

## 1 A ultra low-dropout LDO with bias

Flip Chip6 (0.8x1.2 mm)

### Features

- Input voltage from  $V_{OUT}$  to 5.5 V
- Input bias supply pin from 3.0 V to 5.5 V
- Ultra low-dropout voltage (40 mV typ. at 1 A load)
- Low ground current (35  $\mu$ A typ. at no load)
- Output voltage tolerance:  $\pm 1\%$  all over temperature range,  $\pm 0.5\%$  at 25 °C
- 1 A guaranteed output current
- 50 mV output voltage step available from 0.4 V to 1.8 V
- 100 mV output voltage step available from 1.9 V to 3.6 V
- Adjustable version from 0.5 V to 3.0 V
- Logic-controlled electronic shutdown
- Internal current limit
- Thermal shutdown
- Output active discharge function
- Available in Flip Chip6 (0.8x1.2 mm) package
- Temperature range: -40 °C to 85 °C

### Applications

- Smartphones
- Cameras
- Low voltage, low noise post regulation

### Description

The **LD57100** is a high accuracy voltage regulator, which provides 1 A of current. It is equipped with an NMOS pass transistor, whose gate is biased by a dedicated pin, thus allowing the ultra-low drop performance even at very low input voltages.

It is available in Flip Chip6 (0.8x1.2 mm), maximizing the space saving. This device is stabilized with a small ceramic capacitor on the output. The ultra low drop, low quiescent current and short-circuit protection make the **LD57100** suitable for low power battery-operated applications.

An enable logic control function puts the **LD57100** in shutdown mode allowing a total current consumption lower than 0.1  $\mu$ A. Thermal protection is also included.

## 6 Application information

### 6.1 $V_{BIAS}$ pin voltage requirements

The bias input is the supply of the internal driving and control circuitry. In order to assure a proper biasing of the N-channel power element, the bias pin must have a minimum voltage of 3.0 V and be 1.6 V (typically) higher than the output. If  $V_{IN}$  supply voltage meets these requirements then the bias pin can be tied to  $V_{IN}$ .

### 6.2 Output discharge function

The LD57100 integrates a MOSFET connected between  $V_{OUT}$  and GND. This transistor is activated when the EN pin goes to low logic level and has the function to quickly discharge the output capacitor when the device is disabled by the user.

### 6.3 Short-circuit and current limitation

The LD57100 is protected against short-circuit on the output. The load current is limited to the maximum value of  $I_{LIM}$  when  $V_{OUT}$  is equal to 90% of its nominal value.

### 6.4 $V_{OUT}$ setting (adjustable version)

In the LD57100 adjustable version, the desired output voltage is set according to the formula below:

$$V_{OUT} = V_{REF} \times \left(1 + \frac{R_1}{R_2}\right) \quad (1)$$

where  $R_2$  cannot be higher than 500 k $\Omega$ .

Please, refer to [Figure 5. Typical application for adjustable version](#) for  $R_1$  and  $R_2$  connections.

### 6.5 Thermal protection

Thermal protection works when the junction temperature reaches 160 °C typical. At this point, the output of the IC shuts down. As soon as the junction temperature falls below the thermal hysteresis value, the device starts working again.

In order to calculate the maximum power that the device can dissipate, keeping the junction temperature below the maximum operating value, the following formula is used:

$$P_{DMAX} = (85 - T_{AMB}) / R_{thJA} \quad (2)$$

### 6.6 Input and output capacitors

The LD57100 requires external capacitors to assure the regulator control loop stability.

Any good quality ceramic capacitor can be used, however the X5R and the X7R are suggested since they guarantee a very stable combination of capacitance and ESR all over the temperature range.

It is recommended to place the input/output capacitors as close as possible to the relative pins. The LD57100 requires a  $V_{IN}$  capacitor with a minimum value of 1  $\mu$ F and a  $V_{BIAS}$  capacitor of 100 nF minimum. These capacitors must be placed as close as possible to the input pins of the device and returned to a clean analog ground.

The control loop is designed to be stable with any good quality output ceramic capacitor (such as: X5R/X7R types) with a minimum value of 1.0  $\mu$ F and equivalent series resistance in the [3 – 300 m $\Omega$ ] range. It is important to highlight that the output capacitor must maintain its capacitance and ESR in the stable region over the full operating temperature, load and input voltage ranges, to assure stability. Therefore, capacitance and ESR variations must be taken into account in the design phase to be sure that the device works in the expected stability region.
