

ISL91302BIK

Dual/Single Output PMIC with 12-Bit Telemetry ADC for Industrial and Computing Applications

The [ISL91302BIK](#) is a highly efficient, dual or single output, synchronous multiphase buck switching regulator that can deliver up to 5A per phase maximum output current. The ISL91302BIK features four integrated power stages and two controllers. The ISL91302BIK can assign its power stages and controllers to two dual-phase outputs (2+2) or one three-phase and one-phase output (3+1) or one-phase output (4+0). This flexibility allows seamless design-in for a wide range of applications in which dual, triple, or quad-phase outputs are needed, such as CPU and GPU core power mobile applications.

ISL91302BIK integrates low ON-resistance MOSFETs at 2MHz switching frequency, allowing very small external inductors and capacitors to be used. With automatic Diode Emulation and Pulse Skipping modes under light-load conditions, this feature improves efficiency and maximizes battery life. The ISL91302BIK delivers a highly robust power solution through a controller based on the Renesas proprietary Rapid Robust Ripple Regulator (R5) technology, offering tight output accuracy and load regulation, ultra-fast transient response, seamless DCM/CCM transitions, and no required external compensation.

In addition to the standard interrupt, chip enable, and watchdog reset functions, the ISL91302BIK also features four MPIOs and two GPIOs that support SPI, I2C communication protocol, external signal telemetry with an internal ADC, Dynamic Voltage Scaling (DVS) with selectable slew rates, and various other pin mode functions.

Features

- Dual output 3+1 or 2+2, or single output 4-phase
- 2.7V to 5.5V supply voltage
- 5A per phase output current capability
- Small solution size
- High efficiency (94% peak for 3.3V  $V_{IN}$ , 1.8V  $V_{OUT}$ ,  $L = 220nH$ )
- Low  $I_Q$  in low power mode
- Proprietary control scheme reduces the output capacitor and supports fast load transients (such as 50A/ $\mu s$  per phase)
- Voltage, current, and temperature telemetry through integrated ADC plus auxiliary inputs
- $\pm 0.7\%$  system accuracy, remote voltage sensing
- I<sup>2</sup>C and SPI programmable output from 0.3V to 2.0V
- Independent Dynamic Voltage Scaling (DVS) for each output
- Soft-start and fault detection (UV, OV, OC, OT), short-circuit protection
- 4.7mmx6.3mm 35 ball TFBGA with 0.8mm pin pitch

Applications

- Industrial controls and FPGAs
- Computing servers and systems
- Home gateways and appliances

### 1.3 Ordering Information

Part Number (Notes 1, 3, 4)	Part Marking	Temp Range (°C)	Tape and Reel (Units) (Note 2)	Package (RoHS Compliant)	Pkg. Dwg. #
ISL91302BIKZ-T	302BK	-40 to +85	3k	4.7mmx6.30mm, 35 ball TFBGA	V35.4.7x6.3
ISL91302BIIK22-EVZ	2-phase + 2-phase evaluation board				
ISL91302BIIK31-EVZ	3-phase + 1-phase evaluation board				
ISL91302BIIK40-EVZ	4-phase single output evaluation board				

**Notes:**

- For additional part options contact your local sales office.
- See [TB347](#) for details about reel specifications.
- These Pb-free BGA packaged products employ special Pb-free material sets; molding compounds/die attach materials and SnAgCu - e6 solder ball terminals, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Pb-free BGA packaged products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J-STD-020.
- For Moisture Sensitivity Level (MSL), see the [ISL91302BIK](#) device page. For more information about MSL, see [TB363](#).

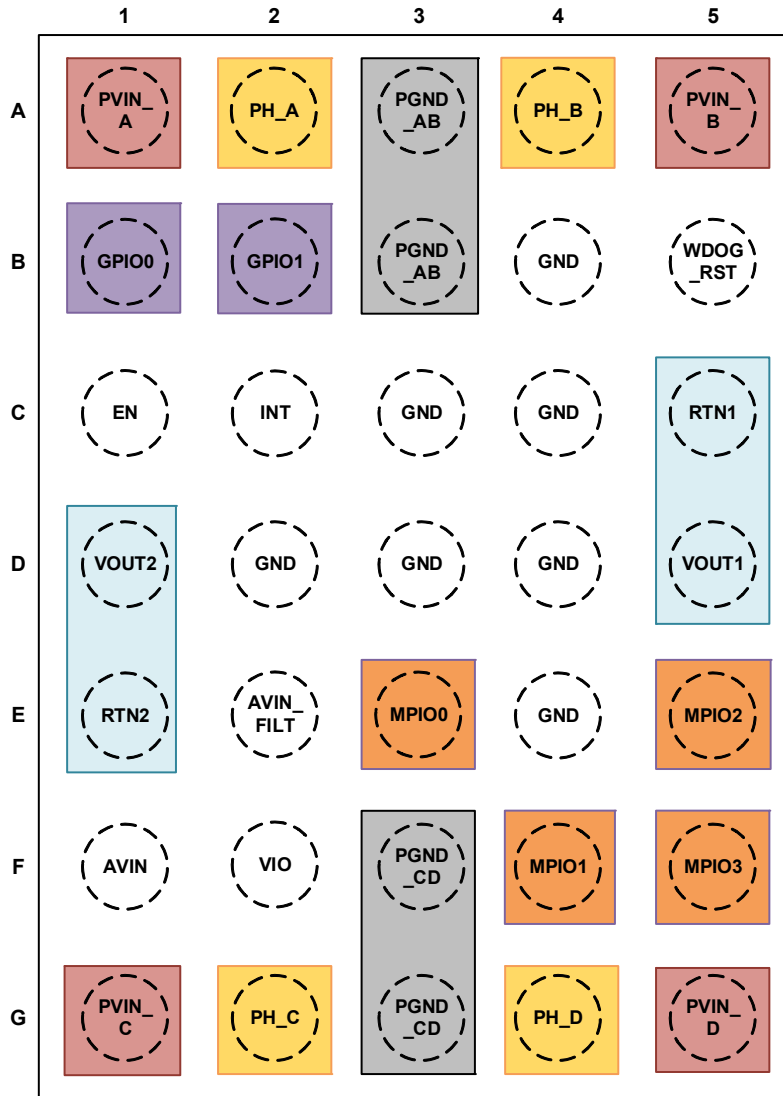

**Table 1. Key Differences Between Family of Parts**

Part Number	Pin Configuration	Pitch	Output Configuration	Maximum Load per Phase
ISL91302BIK	35 Ball 5x7 TFBGA	0.8mm	Single Output (4+0 Phase)	5A
	35 Ball 5x7 TFBGA	0.8mm	Dual Output (3+1 Phase)	5A
	35 Ball 5x7 TFBGA	0.8mm	Dual Output (2+2 Phase)	5A
ISL91211AIK	35 Ball 5x7 TFBGA	0.8mm	Triple Output (2+1+1 Phase)	5A
ISL91211BIK	35 Ball 5x7 TFBGA	0.8mm	Quad Output (1+1+1+1 Phase)	5A

### 1.4 Pin Configuration

35 Ball TFBGA  
Top View

JEDEC Standard:  
Balls Down, A1 Top Left Corner

### 1.5 Pin Descriptions

Pin Number	Pin Name	Type	Description
A1	PVIN_A	Input	Power supply for Power Stage A.
A2	PH_A	Output	Switching node for Power Stage A.
A3, B3	PGND_AB	Input	Ground connection for Power Stage A and B
A4	PH_B	Output	Switching node for Power Stage B.
A5	PVIN_B	Input	Power supply for Power Stage B.
B1	GPIO0	Input/Output	General purpose I/O pin, see <a href="#">Table 2</a> .
B2	GPIO1		
B4, C3, C4, D2, D3, D4, E4	GND	Input	Analog chip ground. Ensure that pin D4 has a low impedance connection to the internal ground layer.
B5	WDOG_RST	Input	Digital input, resets the bucks to default output voltage.

