

## H-bridge gate driver for automotive applications

Datasheet - production data

### Applications

- Wiper
- Power door
- Seat belt tensioner
- Seat positioning
- Valve tronic
- Park break
- 2H motors

### Features

- AEC-Q100 qualified
- Operating supply voltage 6 V to 28 V
- Central 2-stage charge pump
- 100% duty cycle
- Full  $R_{DS(on)}$  down to 6 V (standard level threshold MOSFETs)
- Charge pump output available for driving an external reverse battery NMOSFET protection
- Charge pump current limited
- PWM operation up to 30 kHz
- SPI interface
- Current sense amplifier / free configurable
- Zero adjust for end of line trimming
- Power management: programmable free wheeling
- Sensing circuitry of external MOSFETs with embedded thermal sensors

### Description

The L99H02 is designed to drive 4 external N-channel MOS transistors in H-bridge configuration for DC-motor driving in automotive applications. A free configurable current sense amplifier is integrated. The integrated standard serial peripheral interface (SPI) controls the device and provides diagnostic information. An interface pin for the thermal sensors of the external MOSFETs is implemented.

Table 1. Device summary

Package	Order codes		
	Part number (tube)	Part number (tape and reel)	Part number (tray)
PowerSSO-36	L99H02XP	L99H02XPTR	-
LQFP32	-	L99H02QFTR	L99H02QF

# 1 Block diagram and pin description

Figure 1. Block diagram

## 1.1 Pin description

Table 2. Pin definitions and functions

Pin	Symbol	Function
1	GND	Ground. Reference potential, connected to slug.
2	GNDD	Digital ground. Reference potential.
3	V <sub>CCD</sub>	Logic voltage supply 3.3 V/5 V: for this input a ceramic capacitor as close as possible to GND is recommended.
4	V <sub>CC</sub>	Analog voltage supply 3.3 V/5 V: for this input a ceramic capacitor as close as possible to GND is recommended.
5	EN	Enable input. The enable input has a pull-down resistor.
6	DIR	Direction select input for H-bridge control. This input has a pull-down current.
7	PWM	PWM input for H-bridge control. This input has a pull-down current.
8	CSN	Chip select not input: this input is low active and requires CMOS logic levels. The serial data transfer between L99H02 and microcontroller is enabled by pulling the input CSN to low-level. This input has a pull-up current.

Table 2. Pin definitions and functions (continued)

Pin	Symbol	Function
9	CLK	Serial clock input: this input controls the internal shift register of the SPI and requires CMOS logic levels. This input has a pull-down current.
10	DI	Serial data in: the input requires CMOS logic levels and receives serial data from the microcontroller. The data is an 8-bit control word and the most significant bit (MSB, bit 7) is transferred first. This input has a pull-down current.
11	DO	Serial data out: the diagnosis data is available via the SPI and this tristate-output. The output remains in tristate, if the chip is not selected by the input CSN (CSN = high).
12, 14, 19, 20, 22	NC	Not connected.
13	CSO	Current sense amplifier output: $V_{CC}$ compatible.
15	CSI1+	Current sense amplifier input: positive input 1, multiplexible.
16	CSI1-	Current sense amplifier input: negative input 1, multiplexible.
17	CSI2+	Current sense amplifier input: positive input 2, multiplexible.
18	CSI2-	Current sense amplifier input: negative input 2, multiplexible.
21	TS/ACT_OFF	Thermal sensor interface or input to switch all driver in sink condition.
23	GL2	Gate driver for PowerMOS low-side switch in half bridge 2.
24	SL2	Source of low-side switch in half bridge 2.
25	GH2	Gate driver for PowerMOS high-side switch in half bridge 2.
26	SH2	Source/drain of half bridge 2.
27	SL1	Source of low-side switch in half bridge 1.
28	GL1	Gate driver for PowerMOS low-side switch in half bridge 1.
29	SH1	Source/drain of half bridge 1.
30	GH1	Gate driver for PowerMOS high-side switch in half bridge 1.
31	CP	Charge pump output.
32	CP2+	Charge pump pin for capacitor 2, positive side.
33	CP2-	Charge pump pin for capacitor 2, negative side.
34	CP1+	Charge pump pin for capacitor 1, positive side.
35	CP1-	Charge pump pin for capacitor 1, negative side.
36	$V_S$	Power supply voltage (external reverse protection required). For EMI reason a ceramic capacitor as close as possible to GND is recommended.

Figure 2. Pinning of device in PowerSSO-36 package

## 1.2 Pinout LQFP32

Table 3. Pin definitions and functions

Pin	Symbol	Function
1	CP2-	Charge pump pin for capacitor 2, negative side.
2	CP1+	Charge pump pin for capacitor 1, positive side.
3	CP1-	Charge pump pin for capacitor 1, negative side.
4	V <sub>S</sub>	Power supply voltage (external reverse protection required). For EMI reason a ceramic capacitor as close as possible to GND is recommended.
5	GND	Ground. Reference potential.
6	GNDD	Digital ground. Reference potential.
7	V <sub>CCD</sub>	Logic voltage supply 3.3 V/5 V: for this input a ceramic capacitor as close as possible to GND is recommended.
8	V <sub>CC</sub>	Analog voltage supply 3.3 V/5 V: for this input a ceramic capacitor as close as possible to GND is recommended.
9	EN	Enable input. The enable input has a pull-down resistor.

