

1.5GHz to 2.5GHz High Linearity Direct Quadrature Modulator

FEATURES

- Direct Conversion from Baseband to RF
- High Output: -2.5dB Conversion Gain
- High OIP3: $+21.6\text{dBm}$ at 2GHz
- Low Output Noise Floor at 20MHz Offset:
 No RF: -158.6dBm/Hz
 $P_{\text{OUT}} = 4\text{dBm}$: -152.5dBm/Hz
- Low Carrier Leakage: -39.4dBm at 2GHz
- High Image Rejection: -41.2dBc at 2GHz
- 4-Channel W-CDMA ACPR: -67.7dBc at 2.14GHz
- Integrated LO Buffer and LO Quadrature Phase Generator
- 50Ω AC-Coupled Single-Ended LO and RF Ports
- High Impedance DC Interface to Baseband Inputs with 0.5V Common Mode Voltage
- 16-Lead QFN $4\text{mm} \times 4\text{mm}$ Package

APPLICATIONS

- Infrastructure Tx for DCS, PCS and UMTS Bands
- Image Reject Up-Converters for DCS, PCS and UMTS Bands
- Low Noise Variable Phase Shifter for 1.5GHz to 2.5GHz Local Oscillator Signals

DESCRIPTION

The LT5572 is a direct I/Q modulator designed for high performance wireless applications, including wireless infrastructure. It allows direct modulation of an RF signal using differential baseband I and Q signals. It supports PHS, GSM, EDGE, TD-SCDMA, CDMA, CDMA2000, W-CDMA and other systems. It may also be configured as an image reject up-converting mixer by applying 90° phase-shifted signals to the I and Q inputs. The high impedance I/Q baseband inputs consist of voltage-to-current converters that in turn drive double-balanced mixers. The outputs of these mixers are summed and applied to an on-chip RF transformer which converts the differential mixer signals to a 50Ω single-ended output. The four balanced I and Q baseband input ports are intended for DC coupling from a source with a common mode voltage level of about 0.5V . The LO path consists of an LO buffer with single-ended input and precision quadrature generators that produce the LO drive for the mixers. The supply voltage range is 4.5V to 5.25V .

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: Specifications over the $-40^{\circ}C$ to $85^{\circ}C$ temperature range are assured by design, characterization and correlation with statistical process controls.

Note 3: Tests are performed as shown in the configuration of Figure 7.

Note 4: At each of the four baseband inputs BBPI, BBMI, BBPQ and BBMQ.

Note 5: $V_{BBPI} - V_{BBMI} = 1V_{DC}$, $V_{BBPQ} - V_{BBMQ} = 1V_{DC}$.

Note 6: Maximum value within -1dB bandwidth.

Note 7: An external coupling capacitor is used in the RF output line.

Note 8: At 20MHz offset from the LO signal frequency.

Note 9: At 20MHz offset from the CW signal frequency.

Note 10: At 5MHz offset from the CW signal frequency.

Note 11: RF power is within 10% of final value.

Note 12: RF power is at least 30dB lower than in the ON state.

Note 13: Baseband is driven by 2MHz and 2.1MHz tones. Drive level is set in such a way that the two resulting RF tones are -10dBm each.

Note 14: IM2 measured at LO frequency + 4.1MHz

Note 15: IM3 measured at LO frequency + 1.9MHz and LO frequency + 2.2MHz.

Note 16: Amplitude average of the characterization data set without image or LO feedthrough nulling (unadjusted).

Note 17: The difference in conversion gain between the spurious signal at $f = 3 \cdot LO - BB$ versus the conversion gain of the desired signal at $f = LO + BB$ for $BB = 2MHz$ and $LO = 2GHz$.

Note 18: The input voltage corresponding to the output P1dB.

TYPICAL PERFORMANCE CHARACTERISTICS $V_{CC} = 5V$, $EN = High$, $T_A = 25^\circ C$, $f_{LO} = 2.14GHz$, $P_{LO} = 0dBm$. BBPI, BBMI, BBPQ, BBMQ inputs $0.5V_{DC}$, baseband input frequency $f_{BB} = 2MHz$, I and Q 90° shifted, without image or LO feedthrough nulling. $f_{RF} = f_{BB} + f_{LO}$ (upper sideband selection). $P_{RF(OUT)} = -10dBm$ ($-10dBm/tone$ for 2-tone measurements), unless otherwise noted. PIN FUNCTIONS

EN (Pin 1): Enable Input. When the EN pin voltage is higher than 1V, the IC is turned on. When the input voltage is less than 0.5V, the IC is turned off.

