

Automotive 5 V low drop voltage regulator

Datasheet - production data

- Programmable reset pulse delay with external capacitor
- Early warning
- Very wide stability range with low value output capacitor
- Thermal shutdown and short circuit protection
- Wide temperature range ($T_j = -40\text{ }^\circ\text{C}$ to $150\text{ }^\circ\text{C}$)
- Enable input for enabling / disabling the voltage regulator

Features

| | | |
|------------------------------|--------------|---|
| Max DC supply voltage | V_S | 40 V |
| Max output voltage tolerance | ΔV_0 | +/-2% |
| Max dropout voltage | V_{dp} | 500 mV |
| Output current | I_O | 300 mA |
| Quiescent current | I_{qn} | 5 $\mu\text{A}^{(1)}$ 55 $\mu\text{A}^{(2)}$ |

1. Typical value with regulator disabled.
2. Typical value with regulator enabled.

- AEC-Q100 qualified 
- Operating DC supply voltage range
- 5.6 V to 40 V
- Low dropout voltage
- 300 mA current capability
- Low quiescent current
- Very low consumption mode
- Precision output voltage 5 V +/- 2%
- Reset circuit sensing the output voltage

Description

L5300GJ is a low dropout linear regulator with microprocessor control functions such as power on reset, low voltage reset, early warning, ON/OFF control. Typical quiescent current is 55 μA in very low output current mode and enabled regulator. It drops to 5 μA with not enabled regulator.

On-chip trimming results in high output voltage accuracy (2%). Accuracy is kept over wide temperature range, line and load variation. Early warning circuit monitors the input voltage and compares it with an internal voltage reference.

The maximum input voltage is 40 V. The maximum output current is internally limited.

Internal temperature protection disables the voltage regulator output. In addition, only low value ceramic capacitor on output is required for stability (equal or above 220 nF).

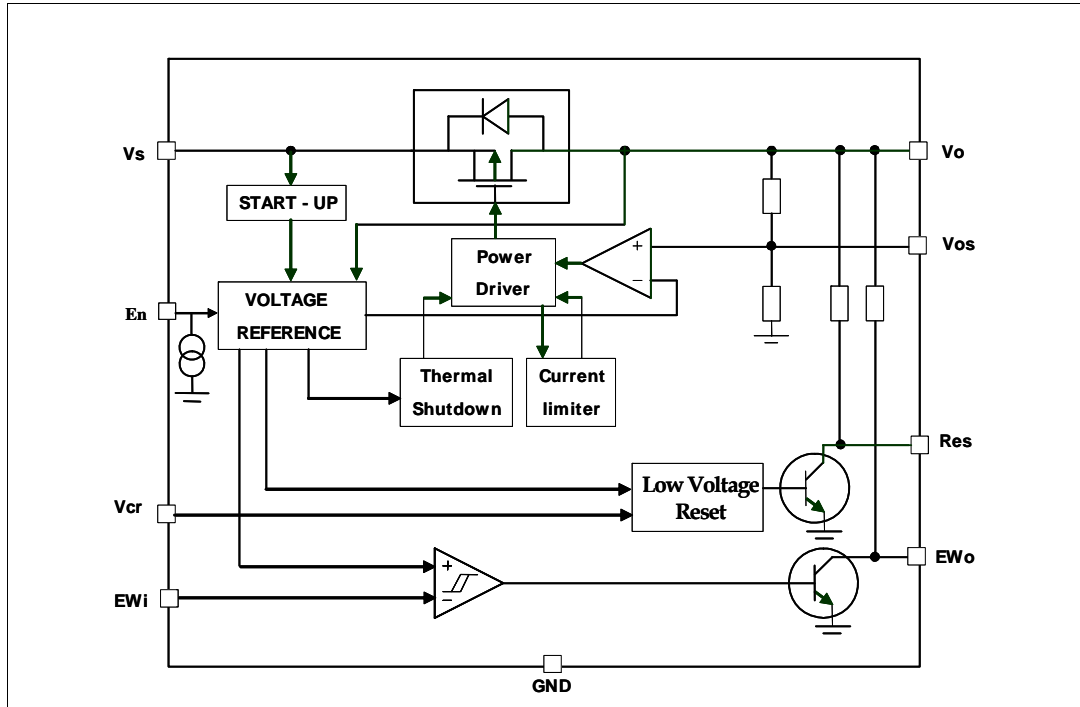

Figure 2. Configuration diagram (top view)