Table 3. Pin definitions and functions (continued)

Pin	Symbol	Function
10	DIR	Direction select input for H-bridge control. This input has a pull-down current.
11	PWM	PWM input for H-bridge control. This input has a pull-down current.
12	CSN	Chip select not input: this input is low active and requires CMOS logic levels. The serial data transfer between L99H01 and microcontroller is enabled by pulling the input CSN to low-level. This input has a pull-up current.
13	CLK	Serial clock input: this input controls the internal shift register of the SPI and requires CMOS logic levels. This input has a pull-down current.
14	DI	Serial data in: the input requires CMOS logic levels and receives serial data from the microcontroller. The data is an 8-bit control word and the most significant bit (MSB, bit 7) is transferred first. This input has a pull-down current.
15	DO	Serial data out: the diagnosis data is available via the SPI and this tristate-output. The output remains in tristate, if the chip is not selected by the input CSN (CSN = high).
16	CSO	Current sense amplifier output: $V_{CC}$ compatible.
17	CSI1+	Current sense amplifier input: positive input 1, multiplexible.
18	CSI1-	Current sense amplifier input: negative input 1, multiplexible.
19	CSI2+	Current sense amplifier input: positive input 2, multiplexible.
20	CSI2-	Current sense amplifier input: negative input 2, multiplexible.
21	NC	Not connected.
22	TS/ACT_OFF	Thermal sensor interface or external off for all gate drivers.
23	GL2	Gate driver for PowerMOS low-side switch in halfbridge 2.
24	SL2	Source of low-side switch in halfbridge 2.
25	GH2	Gate driver for PowerMOS high-side switch in halfbridge 2.
26	SH2	Source/drain of halfbridge 2.
27	SL1	Source of low-side switch in halfbridge 1.
28	GL1	Gate driver for PowerMOS low-side switch in halfbridge 1.
29	SH1	Source/drain of halfbridge 1.
30	GH1	Gate driver for PowerMOS high-side switch in halfbridge 1.
31	CP	Charge pump output.
32	CP2+	Charge pump pin for capacitor 2, positive side.

Figure 3. Pinning of device in LQFP-32 package

## 2 Electrical specifications

### 2.1 Absolute maximum ratings

Stressing the device above the rating listed in [Table 4](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Table 4. Absolute maximum ratings**

Item	Symbol	Parameter	Value	Unit
4.1.1	$V_S$	Power supply voltage	-0,3 to 35	V
4.1.2		Single pulse $t_{max} < 400$ ms	40	V
4.2	$V_{CC}$	Stabilished supply voltage	-0.3 to 5.5	V
4.3	DI, DO, CLK, CSN, EN, DIR, PWM	Digital input / output voltage	-0.3 to $V_{CC} + 0.3$	V
4.4	CSO, TS	Analog input / output voltage	-0.3 to $V_{CC} + 0.3$	V
4.5	CSI1+, CSI1-, CSI2+, CSI2-	HV signal pins	-4 to $V_S + 8$ V	V
4.6	GL2, GH2, GL1, GH1 (Gxy)	HV signal pins	$S_{xy} - 1$ to $S_{xy} + 10$ ; $V_{CP} + 0.3$	V
4.7	SL2, SH2, SL1, SH1	HV signal pins	-6 to 40	V
4.8	CP2- CP1-	HV signal pins	-0.3 to $V_S + 0.3$	V
4.9	CP1+	HV signal pins	$V_S - 0.3$ to $V_S + 14$	V
4.10	CP2+	HV signal pins	$V_S - 0.6$ to $V_S + 14$	V
4.11	CP	Power pin	$V_S - 0.3$ to $V_S + 14$	V

### 2.2 ESD protection

**Table 5. ESD protection**

Item	Parameter	Value	Unit
5.1	All pins	$\pm 2$ <sup>(1)</sup>	kV
5.2	$V_S$ versus GND	$\pm 4$ <sup>(1)</sup>	kV

1. - HBM according to MIL 883C, Method 3015.7 or EIA/JESD22-A114-A.  
- HBM with all unzapped pins grounded.

## 2.3 Thermal data

**Table 6. Operating junction temperature**

Item	Symbol	Parameter	Value	Unit
6.1	$T_j$	Operating junction temperature	-40 to 150	°C

**Table 7. Temperature warning and thermal shutdown**

Item	Symbol	Parameter	Min.	Typ.	Max.	Unit
7.1	$T_{jTW\ ON}$	Temperature warning threshold junction temperature	135	—	165	°C
7.2	$T_{jSD\ ON}$	Thermal shutdown threshold junction temperature	155	—	185	°C
7.3	$T_{jSD\ OFF}$	Thermal shutdown threshold junction temperature	150	—	180	°C

**Table 8. Packages thermal resistance**

Item	Symbol	Parameter	Value		Unit
			PowerSSO-36	LQFP32	
8.1	$R_{thj-amb}$	Thermal resistance junction-ambient (max.)	58 <sup>(1)</sup>	80 <sup>(1)</sup>	°C/W

1. Minimum footprint.

## 2.4 Electrical characteristics

$V_S = 6\text{ V to }28\text{ V}$ ,  $V_{CC} = 3\text{ V to }5.3\text{ V}$ ,  $T_j = -40^\circ\text{C to }150^\circ\text{C}$ , unless otherwise specified.

The voltages are referred to GND and currents are assumed positive, when the current flows into the pin.

**Table 9. Supply**

Item	Symbol	Parameter	Test condition	Min.	Typ.	Max.	Unit
9.1	$V_S$	Operating supply voltage range		6		28	V
9.2	$V_{VS\_OV1}$	Overvoltage disable high threshold 1	SPI: OVT = 1	28	30.5	32	V
9.3	$V_{VS\_OV1H}$	Overvoltage threshold 1 hysteresis		0.57	0.77	1.07	V
9.4	$V_{VS\_OV2}$	Overvoltage disable high threshold 2	SPI: OVT = 0	18	20	22	V
9.5	$V_{VS\_OV2H}$	Overvoltage threshold 2 hysteresis		0.42	0.62	0.82	V

**Table 9. Supply (continued)**

Item	Symbol	Parameter	Test condition	Min.	Typ.	Max.	Unit
9.6	$V_{VS\_UV}$	Undervoltage disable low threshold		4.7	4.9	5.1	V
9.7	$V_{VS\_UVH}$	Undervoltage threshold hysteresis		0.2	0.3	0.4	V
9.8.1	$I_S$	$V_S$ DC supply current	$V_S = 13\text{ V}; V_{CC} = 5\text{ V};$ Active mode; Outputs floating	4.5	5.5	6.5	mA
9.8.2			$V_S = 6\text{ V to }28\text{ V};$ $V_{CC} = 5.0\text{ V};$ Active mode; Outputs floating	2.5		18	mA
9.9	$I_{SL}$	$V_S$ quiescent supply current	$V_S = 13\text{ V}; V_{CC} = 0\text{ V};$ Standby mode; $T_{Test} = -40^\circ\text{C}, 25^\circ\text{C};$ Outputs floating			5	$\mu\text{A}$
9.10	$I_{CC}$	$V_{CC}$ DC supply current	$V_S = 13\text{ V}; V_{CC} = 5\text{ V};$ active mode	1.5	1.8	2.5	mA
9.11	$I_{CC}$	$V_{CC}$ quiescent supply current	$V_{CC} = 5\text{ V};$ standby mode	30	70	150	$\mu\text{A}$
9.12	$I_{CCd}$	$V_{CCd}$ supply current	$V_S = 13\text{ V};$ $V_{CC} = V_{CCd} = 5\text{ V};$ active mode	250	500	750	$\mu\text{A}$

