

ISL55033

400MHz Slew Rate Enhanced, Rail-to-Rail Output Gain Block

FN6346
Rev 1.00
June 29, 2015

The **ISL55033** is a triple rail-to-rail output gain block with a -3dB bandwidth of 400MHz and slew rate of 2350V/ μ s into a 150 Ω load. The ISL55033 has a fixed gain of +2. The inputs are capable of sensing ground. The outputs are capable of swinging to 0.45V to either rail through a 150 Ω resistor connected to $V+/2$.

The ISL55033 is designed for general purpose video applications. The part includes a fast-acting global disable/power-down function.

The ISL55033 is available in a 12 Ld TQFN package. Operation is specified over the -40°C to +85°C temperature range.

Features

- 400MHz -3dB bandwidth
- 2350V/ μ s typ slew rate, $R_L = 150\Omega$ to $V+/2$
- Single-supply operation from +3V to +5.5V
- Rail-to-rail output
- Input ground sensing
- Fast 25ns disable time
- Pb-free (RoHS compliant)

Applications

- Video amplifiers
- Set-top boxes
- Video distribution

Pin Configuration

Pin Descriptions

PIN NUMBER	PIN NAME	EQUIVALENT CIRCUIT	DESCRIPTION
1	IN+_1	Circuit 1	Amplifier 1 noninverting input
2	IN+_2	Circuit 1	Amplifier 2 noninverting input
3	IN+_3	Circuit 1	Amplifier 3 noninverting input
4	GND_IN-(1, 2, 3)	Circuit 4	Common input for amplifiers 1, 2, 3 inverting inputs
5	GND_PWR	Circuits 1, 2, 4, 5	Power supply ground. This is also the potential of the exposed metal pad on the package bottom.
6	GND_OUTPUT	Circuit 3	Output power supply ground
7	OUTPUT_3	Circuit 3	Amplifier 3 output
8	OUTPUT_2	Circuit 3	Amplifier 2 output
9	OUTPUT_1	Circuit 3	Amplifier 1 output
10	V+_OUTPUT	Circuit 3	Output power supply
11	$\overline{\text{EN}}$	Circuit 2	Enable pin with internal pull-down: Logic "1" selects the disabled state; Logic "0" selects the enabled state
12	V+	Circuits 1, 2, 4	Positive power supply
EP	EP	Circuit 5	Package's exposed thermal pad. Connect to GND_PWR.

Ordering Information

PART NUMBER (Note 1, 2, 3)	PART MARKING	TEMP RANGE (°C)	PACKAGE (RoHS Compliant)	PKG. DWG. #
ISL55033IRTZ	5033	-40 to +85	12 Ld TQFN	L12.3x3A

NOTES:

1. Add "-T*" suffix for tape and reel. Please refer to [TB347](#) for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see product information page for [ISL55033](#). For more information on MSL, please see tech brief [TB363](#).

Absolute Maximum Ratings ($T_A = +25^\circ\text{C}$)

Supply Voltage from V+ to GND	5.75V
Supply Turn-on Voltage Slew Rate	1V/ μs
$\overline{\text{EN}}$ Input Current	4mA
Input Voltage	(V+) + 0.3V to GND - 0.3V
Continuous Output Current	40mA
ESD Rating:	
Human Body Model	2.5kV
Machine Model	300V
Charge Device Model	1.5kV

Thermal Information

Thermal Resistance (Typical)	θ_{JA} ($^\circ\text{C}/\text{W}$)	θ_{JC} ($^\circ\text{C}/\text{W}$)
12 Ld TQFN Package (Notes 4, 5)	57	10
Storage Temperature	-65 $^\circ\text{C}$ to +125 $^\circ\text{C}$	
Pb-free Reflow Profile	see TB493	

Operating Conditions

Ambient Operating Temperature Range (T_A)	-40 $^\circ\text{C}$ to +85 $^\circ\text{C}$
Maximum Operating Junction Temperature (T_J)	+125 $^\circ\text{C}$

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

- θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief [TB379](#) for details.
- For θ_{JC} , the "case temp" location is the center of the exposed metal pad on the package underside.

