

## LDE SERIES – DIGITAL LOW DIFFERENTIAL PRESSURE SENSORS

The LDE differential low-pressure sensors are based on thermal flow measurement of gas through a micro-flow channel integrated within the sensor chip. The innovative LDE technology features superior sensitivity especially for ultra-low pressures. The extremely low gas flow through the sensor ensures high immunity to dust contamination, humidity and long tubing compared to other flow-based pressure sensors.

### Features

- Ultra-low-pressure ranges from 25 to 500 Pa (0.1 to 2 inH<sub>2</sub>O)
- Pressure sensor based on thermal micro-flow measurement
- High flow impedance
- very low flow-through leakage
- high immunity to dust and humidity
- no loss in sensitivity using long tubing
- Calibrated and temperature compensated
- Unique offset autozeroing feature ensuring superb long-term stability
- Offset accuracy better than 0.2% FS
- Total accuracy better than 0.5% FS typical
- On-chip temperature sensor
- Analog output and digital SPI interface
- No position sensitivity

### Certificates

- Quality Management System according to EN ISO 13485 and EN ISO 9001
- RoHS and REACH compliant

### Media compatibility

Air and other non-corrosive gases

### Applications

#### Medical

- Ventilators
- Spirometers
- CPAP
- Sleep diagnostic equipment
- Nebulizers
- Oxygen conservers/concentrators
- Insufflators/endoscopy

#### Industrial

- HVAC
- VAV
- Filter monitoring
- Burner control
- Fuel cells
- Gas leak detection
- Gas metering
- Fume hood
- Instrumentation
- Security systems

## Performance characteristics

### Temperature sensor

| Parameter                     | Min. | Typ. | Max. | Unit      |
|-------------------------------|------|------|------|-----------|
| Scale factor (digital output) |      | 95   |      | counts/°C |
| Non-linearity                 |      | ±0.5 |      | %FS       |
| Hysteresis                    |      | ±0.1 |      | %FS       |

Total accuracy <sup>(14)</sup>

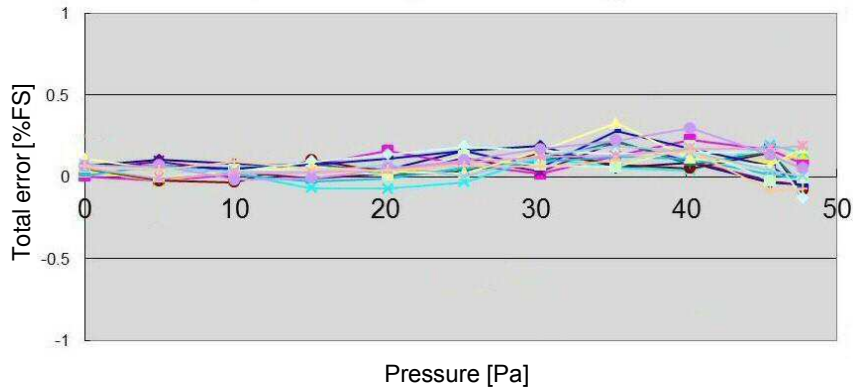

Fig. 1: Typical total accuracy plot of 16 LDE 50 Pa sensors @ 25 °C (typical total accuracy better than 0.5 %FS)

Offset long term stability

Fig. 2: Offset long term stability for LDE 250 Pa sensors after 10,000 hours @ 85°C powered, equivalent to over 43.5 years @ 25 °C (better than  $\pm 2$  mV /  $\pm 0.125$  Pa)

## SPI – Serial Peripheral Interface

**Note:** it is important to adhere to the communication protocol in order to avoid damage to the sensor.

### Introduction

The LDE serial interface is a high-speed synchronous data input and output communication port. The serial interface operates using a standard 4-wire SPI bus. The LDE device runs in SPI mode 0, which requires the clock line SCLK to idle low (CPOL = 0), and for data to be sampled on the leading clock edge (CPHA = 0). Figure 5 illustrates this mode of operation.

Care should be taken to ensure that the sensor is properly connected to the master microcontroller. Refer to the manufacturer's datasheet for more information regarding physical connections.

### Application circuit

The use of pull-up resistors is generally unnecessary for SPI as most master devices are configured for push-pull mode. If pull-up resistors are required for use with 3 V LDE devices, however, they should be greater than 50 k $\Omega$ .

There are, however, some cases where it may be helpful to use 33 $\Omega$  series resistors at both ends of the SPI lines, as shown in Figure 3.

Signal quality may be further improved by the addition of a buffer as shown in Figure 4. These cases include multiple slave devices on the same bus segment, using a master device with limited driving capability and long SPI bus lines.

If these series resistors are used, they must be physically placed as close as possible to the pins of the master and slave devices.