**Table 10. Undervoltage detection**

Item	Symbol	Parameter	Test condition	Min.	Typ.	Max.	Unit
10.1	$V_{POR\ OFF}$	Power-on reset threshold	$V_{CC}$ increasing	2.2	2.55	2.8	V
10.2	$V_{POR\ ON}$	Power-on reset threshold	$V_{CC}$ decreasing	2.0	2.25	2.6	V
10.3	$V_{POR\ hyst}$	Power-on reset hysteresis	$V_{POR\ OFF} - V_{POR\ ON}$	0.2	0.3	0.4	V

**Table 11. Watchdog**

Item	Symbol	Parameter	Test condition	Min.	Typ.	Max.	Unit
11.1	$T_{WDTO}$	Watchdog time out	—	50	60	100	ms

Table 12. Inputs: CSN, CLK, PWM, DIR, EN and DI

Item	Symbol	Parameter	Test condition	Min.	Typ.	Max.	Unit
12.1	$V_{inL}$	Low-level input voltage		$0.3 * V_{CC}$	$0.4 * V_{CC}$		V
12.2	$V_{inH}$	High-level input voltage			$0.6 * V_{CC}$	$0.7 * V_{CC}$	V
12.3	$V_{inHyst}$	Input voltage hysteresis		$0.1 * V_{CC}$			V
12.4	$I_{CSN in}$	Pull-up current at input CSN	$V_{CSN} = V_{CC} - 1.5 V$	-50	-25	-10	$\mu A$
12.5	$I_{CLK in}$	Pull-down current at input CLK	$V_{CLK} = 1.5 V$	10	35	50	$\mu A$
12.6	$I_{DI in}$	Pull-down current at input DI	$V_{DI} = 1.5 V$	10	35	50	$\mu A$
12.7	$I_{DIR in}$	Pull-down current at input DIR	$V_{DIR} = 1.5 V$	10	35	50	$\mu A$
12.8	$I_{PWM in}$	Pull-down current at input PWM	$V_{PWM} = 1.5 V$	10	35	50	$\mu A$
12.9	$R_{EN in}$	Pull-down resistance at input EN	$V_{EN} = V_{CC}$	100	210	480	$k\Omega$
12.10	$C_{in}^{(1)}$	Input capacitance at input CSN, CLK, DI, DIR and PWM	$0 V < V_{CC} < 5.3 V$		10	15	$\mu F$

1. Value of input capacity is not measured in production test. Parameter guaranteed by design.

Table 13. Charge pump output

Item	Symbol	Parameter	Test condition	Min.	Typ.	Max.	Unit
13.1.1	$V_{CP}$	Charge pump output voltage	$V_S = 6 V; I_{CP} = 15 mA$	$V_S + 6$	$V_S + 7$	$V_S + 7.5$	V
13.1.2			$V_S = 10 V; I_{CP} = 15 mA$	$V_S + 11$	$V_S + 12$	$V_S + 13.5$	V
13.1.3			$V_S > 12 V; I_{CP} = 15 mA$	$V_S + 11$	$V_S + 12$	$V_S + 13.5$	V
13.2	$I_{CP}$	Charge pump output current	$f_{CP} = f_{SYS\_CLK} / 32;$ $V_S = 14 V; V_{CP} = V_S + 10 V$	26	38	48	mA
13.3	$V_{CP\_LOW}$	Charge pump low threshold voltage		$V_S + 4.5$	$V_S + 5$	$V_S + 5.5$	V
13.4.1	$f_{SYS\_CLK}$	Clock frequency (internal oscillator)	$V_{CC} = 5 V$	3	4	4.5	MHz
13.4.2			$V_{CC} = 3 V$	2.4	3.3	3.5	MHz
13.5	$T_{CP}$	Charge pump low filter time			64		$\mu s$

**Table 14. Gate drivers for external PowerMOS**

Item	Symbol	Parameter	Test condition	Min.	Typ.	Max.	Unit
Drivers for external high-side PowerMOS							
14.1	$I_{GHx(on)}$	Turn on current (SOURCE stage)	$T_j = 25\text{ °C}^{(1)}$	0.3	0.5 <sup>(2)</sup>	0.8	A
14.2.1	$R_{GHx}$	On-resistance of SINK stage	$V_{SHx} = 0\text{ V}; I_{GHx} = 50\text{ mA}; T_j = 25\text{ °C}$	3	4	5	$\Omega$

## 3 Device description

### 3.1 Dual power supply: $V_S$ and $V_{CC}$

The power supply  $V_S$  supplies the charge pump and the gate drivers. An internal charge-pump is used to drive the high-side switches and the low-side switches. The supply voltage  $V_{CC}$  (3.3 V / 5 V) is used for the logic part, the SPI of the device and for the output stage of the current sense amplifier. Due to the independent logic supply voltage the control and the status information is not lost, even if the supply voltage  $V_S$  is switched-off. In case of power-on ( $V_{CC}$  increases from undervoltage to  $V_{POR\ OFF} = 2.5$  V, typical) the circuit is initialized by an internally generated power-on reset (POR). If the voltage  $V_{CC}$  decreases under the minimum threshold ( $V_{POR\ ON} = 2.2$  V, typical), the outputs are switched-off and the status and the control registers are reset to default values.