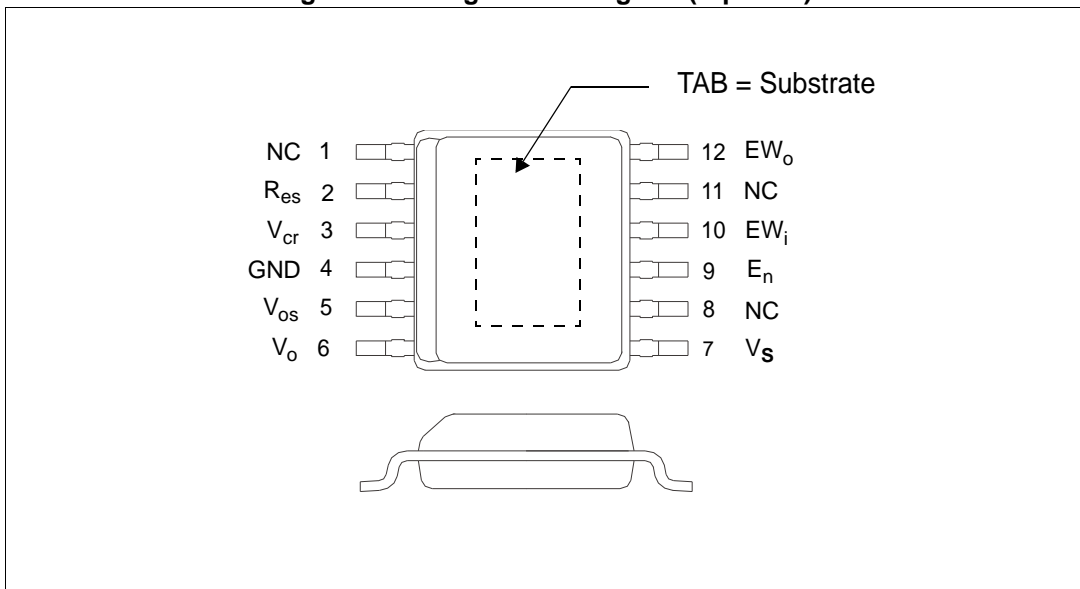

Table 2. Pins description

| N° | Name | Function |
|----|-----------------|--|
| 1 | NC | Not connected |
| 2 | R _{es} | Reset output. Internally connected to V _o through a 20 KΩ pull up resistor. This pin is pulled low when V _o < V _{o_th} . Keep open if not needed |
| 3 | V _{cr} | Reset delay. Connect an external capacitor between V _{cr} pin and ground to adjust the reset delay time. Keep open if not needed |
| 4 | GND | Ground reference |
| 5 | V _{os} | Regulator output voltage sensing (connect to V _o) |
| 6 | V _o | 5 V regulated output. Block to GND with a ceramic capacitor (C _o ≥ 220 nF for regulator stability) |
| 7 | V _S | Supply voltage, block directly to GND on the IC with a capacitor |
| 8 | NC | Not connected |
| 9 | E _n | Enable input. A high signal switches the regulator ON. Connect to V _S if not needed |
| 10 | EW _i | Early warning input. This pin monitors the V _S voltage level through a resistor divider. Connect to V _S if not needed |
| 11 | NC | Not connected |
| 12 | EW _o | Early warning output. Internally connected to V _o through 20 KΩ pull up resistor. This pin is pulled low when EW _i is below bandgap reference voltage. Keep open if not needed |
| - | TAB | TAB is connected to the substrate of the chip: connect to GND or leave open (see Figure 2). |

2 Electrical specifications

2.1 Absolute maximum ratings

Stressing the device above the rating listed in the [Table 3: Absolute maximum ratings](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 3. Absolute maximum ratings

| Symbol | Parameter | Value | Unit |
|---------------|--|-------------------------|------|
| V_{sdc} | DC supply voltage | -0.3 to 40 | V |
| I_{Vsdc} | Input current | Internally limited | |
| V_{odc} | DC output voltage | -0.3 to 6 | V |
| I_{Vodc} | DC output current | Internally limited | |
| $V_{od Res}$ | Open drain output voltage R_{es} | -0.3 to $V_{odc} + 0.3$ | V |
| $I_{od Res}$ | Open drain output current R_{es} | Internally limited | |
| $V_{od EW_o}$ | Open drain output voltage EW_o | -0.3 to $V_{odc} + 0.3$ | V |
| $I_{od EW_o}$ | Open drain output current EW_o | Internally limited | |
| V_{cr} | V_{cr} voltage | -0.3 to $V_o + 0.3$ | V |
| V_{EW_i} | Early warning input voltage | -0.3 to 40 | V |
| V_{En} | Enable input | -0.3 to 40 | V |
| T_j | Junction temperature | -40 to 150 | °C |
| $V_{ESD HBM}$ | ESD HBM voltage level (HBM-MIL STD 883C) | +/- 2 | kV |
| $V_{ESD CDM}$ | ESD CDM voltage level (CDM AEC-Q100-011) | +/- 750 | V |

2.2 Thermal data

Table 4. Thermal data

| Symbol | Parameter | Value | Unit |
|----------------|---|-------|------|
| $R_{thj-case}$ | Thermal resistance junction to case: PowerSSO-12 | 8 | °K/W |
| $R_{thj-amb}$ | Thermal resistance junction to ambient: PowerSSO-12 | 48 | °K/W |

Note: The values quoted are for PCB 77mm x 86 mm x 1.6mm, FR4, double layer with thermal vias (one copper heatsink layer, thickness 0.070 mm, area 8 cm²).