Pin Number	Pin Name	Type	Description
C1	EN	Input	Master chip enable input, NMOS logic threshold.
C2	INT	Output	Interrupt line.
C5	RTN1	Input	Remote ground voltage sense for Buck #1.
D1	VOOUT2	Input	Remote output voltage sense for Buck #2.
D5	VOOUT1	Input	Remote output voltage sense for Buck #1.
E1	RTN2	Input	Remote ground voltage sense for Buck #2.
E2	AVIN_FILT	Output	Filtered analog supply voltage, 2.7 to 5.5V. Place a decoupling capacitor close to the IC.
E3	MPIO0	Input/Output	Multipurpose I/O, see <a href="#">Table 2</a> .
E5	MPIO2		
F4	MPIO1		
F5	MPIO3		
F1	AVIN	Input	Analog supply voltage, 2.7V to 5.5V.
F2	VIO	Input	I/O supply voltage for digital communications. Normally connected to 1.8V supply.
F3, G3	PGND_CD	Input	Ground connection for Power Stage C and D
G1	PVIN_C	Input	Power supply connection for Power Stage C.
G2	PH_C	Output	Switching node for Power Stage C.
G4	PH_D	Output	Switching node for Power Stage D.
G5	PVIN_D	Input	Power supply connection for Power Stage D.

## 1.6 I/O Pin Configurations

The ISL91302BIK features two general purpose I/O (GPIO) pins for I<sup>2</sup>C and other functions, along with four multipurpose I/O (MIO) pins. These pins perform different functions depending on the IO\_PINMODE setting. The default factory setting for IO\_PINMODE is 0x0. For features requiring IO\_PINMODE to be different than the default value, contact Renesas [support](#) for factory OTP programming.

**Table 2. I/O Pin Mode**

IO_PINMODE	MPIO0	MPIO1	MPIO2	MPIO3	GPIO0	GPIO1	Description
0x0	SCK	SS_B	MOSI	MISO	SCL	SDA	I <sup>2</sup> C/SPI both available
0x1	SCK	SS_B	MOSI	MISO	EN_A	EN_B	SPI mode with hardware enables for BUCKS 1-2
0x3	SCK	SS_B	MOSI	MISO	DVS1_0	DVS2_0	SPI with hardware DVS pins
0x4	DVS_PIN1	DVS_PIN0	PGOOD1	PGOOD2	SCL	SDA	I <sup>2</sup> C with global DVS mode with PGOOD1 and PGOOD2
0x5	BUCK1_DVS0	BUCK1_DVS1	BUCK2_DVS0	BUCK2_DVS1	SCL	SDA	I <sup>2</sup> C with full pin controlled DVS for Buck1 and Buck2
0x6	BUCK1_DVS0	BUCK2_DVS0	PGOOD1	PGOOD2	SCL	SDA	I <sup>2</sup> C with DVS and PGOOD for Buck1 and Buck2
0xD	ADC_IN0	ADC_IN1	PGOOD1	PGOOD2	SCL	SDA	I <sup>2</sup> C with ADC input and PGOOD1 and PGOOD2
0xE	ADC_IN0	ADC_IN1	DVS_PIN1	DVS_PIN0	SCL	SDA	I <sup>2</sup> C with ADC input and global DVS

**Note:** Pinmodes 0x7 through 0xC and 0xF are reserved.

**Table 3. Pin Mode Descriptions**

Name	Definition
SCK	SPI clock.
SS_B	SPI slave select (must be pulled to VIO when using I <sup>2</sup> C).
MOSI	SPI master out slave in.
MISO	SPI master in slave out.
SCL	I <sup>2</sup> C clock.
SDA	I <sup>2</sup> C data.
PGOOD1, PGOOD2	Power-good output pins. PGOOD pins for BUCK1 and BUCK2
EN_A, EN_B	Buck enable input pins. Two buck enable input pins. A single buck enable pin can enable/disable up to two bucks. Enable/disable on a buck can be controlled from one enable pin (EN_A or EN_B)
DVS_PIN1, DVS_PIN0	Global DVS logic pins which references a look-up table to allow complete DVS control.
BUCK1_DVS0, BUCK1_DVS1	DVS input logic pins for Buck1.
BUCK2_DVS0, BUCK2_DVS1	DVS input logic pins for Buck2.
ADC_IN0, ADC_IN1	Input pins for auxiliary ADC.

## 2. Specifications

### 2.1 Absolute Maximum Ratings

Parameter	Minimum	Maximum	Unit
PVIN and AVIN Pins to PGND	-0.3	+6	V
VOUT Pin BUCKx_VOUTFBDIV = 0x0	-0.3	+2.0	V
VOUT Pin BUCKx_VOUTFBDIV = 0x1	-0.3	+2.4	V
VOUT Pin BUCKx_VOUTFBDIV = 0x2	-0.3	+3.0	V
PH to PGND	-0.3	+0.3 + PVIN	V
VIO EN Pins to GND	-0.3	+0.3 + AVIN	V
RTN, GND to PGND Pins	-0.3	+0.3	V
INT, WDOG_RST, MPIO, GPIO Pins to GND	-0.3	+0.3 + VIO	V
ESD Ratings (Note 5)		Value	Unit
Human Body Model (Tested per JS-001-2017)		2	kV
Charged Device Model (Tested per JS-002-2014)		750	V
Latch-Up (Tested per JESD78E; Class 2, Level A)		100	mA

**CAUTION:** Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions can adversely impact product reliability and result in failures not covered by warranty.

**Note:**

5. ESD ratings apply to external pins only.

### 2.2 Thermal Information

Thermal Resistance (Typical)	$\theta_{JA}$ (°C/W)	$\theta_{JC}$ (°C/W)
35 Ball TFBGA Package (Notes 6, 7)	47	3

**Notes:**

6.  $\theta_{JA}$  is measured in free air with the component mounted on a high-effective thermal conductivity test board with direct attach features. See [TB379](#).
7. For  $\theta_{JC}$ , the case temperature location is taken at the package top center.

Parameter	Minimum	Maximum	Unit
Maximum Junction Temperature		+150	°C
Storage Temperature Range	-65	+150	°C
Pb-Free Reflow Profile	See <a href="#">TB493</a>		

### 2.3 Recommended Operation Conditions

Parameter	Minimum	Maximum	Unit
Junction Temperature	-40	+125	°C
Supply Voltage			
AVIN to GND	2.7	5.5	V
PVIN to PGND	2.7	5.5	V
VIO Voltage (VIO to GND)	1.7	AVIN	V
INT, WDOG_RST, MPIO, GPIO Pins to GND	0	VIO	V

## 2.4 Analog Specifications

## 5. Applications Information

### 5.1 Inductor Selection

The ISL91302BIK is a high efficiency, high performance, dual output multiphase/single-phase synchronous buck converter that can deliver up to 5A of peak current per phase at 0.3V to 2.0V regulated voltage. The ISL91302BIK operates as one quad-phase output (4+0), one three-phase and one single-phase output (3+1), or two dual-phase outputs (2+2) at a switching frequency fixed at 2MHz. Switching MOSFETs are fully integrated and no additional external MOSFETs or diodes are needed. Each phase requires an equal external inductor, that can deliver up to the maximum load current divided by the number of phases used.

