at an appropriate common mode voltage and AC couple the signal ([Figure 25](#)), or:
- Ensure the driving signal is within the common mode range of the ISL1557. The ISL1557IUEZ must be used in single supply applications.

FIGURE 25. SINGLE SUPPLY OPERATION WITH INPUT COMMON-MODE BIASING

**ADSL CPE Applications**

The ISL1557 is designed as a line driver for ADSL CPE modems. It is capable of outputting 450mA of output current with a typical supply voltage headroom of 1.3V. It can achieve -85dBc of distortion at low 7.1mA of supply current per amplifier.

The average line power requirement for the ADSL CPE application is 14.5dBm (28mW) into a 100Ω line. The average

line voltage is 1.67V<sub>RMS</sub>. The ADSL DMT peak to average ratio (crest factor) of 5.3 implies peak voltage of 7.5V into the line. Using a differential drive configuration and transformer coupling with standard back termination, a transformer ratio of 1:2 is selected. The circuit configuration is shown in [Figure 26](#).