### 3.2 Standby mode (EN)

The L99H02 is activated with enable input high. For enable input floating (not connected) or  $V_{EN} = 0$  V the device is in standby mode. In standby mode all latched data are cleared and inputs and outputs are switched-off. In standby mode the current at  $V_S$  is less than 5  $\mu$ A (1  $\mu$ A) for CSN = high (DO in tristate). If  $V_{CC} > V_{POR\ OFF}$  and EN = high the device enters the active mode.

In active mode the diagnostic functions are active. In fact gate drivers and charge pump status will depend on the fault flags. For example if the device enters in active mode with  $V_S > V_{SOV}$  the charge pump will be disabled.

### 3.3 H-bridge control (DIR, PWM, bit FW)

The DIR and PWM inputs control the drivers of the external H-bridge transistors. The motor direction can be chosen with the DIR input, the duty cycle and frequency with the PWM input. With the SPI bits FW and FW-PAS 4 different free wheeling modes (2 active and 2 passive) can be selected by using the high-side transistors or the low-side transistors. Unconnected inputs are defined by internal pull-down current.

Table 23. Truth table

1. Only the half bridge (low-side and high-side) where one MOSFET is in short-circuit condition is switched-off. Both MOSFETs of the other half bridge remain active and driven by DIR and PWM.

Symbols:

- **x**: Don't care
- **1**: Logic high or active
- **0**: Logic low or not active
- **H**: Output in source condition
- **L**: Output in sink condition
- **RL**: Resistive low (see [Section 3.4: Resistive low](#))
- **T**: Tristate
- **FW**: Free wheeling
- **FW\_PAS**: Free wheeling passive
- **CP\_LOW**: Charge pump low
- **OV**: Overvoltage
- **UV**: Undervoltage
- **DS\_MON**: Short-circuit
- **TSD**: Thermal shutdown
- **GL\_ER**: Global error flag

### 3.4 Resistive low

The resistive low output mode protects the L99H02 and the H-bridge in standby mode and in some failure modes (internal thermal shutdown (TSD), charge pump low (CP\_LOW), stucked reset (STK\_RESET\_Q) and power-on reset (POR)). When a gate driver changes into the resistive low output mode due to a failure a sequence is started. In this sequence the concerning driver is switched in sink condition for 32  $\mu$ s to 64  $\mu$ s to ensure a fast switch-off of the H-bridge transistor. Afterwards the driver is switched in the resistive output mode (resistive path to source).

### 3.5 Diagnostic functions

The diagnostic functions (over load, power supply over- and undervoltage, charge pump low, watchdog, temperature warning and internal/external thermal shutdown) are internally filtered and the condition has to be valid for at least 64  $\mu$ s (6  $\mu$ s for a short-circuit) before the corresponding status bit in the status registers is set. The filters are used to improve the noise immunity of the device. The internal temperature warning function is intended for information purpose and does not change the state of the output drivers. On the contrary, the over load condition switches the corresponding half bridge in sink condition. The internal thermal shutdown condition and charge pump low disable all drivers (resistive low). The external thermal shutdown, watchdog, over- and undervoltage condition switch all drivers in sink condition. The microcontroller needs to clear the status bits to reactivate the drivers.

### 3.6 Overvoltage and undervoltage detection

If the power supply voltage  $V_S$  rises above the overvoltage threshold  $V_{VS\_OV}$  (typical 20 V / 30 V), all gate driver stages are switched in sink condition to protect the H-bridge and the load, setting the OV flag. Two values for the overvoltage threshold can be selected with the SPI. When the voltage  $V_S$  drops below the undervoltage threshold

$V_{VS\_UV}$ , all gate driver stages are switched in the sink condition to avoid driving the power devices without sufficient gate driving voltage (increased power dissipation), setting the UV bit. In both cases, overvoltage and undervoltage detection, the charge pump is disabled. If the supply voltage  $V_S$  recovers from UV/OV to normal operating voltage range and if the OV\_UV\_RD is set to 0, then the charge pump is automatically enabled. In any case, regardless of the OV\_UV\_RD bit value, the microcontroller needs to clear the status register to reactivate the gate drivers.

*Note:* In particular when the OV\_UV\_RD control bit is set to one, two status register clear operations are needed to reactivate the gate drivers, one to clear the OV/UV flag and turn on the charge pump and one to clear the CP\_LOW flag.

### 3.7 Charge pump

The charge pump uses 2 external capacitors. The output of the charge pump has a current limitation. In standby mode and after overvoltage, undervoltage or a thermal shutdown has been triggered the charge pump is disabled. If the charge pump output voltage drops below the charge pump low voltage threshold for longer than  $T_{CP}$ , the CP\_LOW flag is set and all gate drivers are switched-off (resistive output, see [Section 3.4: Resistive low](#)). The CP\_LOW flag has to be cleared through a software reset to reactivate the gate drivers.

### 3.8 Temperature warning and thermal shutdown

If junction temperature rises above  $T_{jTWON}$  the temperature warning flag TW is set and detectable via the SPI. If junction temperature rises above the second threshold  $T_{jSDON}$ , the thermal shutdown flag (TSD) is set and the gate drivers and the charge pump are switched-off to protect the device. The gates of the H-bridge are discharged by the resistive low mode (see [Section 3.4: Resistive low](#)). In order to reactivate the output stages the junction temperature must decrease below  $T_{jSDOFF}$  and the thermal shutdown flag has to be cleared by the microcontroller.

### 3.9 Short-circuit detection / drain source monitoring

The drain - source voltage of each activated external MOSFET of the H-bridge is monitored by comparators to detect shorts to ground or battery. If the voltage drop over the external MOSFET exceeds the threshold voltage  $V_{SCd}$  for longer than the short current detection time  $t_{SCd}$  the corresponding gate driver switches the external MOSFET off and the corresponding drain source monitoring flag (DS\_MON\_[3:0]) is set. Until this failure flag is reset the corresponding half bridge is in sink condition. The DS\_MON flags have to be cleared through a software reset to reactivate the gate drivers. The drain source monitoring has a nominal filter time of 6  $\mu$ s. This monitoring is only active when the corresponding gate driver is in source condition. The threshold voltage  $V_{SCd}$  can be programmed in 4 steps between 0.5 V and 2 V with the SPI.