**Table 5. Recommended Output Inductors**

Manufacturer	Part Number	L x W x H (mm)	Value (nH)	DCR mΩ (Typ)	I <sub>SAT</sub> (Typ)
Cyntec	HMLB25201T	2.5x2.0x1.0	220	9.4	7.0
Taiyo Yuden	MAKK2520HR22M	2.5x2.0x1.0	220	16	8.5
Cyntec	HTTN2016T	2.0x1.6x1.0	220	13	7.2
Murata	DFE2016E	2.0x1.6x1.0	240	16	7.0
Murata	DFE252012F	2.5x2.0x1.2	470	23	6.7

### 5.2 Output Capacitor Selection

Output capacitors are needed to provide filtering of square voltage at the phase node into a regulated output voltage. The amount of output capacitance required is based on the parameters of the maximum load step, the slew rate of the load step, and the maximum allowable voltage regulation tolerance during the transient. The amount of ripple voltage at the output capacitor is also a design constraint; the total peak-to-peak ripple voltages produced from the output capacitor is equal to its ESR multiplied by the worst case inductor ripple current.

Make sure to select X7R or X5R type capacitors and consider for DC bias effects. A wide range of output capacitor values can be used.

**Table 6. Recommended Output Capacitors**

Manufacturer	Part Number	Case Size	Value (μF)	Voltage Rating (V)
TDK	C1608X5R1A226M080AC	0603	22	10
TDK	C0510X6S0G105M030AC	0204	1	4
Murata	LLD154R60G435ME01	0402	4.3	4
Murata	LLL1U4R60G435ME22	0204	4.3	4

### 5.3 Input Capacitor Selection

Ceramic input capacitors source the AC component of the input current flowing into the high-side MOSFETs. Place them as close to the IC as possible. A 10μF local decoupling capacitor is recommended for each phase PVIN. If long wires are used to bring power to the IC, use additional Bulk capacitors between C<sub>IN</sub> and the battery/power supply to dampen ringing and overshoot at start-up.

Internal analog reference circuits also require additional filtering at the AVIN\_FLT pin.

**Table 7. Recommended Input Capacitors**

Manufacturer	Part Number	Case Size	Value (μF)	Volt (V)	Input
TDK Corp	CGB2A1X5R1A105M033BC	0402	1	10	AVIN
Kemet	C0402C104K8RACTU	0402	0.1	10	AVIN
Samsung	CL05A10MP5NUNC	0402	10	10	PVIN
Murata	GRM188R61A106MAAL	0603	10	10	PVIN

## 5.4 ADC Telemetry

The ISL91302BIK has an internal SAR ADC that monitors and reports the die temperature, individual phase currents, total buck output current, output voltage, and input voltage. Two additional channels provide internal or external monitoring. Using these channels requires OTP programming from the factory. The ADC is OTP programmed to be turned off during Discontinuous Conduction mode to save current and improve light-load efficiency.

Reading the ADC output is accomplished by reading the respective MSB (8-bit) and LSB (8-bit). [Table 8](#) shows which registers hold the ADC data.

**Table 8. ADC Register Addresses**

Monitor	Register Name	Register Address MSB	Register Address LSB
Temperature	SAMPLE0	0x16	0x17
Buck1 Ph1 Current	SAMPLE1PH1	0x18	0x19
Buck1 Ph2 Current	SAMPLE1PH2	0x1A	0x1B
Buck1 Ph3 Current	SAMPLE1PH3	0x1C	0x1D
Buck1 Ph4 Current	SAMPLE1PH4	0x1E	0x1F
Buck1 Total Current	SAMPLE1T	0x20	0x21
PVIN for Buck1	SAMPLE2	0x22	0x23
VOUT1	SAMPLE3	0x24	0x25
Buck2 Ph1 Current	SAMPLE4PH1	0x26	0x27
Buck2 Ph2 Current	SAMPLE4PH2	0x28	0x29
Buck2 Total Current	SAMPLE4T	0x2A	0x2B
PVIN for Buck2	SAMPLE5	0x2C	0x2D
VOUT2	SAMPLE6	0x2E	0x2F
AUX INPUT0	AUX0	0x30	0x31
AUX INPUT1	AUX1	0x32	0x33

The ADC 16-bit output is a signed format in which the LSB is 0.25 when referring to temperature, voltage, or individual phase current. The total buck current measurement has an LSB of 1. Each channel is filtered through an internally programmable IIR filter. AUX input 0 and AUX input 1 allow the user to read the external values with the ISL91302BIK ADC.

**Table 9. ADC Result Registers**

Units	Phase Current (mA)	Total Buck Current (mA)	Temperature (°C)	Voltage (mV)
0x0000	0	0	0	0
0x0001	0.25	1	0.25	0.25
0x0002	0.5	2	0.5	0.5
0x0003	0.75	3	0.75	0.75
0x0004	1	4	1	1
...				
0x0010	4	16	4	4
...				
0x0100	64	256	64	64
...				
0x7FFF	8191.75	32767	8191.75	8191.75
0x8000	-8192	-32768	-8192	-8192

**Table 9. ADC Result Registers (Continued)**

Units	Phase Current (mA)	Total Buck Current (mA)	Temperature (°C)	Voltage (mV)
0x8001	-8191.75	-32767	-8191.75	-8191.75
...				
0xFFFF	-0.25	-1	-0.25	-0.25

## 5.5 Dynamic Voltage Scaling (DVS)

The ISL91302BIK has several options to achieve DVS. Each buck controller has four independently programmable voltage settings to set the output voltage. The settings are DVS0, DVS1, DVS2, and DVS3. Changing the selected DVS number selects the corresponding output voltage. The two methods to select the DVS are:

**Method 1)** - Use internal registers to select DVS by writing to the BUCKx\_DVSSELECT[1:0] bits in the BUCKx\_DVSSEL register for each respective buck using SPI or I<sup>2</sup>C.

To use this method, the BUCKx\_DVSCTRL[0] bit has to be set to 0x0 for the corresponding buck. The BUCKxDVSSELECT[1:0] setting allows the user to switch between the four different DVS settings, each of which corresponds to a set of DVS registers holding the DVS information.

For example, DVS0 corresponds to BUCKx\_DVS0VOUT92[7:0] and BUCKx\_DVS0VOUT10[1:0]. The two register values combined represent the complete 10-bit DAC code for DVS0.

**Table 10. DVS Method Selection**

BUCKx_DVSCTRL[0]	
0x0	Use BUCKx_DVSSELECT[1:0] to select active DVS configuration
0x1	Use DVS pin(s) to control DVS selection

**Table 11. DVS Pointers**

BUCKx_DVSSELECT[1:0]	Active DVS for BUCKx
0x0	DVS0
0x1	DVS1
0x2	DVS2
0x3	DVS3

Each output voltage is set writing a 10-bit word to DVS Configuration 1 (BUCKx\_DVS0CFG1 register) and DVS Configuration 0 (BUCKx\_DVS0CFG0 register) in each buck. Configuration 1 holds the eight most significant bits and Configuration 0 holds the last two bits of the 10-bit word. The output voltage does not change until the LSB register has been written. [Table 12](#) shows the relationship between the DVS word and V<sub>OUT</sub>.

**Table 12. 10-Bit DVS Code to Voltage Translation**

FBDIV	1.0	0.8	0.6
DAC [9:0]	V <sub>OUT</sub> (V)	V <sub>OUT</sub> (V)	V <sub>OUT</sub> (V)
0x000	0.0000	0.0000	0.0000
0x001	0.0012	0.0015	0.0020
...			
0x200	0.6144	0.768	1.024
0x201	0.6156	0.7695	1.026
...			
0x3E8	1.2	1.5	2.0

**Method 2)** - Using GPIO/MPIO pins to achieve DVS, there are five variations depending on the IO\_PINMODE register setting. See [Table 2](#).

