

Over-The-Top Micropower, Rail-To-Rail Input and Output Op Amp

FEATURES

- Operates with Inputs Above V^+
- Rail-to-Rail Input and Output
- Micropower: 250μA Supply Current Max
- Operating Temperature Range: -55°C to 125°C
- Gain-Bandwidth Product: 1.1MHz
- Slew Rate: 0.4V/μs
- Low Input Offset Voltage: 350μV Max
- Single Supply Input Range: -0.4V to 44V
- High Output Current: 25mA Min
- Specified on 3V, 5V and $\pm 15\text{V}$ Supplies
- Output Shutdown
- Output Drives 4700pF with Output Compensation
- Reverse Battery Protection to 25V
- High Voltage Gain: 800V/mV
- High CMRR: 110dB
- Available in 8-Lead MSOP, PDIP and SO Packages; and a Tiny ($3\text{mm} \times 3\text{mm} \times 0.8\text{mm}$) DFN Package

APPLICATIONS

- Battery or Solar Powered Systems:
 - Portable Instrumentation
 - Sensor Conditioning
- Supply Current Sensing
- Battery Monitoring
- MUX Amplifiers
- 4mA to 25mA Transmitters

DESCRIPTION

The LT[®]1637 is a rugged op amp that operates on all single and split supplies with a total voltage of 2.7V to 44V. The LT1637 has a gain-bandwidth product of 1.1MHz while drawing less than 250μA of quiescent current. The LT1637 can be shut down, making the output high impedance and reducing the quiescent current to only 3μA. The LT1637 is reverse supply protected: it draws virtually no current for reverse supply up to 25V. The input range of the LT1637 includes both supplies and the output swings to both supplies. Unlike most micropower op amps, the LT1637 can drive heavy loads; its rail-to-rail output drives 25mA. The LT1637 is unity-gain stable into all capacitive loads up to 4700pF when optional 0.22μF and 150Ω compensation is used.

The LT1637 has a unique input stage that operates and remains high impedance when above the positive supply. The inputs take 44V both differential and common mode, even when operating on a 3V supply. Built-in resistors protect the inputs for faults below the negative supply up to 22V. There is no phase reversal of the output for inputs 5V below V_{EE} or 44V above V_{EE} , independent of V_{CC} .

The LT1637 op amp is available in the 8-pin MSOP, PDIP and SO packages. For space limited applications, the LT1637 is available in a $3\text{mm} \times 3\text{mm} \times 0.8\text{mm}$ dual fine pitch leadless package (DFN).

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: A heat sink may be required to keep the junction temperature below absolute maximum. The θ_{JA} specified for the DD package is with minimal PCB heat spreading metal. Using expanded metal area on all layers of a board reduces this value.

Note 3: The LT1637C and LT1637I are guaranteed functional over the operating temperature range of -40°C to 85°C . The LT1637H is guaranteed functional over the operating temperature range of -40°C to 125°C . The LT1637MP is guaranteed functional over the operating temperature range -55°C to 125°C .

Note 4: The LT1637C is guaranteed to meet specified performance from 0°C to 70°C . The LT1637C is designed, characterized and expected to meet

specified performance from -40°C to 85°C but is not tested or QA sampled at these temperatures. The LT1637I is guaranteed to meet specified performance from -40°C to 85°C . The LT1637H is guaranteed to meet specified performance from -40°C to 125°C and the LT1637MP is guaranteed to meet specified performance from -55°C to 125°C .

Note 5: $V_S = 5\text{V}$ limits are guaranteed by correlation to $V_S = 3\text{V}$ and $V_S = \pm 15\text{V}$ or $V_S = \pm 22\text{V}$ tests.

Note 6: $V_S = 3\text{V}$ limits are guaranteed by correlation to $V_S = 5\text{V}$ and $V_S = \pm 15\text{V}$ or $V_S = \pm 22\text{V}$ tests.

Note 7: Guaranteed by correlation to slew rate at $V_S = \pm 15\text{V}$ and GBW at $V_S = 3\text{V}$ and $V_S = \pm 15\text{V}$ tests.

Note 8: This specification implies a typical input offset voltage of $650\mu\text{V}$ at $V_{CM} = 44\text{V}$ and a maximum input offset voltage of 5.4mV at $V_{CM} = 44\text{V}$.

Note 9: This parameter is not 100% tested.

