

### FEATURES

- ESD Protection over  $\pm 10\text{kV}$   
( $\pm 15\text{kV}$  IEC-1000-4-2 for LT1133A, LT1137A and LT1141A)
- Uses Small Capacitors:  $0.1\mu\text{F}$ ,  $0.2\mu\text{F}$
- $1\mu\text{A}$  Supply Current in SHUTDOWN
- 120kbaud Operation for  $R_L = 3\text{k}$ ,  $C_L = 2500\text{pF}$
- 250kbaud Operation for  $R_L = 3\text{k}$ ,  $C_L = 1000\text{pF}$
- CMOS Comparable Low Power
- Easy PC Layout: Flowthrough Architecture
- Rugged Bipolar Design: Absolutely No Latchup
- Outputs Assume a High Impedance State When Off or Powered Down
- Improved Protection: RS232 I/O Lines Can Be Forced to  $\pm 30\text{V}$  Without Damage
- Output Overvoltage Does Not Force Current Back into Supplies
- Available in SO and SSOP Packages

### DESCRIPTION

The LT<sup>®</sup>1130A/LT1140A series of RS232 drivers/receivers features special bipolar construction techniques which protect the drivers and receivers beyond the fault conditions stipulated for RS232. Driver outputs and receiver inputs can be shorted to  $\pm 30\text{V}$  without damaging the device or the power supply generator. In addition, the RS232 I/O pins are resilient to multiple  $\pm 10\text{kV}$  ESD strikes. An advanced driver output stage operates up to 250kbaud while driving heavy capacitive loads. Supply current is typically 12mA, competitive with CMOS devices.

Several members of the series include flexible operating mode controls. The DRIVER DISABLE pin disables the drivers and the charge pump, the ON/OFF pin shuts down all circuitry. While shut down, the drivers and receivers assume high impedance output states.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.

### TYPICAL APPLICATION

Basic Operation

Output Waveforms

- LT1130A 5-Driver/5-Receiver RS232 Transceiver
- LT1131A 5-Driver/4-Receiver RS232 Transceiver w/Shutdown
- LT1132A 5-Driver/3-Receiver RS232 Transceiver
- LT1133A 3-Driver/5-Receiver RS232 Transceiver
- LT1134A 4-Driver/4-Receiver RS232 Transceiver
- LT1135A 5-Driver/3-Receiver RS232 Transceiver w/o Charge Pump

- LT1136A 4-Driver/5-Receiver RS232 Transceiver w/Shutdown
- LT1137A 3-Driver/5-Receiver RS232 Transceiver w/Shutdown
- LT1138A 5-Driver/3-Receiver RS232 Transceiver w/Shutdown
- LT1139A 4-Driver/4-Receiver RS232 Transceiver w/Shutdown
- LT1140A 5-Driver/3-Receiver RS232 Transceiver w/o Charge Pump
- LT1141A 3-Driver/5-Receiver RS232 Transceiver w/o Charge Pump

# LT1130A/LT1140A Series

## ABSOLUTE MAXIMUM RATINGS (Note 1)

Supply Voltage ( $V_{CC}$ ) .....	6V	Short-Circuit Duration	
$V^+$ .....	13.2V	$V^+$ .....	30 sec
$V^-$ (Note 7) .....	-13.2V	$V^-$ .....	30 sec
Input Voltage		Driver Output .....	Indefinite
Driver .....	$V^-$ to $V^+$	Receiver Output .....	Indefinite
Receiver .....	-30V to 30V	Operating Temperature Range	
On/Off Pin .....	-0.3V to 12V	LT113XAC/LT114XAC .....	0°C to 70°C
Driver Disable Pin .....	-0.3V to ( $V_{CC} + 0.3V$ )	LT113XAI/LT114XAI .....	-40° to 85°C