NOTE: To use DVS by GPIO/MPIO pins requires IO\_PINMODE to be OTP programmed before a start-up boot sequence is initiated. On-the-fly programming is not recommended for the following configurations.

(i) **IO\_PINMODE = 0x3:** SPI with two Independent Buck DVS pins

MPIO0	MPIO1	MPIO2	MPIO3	GPIO0	GPIO1
SCK	SS_B	MOSI	MISO	DVS1_0	DVS2_0

BUCKx\_DVSCTRL[0] should be OTP programmed high before the start-up sequence. The active DVS follows the DVSx\_0 pin logic for the respective buck. See [Table 13](#) for more information.

**Table 13. Single DVS Pin Logic**

Function	
DVS1_0	Active DVS for BUCK1
0	DVS0
1	DVS1
DVS2_0	Active DVS for BUCK2
0	DVS0
1	DVS1

(ii) **IO\_PINMODE = 0x4:** I<sup>2</sup>C with Global DVS and PGOOD pins

MPIO0	MPIO1	MPIO2	MPIO3	GPIO0	GPIO1
DVS_PIN1	DVS_PIN0	PGOOD1	PGOOD2	SCL	SDA

BUCKx\_DVSPIN\_CTRL[1:0] bits in BUCKx\_DVSCFG register in combination with the DVS\_PIN1 and DVS\_PIN2 sets the active DVS for the respective BUCK. See [Table 14](#) for more information. BUCKx\_DVSCTRL[0] should be OTP programmed high before the start-up sequence.

**Table 14. Global DVS Pin Logic**

BUCKx_DVSPIN_CTRL[1:0]	DVS_PIN1	DVS_PIN0	Active DVS
0x0	X	X	DVS0
0x1	X	0	DVS0
	X	1	DVS1
0x2	0	X	DVS0
	1	X	DVS2
0x3	0	0	DVS0
	0	1	DVS1
	1	0	DVS2
	1	1	DVS3

**Note:** The 'X' indicates that either a 0 or 1 is acceptable.

(iii) **IO\_PINMODE = 0x5**: I<sup>2</sup>C with 2 DVS pins for Buck1 and 2 DVS pins for Buck2

MPIO0	MPIO1	MPIO2	MPIO3	GPIO0	GPIO1
DVS1_0	DVS1_1	DVS2_0	DVS2_1	SCL	SDA

The active DVS is selected based off the combined DVSx\_1 and DVSx\_2 input pin logic. See [Table 15](#) for more information. BUCKx\_DVSCTRL[0] should be OTP programmed high before the start-up sequence.

**Table 15. Active DVS for 2 DVS Pins Configuration**

DVSx_1	DVSx_0	Active DVS for BUCKx
0	0	DVS0
0	1	DVS1
1	0	DVS2
1	1	DVS3

(iv) **IO\_PINMODE = 0x6**: I<sup>2</sup>C with 2 DVS pins and 2 PGOOD pins

MPIO0	MPIO1	MPIO2	MPIO3	GPIO0	GPIO1
DVS1_0	DVS2_0	PGOOD1	PGOOD2	SCL	SDA

BUCKx\_DVSCTRL[0] should be OTP programmed high before the start-up sequence. DVS1\_0 and DVS2\_0 follows the same active DVS table as in IO\_PINMODE = 0x3. See [Table 13](#) for more information.

(v) **IO\_PINMODE = 0xE**: I<sup>2</sup>C with 2 DVS pins and 2 AUX ADC pins

MPIO0	MPIO1	MPIO2	MPIO3	GPIO0	GPIO1
ADC_IN0	ADC_IN1	DVS_PIN1	DVS_PIN2	SCL	SDA

DVS\_PIN0 and DVS\_PIN1 behave the same as in IO\_PINMODE = 0x4. See [Table 14](#) for more information. BUCKx\_DVSCTRL[0] should be OTP programmed high before the start-up sequence.

## 5.6 Configuring DVS Speed

### 5.6.1 Power-Up and Shutdown Slew Rate Setting

The BUCKx\_RSPPUP[2:0] bits in the BUCKx\_RSPCFG0 register set the slew rates (DVS speed) in BUCKx only during V<sub>OUTx</sub> power-up. Similarly, the BUCKx\_RSPPDN[2:0] in the BUCKx\_RSPCFG0 register sets the slew rates in BUCKx during normal V<sub>OUTx</sub> shutdown. The achievable slew rates varies with different FBDIV settings (Factory OTP programmed). For more details, see Register [BUCK1\\_RSPCFG0](#).

### 5.6.2 DVS Transition Slew Rate Setting

BUCKx\_RSPUP[2:0] and BUCKx\_RSPDN[2:0] in the BUCKx\_RSPCFG1 register sets the slew rates (DVS speed) in BUCKx during normal DVS transition. The achievable slew rates varies with different FBDIV settings (factory OTP programmed). For more details, see Register [BUCK1\\_RSPCFG1](#).

## 5.7 Output Voltage Setting

Each output voltage is set by writing a 10-bit word to DVS Configuration 1 (BUCKx\_DVS0CFG1 register) and DVS Configuration 0 (BUCKx\_DVS0CFG0 register) in each buck. Configuration 1 holds the MSB and Configuration 0 holds the last two bits of the 10-bit word. The output voltage does not change until the LSB register has been written. [BUCK1\\_DVS0CFG1](#) shows the relationship between the DVS word and V<sub>OUT</sub>.

## 5.8 Power Sequencing

When the master chip Enable (EN) pin is brought above an NMOS threshold, the ISL91302BIK powers up its key biasing circuits, loads the OTP configuration registers, and does one of two things based on the preprogrammed OTP setting:

### 1. Manual buck start-up:

Program the internal IO\_BUCKx\_EN bits to 1 from I<sup>2</sup>C/SPI to enable the respective buck. When IO\_PINMODE = 0x1, the EN\_A and EN\_B pins can also be used to enable the respective bucks. If using IO\_PINMODE = 0x1, the internal IO\_BUCKx\_EN bits should be set high in OTP. The slew rate of each buck during its soft-start is specified by the BUCKx\_RSPPUP[2:0] bits.

**Note:** The programmable (1ms to 63ms) delay using BUCKx\_EN\_DLY[5:0] is not used for Manual Buck start-up.

### 2. Auto Buck start-up from master chip enable pin:

Run a predetermined start-up sequence for the buck outputs as soon as BOOT is complete. The slew rate of each buck during its soft-start is specified in BUCKx\_RSPPUP[2:0].

**Note:** The delay, BUCKx\_EN\_DLY[5:0] shown in [Figure 24](#) as EN\_dlyx, is programmable from 0 to 63ms in 1ms steps.

[Figure 24](#) provides an example of power-up configurability. The master chip enable pin (EN) transitions from 0 to 1 and OTP is loaded over 1.4ms. After the initial 1.4ms boot interval, the buck output start-up sequence begins. In the [Figure 24](#) example, BUCK1\_EN\_DLY is set for 0ms and BUCK2\_EN\_DLY is set for 1ms.

Figure 24. Master Chip Enable Power-Up Example

The buck outputs can also be programmed to execute a controlled shutdown in two ways:

### 1. Manual buck power-down:

Program the internal IO\_BUCKx\_EN bit to 0 through I<sup>2</sup>C/SPI or lower the Buck Enable pin (EN\_A or EN\_B when IO\_PINMODE = 0x1). The manual method can be used to power down a specific buck (with a controlled slew rate) while keeping the rest of the chip alive.