Electrical Specifications $V_+ = V_{+_OUTPUT} = 5\text{V}$, $T_A = +25^\circ\text{C}$, $R_L = 1\text{k}\Omega$ to $V_+/2$, $V_{IN} = 0.1\text{VDC}$, unless otherwise specified.

PARAMETER	DESCRIPTION	TEST CONDITIONS	MIN (Note 7)	TYP	MAX (Note 7)	UNIT

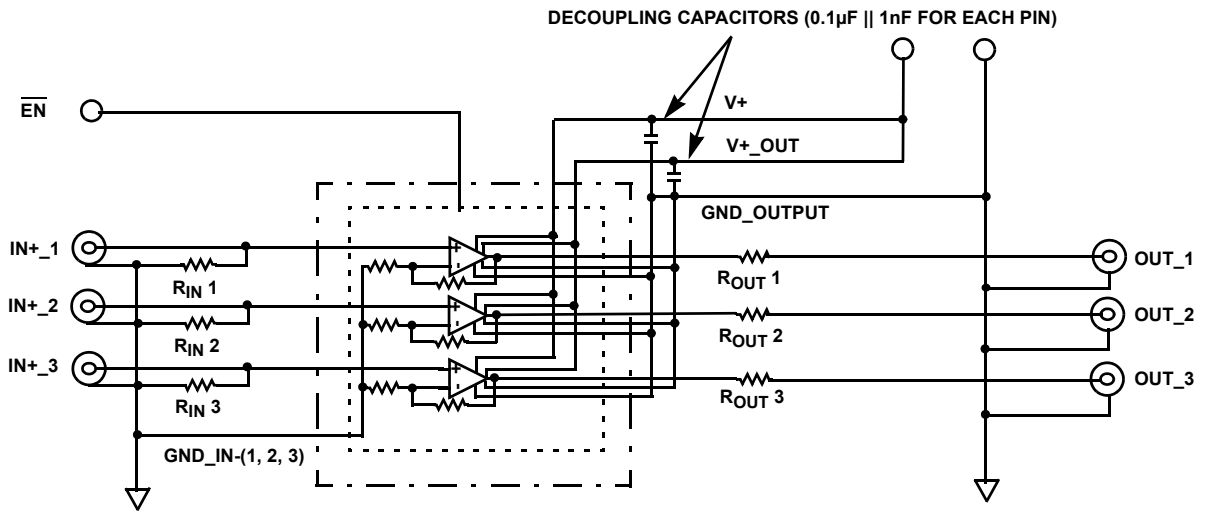

FIGURE 32. BASIC APPLICATION CIRCUIT

Application Information

General

The ISL55033 single supply, fixed gain, triple amplifier is intended for use in a variety of video and other high speed applications. The device features a ground-sensing PNP input stage and a bipolar rail-to-rail output stage. The three amplifiers have an internally fixed gain of 2 and share a single enable pin as shown in [Figure 32](#).

Ground Connections

For the best isolation performance and crosstalk rejection, all GND pins must connect directly to the GND plane. In addition, the electrically conductive thermal pad (EP) must also connect directly to ground.

Power Considerations

Separate V+ power supply and GND pins for the input and output stages are provided to maximize PSRR. Providing separate power pins provides a way to prevent high speed transient currents in the output stage from bleeding into the sensitive amplifier input and gain stages. To maximize crosstalk isolation, each power supply pin should have its own decoupling capacitors connected as close to the pin as possible as shown in [Figure 32](#) (0.1 μ F in parallel with 1nF recommended).

The ESD protection circuits use internal diodes from all pins to the V+ and ground pins. In addition, a dV/dt-triggered clamp is connected between the V+ and V- pins, as shown in Equivalent Circuit 1 on [page 2](#). The dV/dt triggered clamp imposes a maximum supply turn-on slew rate of 1V/ μ s. Damaging currents can flow for power supply slew rates in excess of 1V/ μ s, such as during hot plugging. Under these conditions, additional methods should be employed to ensure the maximum supply slew rate is not exceeded.