### 3.10 Programmable cross current protection

The external Power MOSFET's transistors in H-bridge (two half bridges) configuration are switched-on with an additional delay time  $t_{CCP}$  to prevent cross current in the half bridge. The cross current protection time  $t_{CCP}$  can be programmed with the SPI.

### 3.11 Current sense amplifier (CSA)

The current sense amplifier (CSA) is specially designed for current sensing in automotive applications. It is a bidirectional, single-supply amplifier for amplifying small differential voltages in a wide common mode voltage range (-4 V to  $(V_{CP} - 8)$  V). It supports the current measurement at two shunts. The result of the respective shunt can be multiplexed to the microcontroller compatible output voltage by a SPI command.

A gain of 50, 20 or 10 is SPI programmable. The inputs (CS1+ / CS1- and CS2+ / CS2-) are built as a transconductance stage. Therefore a series resistor (for filtering etc.) should not exceed 50  $\Omega$  to keep the additional gain error below 1%.

The output works at half scale:  $V_{CSO0} = (0,5 * V_{CC})$  V for  $V_{IDIFF} = 0$  V. An internal offset measurement is in normal mode available with the "OFF\_CAL" SPI-bit. If this bit is set to logic "1" the input pins are disconnected from the amplifier and a virtual zero input differential voltage is selected.

### 3.12 Thermal sensor interface / H-bridge switch-off input

The TS/ACT\_OFF input pin is configurable by SPI with the EXT\_TS bit. This pin could be used as temperature sensor interface for the power stage temperature sensors or as external switch off input for the power stage (all the external MOSFETs). The output bias current for the power stage temperature sensors ITS\_bias is on for EN = high.

#### 3.12.1 EXT\_TS-bit = low (active off)

The TS/ACT\_OFF input is used as a logic driver control input, without filter delay and without latching the information.

Pulling the TS/ACT\_OFF pin below the programmed threshold shuts off all the MOSFETs and sets the OT\_EXT bit.

Increasing the voltage at TS/ACT\_OFF pin above the programmed threshold brings back the MOSFETs to the status set by DIR and PWM-pins and resets the OT\_EXT bit.

The threshold is programmable by SPI with the bits EXTTH\_5:0.

#### 3.12.2 EXT\_TS-bit = high (thermal sensor interface)

The thermal sensor interface together with the thermal sensor diodes, can be used to control the temperature of the external H-bridge. When the drop over the diodes chain decreases below the reference voltage for longer than the internal filter time (64  $\mu$ s) the OT\_EXT bit is set and the drivers switch in sink condition.

In this mode the OT\_EXT-status-bit has to be cleared through a software reset to reactivate the gate drivers.

The threshold is programmable by SPI with the bits EXTTH\_5:0.

### 3.13 Watchdog

The task of the watchdog is to monitor the microcontroller during normal operation within a nominal trigger cycle of 60 ms. The microcontroller has to restart the watchdog timer by setting the watchdog restart bit via SPI repeatedly within the watchdog time  $T_{WDTO}$ . If no

correct watchdog trigger is sent from the microcontroller, all gate drivers switch in sink condition and the watchdog time out flag (WDTO) is set. Once a watchdog time out is detected, the gate drivers can only be reactivated by sending a software reset.

## 4 Functional description of the SPI

### 4.1 Signal description

#### 4.1.1 Serial clock (CLK)

This input signal provides the timing of the serial interface. Data present at serial data input (DI) is latched on the rising edge of serial clock (CLK). Data on Serial Data Out (DO) is shifted out at the falling edge of serial clock (CLK).

The serial clock CLK must be active only during a frame (CSN low phase). Any other switching of CLK close to any CSN edge could generate setup/hold violations in the SPI logic of the device.

#### 4.1.2 Serial data input (DI)

This input is used to transfer data serially into the device. Values are latched on the rising edge of serial clock (CLK).

#### 4.1.3 Serial data output (DO)

This output is used to transfer data serially out of the device. Data is shifted out on the falling edge of serial clock (CLK).

DO also reflects the status of the *<Global Error Flag>* (*<Global Status Byte>*[7]) while CSN is low and no clock signal is present.

#### 4.1.4 Chip select not (CSN)

When this input signal is high, the communication interface of the device is deselected and serial data output (DO) is high impedance. Driving this input low enables the communication. The communication must start and stop on a low-level of serial clock (CLK).

The SPI can be driven by a microcontroller with its SPI peripheral running in the following mode: CPOL = 0 and CPHA = 0.

For timing details and figures refer to [Section 2.5: SPI - electrical characteristics](#)

### 4.2 General data description

The SPI communication is based on a SPI interface structure using CSN (chip select not), DI (serial data in), DO (serial data out/error) and CLK (serial clock) signal lines.

Each DI communication frame consists of a *<Command Byte>* which is followed by 1 *<Data Byte>*.

The data returned on DO within the same frame always starts with the *<Global Status Byte>*, which provides general status information about the device. This byte is followed by 1 *<Data Byte>* (*'In-frame-response'*).

Table 24. DI

Command byte								DI - data byte							
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OC1	OC0	A5	A4	A3	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0

Table 25. DO

Global Status byte								DO - data byte								
15	14	13		12	11	10	9	8	7	6	5	4	3	2	1	0
GL_ER	FE	STK_RESET_Q		TSD	TW	UV	OV	WDTO	D7	D6	D5	D4	D3	D2	D1	D0

### 4.2.1 Command byte

Each communication frame starts with a command byte. It consists of an operating code which specifies the type of operation (<Read>, <Write>, <Clear status>, <Read Device Information>) and a 6-bit address.

Table 26. Command byte

Command byte							
MSB				LSB			
Op code		Address					
OC1	OC0	A5	A4	A3	A2	A1	A0

Comments:

- **OCx**: Operating code
- **Ax**: Address

### 4.2.2 OpCode definition

Table 27. Operating code definition

OC1	OC0	Meaning
0	0	<Write Mode>
0	1	<Read Mode>
1	0	<Clear Status>
1	1	<Read Device Information>

The <Write Mode> and <Read Mode> operations allow access to the RAM of the device. The <Clear Status> operation is used to read a status register and subsequently clear its content. <Read Device Information> allows access to the ROM area which contains device related information such as <ID-Header>, <Product Code>, <Silicon Version and Category> and <SPI-frame-ID>.