### Signal control

The serial interface is enabled by asserting /CS low. The serial input clock, SCLK, is gated internally to begin accepting the input data at MOSI or sending the output data on MISO. When /CS rises, the data clocked into MOSI is loaded into an internal register.

Fig. 3: Application circuit with resistors at both ends of the SPI lines

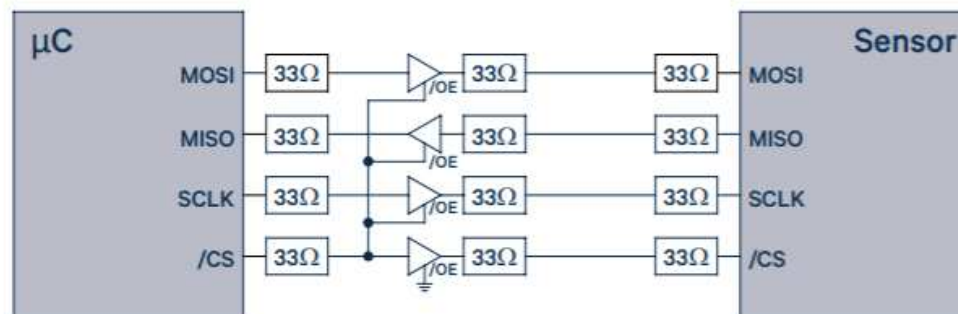

Fig. 4: Application circuit with additional buffer

**SPI – Serial Peripheral Interface (cont.)**

**Note:** it is important to adhere to the communication protocol in order to avoid damage to the sensor.

**Data read – pressure**

When powered on, the sensor begins to continuously measure pressure. To initiate data transfer from the sensor, the following three unique bytes must be written sequentially, MSB first, to the MOSI pin (see Figure 5):

| Step | Hexadecimal | Binary    | Description                       |
|------|-------------|-----------|-----------------------------------|
| 1    | 0x2D        | B00101101 | Poll current pressure measurement |
| 2    | 0x14        | B00010100 | Send result to data register      |
| 3    | 0x98        | B10011000 | Read data register                |

The entire 16 bit content of the LDE register is then read out on the MISO pin, MSB first, by applying 16 successive clock pulses to SCLK with /CS asserted low. Note that the value of the LSB is held at zero for internal signal processing purposes. This is below the noise threshold of the sensor and thus its fixed value does not affect sensor performance and accuracy.

From the digital sensor output the actual pressure value can be calculated as follows:

$$\text{Pressure [Pa]} = \frac{\text{Digital output [counts]}}{\text{Scale factor} \left[ \frac{\text{counts}}{\text{Pa}} \right]}$$

For example, for a ±250 Pa sensor (LDES250Bxxx) with a scale factor of 120 a digital output of 30 000 counts (7530'h) calculates to a positive pressure of 250 Pa. Similarly, a digital output of -30 000 counts (8AD0'h) calculates to a negative pressure of -250 Pa.

Fig. 5: SPI data transfer

### SPI – Serial Peripheral Interface (cont.)

#### Data read – temperature

The on-chip temperature sensor changes 95 counts/°C over the operating range. The temperature data format is 15-bit plus sign in two's complement format. To read temperature, use the following sequence:

| Step | Hexadecimal | Binary    | Description                          |
|------|-------------|-----------|--------------------------------------|
| 1    | 0x2A        | B00101010 | Poll current temperature measurement |
| 2    | 0x14        | B00010100 | Send result to data register         |
| 3    | 0x98        | B10011000 | Read data register                   |

From the digital sensor output, the actual temperature can be calculated as follows

$$\text{Temperature } [^{\circ}\text{C}] = \frac{\text{TS} - \text{TS}_0 \text{ [counts]}}{\text{Scalefactor}_{\text{TS}} \left[ \frac{\text{counts}}{^{\circ}\text{C}} \right]} + T_0 [^{\circ}\text{C}]$$

where

TS is the actual sensor readout;

TS<sub>0</sub> is the sensor readout at known temperature T<sub>0</sub> <sup>(15)</sup>;

Scale factor <sub>TS</sub> = 95 counts/°C

## LDE SERIES – DIGITAL LOW DIFFERENTIAL PRESSURE SENSORS

### Recommended PCB footprint for LDExxxExxx

dimensions in mm measurements without tolerance are for reference only

### Electrical connection <sup>(17)</sup>

There are three use cases that will change the manner in which the LDE series device is connected in-circuit:

Case 1: Reading of pressure measurement as a digital (SPI) signal;

Case 2: Reading of pressure measurement as an analog (voltage) signal;

Case 3: Pin-to-pin compatible drop-in replacement for LBA series devices (5 V LDE devices only).

| Pin | Function       | Case 1:<br>Digital signal<br>output | Case 2:<br>Analog signal output                       | Case 3:<br>LBA drop-in replacement (5 V<br>only)  |