**Note:** The programmable (0ms to 63ms) delay from BUCKx\_SHUTDOWN\_DLY[5:0] is not used for manual buck power-down.

### 2. Auto Buck power-down from master chip enable pin:

When the master chip Enable pin (EN) is brought below the falling threshold of the comparator, the Bucks are ramped down at a controlled rate using preprogrammed delays. This is then followed by the power-down of the bias circuits forcing the chip into shutdown. The slew rate of each buck during its power-down (down to ~250mV) is specified in BUCKx\_RSPPDN[2:0].

**Note:** The delay, BUCKx\_SHUTDOWN\_DLY[5:0] shown in [Figure 25](#) as Dis\_dlyx, is programmable from 0 to 63ms in 1ms steps.

[Figure 25](#) provides an example of power-down configurability. The master chip enable pin (EN) transitions from logic 1 to 0. In the [Figure 25](#) example, BUCK1\_SHUTDOWN\_DLY is set for 1ms and BUCK2\_SHUTDOWN\_DLY is set for 2ms.

Figure 25. Auto Chip Power-Down Example

The actual slew rate that each buck ramps down to is specified by the register BUCKx\_RSPSHUTDN. This slew rate is controlled until the output voltage is ~250mV, at which point the ISL91302BIK engages a weak resistive pull-down (if enabled by factory OTP) that can keep  $V_{OUT} = 0V$  when the buck is not enabled. Figure 26 shows an example of the weak pull-down behavior.

- **Option 1:** If the disable event for a buck output is the master chip enable pin (EN) falling below its logic low threshold, then when the output falls below 250mV, the output voltage decay is dictated by the system load passively discharging the buck output capacitance. PULL\_DOWN\_DISCHARGE IO\_MPIO\_DATA[4] bit per the IO\_MPIO\_DATA register is **not** used in this method.
- **Option 2:** If the disable event for a buck output is the master chip enable pin (EN) remaining high and the enable register bit (IO\_BUCKx\_EN) transitioning from a logic 1 to a logic 0, then PULL\_DOWN\_DISCHARGE IO\_MPIO\_DATA[4] bit per the IO\_MPIO\_DATA register is used enabling an internal weak pull down.

**Note:** The weak pull-down can be disabled (using factory OTP).

Figure 26. Buck Disable Waveform

### 5.9 Watchdog Time (WDOG\_RST Pin)

The ISL91302BIK implements a watchdog function which allows the output voltages to return to a safe default when communication to the processor host is lost. This is determined by monitoring the state of the WDOG\_RST pin. If the pin goes into the failure state for a duration greater than the programmed debounce time, the default voltages from OTP are restored.

Both bucks respond to the WDOG\_RST pin. The polarity of the WDOG\_RST pin is active low.

Table 16. WDOG\_RST Function

Action	
At Boot Up	DVS registers are loaded with values stored in OTP.
After Debounce Time	Restore selected output voltages to their original values stored in OTP (DVS0), and slew the buck outputs to that voltage.

Total recovery time for the buck is the sum of the  $t_{SLEW}$  and  $t_{DEBOUNCE}$ . The target voltage WDOG\_RST pin resets the ISL91302BIK buck output(s), set by DVS0, which reside in the BUCKx\_DVS0CFG1 and BUCKx\_DVS0CFG0 registers.

$t_{SLEW}$  is determined by the default output voltage divided by  $3mV/\mu s$ , while  $t_{DEBOUNCE}$  is set at 10ms.  $t_{DEBOUNCE}$  is factory programmable.

Figure 27. Watchdog Timer Example Case

### 5.10 Interrupt Pin

The ISL91302BIK can alert the host when a warning or a fault has occurred through an IRQ interrupt request signal with configurable masking options that is connected to a configurable interrupt (INT) pin. The interrupt pin can be programmed to be active high, active low, an open drain, or a CMOS output.

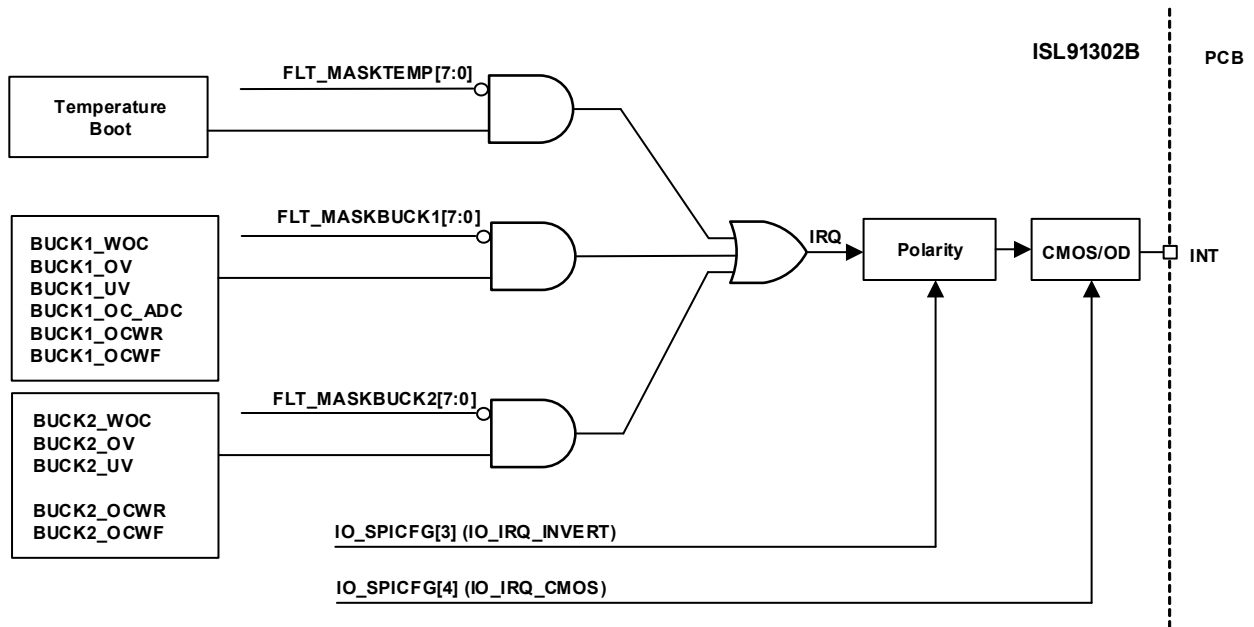

Figure 28. Interrupt Tree

## 6. Protection Features (Faults)

The ISL91302BIK has integrated Overcurrent (OC), Overvoltage (OV), Undervoltage (UV), and Over-Temperature (OT) protection features.

### 6.1 Over-Temperature Protection

The ISL91302BIK provides protection against over-temperature conditions. An over-temperature protection circuit continuously monitors the die temperature of the chip and raises a fault when the temperature exceeds a predefined limit programmed by Register [FLT\\_TEMP SHUTDN](#). The ISL91302BIK also contains a programmable thermal warning threshold set by Register [FLT\\_TEMP WARN](#). Programmable Hysteresis enables the circuit to clear the fault or warning once the temperature is below a user-defined safe temperature. The warning and shutdown hysteresis level are factory programmable. Contact Renesas [support](#) for custom settings. The over-temperature protection is disabled if all bucks are operating in PFM mode or in the off state.