More detailed descriptions of the *device information* are available in [Section 4.7](#).

## 4.3 Device memory map

### 4.3.1 Control and status (RAM) address map

Table 28. Control and status (RAM) address map

Name	Access	Address						Content							
		A5	A4	A3	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0
Start Reg0	Read/ Clear	0	0	0	0	0	0	DS_MON_3	DS_MON_2	DS_MON_1	DS_MON_0	0	0	OT_EXT	CP_LOW
Start Reg1	Read/ Write	0	0	0	0	0	1	RWD	FW_PAS	OFF_CAL	CLK_SPCTR	OVT	OV_UV_R D	DIAG_1	DIAG_0
Start Reg2	Read/ Write	0	0	0	0	1	0	RWD	COPT_2	COPT_1	COPT_0	FW	MCSA	GCSA_1	GCSA_0
Start Reg3	Read/ Write	0	0	0	0	1	1	RWD	EXT_TS	EXTTH_5	EXTTH_4	EXTTH_3	EXTTH_2	EXTTH_1	EXTTH_0

### 4.3.2 Device (ROM) address map (access with OC0 and OC1 set to '1')

Table 29. Device (ROM) address map (access with OC0 and OC1 set to '1')

Name	Access	Address						Content							
		A5	A4	A3	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0
ID-Header	Read device	0	0	0	0	0	0	FAM_1	FAM_0	NR_PI_5	NR_PI_4	NR_PI_3	NR_PI_2	NR_PI_1	NR_PI_0
Product code 1	Read device	0	0	0	0	0	1	PR_ID_7	PR_ID_6	PR_ID_5	PR_ID_4	PR_ID_3	PR_ID_2	PR_ID_1	PR_ID_0
Product code 2	Read device	0	0	0	0	1	0	PR_ID_15	PR_ID_14	PR_ID_13	PR_ID_12	PR_ID_11	PR_ID_10	PR_ID_9	PR_ID_8

Reserved	Read device	1	1	1	1	1	1	Reserved, accessing this address is recognized as a failure, the device enters a fail-safe state (see <a href="#">Table 30</a> ).							

## 4.4 Global Status Byte

The Global Status Byte is the first byte shifted out at every SPI access.

The GL\_ER bit is present at DO with the falling edge of CSN.

This byte can be reset with the command <clear status>.

The <clear status> command represents a software reset.

**Table 30. Global Status Byte**

Bit	15	14	13	12	11	10	9	8
Name	GL_ER	FE	STK_RESET_Q	TSD	TW	UV	OV	WDTO
<default>	0	0	1	0	0	0	0	0

Comments:

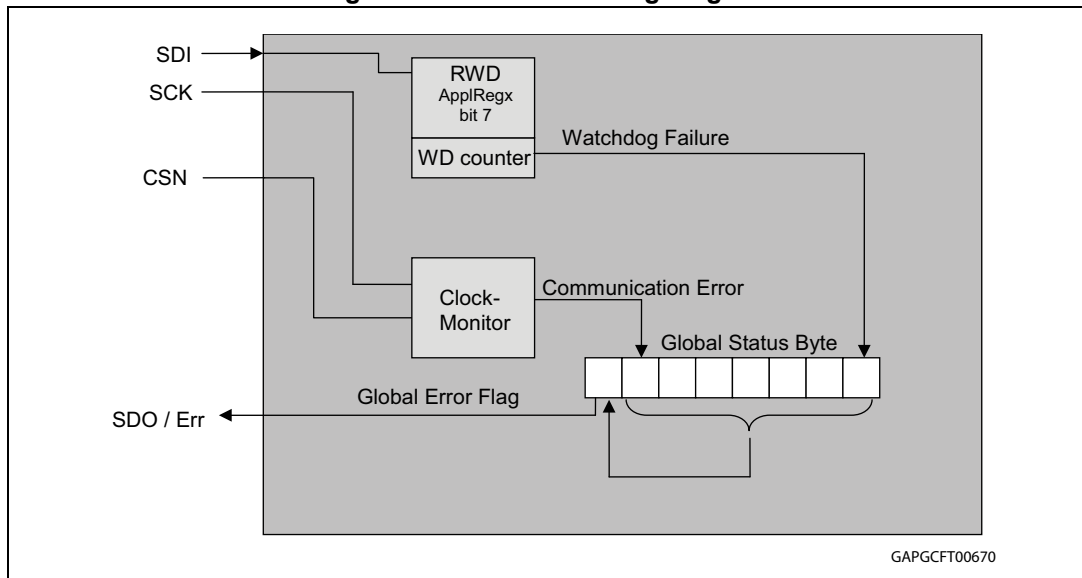

- **GL\_ER**: Global Error Flag. This signal is a logical OR among all the errors of the Global Status Byte (<Global Status Register>[8:14]).
- **FE**: Frame Error. If the number of clock pulses within the previous frame is not 16 the frame is ignored and this bit is set.
- **STK\_RESET\_Q**: if a stuck at '1' on SPI\_DI during any SPI frame occurs, or if a power-on reset occurs, the STK\_RESET\_Q is set '0'. STK\_RESET\_Q is reset ('1') with any SPI command. When STK\_RESET\_Q is active ('0'), the gate drivers are switched-off (see [Section 3.4: Resistive low](#)). After a startup of the circuit the STK\_RESET\_Q is active because of the POR pulse and the gate drivers are switched-off. The Gate drivers can only be activated after the STK\_RESET\_Q has been reset with a SPI command.
- **TSD**: Thermal Shutdown due to internal sensor. All the gate drivers and the charge pump are switched-off (see [Section 3.4: Resistive low](#)). The gate drivers can only be activated after the TSD has been reset with a SPI command.
- **TW**: Thermal Warning
- **UV**: V<sub>S</sub> Undervoltage
- **OV**: V<sub>S</sub> Overvoltage
- **WDTO**: Watchdog time out.

Failures of <Global Status Byte>[8:14] are always linked to the <Global Error Flag>.

The Global Error Flag is reflected via the DO pin while CSN is held low and no clock signal is available. The flag remains as long as CSN is low. This operation does not cause the <communication error> bit (FE) in the <Global Status Byte> to be set.

