

ISL91127IR

High Efficiency Buck-Boost Regulator with 4.5A Switches

FN8859  
Rev 1.00  
August 3, 2016

The [ISL91127IR](#) is a high-current buck-boost switching regulator for systems using new battery chemistries. It uses Intersil's proprietary buck-boost algorithm to maintain voltage regulation while providing excellent efficiency and very low output voltage ripple when the input voltage is close to the output voltage.

The ISL91127IR is capable of delivering at least 2A continuous output current ( $V_{OUT} = 3.3V$ ) over a battery voltage range of 2.5V to 4.35V. This maximizes the energy utilization of advanced single-cell Li-ion battery chemistries that have significant capacity left at voltages below the system voltage. Its fully synchronous low ON-resistance, 4-switch architecture and a low quiescent current of only 30 $\mu$ A optimize efficiency under all load conditions.

The ISL91127IR supports stand-alone applications with a fixed 3.3V or 3.5V output voltage or adjustable output voltage with an external resistor divider. Output voltages as low as 1.0V or as high as 5.2V are supported.

The ISL91127IR is available in a 20 Ld, 0.5mm pitch QFN (4mmx4mm) package. The 2.5MHz switching frequency further reduces the size of external components.

**Related Literature**

- [UG080](#), "ISL91127IRN-EVZ, ISL91127IR2A-EVZ, ISL91127IRA-EVZ Evaluation Boards User Guide"

**Features**

- Accepts input voltages above or below regulated output voltage
- Automatic and seamless transitions between buck and boost modes
- Input voltage range: 1.8V to 5.5V
- Output current: up to 2A ( $P_{VIN} = 2.5V, V_{OUT} = 3.3V$ )
- High efficiency: up to 96%
- 30 $\mu$ A quiescent current maximizes light-load efficiency
- 2.5MHz switching frequency minimizes external component size
- Fully protected for short-circuit, over-temperature and undervoltage
- 20 Ld 4mmx4mm QFN package

**Applications**

- Handheld and battery powered consumer and medical devices
- Brownout free system voltage for smartphones and tablet PCs
- Wireless communication devices
- 2G/3G/4G RF power amplifiers

(20 LD, 4x4 QFN)  
TOP VIEW

## Pin Descriptions

PIN #	PIN NAMES	DESCRIPTION
6, 7, 8, 9	PVIN	Power input. Range: 1.8V to 5.5V. Connect 2x10 $\mu$ F capacitors to PGND.
4, 5	LX1	Inductor connection, input side
3	PGND	Power ground for high switching current
1, 2	LX2	Inductor connection, output side
17, 18, 19, 20	VOUT	Buck-boost regulator output. Connect 2x22 $\mu$ F capacitors to PGND.
12	MODE	Logic input, HIGH for auto PFM mode. LOW for forced PWM operation. Also, this pin can be used with an external clock sync input. Range: 2.75MHz to 3.25MHz.
10	VIN	Supply input. Range: 1.8V to 5.5V.
11	EN	Logic input, drive HIGH to enable device.
13, 14	SGND	Analog ground pin
15	FB	Voltage feedback pin
16	NC	No connect pin
	EPAD	Thermal pad, connect to PGND

### NOTES:

- Please refer to [TB347](#) for details on reel specifications.
- These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
- For Moisture Sensitivity Level (MSL), please see product information page for [ISL91127IR](#). For more information on MSL please see techbrief [TB363](#).

## Absolute Maximum Ratings

PVIN, VIN	-0.3V to 6.5V
LX1, LX2	-0.3V to 6.5V
FB (Adjustable Version)	-0.3V to 2.7V
FB (Fixed V <sub>OUT</sub> Versions)	-0.3V to 6.5V
GND, PGND	-0.3V to 0.3V
All Other Pins	-0.3V to 6.5V
ESD Rating	
Human Body Model (Tested per JS-001-2010)	2.5kV
Machine Model (Tested per JESD22-A115C)	250V
Charged Device Model (Tested per JS-002-2014)	1kV
Latch-Up (Tested per JESD-78B; Class 2, Level A)	100mA

## Thermal Information

Thermal Resistance (Typical)	$\theta_{JA}$ (°C/W)	$\theta_{JC}$ (°C/W)
20 Ld 4x4 QFN Package (Notes 4, 5)	40	5
Maximum Junction Temperature	+125°C	
Storage Temperature Range	-65°C to +150°C	
Pb-Free Reflow Profile	see <a href="#">TB493</a>	

## Recommended Operating Conditions

Ambient Temperature Range	-40°C to +85°C
Supply Voltage Range	1.8V to 5.5V
Maximum Load Current	
V <sub>IN</sub> = 2.5V V <sub>OUT</sub> = 3.3V	2ADC

**CAUTION:** Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

### NOTES:

- $\theta_{JA}$  is measured in free air with the component mounted on a high effective thermal conductivity test board with “direct attach” features. See Tech Brief [TB379](#)
- For  $\theta_{JC}$ , the “case temp” location is the center of the exposed metal pad on the package underside.