### 6.2 Overcurrent Protection Mode

The ISL91302BIK has implemented a comparator-based OCP and an ADC-based OCP mechanism. The comparator based OCP or 'WOC' block has a current comparator, which compares the load current through the high-side power FET with the reference current level through a replica device. If the sensed FET current is higher than the WOC threshold, the WOC is triggered immediately, preventing a catastrophic condition. The WOC disables the buck and latches the power-stage into tri-state until the fault is cleared. The WOC fault is self-cleared when the OC condition is removed and the buck attempts to re-enable in a hiccup type fashion. The ADC based OCP monitors the averaged high-side and low-side MOSFET current for each phase and is slower but more accurate than the comparator based WOC. If the Buck total current is higher than the ADC based OCP threshold, the ADC OCP is triggered, which shutdowns the Buck and latches the power-stage into tri-state. ADC based OCP can only be cleared by recycling the PVIN/AVIN or by toggling the EN pin. Please note the ADC based OC cannot be cleared by toggling the IO\_BUCKx\_EN bit by I<sup>2</sup>C/SPI.

Overcurrent protection can be enabled or disabled using the fault register setting in FLT\_BUCKx\_CTRL. ADC based current warning and shutdown limits can be adjusted with the FLT\_BUCKx\_ISENSEWARN and FLT\_BUCKx\_ISENSESHUTDN registers, respectively.

### 6.3 Overvoltage (OV)/Undervoltage (UV) Protection

The ISL91302BIK protects against output overvoltage and undervoltage fault conditions. The OV/UV protection circuitry has low power comparators configured with differential input and single-ended outputs capable of working over large common-mode input ranges. This comparator is used to monitor the output voltage in both DCM and CCM for faults. By default, when an OV/UV event is triggered, the buck converter is shut down until the fault is cleared. Fault control register FLT\_BUCKx\_CTRL is used to enable or disable the functionality. The OV/UV limits are adjustable using the BUCKx\_UVOVTH[1:0] bits in the BUCKx\_PROTCFG register. See [Table 17](#) for more details.

**Table 17. OV/UV Protection Thresholds**

BUCKxUVOVTH[1:0]	OV/UV Threshold
0x0	±150mV around DAC target
0x1	±200mV around DAC target
0x2	±250mV around DAC target
0x3	±300mV around DAC target

## 7. Serial Communication Interface

The ISL91302BIK has two serial interface protocols to read/write the registers.

- SPI
- I<sup>2</sup>C

Figure 29. SPI and I<sup>2</sup>C Interface Block Diagram

The arbitration of the register access bus between SPI and I<sup>2</sup>C is determined by the pad MPIO1 when using IO\_PINMODE = 0x0, as shown in [Table 18](#):

Table 18. SPI/I<sup>2</sup>C Register Access

Register IO_PINMODE	Pad MPIO_1 (SS_B)	Register Access
0	0	SPI (Read/Write Access ( <a href="#">Note 11</a> ))
	1	I <sup>2</sup> C ( <a href="#">Note 12</a> )

**Notes:**

11. When the device is configured for SPI access, the I<sup>2</sup>C should not be addressed with the device ID.
12. When the device is configured for I<sup>2</sup>C access, in PINMODE 0, the SS\_B line must be held high.

After switching from SPI to I<sup>2</sup>C or from I<sup>2</sup>C to SPI, there is a minimum of 50ns wait time is required before starting a transaction.

### 7.1 SPI Serial Interface

The SPI interface is a general specification four-wire slave interface capable of operating at a clock speed of up to 26MHz. It is based on byte transfers.

#### 7.1.1 SPI Data Protocol

Both Read and Write SPI transactions begin when SS\_B goes low and end when SS\_B goes high.

##### 7.1.1.1 Write Operation

To write to the ISL91302BIK, the master (controller) needs to drive SS\_B low and send the Control Byte, followed by the register address, packet length (if IO\_SPI MODE = 1), Data bytes to be written, and finally drive SS\_B high to terminate the transaction as shown below. The MSB of the Control byte is the R/W bit, which needs to be set to 'write' operation (see [IO\\_SPI RW POL](#)). Bit 6, AI indicates if it is going to be a single-byte write operation or a multi-byte write. Bits 1 and 0 of the Control byte, indicate the page number of the register location desired to be written (MSBs of the register address). The register address byte is the 8-bit address of the register within the page specified by Page[1:0] bits. If IO\_SPI MODE = 1, the register address needs to be followed by 8-bit packet length, which indicates the number of bytes to be written. Following the packet length field, the master needs to send the data bytes. When all eight bits of data are received, they get written to the specified register address and the ISL91302BIK increments the register address.

In single byte transactions, (AI = 0 or Packet length = 1), the ISL91302BIK goes into wait state and waits for SS\_B to go high.

In multi-byte transactions with IO\_SPIMODE = 1, the ISL91302BIK writes the subsequently received data bytes to sequentially incrementing addresses until the number of bytes, as specified by 'packet length', are received and then go into the wait state and wait for SS\_B to go high. For multi-byte transactions with IO\_SPIMODE = 0 and AI = 1, the ISL91302BIK keeps writing the subsequently received data bytes to sequentially incrementing addresses until SS\_B goes high. If SS\_B goes high in the middle of a transaction, the transaction is terminated. The data byte is written if all eight bits are received.

Figure 30. SPI Write Transaction with IO\_SPIMODE = 1; IO\_SPICPOL = 0; IO\_SPICPHA = 0

7.1.1.2 Read Operation

To read from the ISL91302BIK, the master (controller) needs to drive SS\_B low and then send the Control Byte, followed by register address, packet length (if IO\_SPIMODE = 1). The ISL91302BIK then sends the data bytes from the requested registers and finally the master drives SS\_B high to terminate the transaction. The MSB of the Control byte is the R/W bit which needs to be set to 'read' operation (see IO\_SPIRWPOL). Bit 6, AI indicates if it is going to be a single-byte read operation or a multi-byte read. Bits 1 and 0 of the Control byte indicate the page number of the register location be read (MSBs of the register address). The register address byte is the 8-bit address of the register within the page specified by Page[1:0] bits. If IO\_SPIMODE = 1, the register address needs to be followed by an 8-bit packet length, which indicates the number of bytes to be written. Following the packet length field, the ISL91302BIK sends the data from the requested register. When all eight bits of data from the requested register address are sent, the ISL91302BIK increments the register address.

In a single-byte transaction, (AI = 0 or Packet length = 1), the ISL91302BIK goes into a wait state and waits for SS\_B to go high.

In a multi-byte transaction with IO\_SPIMODE = 1, the ISL91302BIK sends the data bytes from sequentially incrementing addresses until the number of bytes as specified by 'packet length' are sent and then goes into a wait state and waits for SS\_B to go high. For multi-byte transactions with IO\_SPIMODE = 0 and AI = 1, the ISL91302BIK keeps sending data bytes from sequentially incrementing addresses until SS\_B goes high.

**Note:** The MISO pin is pulled low while SS\_B is high.

Figure 31. SPI Read Transaction with IO\_SPIMODE = 1; IO\_SPICPOL = 0; IO\_SPICPHA = 0

R/W	Read/Write Bit Indicating Read or Write Operation
AI	Auto Increment. 1 indicates multi-byte transfer, 0 indicates single byte transfer
Page	2-bit page address of the register to be written/read
Address	8-bit register address of the register to be written/read
Packet Length	8-bit packet length indicating number of data bytes to be transferred. Overrides AI when IO_SPIMODE = 1
Read Data	Data in the register at address, Address [7:0] + n
Write Data	Data to be written to the register at address, Address [7:0] + n

### 7.1.2 SPI Configuration

The following register bits configure the SPI operation:

- **IO\_SPICPOL:** SPI clock polarity, ISL91302BIK is configured as active high, IO\_SPICPOL = 0
- **IO\_SPICPHA:** SPI clock phase, ISL91302BIK samples data on rising edge of SPI clock, IO\_SPICPHA = 0

The four possible modes of clocking are shown in [Figure 32](#).

Figure 32. Four Possible Clocking Modes

- **IO\_SPIRWPOL:** R/W bit polarity, ISL91302BIK SPI\_RWPOL is set to 0, 1: Read, 0: Write.