#### 4.4.1 SPI clock monitor and watchdog

Figure 11. Global error flag diagram

*Note:* Writing a "1" to RWD - bit in ApplRegx restarts the internal watchdog counter.

The clock monitor counts the number of clock pulses during a communication frame (while CSN is low). If the number of SCK pulses does not correspond with the frame width indicated in the <SPI-frame-ID> (ROM address 03hex) the frame is ignored and the bit <frame error> in the <Global Status Byte> is set.

*Note:* Due to this safety functionality, daisy chaining the SPI is not possible. Instead, a parallel operation of the SPI bus by controlling the CSN signal of the connected ICs is recommended.

### 4.5 Detailed byte description of status register (StatReg0)

The read operation starts always with the command byte followed by 1 data byte. The content of the send data byte has to be '0'. The content of the addressed register is shifted out at DO within the same frame ('in-frame response').

The device uses 1 status register to monitor the status of the device. [Table 31](#) shows the address and the content of the register.

*Note:* The errors of the status register are not linked to the <Global Error Flag>.

**Table 31. Address 0<00(hex)>:StatReg 0 - read clear**

Bit	7	6	5	4	3	2	1	0
Name	DS_MON_3	DS_MON_2	DS_MON_1	DS_MON_0	X	X	OT_EXT	CP_LOW
<default>	0	0	0	0	0	0	0	0

Comments:

- **DS\_MON[3:0]:** if max drain source voltage exceeds the defined thresholds, the DS\_MON are set and the corresponding drivers go to sink mode. In particular both gate drivers of the faulty leg will be in sink mode until the DS\_MON flag of one of its switch is reset. The DS\_MON bits have to be cleared through a software reset to reactivate the drivers.

**Table 32. DS\_MON - drivers relations**

Register	Deactivated driver
DS_MON_3	High-side 2
DS_MON_2	High-side 1
DS_MON_1	Low-side 2
DS_MON_0	Low-side 1

- **OT\_EXT:** Depending on EXT\_TS bit, the following two meanings exist:
  - EXT\_TS = low (active off):  
TS/ACT\_OFF pin is used as input to switch the H-bridge in tristate and back. Details are described in [Section 3.12.1](#).
  - EXT\_TS = high (thermal sensor interface):  
TS/ACT\_OFF pin is used as thermal sensor interface for external temperature diodes. Details are described in [Section 3.12.1](#).
- **CP\_LOW:** if a charge pump output low voltage event occurs, all gate drivers are switched-off (resistive low). The CP\_LOW bit has to be cleared through a software reset to reactivate the gate driver.

## 4.6 Detailed byte description of application registers (ApplRegX)

The write/read operation starts always with a command byte followed by 1 data byte.

### 4.6.1 Description of the data byte

The device uses 3 application registers to configure the device. The default values represent the bits values after a POR event.

**Table 33. Address 1 <01(hex)>:ApplReg1-read/write**

Bit	7	6	5	4	3	2	1	0
Name	RWD	FW_PAS	OFF_CAL	CLK_SPCTR	OVT	OV_UV_RD	DIAG1	DIAG0
<default>	0	0	0	0	0	0	0	0

Comments:

- **RWD**: restarts the watchdog counter by setting the bit to one
- **FW\_PAS**: enables passive free wheeling according to [Table 23](#)
- **OFF\_CAL**: offset calibration mode for CSA
- **OVT**: overvoltage threshold selection
- **CLK\_SPCTR**: switch the clock to the charge pump
  - 0: 125 KHz (50% duty cycle)
  - 1: pulses train (max = 8  $\mu$ s, min = 2  $\mu$ s) to optimize power spectrum

**Table 34. Overvoltage threshold of the Vs monitoring**

OVT	Threshold
0	20 V
1	29 V

- **OV\_UV\_RD**: over/undervoltage recovery disabled.
  - 0: if  $V_S$  recovers from OV/UV condition to normal operating voltage range, the charge pump is automatically enabled;
  - 1: if  $V_S$  recovers from OV/UV condition to normal operating voltage range, the charge pump remains disabled;

In both cases the microcontroller has to clear the status register to enable the gate drivers

- **DIAG[1:0]**: drain source monitoring threshold voltage selection

**Table 35. DIAG monitoring of source voltages**

DIAG[1]	DIAG[0]	Monitoring threshold voltage
0	0	$V_{SCd1} = 0.5 \text{ V}$
0	1	$V_{SCd2} = 1 \text{ V}$
1	0	$V_{SCd3} = 1.5 \text{ V}$
1	1	$V_{SCd4} = 2 \text{ V}$

**Table 36. Address 2 <02(hex)>: ApplReg2 – read/write**

Bit	7	6	5	4	3	2	1	0
Name	RWD	COPT_2	COPT_1	COPT_0	FW	MCSA	GCSA_1	GCSA_0
<default>	0	0	0	0	0	0	0	0

Comments:

- **RWD**: restarts the watchdog counter by setting the bit to one
- **COPT[2:0]**: filter time to protect the two external half bridges against cross current

**Table 37. Cross current protection time (t<sub>CCP</sub>)**

COPT_2	COPT_1	COPT_0	Protection time
0	0	0	250 ns
0	0	1	500 ns
0	1	0	750 ns
0	1	1	1000 ns
1	0	0	1250 ns
1	0	1	1500 ns
1	1	0	1750 ns
1	1	1	2000 ns

- **FW**: selects high-side or low-side free wheeling
- **MCSA**: multiplexer for current sense amplifier.

**Table 38. Multiplexer for current sense amplifier**

MCSA	Selected amplifier
0	CSA2 (CSI2+ / CSI2-)
1	CSA1 (CSI1+ / CSI1-)

- **GCSA[1:0]**: gain of the current sense amplifier.