APPLICATIONS INFORMATION

Supply Voltage

The positive supply pin of the LT1637 should be bypassed with a small capacitor (about $0.01\mu\text{F}$) within an inch of the pin. When driving heavy loads an additional $4.7\mu\text{F}$ electrolytic capacitor should be used. When using split supplies, the same is true for the negative supply pin.

The LT1637 is protected against reverse battery voltages up to 25V. In the event a reverse battery condition occurs, the supply current is typically less than 1nA.

When operating the LT1637 on total supplies of 30V or more, the supply must not be brought up faster than $1\mu\text{s}$. This is especially true if low ESR bypass capacitors are used. A series RLC circuit is formed from the supply lead inductance and the bypass capacitor. 5Ω of resistance in the supply or the bypass capacitor will dampen the tuned circuit enough to limit the rise time.

Inputs

The LT1637 has two input stages, NPN and PNP (see the Simplified Schematic), resulting in three distinct operating regions as shown in the Input Bias Current vs Common Mode typical performance curve.

For input voltages about 0.9V or more below V^+ , the PNP input stage is active and the input bias current is typically -20nA . When the input voltage is about 0.5V or less from V^+ , the NPN input stage is operating and the input bias current is typically 80nA . Increases in temperature will cause the voltage at which operation switches from the PNP stage to the NPN stage to move towards V^+ . The input offset voltage of the NPN stage is untrimmed and is typically $600\mu\text{V}$.

A Schottky diode in the collector of each NPN transistor of the NPN input stage allows the LT1637 to operate with either or both of its inputs above V^+ . At about 0.3V above V^+ the NPN input transistor is fully saturated and the input bias current is typically $23\mu\text{A}$ at room temperature. The input offset voltage is typically $600\mu\text{V}$ when operating above V^+ . The LT1637 will operate with its input 44V above V^- regardless of V^+ .

The inputs are protected against excursions as much as 22V below V^- by an internal 1.3k resistor in series with each input and a diode from the input to the negative supply. There is no output phase reversal for inputs up to 5V below V^- . There are no clamping diodes between the inputs and the maximum differential input voltage is 44V.

Output

The output voltage swing of the LT1637 is affected by input overdrive as shown in the typical performance curves. When monitoring input voltages within 100mV of V^+ , gain should be taken to keep the output from clipping.

The output of the LT1637 can be pulled up to 25V beyond V^+ with less than 1nA of leakage current, provided that V^+ is less than 0.5V.

The normally reverse biased substrate diode from the output to V^- will cause unlimited currents to flow when the output is forced below V^- . If the current is transient and limited to 100mA, no damage will occur.

The LT1637 is internally compensated to drive at least 200pF of capacitance under any output loading conditions. A $0.22\mu\text{F}$ capacitor in series with a 150Ω resistor between the output and ground will compensate these amplifiers for larger capacitive loads, up to 4700pF, at all output currents.

Distortion

There are two main contributors of distortion in op amps: output crossover distortion as the output transitions from sourcing to sinking current and distortion caused by nonlinear common mode rejection. Of course, if the op amp is operating inverting there is no common mode induced distortion. When the LT1637 switches between input stages there is significant nonlinearity in the CMRR. Lower load resistance increases the output crossover distortion, but has no effect on the input stage transition distortion. For lowest distortion the LT1637 should be operated single supply, with the output always sourcing current and with the input voltage swing between ground and $(V^+ - 0.9\text{V})$. See the Typical Performance Characteristics curves.

APPLICATIONS INFORMATION

Gain

The open-loop gain is less sensitive to load resistance when the output is sourcing current. This optimizes performance in single supply applications where the load is returned to ground. The typical performance photo of Open-Loop Gain for various loads shows the details.

Shutdown

The LT1637 can be shut down two ways: using the shutdown pin or bringing V^+ to within 0.5V of V^- . When V^+ is brought to within 0.5V of V^- both the supply current and output leakage current drop to less than 10nA. When the shutdown pin is brought 1.2V above V^- , the supply current drops to about 3 μ A and the output leakage current is less than 1 μ A, independent of V^+ . In either case the input bias current is less than 0.1nA (even if the inputs are 44V above the negative supply).

The shutdown pin can be taken up to 32V above V^- . The shutdown pin can be driven below V^- , however the pin current through the substrate diode should be limited with an external resistor to less than 10mA.

Input Offset Nulling

The input offset voltage can be nulled by placing a 10k potentiometer between Pins 1 and 8 with its wiper to V^- (see Figure 1). The null range will be at least ± 3 mV.