**Analog Specifications** V<sub>IN</sub> = V<sub>PVIN</sub> = V<sub>EN</sub> = 3.6V, V<sub>OUT</sub> = 3.3V, L<sub>1</sub> = 1μH, C<sub>1</sub> = 10μF, C<sub>2</sub> = 2x22μF, T<sub>A</sub> = +25°C. Boldface limits apply across the operating temperature range, -40°C to +85°C and input voltage range (1.8V to 5.5V) unless specified otherwise.

## NOTES:

- Parameters with MIN and/or MAX limits are 100% tested at  $+25^\circ C$ , unless otherwise specified. Temperature limits established by characterization and are not production tested.
- Typical values are for  $T_A = +25^\circ C$  and  $V_{IN} = 3.6V$ .
- Quiescent current measurements are taken when the output is not switching.

# Typical Performance Curves

Unless otherwise noted, operating conditions are:  $T_A = +25^\circ\text{C}$ ,  $V_{IN} = EN = 3.6\text{V}$ ,  $L = 1\mu\text{H}$ ,  $C_1 = 10\mu\text{F}$ ,  $C_2 = 2 \times 22\mu\text{F}$ ,  $V_{OUT} = 3.3\text{V}$ ,  $I_{OUT} = 0\text{A to } 3\text{A}$

## Functional Description

### Functional Overview

Refer to the [“Block Diagram” on page 2](#). The ISL91127IR implements a complete buck-boost switching regulator, with PWM controller, internal switches, references, protection circuitry and control inputs.

The PWM controller automatically switches between buck and boost modes as necessary to maintain a steady output voltage, with changing input voltages and dynamic external loads.

### Internal Supply and References

Referring to the [“Block Diagram” on page 2](#), the ISL91127IR provides four power input pins. The PVIN pin supplies input power to the DC/DC converter, while the VIN pin provides operating voltage source required for stable  $V_{REF}$  generation. Separate ground pins (GND and PGND) are provided to avoid problems caused by ground shift due to the high switching currents.

### Enable Input

The device is enabled by asserting the EN pin HIGH. Driving EN LOW invokes a power-down mode, where most internal device functions are disabled.

### Soft Discharge

When the device is disabled by driving EN LOW, an internal resistor between VOUT and GND is activated to slowly discharge the output capacitor. This internal resistor has a typical  $120\Omega$  resistance.

### POR Sequence and Soft-Start

Asserting the EN pin HIGH allows the device to power up. A number of events occur during the start-up sequence. The internal voltage reference powers up and stabilizes. The device then starts operating. There is a typical  $1\text{ms}$  delay between assertion of the EN pin and the start of the switching regulator soft-start ramp.

The soft-start feature minimizes output voltage overshoot and input inrush currents. During soft-start, the reference voltage is ramped to provide a ramping  $V_{OUT}$  voltage. While the output

voltage is lower than approximately 20% of the target output voltage, switching frequency is reduced to a fraction of the normal switching frequency to aid in producing low duty cycles necessary to avoid input inrush current spikes. Once the output voltage exceeds 20% of the target voltage, switching frequency is increased to its nominal value.

When the target output voltage is higher than the input voltage, there will be a transition from buck mode to boost mode during the soft-start sequence. At the time of this transition, the ramp rate of the reference voltage is decreased, such that the output voltage slew rate is decreased. This provides a slower output voltage slew rate.

The  $V_{OUT}$  ramp time is not constant for all operating conditions. Soft-start into boost mode will take longer than soft-start into buck mode. The total soft-start time into buck operating mode is typically 2ms, whereas the typical soft-start time into boost mode operating mode is typically 3ms. Increasing the load current will increase these typical soft-start times.

### Short-Circuit Protection

The ISL91127IR provides short-circuit protection by monitoring the feedback voltage. When feedback voltage is sensed to be lower than a certain threshold, the PWM oscillator frequency is reduced in order to protect the device from damage. The P-channel MOSFET peak current limit remains active during this state.

### Thermal Shutdown

A built-in thermal protection feature protects the ISL91127IR, if the die temperature reaches +155°C (typical). At this die temperature, the regulator is completely shut down. The die temperature continues to be monitored in this thermal shutdown mode. When the die temperature falls to +125°C (typical), the device will resume normal operation. When exiting thermal shutdown, the ISL91127IR will execute its soft-start sequence.

### Buck-Boost Conversion Topology

The ISL91127IR operates in either buck or boost mode. When operating in conditions where  $PV_{IN}$  is close to  $V_{OUT}$ , ISL91127IR alternates between buck and boost mode as necessary to provide a regulated output voltage.

[Figure 19](#) shows a simplified diagram of the internal switches and external inductor.