**Table 39. Gain of current sense amplifier**

GCSA_1	GCSA_0	Gain
0	0	10
0	1	20
1	0	50
1	1	Not applicable

Table 40. Address 3 &lt;03(hex)&gt;: ApplReg3 – read/write

Bit	7	6	5	4	3	2	1	0
Name	RWD	EXT_TS	EXTTH_5	EXTTH_4	EXTTH_3	EXTTH_2	EXTTH_1	EXTTH_0
<default>	0	0	0	0	0	0	0	0

Comments:

- **RWD**: restarts the watchdog counter by setting the bit to one
- **EXT\_TS**: the bit selects the mode of the input pin TS/ACT\_OFF:
  - EXT\_TS = low (active off):  
TS/ACT\_OFF pin is used as input to switch the H-bridge in tristate and back. Details are described in [Section 3.12.1](#).
  - EXT\_TS = high (thermal sensor interface):  
TS/ACT\_OFF pin is used as thermal sensor interface for external temperature diodes. Details are described in [Section 3.12.2](#).
- **EXTTH[5:0]**: determines the threshold of the external thermal shutdown

Table 41. External threshold voltage, factor n

EXTTH_5	EXTTH_4	EXTTH_3	n
0	0	0	7
0	0	1	6
0	1	0	5
0	1	1	4
1	0	0	3
1	0	1	2
1	1	0	1
1	1	1	0

Table 42. External threshold voltage, factor m

EXTTH_2	EXTTH_1	EXTTH_0	m
0	0	0	7
0	0	1	6
0	1	0	5
0	1	1	4
1	0	0	3
1	0	1	2
1	1	0	1
1	1	1	0

**Equation 1**

$$V_{th} = n * (0.31 + m * 0.03) V$$

The purpose of factor n is to determine the number of external temperature sense diodes (in series). With factor m the level of the threshold voltage can be fine tuned.

## 4.7 Read device information (ROM)

The device information is stored at the ROM addresses defined below and it is read using the corresponding operating code.

**Table 43. Read device information (ROM)**

Op code		Address	Device information
OC1	OC0	Ax	
1	1	00H	<ID-Header>
1	1	01H	<Product Code 1>
1	1	02H	<Product Code 2>
1	1	03H	<SPI-frame-ID>
1	1	3FH	Reserved, accessing this address is recognized as a failure, the device enters a fail-safe state (see <a href="#">Table 30: Global Status Byte</a> ).

The <ID-Header> indicates the product family and specifies how many bytes of device information are available.

In [Table 44](#) the register is addressable only through a read device information command.

**Table 44. Address 0 <00(hex)>: ID-header - read only**

Bit	7	6	5	4	3	2	1	0
Name	FAM_1	FAM_0	NR_PI_5	NR_PI_4	NR_PI_3	NR_PI_2	NR_PI_1	NR_PI_0
<default>	0	1	0	0	0	0	1	0

- **FAM[1:0]:** family identifier, FAM[1:0] = [0:1] stands for ASSPs.
- **NR\_PI[5:0]:** number of product information bytes.

The <Product Code 1 and 2> represents a unique identifier of the device and version.

In [Table 45](#) the register is addressable only through a read device information command.

**Table 45. Address 1 <01(hex)>: product ID (LSB) - read only**

Bit	7	6	5	4	3	2	1	0
Name	PR_ID_7	PR_ID_6	PR_ID_5	PR_ID_4	PR_ID_3	PR_ID_2	PR_ID_1	PR_ID_0
<default>	0	0	0	0	0	0	0	1

In [Table 46](#) the register is addressable only through a read device information command.

**Table 46. Address 2 <02(hex)>: product ID (MSB) - read only**

Bit	7	6	5	4	3	2	1	0
Name	PR_ID_15	PR_ID_14	PR_ID_13	PR_ID_12	PR_ID_11	PR_ID_10	PR_ID_9	PR_ID_8
<default>	0	0	1	0	1	X	X	X

The <SPI-frame-ID> (ROM address 03H) provides information about the register width (1, 2, 3 bytes) and the availability of 'burst mode read' option.

In [Table 47](#) the register is addressable only through a read device information command.

**Table 47. Address 3 <03(hex)>: SPI frame ID - read only**

Bit	7	6	5	4	3	2	1	0
Name	BR	AR5	AR4	AR3	32 bits	24 bits	16 bits	8 bits
<default>	0	0	0	0	0	0	1	0

Comments:

- **BR**: Burst mode read. Not supported
- **AR5**: Address width reduction. Not supported
- **AR4**: Address width reduction. Not supported
- **AR3**: Address width reduction. Not supported
- **32 bits**: 32 bits frame width. Not supported
- **24 bits**: 24 bits frame width. Not supported
- **16 bits**: 16 bits frame width, 8 bits command and 8 bits data
- **8 bits**: 8 bits frame width. Not supported

## 5 Package and packing information

### 5.1 ECOPACK

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK is an ST trademark.

### 5.2 Package thermal data

Figure 12. PowerSSO-36  $R_{thj-amb}$  vs. PCB copper area in open box free air condition

Note: In Figure 12 the Layout condition of  $R_{th}$  and  $Z_{th}$  measurements (PCB: double layer, thermal vias FR4 area = 129 mm x 60 mm, PCB thickness = 1.6 mm, Cu thickness = 70  $\mu$ m (front and back side). Copper areas: from minimum pad layout to 8 cm<sup>2</sup>).

### 5.3 PowerSSO-36 package information

## 6 Revision history

**Table 50. Document revision history**

Date	Revision	Changes
15-Nov-2018	1	Initial release.
11-Mar-2019	2	Removed watermarks "Restricted". Updated Table 8.
08-Apr-2019	3	Updated Table 2: Pin definitions and functions.
05-Nov-2020	4	Added package LQFP32. Updated Table 1: Device summary. Updated Figure 1: Block diagram, Update Table 2: Pin definitions and functions, Table 4: Absolute maximum ratings, Table 14: Gate drivers for external PowerMOS, Table 22: EN, CSN timing, Figure 6: SPI - transfer timing diagram, Section 3: Device description, Section 4: Functional description of the SPI.
26-Nov-2020	5	Updated Table 2: Pin definitions and functions. Table 2: Pin definitions and functions Table 8: Packages thermal resistance Added Section 1.2: Pinout LQFP32, Section 5.2: Package thermal data, Section 5.5: LQFP32 package information, Section 5.7: LQFP32 packing information.
24-Feb-2021	6	Updated <a href="#">Table 18: Current sense amplifier</a> .