GND (Pins 2, 4, 6, 9, 10, 12, 15, 17): Ground. Pins 6, 9, 15 and the Exposed Pad, Pin 17, are connected to each other internally. Pins 2 and 4 are connected to each other internally and function as the ground return for the LO signal. Pins 10 and 12 are connected to each other internally and function as the ground return for the on-chip RF balun. For best RF performance, Pins 2, 4, 6, 9, 10, 12, 15 and the Exposed Pad, Pin 17, should be connected to the printed circuit board ground plane.

LO (Pin 3): LO Input. The LO input is an AC-coupled single-ended input with approximately 50Ω input impedance at RF frequencies. Externally applied DC voltage should be within the range $-0.5V$ to $(V_{CC} + 0.5V)$ in order to avoid turning on ESD protection diodes.

BBPQ, BBMQ (Pins 7, 5): Baseband Inputs for the Q channel with about 90kΩ differential input impedance. These pins should be externally biased at about 0.5V. Applied common mode voltage must stay below 0.6V.

V_{CC} (Pins 8, 13): Power Supply. Pins 8 and 13 are connected to each other internally. It is recommended to use 0.1μF capacitors for decoupling to ground on each of these pins.

RF (Pin 11): RF Output. The RF output is an AC-coupled single-ended output with approximately 50Ω output impedance at RF frequencies. Externally applied DC voltage should be within the range $-0.5V$ to $(V_{CC} + 0.5V)$ in order to avoid turning on ESD protection diodes.

BBPI, BBMI (Pins 14, 16): Baseband Inputs for the I channel with about 90kΩ differential input impedance. These pins should be externally biased at about 0.5V. Applied common mode voltage must stay below 0.6V.

BLOCK DIAGRAM

APPLICATIONS INFORMATION

The LT5572 consists of I and Q input differential voltage-to-current converters, I and Q up-conversion mixers, an RF output balun, an LO quadrature phase generator and LO buffers.

External I and Q baseband signals are applied to the differential baseband input pins, BBPI, BBMI, and BBPQ, BBMQ. These voltage signals are converted to currents and translated to RF frequency by means of double-balanced up-converting mixers. The mixer outputs are combined in an RF output balun, which also transforms the output impedance to 50Ω. The center frequency of the resulting RF signal is equal to the LO signal frequency. The LO input drives a phase shifter which splits the LO signal into in-phase and quadrature LO signals. These LO signals are then applied to on-chip buffers which drive the up-conversion mixers. Both the LO input and RF output are single-ended, 50Ω matched and AC coupled.

Baseband Interface

The baseband inputs (BBPI, BBMI) and (BBPQ, BBMQ) present a differential input impedance of about 90kΩ. At each of the four baseband inputs, a capacitor of 1.8pF to ground and a PNP emitter follower is incorporated (see Figure 1), which limits the baseband -1dB bandwidth to approximately 250MHz. The circuit is optimized for an externally applied common mode voltage of 0.5V. The baseband input pins should not be left floating because

the internal PNP's base current will pull the common mode voltage higher than the 0.6V limit. This may damage the part if continued indefinitely. The PNP's base current is about 20μA in normal operation. On the LT5572 demo board, external 50Ω resistors to ground are included at each baseband input to prevent this condition and to serve as a termination resistance for the baseband connections.

The I/Q input signals to the LT5572 should be DC coupled with an applied common mode voltage level of about 0.5V in order to bias the LT5572 at its optimum operating point. Some I/Q test generators allow setting the common mode voltage independently. In this case, the common mode voltage of those generators must be set to 0.5V (See Figure 2).

The baseband inputs should be driven differentially; otherwise, the even-order distortion products will degrade the overall linearity severely. Typically, a DAC will be the signal source for the LT5572. Reconstruction filters should be placed between the DAC outputs and the LT5572's baseband inputs.

In Figure 3, a typical baseband interface is shown including a 5th-order lowpass ladder filter for reconstruction. For each baseband pin, a 0V to 1V swing is developed corresponding to a DAC output current of 0mA to 20mA. The maximum sinusoidal single sideband RF output power at 2.14GHz is about +6.2dBm for full 0V to 1V swing on each baseband

APPLICATIONS INFORMATION

0.4	113	-2.0	8.6	51	18.2	-160.2	-42.4	-39.3
0.5	126	-1.9	9.3	52	21.2	-159.2	-42.4	-41.5
0.6	138	-1.9	9.1	52	21.1	-158.6	-42.1	-44.4

input ($2V_{P-P,DIFF}$). This maximum RF output level is limited by the $0.5V_{PEAK}$ maximum baseband swing possible for a $0.5V_{DC}$ common mode voltage level (assuming no extra negative supply voltage available).