2.3 Electrical characteristics

Values specified in this section are for $V_S = 5.6\text{ V to }31\text{ V}$, $T_j = -40^\circ\text{C to }150^\circ\text{C}$ unless otherwise stated.

Table 5. General

| Pin | Symbol | Parameter | Test condition | Min. | Typ. | Max. | Unit |
|------------|-----------------|---|---|------|------|------|------------------|
| V_o | V_{o_ref} | Output voltage | $V_S = 8\text{ V to }18\text{ V};$ $I_o = 8\text{ mA to }300\text{ mA}$ | 4.9 | 5.0 | 5.1 | V |
| V_o | V_{o_ref} | Output voltage | $V_S = 5.6\text{ V to }31\text{ V};$ $I_o = 8\text{ mA to }300\text{ mA}$ | 4.85 | 5.0 | 5.15 | V |
| V_o | V_{o_ref} | Output voltage | $V_S = 5.6\text{ V to }31\text{ V};$ $I_o = 0.1\text{ mA to }8\text{ mA}$ | 4.75 | 5.0 | 5.25 | V |
| V_o | I_{short} | Short circuit current | $V_S = 13.5\text{ V}$ | 0.8 | 1.8 | 2.6 | A |
| V_o | I_{lim} | Output current capability ⁽¹⁾ | $V_S = 13.5\text{ V}$ | 0.6 | 1.6 | 2.5 | A |
| V_S, V_o | V_{line} | Line regulation voltage | $V_S = 6\text{ V to }28\text{ V};$ $I_o = 60\text{ mA}$ | | | 40 | mV |
| V_o | V_{load} | Load regulation voltage | $V_S = 13.5\text{ V};$ $I_o = 8\text{ mA to }300\text{ mA};$ $T_j = 25^\circ\text{C}$ | | | 40 | mV |
| | | | $V_S = 8\text{ V to }18\text{ V};$ $I_o = 8\text{ mA to }300\text{ mA}$ | | | 55 | |
| V_S, V_o | V_{dp} | Drop voltage ⁽²⁾ | $I_o = 300\text{ mA}$ | | | 500 | mV |
| V_S, V_o | SVR | Ripple rejection | $f_r = 100\text{ Hz}$ ⁽³⁾ | | 60 | | dB |
| V_o | I_{oth_H} | Normal consumption mode output current | | 8 | | | mA |
| V_o | I_{oth_L} | Very low consumption mode output current | | | | 1.1 | mA |
| V_o | I_{oth_Hyst} | Output current switching threshold hysteresis | $V_S = 13.5\text{ V}; T_j = 25^\circ\text{C}$ | | 0.8 | | mA |
| V_S, V_o | I_{qs} | Current consumption with regulator disabled $I_{qs} = I_{V_S} - I_o$ | $V_S = 13.5\text{ V}; E_n = \text{low}$ | | 5 | 10 | μA |
| V_S, V_o | I_{qn_1} | Current consumption with regulator enabled $I_{qn_1} = I_{V_S} - I_o$ | $V_S = 13.5\text{ V};$ $I_o = 0.1\text{ mA to }1\text{ mA};$ $E_n = \text{high}$ | | 55 | 80 | μA |
| V_S, V_o | I_{qn_300} | Current consumption with regulator enabled $I_{qn_300} = I_{V_S} - I_o$ | $V_S = 13.5\text{ V};$ $I_o = 300\text{ mA}; E_n = \text{high}$ | | 3 | 4.2 | mA |
| | T_w | Thermal protection temperature | | 150 | | 190 | $^\circ\text{C}$ |
| | T_{w_hy} | Thermal protection temperature hysteresis | | | 10 | | $^\circ\text{C}$ |

1. Measured output current when the output voltage has dropped 100 mV from its nominal value obtained at 13.5 V and $I_o = 75\text{ mA}$.

2. $V_S - V_O$ measured dropout when the output voltage has dropped 100 mV from its nominal value obtained at 13.5V and $I_O = 75$ mA.
3. Guaranteed by design.