SPI_RWPOL	R/W	Operation
0	0	Write
0	1	Read

- **IO\_SPIMODE:** Packet length enable, the ISL91302BIK uses packet length mode by default, meaning the third data byte from master is the packet length and indicates the total number of data words to be sent/received in a burst transaction.

### 7.1.3 SPI Timing

Figure 33 shows SPI timing for  $IO\_SPICPOL = 0$ ;  $IO\_SPICPHA = 0$ . The timing values in Tables 19 hold true for other values of  $IO\_SPICPOL$ ,  $IO\_SPICPHA$  as well.

**Table 19. Timing Values**

Parameter	Symbol	Min	Max	Units
Clock Period	$t_1$	38.4		ns
Enable Lead Time	$t_2$	12		ns
Enable Lag Time	$t_3$	12		ns
Clock High or Low Time	$t_4$	15		ns
Data Setup Time (Input)	$t_5$	12		ns
Data Hold Time (Input)	$t_6$	10		ns
Time MISO is Stable before the Next Rising Edge of CLK	$t_7$	5		ns
Data Held after Clock Edge (Output)	$t_8$	5		ns
Load Capacitance	$C_L$		10	pF

**Figure 33. SPI Timing for  $IO\_SPICPHA = 0$ ,  $IO\_SPICPOL = 0$**

## 7.2 I<sup>2</sup>C Interface

The I<sup>2</sup>C interface is a simple, bidirectional 2-wire bus protocol, consisting of the Serial Clock Control (SCL/I<sup>2</sup>C\_CLK) and the Serial Data Signal (SDA/I<sup>2</sup>C\_SDA). The ISL91302BIK hosts a slave I<sup>2</sup>C interface that supports data speeds up to 3.4Mbps. SCL is an input to the ISL91302BIK and is supplied by the controller, whereas SDA is bidirectional. The ISL91302BIK has an open-drain output to transmit data on SDA. An external pull-up resistor must be placed on the serial data line to pull the drain output high during data transmission.

The ISL91302BIK uses a 7-bit hardware address scheme. The default address is set to 0x1D by a one-time programmable fuse.

### 7.2.1 I<sup>2</sup>C Bus Operation

The chip supports 7-bit addressing. The ISL91302BIK I<sup>2</sup>C device address is reconfigurable through the OTP.

All communication over the I<sup>2</sup>C interface is conducted by sending the MSB of each byte of data first. Data states on the SDA line can change only during SCL LOW periods. SDA state changes during SCL HIGH are reserved for indicating START and STOP conditions (see Figure 38).

All I<sup>2</sup>C interface operations must begin with a START condition, which is a HIGH to LOW transition of SDA while SCL is HIGH. The ISL91302BIK continuously monitors the SDA and SCL lines for the START condition and does not respond to any command until this condition is met. All I<sup>2</sup>C interface operations must be terminated by a STOP condition, which is a LOW to HIGH transition of SDA while SCL is HIGH.

An Acknowledge (or ACK), is a software convention used to indicate a successful data transfer. The transmitting device, either master or slave, releases the SDA bus after transmitting eight bits. During the ninth clock cycle, the receiver pulls the SDA line LOW to acknowledge the reception of the eight bits of data (Figure 38). The ISL91302BIK responds with an ACK after recognition of a START condition, followed by a valid Identification (also known as I<sup>2</sup>C Address) Byte. The ISL91302BIK also responds with an ACK after receiving a Data Byte of a write operation. The master must respond with an ACK after receiving a Data Byte of a read operation.

**7.2.1.1 Write Operation**

A Write operation requires a START condition, followed by an ISL91302BIK I<sup>2</sup>C Address byte with the R/W bit set to 0, a Register Address Byte, Data Bytes, and a STOP condition. After each byte, the ISL91302BIK responds with an ACK. After every data byte, the ISL91302BIK auto increments the register address so subsequent data bytes get written to sequentially incremental register locations. A STOP condition that terminates the write operation must be sent by the master after sending at least one full data byte and its associated ACK signal. If a STOP byte is issued in the middle of a data byte, then the write is not performed.

**Figure 34. 1-Byte Write to Register M**

**Figure 35. L-Byte Sequential Data Write Starting Register M**

**7.2.1.2 Read Operation**

A Read operation consists of a three-byte dummy write instruction to send the register address to begin reading from, followed by a Current Address Read operation. The master initiates the operation, issuing the following sequence: a START condition, followed by an ISL91302BIK I<sup>2</sup>C Address byte with the R/W bit set to 0, a Register Address Byte, a second START, and a second ISL91302BIK I<sup>2</sup>C Address byte with the R/W bit set to 1. After each of the three bytes, the ISL91302BIK responds with an ACK. The ISL91302BIK then transmits Data Bytes. The master terminates the Read operation from the ISL91302BIK by issuing a STOP condition following the last bit of the last data byte. After every data byte, the ISL91302BIK auto increments the register address so subsequent data bytes are sent from sequentially incremental register locations.

**Figure 36. 1-Byte Data Read from Register M**

**Figure 37. L-Byte Sequential Data Read Starting Register M**

### 7.2.2 I<sup>2</sup>C Timing

The timing specifications of the I<sup>2</sup>C I/O from the I<sup>2</sup>C spec are shown in [Figure 38](#) and [Table 20](#). The I<sup>2</sup>C controller provides a slave I<sup>2</sup>C transceiver capable of interpreting I<sup>2</sup>C protocol in Standard, Fast, Fast+, and High Speed modes.

Figure 38. I<sup>2</sup>C Timing

**Table 20. I<sup>2</sup>C Specification**

Parameter	Symbol	Standard Mode		Fast Mode		Fast Mode Plus		High Speed Mode		Unit
		Min	Max	Min	Max	Min	Max	Min	Max	
Clock Frequency	f <sub>SCL</sub>	0	100	0	400	0	1000	0	3400	kHz
Hold Time (repeated) START Condition. (After this period, the first clock pulse is generated.)	t <sub>HD;STA</sub>	4000	-	600	-	260	-	160	-	ns
LOW Period of the SCL Clock	t <sub>LOW</sub>	4700	-	1300	-	500	-	160	-	ns
HIGH Period of the SCL Clock	t <sub>HIGH</sub>	4000	-	600	-	260	-	60	-	ns
Setup Time for a Repeated START Condition	t <sub>SU;STA</sub>	4700	-	600	-	260	-	160	-	ns
Data Hold Time	t <sub>HD;DAT</sub>	15	-	15	-	15	-	15	70	ns
Data Setup Time	t <sub>SU;DAT</sub>	250	-	100	-	50	-	10	-	ns
Rise Time of SCL	t <sub>rCL</sub>	-	1000	-	300	-	120	-	40	ns
Fall Time of SCL	t <sub>fCL</sub>	-	300	-	300	-	120	-	40	ns
Rise Time of SDA	t <sub>rDA</sub>	-	1000	20	300	-	120	10 <a href="#">Note 14</a>	80	ns
Fall Time of SDA	t <sub>fDA</sub>	-	300	20 × (V <sub>DD</sub> /5.5V) <a href="#">Note 13</a>	300	20 × (V <sub>DD</sub> /5.5V) <a href="#">Note 13</a>	120	10 <a href="#">Note 14</a>	80	ns
Setup Time for STOP Condition	t <sub>SU;STO</sub>	4000	-	600	-	260	-	160	-	ns
Bus Free Time between a STOP and START Condition	t <sub>BUF</sub>	4700	-	1300	-	500	-	-	-	ns
Capacitive Load for each Bus Line	C <sub>b</sub>	-	400	-	400	-	400	-	100	pF
Output Fall Time from VIHmin to VILmax	t <sub>of</sub>	-	250[5]	20 × (V <sub>DD</sub> /5.5V)[6]	250[5]	20 × (V <sub>DD</sub> /5.5V)[6]	120[7]	10 <a href="#">Note 14</a>	80	ns
Pulse Width of Spikes Suppressed by the Input Filter	t <sub>SP</sub>	-	-	0	50	0	50	0	10	ns

**Notes:**

- 13. Valid only for V<sub>DD</sub> < 4V.
- 14. Valid only for V<sub>DD</sub> < 1.9V.
- 15. V<sub>DD</sub> is the pull-up source to the I<sup>2</sup>C lines (GPIO0, GPIO1).

