

500 mA low quiescent current and low noise voltage regulator

Datasheet - production data

**Features**

- Input voltage from 1.5 to 5.5 V
- Ultra low-dropout voltage (200 mV typ. at 500 mA load)
- Very low quiescent current (20 μ A typ. at no load, 100 μ A typ. at 500 mA load, 1 μ A max. in OFF mode)
- Very low noise without bypass capacitor
- Output voltage tolerance: $\pm 2.0\%$ @ 25 °C
- 500 mA guaranteed output current
- Wide range of output voltages available on request: 0.8 V to 4.5 V with 100 mV step and adjustable from 0.8 V
- Logic-controlled electronic shutdown
- Compatible with ceramic capacitor $C_{OUT} = 1 \mu$ F
- Internal current and thermal limit
- Package DFN6 (3x3 mm) and DFN6 (2x2 mm)
- Temperature range: from -40 °C to 125 °C

Description

The LD39050 provides 500 mA maximum current with an input voltage range from 1.5 V to 5.5 V and a typical dropout voltage of 200 mV. Stability is given by ceramic capacitors. The ultra low drop voltage, low quiescent current and low noise features make it suitable for low power battery-powered applications. Power supply rejection is 65 dB at low frequencies and starts to roll off at 10 kHz. The enable logic control function puts the LD39050 in shutdown mode allowing a total current consumption lower than 1 μ A. The device also includes short-circuit constant current limiting and thermal protection. Typical applications are mobile phones, hard disks and battery-powered systems.

6 Application information

The LD39050 is an ultra low-dropout linear regulator. It provides up to 500 mA with a 200 mV dropout. The input voltage range is from 1.5 V to 5.5 V. The device is available in fixed and adjustable output versions.

The regulator is equipped with internal protection circuitry, such as short-circuit current limiting and thermal protection.

The regulator is designed to be stable with ceramic capacitors on the input and the output. The recommended values of the input and output ceramic capacitors are from 1 μF to 22 μF with 1 μF typical. The input capacitor must be connected within 0.5 inches of the V_{IN} terminal. The output capacitor must also be connected within 0.5 inches of output pin. There is no upper limit to the value of the input capacitor.

Figure 35 and *Figure 36* illustrate the typical application schematics:

Figure 35. Application schematic for fixed version

Figure 36. Application schematic for adjustable version

Regarding to the adjustable version, the output voltage can be adjusted from 0.8 V up to the input voltage minus the voltage drop across the PMOS (dropout voltage), by connecting a resistor divider between the ADJ pin and the output, thus allowing the remote voltage sensing.

The resistor divider should be selected using the following equation:

$$V_{OUT} = V_{ADJ} (1 + R_1 / R_2) \text{ with } V_{ADJ} = 0.8 \text{ V (typ.)}$$

Resistors should be used with values in the range from 10 kΩ to 50 kΩ. Lower values can also be suitable, but they increase current consumption.

6.1 Power dissipation

An internal thermal feedback loop disables the output voltage if the die temperature reaches approximately 160 °C. This feature protects the device from excessive temperature and allows the user to push the limits of the power handling capability of a given board without damaging the device.

A good PC board layout should be used to maximize the power dissipation. The thermal path for the heat generated by the device goes from the die to the copper lead frame through the package leads and exposed pad to the PC board copper. The PC board copper acts as a heat sink. The footprint copper pads should be as wider as possible to spread and dissipate the heat to the surrounding ambient. Feed-through vias to inner or backside copper layers improve the overall thermal performance of the device.

The power dissipation of the device depends on the input voltage, output voltage and output current, and is given by:

$$P_D = (V_{IN} - V_{OUT}) I_{OUT}$$

The junction temperature of the device is:

$$T_{J_MAX} = T_A + R_{thJA} \times P_D$$

where:

T_{J_MAX} is the maximum junction of the die, 125 °C;

T_A is the ambient temperature;

R_{thJA} is the thermal resistance junction-to-ambient.

6.2 Enable function

The LD39050 features an enable function. When the EN voltage is higher than 0.9 V the device is ON, and if it is lower than 0.4 V the device is OFF. In shutdown mode, consumption is lower than 1 μ A.

The EN pin does not have an internal pull-up, therefore it cannot be left floating if it is not used.

6.3 Power Good function

Most applications require a flag showing that the output voltage is in the correct range.

The Power Good threshold depends on the adjustable voltage. When the adjustable voltage is higher than $0.92 \cdot V_{ADJ}$, the Power Good (PG) pin goes to high impedance. If it is below $0.80 \cdot V_{ADJ}$ the PG pin goes to low impedance. If the device is working well, the PG pin is at high impedance. If the output voltage is fixed using an external or internal resistor divider, the Power Good threshold is $0.92 \cdot V_{OUT}$.

The use of the Power Good function requires an external pull-up resistor, which must be connected between the PG pin and V_{IN} or V_{OUT} . The typical current capability of the PG pin is up to 6 mA. The use of a pull-up resistor for PG in the range from 100 k Ω to 1 M Ω is recommended. If the Power Good function is not used, the PG pin must remain floating.

When EN pin is in low state the power good is asserted to the high state.

7 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com. ECOPACK is an ST trademark.