Table 6. Reset

| Pin | Symbol | Parameter | Test condition | Min. | Typ. | Max. | Unit |

3 Application information

3.1 Voltage regulator

The voltage regulator uses a p-channel mos transistor as a regulating element. With this structure a very low dropout voltage at current up to 300 mA is obtained. The output voltage is regulated up to input supply voltage of 40 V. The high-precision of the output voltage (2%) is obtained with a pre-trimmed reference voltage. The voltage regulator automatically adapts its own quiescent current to the output current level. In light load conditions the quiescent current goes down to 55 μ A only (low consumption mode). This procedure features a certain hysteresis on the output current (see [Figure](#)). Short-circuit protection to GND and a thermal shutdown are provided.

Figure 23. Application schematic

The input capacitor $C_1 \geq 100 \mu\text{F}$ is necessary as backup supply for negative pulses which may occur on the line. The second input capacitor $C_2 \geq 220 \text{ nF}$ is needed when the C_1 is too distant from the V_S pin and it compensates smooth line disturbances. The C_0 ceramic capacitor, connected to the output pin, is for bypassing to GND the high-frequency noise and it guarantees stability even during sudden line and load variations. Suggested value is $C_0 = 220 \text{ nF}$ with $\text{ESR} \geq 100 \text{ m}\Omega$.

Stability region is reported in [Figure 24](#).

Figure 24. Stability region

Figure 25. Maximum load variation response

3.2 Reset

The reset circuit monitors the output voltage V_o . If the output voltage becomes lower than V_{o_th} then R_{es} goes low with a delay time (t_{rr}). When the output voltage becomes higher than V_{o_th} then R_{es} goes high with a delay time T_{rd} . This delay is obtained by 32 periods of oscillator.

The oscillator period is given by:

Equation 1

$$T_{osc} = [(V_{Rhth} - V_{Rlth}) \times C_{tr}] / I_{cr} + [(V_{Rhth} - V_{Rlth}) \times C_{tr}] / I_{dr}$$

where:

- $I_{cr} = 20 \mu A$ is an internally generated charge current,
- $I_{dr} = 20 \mu A$ is an internally generated discharge current,
- $V_{Rhth} = 2.5 V$ (typ) and $V_{Rlth} = 0.95 V$ (typ) are two voltage thresholds,
- C_{tr} is an external capacitor to be put between V_{cr} pin and GND.

Reset pulse delay T_{rd} is given by:

Equation 2

$$T_{rd} = 32 \times T_{osc}$$

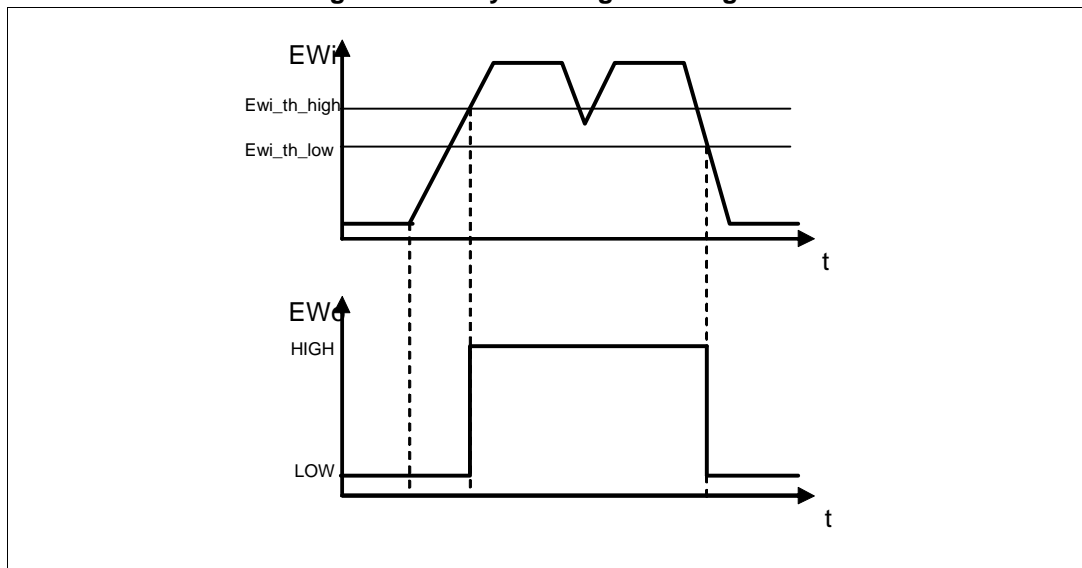

Figure 26. Reset time diagram

3.3 Early warning

This circuit compares the EW_i input signal with the internal voltage reference (typically 2.5 V). The use of an external voltage divider makes the comparator very flexible in the application. This function can be used to supervise the supply input voltage either before or after the protection diode and to give additional information to the microprocessor such as low voltage warnings.

Figure 27. Early warning time diagram

3.4 Enable

L5300GJ is also provided with an enable input, a high signal switches the regulator ON. In standby mode the output is disabled and the current consumption of the device (quiescent current) is less than 10 μA .