## 8. Board Layout Recommendations

The ISL91302BIK is a high frequency multiphase switching regulator and the proper PCB layout is an important design practice to ensure a satisfactory performance. The power loop is composed of the output inductor L, the output capacitor  $C_{OUT}$ , the PH pin, and the PGND pin. It is important to make the power loop as small as possible and the connecting traces among them should be direct, short, and wide. The same practice should be applied to the connections of the PVIN pin, the input capacitor, and PGND. The switching node of the converter, the PH pin, and the traces connected to this node are very noisy, so keep the VOUT and RTN lines and other noise sensitive traces away from these traces. Place the input capacitors as close as possible to the PVIN(s) and PGND(s) pins. Connect the ground of the input and output capacitors as close as possible as well. In addition, a solid ground plane is helpful for a good EMI performance.

Inductor placement should also be as close to the phase pins as possible. Using wide traces and reducing the length helps to improve the overall efficiency and reduce the amount of radiated EMI. For the phase traces, Renesas recommends only descending one layer to reduce the effective path to the inductor. Ensure the length and width of each inductor trace and number of microvias used match to help ensure proper current sharing between phases.

Place an AVIN filter capacitor as close as possible to the AVIN\_FILT pin but away from noise sources. Always reference the GND pad of the decoupling capacitor to a quiet GND plane.

Do not use plated through-holes when passing the BGA pins to lower layers. Renesas recommends to using microvias that are staggered if they are required to pass down multiple layers.

The VOUT and RTN lines are used to sense the output voltage and should be routed directly to the load. Connecting the RTN line to ground away from the load causes a ground error in the output voltage load regulation due to parasitic ground resistance. Keep these traces away from switching nodes, which could be a converter phase node or high-speed digital signals. The use of small low inductance capacitors at the load improves noise immunity and transient response to the ISL91302BIK.

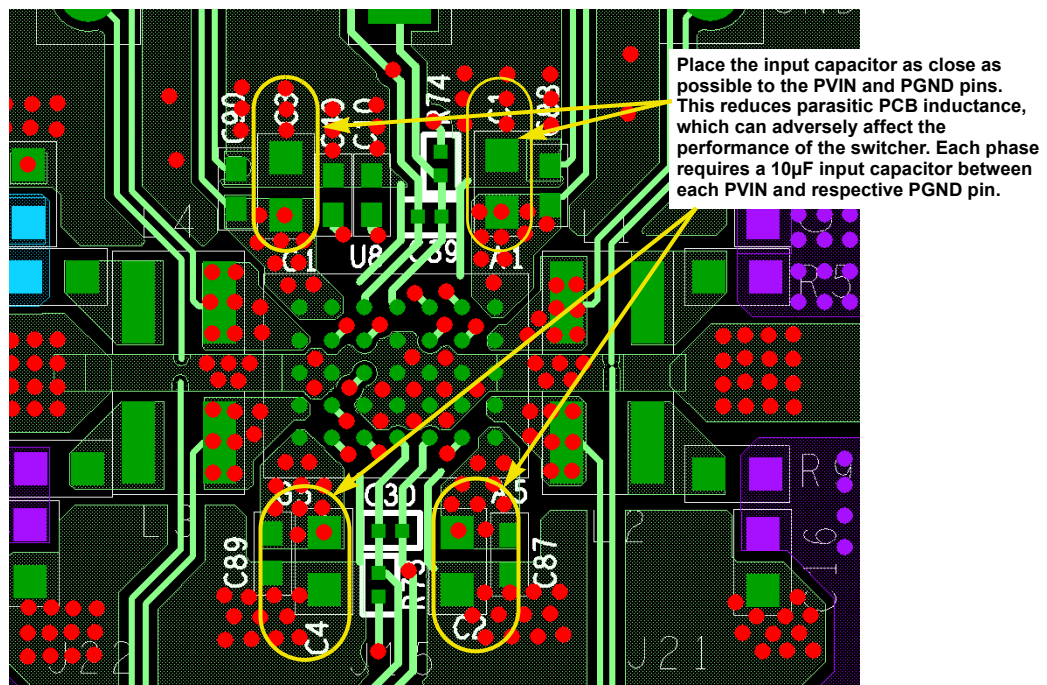

Figure 39. Recommended PCB Layout Top Layer

Provide a solid ground plane in the adjacent layer to provide a low impedance path to support high current flow. Copper planes need to be parallel with the phase traces on the top layer to minimize resistance, and they must be surrounded by a GND plane to prevent noise coupling.

Figure 40. Recommended PCB Layout Second Layer

Feedback lines must be kept away from noise sources such as the switching node, inductor, and high-speed digital signals. Run the traces to cut through the surrounding ground plane areas to minimize noise pick up. Add ground planes above and below the signals when applicable.

Figure 41. Recommended PCB Layout Bottom Layer

### 8.1 PCB Layout Summary

1. Place input capacitors as close as possible to their respective PVIN and PGND pins.
2. Route phase nodes with short, wide traces, and avoid any sensitive nodes.
3. Route VOUT and RTN lines differentially to the load and use small low ESL capacitors at the load for bypassing.
4. Output capacitors should be close to the inductors and have a low impedance path to the PGND pins.
5. Keep digital and phase nodes from intersecting AVIN\_FILTER, VOUT, and RTN lines on adjacent layers.

## 8.2 PCB Design for TFBGA Recommendations

Design Feature	Design Specification
Cu Pad Diameter	0.8mm pitch: $0.215 \pm 0.012$ mm
Microvia Structure	All microvias should be copper filled.
Microvia Stacking	Avoid microvia stacking if possible. Use staggered vias instead. If microvia stacking is absolutely necessary for the layout, the maximum number of recommended via stacks is two.
Plated Through-Hole (PTH) Location	No PTH should be placed under the BGA ball pads. Microvias and trace routing should be used to fan the PTH away from the BGA ball array.

## 9. Register Address Map

When communicating with registers that contain reserved bits, it is recommended to do a masked write/read to avoid modifying sensitive register values.

Address	Register	Address	Register	Address	Register
0x01	IO_CHIPNAME	0x2A	ADC_SAMPLE4TMSB	0x77	BUCK1_DVS2CFG0

## 11. Revision History

Rev.	Date	Description
1.01	Feb.25.20	Removed addendum.
1.00	Dec.6.19	Rewrite throughout. Addendum added on page 61.
0.00	Jul.26.18	Initial release

# 12. Package Outline Drawing

For the most recent package outline drawing, see [V35.4.7x6.3](#).

V35.4.7x6.3  
 35 Thin Profile Ball Grid Array Package (TFBGA)  
 Rev 3, 10/19

- Notes:
- All dimensions and tolerances conform to ASME Y14.5 - 2009.
  - Dimension is measured at the maximum solder ball diameter, parallel to primary datum **C**.
  - Primary datum **C** and seating plane are defined by the spherical crowns of the solder balls.
  - Unless otherwise specified, dimensions are in millimeters.