Input Resistance	$-10\text{V} < V_{\text{IN}} < 10\text{V}$		3	5	7	$\text{k}\Omega$
Output Voltage	Output Low, $I_{\text{OUT}} = -1.6\text{mA}$ Output High, $I_{\text{OUT}} = 160\mu\text{A}$ ( $V_{\text{CC}} = 5\text{V}$ )	● ●	3.5	0.2 4.2	0.4	V V
Output Leakage Current	Shutdown (Note 4) $0 \leq V_{\text{OUT}} \leq V_{\text{CC}}$	●		1	10	$\mu\text{A}$
Output Short-Circuit Current	Sinking Current, $V_{\text{OUT}} = V_{\text{CC}}$ Sourcing Current, $V_{\text{OUT}} = 0\text{V}$		10	-20 20	-10	mA mA
Propagation Delay	Output Transition $t_{\text{HL}}$ High to Low (Note 6) Output Transition $t_{\text{LH}}$ Low to High			250 350	600 600	ns ns

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of the device may be impaired.

**Note 2:** Testing done at  $V_{\text{CC}} = 5\text{V}$  and  $V_{\text{ON/OFF}} = 3\text{V}$ .

**Note 3:** Supply current is measured with driver and receiver outputs unloaded and the driver inputs tied high.

**Note 4:** Supply current and driver leakage current measurements in shutdown are performed with  $V_{\text{ON/OFF}} = 0.1\text{V}$ . Supply current measurements using DRIVER DISABLE are performed with  $V_{\text{DRIVER DISABLE}} = 3\text{V}$ . For LT1135, LT1139, LT1140 and LT1141 with 12V supplies,  $V_{\text{OUT}}$  leakage is  $200\mu\text{A}$  for  $V_{\text{OUT}}$  forced to  $\pm 25\text{V}$ .

**Note 5:** For driver delay measurements,  $R_L = 3\text{k}$  and  $C_L = 51\text{pF}$ . Trigger points are set between the driver's input logic threshold and the output transition to the zero crossing ( $t_{\text{HL}} = 1.4\text{V}$  to  $0\text{V}$  and  $t_{\text{LH}} = 1.4\text{V}$  to  $0\text{V}$ ).

**Note 6:** For receiver delay measurements,  $C_L = 51\text{pF}$ . Trigger points are set between the receiver's input logic threshold and the output transition to standard TTL/CMOS logic threshold ( $t_{\text{HL}} = 1.3\text{V}$  to  $2.4\text{V}$  and  $t_{\text{LH}} = 1.7\text{V}$  to  $0.8\text{V}$ ).

**Note 7:** For LT1133A/LT1137A, absolute maximum externally applied  $V^- = -6.5\text{V}$ . Internal charge pump will drive this pin to a higher negative voltage.

**Note 8:** For LT1137A,  $4\text{V}/\mu\text{s}$  minimum.

## TYPICAL PERFORMANCE CHARACTERISTICS

## PIN FUNCTIONS

**V<sub>CC</sub>**: 5V Input Supply Pin. Supply current drops to zero in the shutdown mode. This pin should be decoupled with a 0.1µF ceramic capacitor close to the package pin. Insufficient supply bypassing can result in low output drive levels and erratic charge pump operation.

**GND**: Ground Pin.

**ON/OFF**: Control the operation mode of the device and is TTL/CMOS compatible. A logic low puts the device in the shutdown mode which reduces input supply current to zero and places all of the drivers and receivers in high impedance state. A logic high fully enables the transceiver.

**DRIVER DISABLE**: This pin provides an alternate control for the charge pump and RS232 drivers. A logic high on this pin shuts down the charge pump and places all drivers

in a high impedance state. Receivers remain active under these conditions. Floating the DRIVER DISABLE pin or driving it to a logic low level fully enables the transceiver. A logic low on the ON/OFF pin supersedes the state of the DRIVER DISABLE pin. Supply current drops to 4mA when in driver disable mode.

**V<sup>+</sup>**: Positive Supply Output (RS232 Drivers).  $V^+ \approx 2V_{CC} - 1.5V$ . This pin requires an external charge storage capacitor  $C \geq 1.0\mu F$ , tied to ground or  $V_{CC}$ . Larger value capacitors may be used to reduce supply ripple. With multiple transceivers, the  $V^+$  and  $V^-$  pins may be paralleled into common capacitors. For large numbers of transceivers, increasing the size of the shared common storage capacitors is recommended to reduce ripple.