Single Supply Input/Output Considerations

For best performance, the input signal voltage range should be maintained between 0.1V to 2.1V. These input limits correspond to an output voltage range of 0.2V to 4.2V and define the limits of linear operation. [Figure 4](#) shows the frequency response versus the input DC voltage level. [Figures 16](#) and [17](#) show the differential gain-phase performance over the input range of 0V to 2.4V operating into a 150 Ω load. The 0.1V to 2.1V input levels corresponds to a 0.2V to 4.2V output levels, which define the minimum and maximum range of output linear operation.

Composite video with sync requires care to ensure that the negative sync tip voltage (typically -300mV) is properly level-shifted up into the ISL55033 input linear operating region of +0.1V to 2.1V. The high input impedance enables AC coupling using low values of coupling capacitance with relatively high input voltage divider resistances.

EN and Power-down States

The $\overline{\text{EN}}$ pin is active low. An internal pull-down resistor ensures the device will be active with no connection to the $\overline{\text{EN}}$ pin. The power-down state is established within approximately 25ns, if a logic high (>2V) is placed on the $\overline{\text{EN}}$ pin. In the power-down state, supply current is reduced significantly by shutting the three

amplifiers off. The output presents a relatively high impedance (~2k Ω) to the output pin. Multiplexing several outputs together is possible using the enable/disable function as long as the application can tolerate the limited power-down output impedance.

Limiting the Output Current

No output short-circuit current limit exists on these parts. All applications need to limit the output current to less than 40mA. Adequate thermal heat sinking of the parts is also required.

PC Board Layout

The AC performance of this circuit depends greatly on the care taken in designing the PC board. The following are recommendations to achieve optimum high frequency performance from your PC board.

- The use of low inductance components, such as chip resistors and chip capacitors, is strongly recommended.
- Minimize signal trace lengths. Trace inductance and capacitance can easily limit circuit performance. Avoid sharp corners. Use rounded corners when possible. Vias in the signal lines add inductance at high frequency and should be avoided. PCB traces greater than 1" begin to exhibit transmission line characteristics with signal rise/fall times of 1ns or less. High frequency performance may be degraded for traces greater than one inch, unless controlled impedance (50 Ω or 75 Ω) strip lines or microstrips are used.
- Match channel-to-channel analog I/O trace lengths and layout symmetry. This will minimize propagation delay mismatches.
- Maximize use of AC decoupled PCB layers. All signal I/O lines should be routed over continuous ground planes (i.e. no split planes or PCB gaps under these lines). Avoid vias in the signal I/O lines.
- Use proper value and location of termination resistors. Input termination resistors should be as close to the input terminal as possible and output termination resistors as close to the receiving device as possible.
- When testing, use good quality connectors and cables, matching cable types and keeping cable lengths to a minimum.
- A minimum of two, high frequency, power supply decoupling capacitors (100pF, 0.1 μ F), on each V+ pin, are recommended as close to the devices as possible. Avoid vias between the capacitor and the device because vias add unwanted inductance. Larger capacitors (e.g., electrolytics) can be farther away. When vias are required in a layout, they should be routed as far away from the device as possible.

The QFN Package Requires Additional PCB Layout Rules for the Thermal Pad

The thermal pad (EP) is electrically connected to power supply ground (GND_PWR) through the high resistance IC substrate. Its primary function is to provide heat sinking for the IC. However, because of the connection to the power ground pins through the substrate, the thermal pad must be tied to the power supply ground to prevent unwanted current flow through the thermal

pad. Maximum AC performance is achieved if the thermal pad has good contact to the IC ground pins. Heat sinking requirements can be satisfied using thermal vias directly beneath the thermal pad to a heat dissipating layer of a square at least 1" on a side. Fill the PCB pad under the EP with vias and connect those vias to a substantial ground plane. Reference [TB379](#), section 3) on page 2 and Appendix A, or JEDEC JESD51-5, for more information.

Revision History
