

## FEATURES

- Low Operating Voltage:  $\pm 5V$  to  $\pm 15V$
- $500\mu A$  Supply Current
- Zero Supply Current when Shut Down
- Outputs Can Be Driven  $\pm 30V$
- Thermal Limiting
- Output "Open" when Off (Three-State)
- 10mA Output Drive
- Pinout Similar to 1488

## APPLICATIONS

- RS232
- Power Supply Inverter
- Micropower Interface
- Level Translator

## DESCRIPTION

The LT<sup>®</sup>1032 is a RS232 and RS423 line driver that operates over a  $\pm 5V$  to  $\pm 15V$  range on low supply current and can be shut down to zero supply current. Outputs are fully protected from externally applied voltages of  $\pm 30V$  by both current and thermal limiting. Since the output swings to within 200mV of the positive supply and 600mV of the negative supply, power supply needs are minimized.

Also included is a strobe pin to force all outputs low independent of input or shutdown conditions. Further, slew rate can be adjusted with a resistor connected to the supply.

A major advantage of the LT1032 is the high impedance output state when off or powered down.

For applications requiring dual or triple RS232 driver/receiver devices, see the LT1180A (dual), LT1039A (triple) or the LT1130A data sheets.

 LTC and LT are registered trademarks of Linear Technology Corporation.

**ELECTRICAL CHARACTERISTICS** The ● denotes specifications which apply over the full operating temperature range, otherwise specifications are at  $T_A = 25^\circ\text{C}$ . Supply voltage =  $\pm 5\text{V}$  to  $\pm 15\text{V}$

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
Change in Slew Rate (Note 3)	$I_{\text{RESPONSE}} = 50\mu\text{A}$		50		%
	$I_{\text{RESPONSE}} = -50\mu\text{A}$		-50		%
Response Pin Leakage	$V_{\text{SUPPLY}} = \pm 6\text{V}$ , $V_{\text{ON/OFF}} \leq 0.4\text{V}$ $V_{\text{RESPONSE}} = \pm 6\text{V}$		1		$\mu\text{A}$

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

**Note 2:** 3V applied to the strobe pin will force all outputs low. Strobe pin input impedance is about 2k to ground. Leave open when not used.

**Note 3:** Response can be changed by connecting a resistor to the supply. For supplies less than  $\pm 6\text{V}$  this current is disconnected when shut down. Leave open when not used.

## TYPICAL PERFORMANCE CHARACTERISTICS

## PIN FUNCTIONS

**$V_{EE}$  (J, N & S: Pin 1):** Minus Supply. Operates  $-2V$  to  $-15V$ .

**(J & N: Pins 2, 5, 9, 12/S: Pins 2, 5, 11, 14):** Logic Input. Operates properly on TTL or CMOS levels. Output valid form  $(V^- + 2V) \leq V_{IN} \leq 15V$ . Connect to ground when not used.

**(J & N: Pins 3, 6, 8, 11/S: Pins 3, 6, 10, 13):** Output. Line drive output.

**ON/OFF (J, N & S: Pin 4):** Shuts down entire circuit. Cannot be left open. For “normally on” operation, connect to  $V^+$ .

**GND (J, N & S: Pin 7):** Ground. Ground must be more positive than  $V^-$ .

**Response Control (J & N: Pin 10/S: Pin 12):** Allows limited change of slew rate. Leave open when not used.

**Strobe (J & N: Pin 13/S: Pin 15):** Forces all outputs low. Drive with  $3V$ .

**$V_{CC}$  (J & N: Pin 14/S: Pin 15):** Positive Supply. Operates  $5V$  to  $15V$ .

## APPLICATIONS INFORMATION

### Application Hints

The LT1032 is exceptionally easy to use when compared to older drivers. Operating supply voltage can be as low as  $\pm 3V$  or as high as  $\pm 15V$ . Input levels are referred to ground.

The logic inputs are internally set at TTL levels. Outputs are valid for input voltages from 1V above  $V^-$  to 25V. Driving the logic inputs to  $V^-$  turns off the output stage. The ON/OFF control completely turns off all supply current of the LT1032. The levels required to drive the device on or off are set by internal emitter-based voltages. Since the current into the ON/OFF pin is so low, TTL or CMOS drivers have no problem controlling the device.

The strobe pin is not fully logic compatible. The impedance of the strobe pin is about  $2k\Omega$  to ground. Driving the strobe pin positive forces the output stages low—even if the device is shut off. Under worst case conditions, 3V minimum at 2mA are needed driving the strobe pin to insure strobing.

The response pin can be used to make some adjustment in slew rate. A resistor can be connected between the response pin and the power supplies to drive  $50\mu A$  to  $100\mu A$  into the pin. The response pin is a low impedance point operating at about 0.75V above ground. For supply voltage up to  $\pm 6V$ , current is turned off when the device is turned off. For higher supply voltages, a Zener should be connected in series with the resistor to limit the voltage applied to the response pin to 6V. Also, for temperatures above  $100^\circ C$ , using the response pin is not recommended. The leakage current into the response pin at high temperatures is excessive.

Outputs are well protected against shorts or externally applied voltage. Tested limits are  $\pm 30V$ , but the device can withstand external voltages up to breakdown of the transistors (typically about 50V). The LT1032 is usually immune to ESD up to 2500V on the outputs with no damage.
