

FEATURES

- Low Cost
- Current Feedback Amplifiers
- Differential Gain: 0.03%, $R_L = 150\Omega$, $V_S = \pm 5V$
- Differential Phase: 0.28° , $R_L = 150\Omega$, $V_S = \pm 5V$
- Flat to 30MHz, 0.1dB
- 90MHz Bandwidth on $\pm 5V$
- Wide Supply Range: $\pm 2V(4V)$ to $\pm 14V(28V)$
- Low Power: 60mW per Amplifier at $\pm 5V$

APPLICATIONS

- RGB Cable Drivers
- Composite Video Cable Drivers
- Gain Blocks in IF Stages

DESCRIPTION

The LT1253 is a low cost dual current feedback amplifier for video applications. The LT1254 is a quad version of the LT1253. The amplifiers are completely isolated except for the power supply pins and therefore have excellent isolation, over 94dB at 5MHz. Dual and quad amplifiers significantly reduce costs compared with singles; the number of insertions is reduced and fewer supply bypass capacitors are required. In addition, these duals and quads cost less per amplifier than single video amplifiers.

The LT1253/LT1254 amplifiers are ideal for driving low impedance loads such as cables and filters. The wide bandwidth and high slew rate of these amplifiers make driving RGB signals between PCs and workstations easy. The excellent linearity of these amplifiers makes them ideal for composite video.

The LT1253 is available in 8-pin DIPs and the S8 surface mount package. The LT1254 is available in 14-pin DIPs and the S14 surface mount package. Both parts have the industry standard dual and quad op amp pin out. For higher performance, see the LT1229/LT1230.

TYPICAL APPLICATION

$$A_V = 1 + \frac{R_F}{R_G} \quad BW = 90\text{MHz}$$

AT AMPLIFIER OUTPUT.
6dB LESS AT V_{OUT} .

APPLICATIONS INFORMATION

Power Dissipation

The LT1253/LT1254 amplifiers combine high speed and large output current drive into very small packages. Because these amplifiers work over a very wide supply range, it is possible to exceed the maximum junction temperature under certain conditions. To insure that the LT1253/LT1254 are used properly, we must calculate the worst case power dissipation, define the maximum ambient temperature, select the appropriate package and then calculate the maximum junction temperature.

The worst case amplifier power dissipation is the total of the quiescent current times the total power supply voltage plus the power in the IC due to the load. The quiescent supply current of the LT1253/LT1254 has a strong negative temperature coefficient. The supply current of each amplifier at 150°C is less than 7mA and typically is only 4.5mA. The power in the IC due to the load is a function of the output voltage, the supply voltage and load resistance. The worst case occurs when the output voltage is at half supply, if it can go that far, or its maximum value if it cannot reach half supply.

For example, let's calculate the worst case power dissipation in a video cable driver operating on a $\pm 12V$ supply that delivers a maximum of 2V into 150 Ω .

$$P_{D\text{MAX}} = 2 \times V_S \times I_{S\text{MAX}} + (V_S - V_{O\text{MAX}}) \times V_{O\text{MAX}}/R_L$$

$$P_{D\text{MAX}} = 2 \times 12V \times 7\text{mA} + (12V - 2V) \times 2V/150 \\ = 0.168 + 0.133 = 0.301 \text{ Watt per Amp}$$

Now if that is the dual LT1253, the total power in the package is twice that, or 0.602W. We now must calculate how much the die temperature will rise above the ambient. The total power dissipation times the thermal resistance of the package gives the amount of temperature rise. For the above example, if we use the S8 surface mount package, the thermal resistance is 150°C/W junction to ambient in still air.

$$\text{Temperature Rise} = P_{D\text{MAX}} \times R_{\theta\text{JA}} = 0.602W \\ \times 150^\circ\text{C/W} = 90.3^\circ\text{C}$$

The maximum junction temperature allowed in the plastic package is 150°C. Therefore the maximum ambient allowed is the maximum junction temperature less the temperature rise.

$$\text{Maximum Ambient} = 150^\circ\text{C} - 90.3^\circ\text{C} = 59.7^\circ\text{C}$$

Note that this is less than the maximum of 70°C that is specified in the absolute maximum data listing. In order to use this package at the maximum ambient we must lower the supply voltage or reduce the output swing.

APPLICATIONS INFORMATION

As a guideline to help in the selection of the LT1253/LT1254, the following table describes the maximum supply voltage that can be used with each part based on the following assumptions:

1. The maximum ambient is 70°C.
2. The load is a double-terminated video cable, 150Ω.
3. The maximum output voltage is 2V (peak or DC).

		MAX POWER at MAX T _A
LT1253CN8	V _S < ±14 (Abs Max)	0.800W
LT1253CS8	V _S < ±10.6	0.533W
LT1254CN	V _S < ±11.4	1.143W
LT1254CS	V _S < ±7.6	0.727W