FIGURE 19. BUCK-BOOST TOPOLOGY

### PWM Operation

In Buck PWM mode, Switch D is continuously closed and Switch C is continuously open. Switches A and B operate as a synchronous buck converter when in this mode.

In Boost PWM mode, Switch A remains closed and Switch B remains open. Switches C and D operate as a synchronous boost converter when in this mode.

### PFM Operation

During PFM operation in buck mode, Switch D is continuously closed and Switch C is continuously open. Switches A and B operate in discontinuous mode during PFM operation. During PFM operation in boost mode, the ISL91127IR closes Switch A and Switch C to ramp up the current in the inductor. When the inductor current reaches a certain threshold, the device turns off Switches A and C, then turns on Switches B and D. With Switches B and D closed, output voltage increases as the inductor current ramps down.

In most operating conditions, there will be multiple PFM pulses to charge up the output capacitor. These pulses continue until  $V_{OUT}$  has achieved the upper threshold of the PFM hysteretic controller. Switching then stops, and remains stopped until  $V_{OUT}$  decays to the lower threshold of the hysteretic PFM controller.

### Operation with $V_{IN}$ Close to $V_{OUT}$

When the output voltage is close to the input voltage, the ISL91127IR will rapidly and smoothly switch from boost to buck mode as needed to maintain the regulated output voltage. This behavior provides excellent efficiency and very low output voltage ripple.

### Output Voltage Programming

The ISL91127IR is available in fixed and adjustable output voltage versions. To use the fixed output version, the  $V_{OUT}$  pin must be connected directly to FB.

In the adjustable output voltage version (ISL91127IIAZ), an external resistor divider is required to program the output voltage. The FB pin has very low input leakage current, so it is possible to use large value resistors (e.g.,  $R_1 = 1M\Omega$  and  $R_2 = 324k\Omega$  for  $V_{OUT} = 3.3V$ ) in the resistor divider connected to the FB input.

## Applications Information

### Component Selection

The fixed-output version of ISL91127IR requires only three external power components to implement the buck-boost converter: an inductor, an input capacitor and an output capacitor.

The adjustable output version of ISL91127IR requires three additional components to program the output voltage, as shown in [Figure 20](#). Two external resistors program the output voltage, and a small capacitor is added to improve stability and response.

FIGURE 20. ADJUSTABLE OUTPUT APPLICATION

### Output Voltage Programming, Adjustable Version

When VREF is connected to GND, setting and controlling the output voltage of the ISL91127IRAZ (adjustable output version) can be accomplished by selecting the external resistor values.

Equation 1 can be used to derive the R<sub>1</sub> and R<sub>2</sub> resistor values:

$$V_{OUT} = 0.8V \cdot \left(1 + \frac{R_1}{R_2}\right) \quad (EQ. 1)$$

When designing a PCB, include a GND guard band around the feedback resistor network to reduce noise and improve accuracy and stability. Resistors R<sub>1</sub> and R<sub>2</sub> should be positioned close to the FB pin.

### Feed-Forward Capacitor Selection

A small capacitor (C<sub>3</sub> in Figure 20) in parallel with resistor R<sub>1</sub> is required to provide the specified load and line regulation. The suggested value of this capacitor is 56pF for R<sub>1</sub> = 1MΩ. An NPO type capacitor is recommended.

### Inductor Selection

An inductor with high frequency core material (e.g., ferrite core) should be used to minimize core losses and provide good efficiency. The inductor must be able to handle the peak switching currents without saturating.

A 1µH inductor with ≥4A saturation current rating is recommended. Select an inductor with low DCR to provide good efficiency. In applications where radiated noise must be minimized, a toroidal or shielded inductor can be used.

### PVIN and VOUT Capacitor Selection

The input and output capacitors should be ceramic X5R type with low ESL and ESR. The recommended input capacitor value is 2x10µF. The recommended V<sub>OUT</sub> capacitor value is 2x22µF.

### Recommended PCB Layout

Correct PCB layout is critical for proper operation of the ISL91127IR. The input and output capacitors should be positioned as closely to the IC as possible. The ground connections of the input and output capacitors should be kept as short as possible, and should be on the component layer to avoid problems that are caused by high switching currents flowing through PCB vias.

For additional products, see [www.intersil.com/en/products.html](http://www.intersil.com/en/products.html)

Intersil products are manufactured, assembled and tested utilizing ISO9001 quality systems as noted in the quality certifications found at [www.intersil.com/en/support/qualandreliability.html](http://www.intersil.com/en/support/qualandreliability.html)

*Intersil products are sold by description only. Intersil may modify the circuit design and/or specifications of products at any time without notice, provided that such modification does not, in Intersil's sole judgment, affect the form, fit or function of the product. Accordingly, the reader is cautioned to verify that datasheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Intersil or its subsidiaries.*