It is possible to bias the LT5572 to a common mode baseband voltage level other than 0.5V. Table 1 shows the typical performance for different common mode voltages.

LO section

The internal LO input amplifier performs single-ended to differential conversion of the LO input signal. Figure 4 shows the equivalent circuit schematic of the LO input.

The internal, differential LO signal is split into in-phase and quadrature (90° phase shifted) signals that drive LO buffer sections. These buffers drive the double balanced I and Q mixers. The phase relationship between the LO input and the internal in-phase LO and quadrature LO signals is fixed, and is independent of start-up conditions. The phase shifters are designed to deliver accurate quadrature signals for an LO frequency near 2GHz. For frequencies significantly below 1.8GHz or above 2.4GHz, the quadrature accuracy will diminish, causing the image rejection

to degrade. The LO pin input impedance is about 50Ω and the recommended LO input power is 0dBm. For lower LO input power, the gain, OIP2, OIP3 and dynamic range will degrade, especially below -5dBm and at $T_A = 85^\circ\text{C}$. For high LO input power (e.g., 5dBm), the LO feedthrough will increase, without improvement in linearity or gain. Harmonics present on the LO signal can degrade the image rejection, because they introduce a small excess phase shift in the internal phase splitter. For the second (at 4GHz) and third harmonics (at 6GHz) at -20dBc level, the introduced signal at the image frequency is about -57dBc or lower, corresponding to an excess phase shift much less than 1 degree. For the second and third harmonics at -10dBc , still the introduced signal at the image frequency is about -47dBc . Higher harmonics than the third will have less impact. The LO return loss typically will be better than 14dB over the 1.7GHz to 2.4GHz range. Table 2 shows the LO port input impedance vs frequency.

Table 2. LO Port Input Impedance vs Frequency for EN = High and $P_{LO} = 0\text{dBm}$

FREQUENCY (MHz)	INPUT IMPEDANCE (Ω)	S_{11}

1600	41.8+j23.6	0.264	95
1800	55.6+j18.5	0.181	63
2000	58.3+j49.1	0.089	28
2200	48.8-j0.1	0.012	-172
2400	40.4+j3.1	0.112	160
2600	34.7+j8.3	0.205	146

To improve S_{22} for lower frequencies, a shunt capacitor can be added to the RF output. At higher frequencies, a shunt inductor can improve the S_{22} . Figure 5 shows the equivalent circuit schematic of the RF output.

Note that an ESD diode is connected internally from the RF output to ground. For strong output RF signal levels (higher than 3dBm) this ESD diode can degrade the linearity performance if the 50Ω termination impedance is connected directly to ground. To prevent this, a coupling capacitor can be inserted in the RF output line. This is strongly recommended for 1dB compression measurements.

Figure 5. Equivalent Circuit Schematic of the RF Output

Enable Interface

Figure 6 shows a simplified schematic of the EN pin interface. The voltage necessary to turn on the LT5572 is 1V . To disable (shut down) the chip, the enable voltage must be below 0.5V . If the EN pin is not connected, the chip is disabled. This EN = Low condition is guaranteed by the 75k on-chip pull-down resistor. It is important that the voltage at the EN pin does not exceed V_{CC} by more than 0.5V . If this should occur, the full-chip supply

APPLICATIONS INFORMATION

Figure 6. EN Pin Interface

current could be sourced through the EN pin ESD protection diodes, which are not designed for this purpose. Damage to the chip may result.

Evaluation Board

Figure 7 shows the evaluation board schematic. A good ground connection is required for the Exposed Pad. If this is not done properly, the RF performance will degrade. Additionally, the Exposed Pad provides heat sinking for the part and minimizes the possibility of the chip overheating. R1 (optional) limits the EN pin current in the

Figure 7. Evaluation Circuit Schematic

event that the EN pin is pulled high while the V_{CC} inputs are low. The application board PCB layouts are shown in Figures 8 and 9.

APPLICATIONS INFORMATION

Application Measurements

The LT5572 is recommended for basestation applications using various modulation formats. Figure 10 shows a typical application. Figure 11 shows the ACPR performance for W-CDMA using 1-, 2- or 4-channel modulation. Figures 12, 13 and 14 illustrate the 1-, 2- and 4-channel W-CDMA

measurement. To calculate ACPR, a correction is made for the spectrum analyzer noise floor (Application Note 99).

If the output power is high, the ACPR will be limited by the linearity performance of the part. If the output power is low, the ACPR will be limited by the noise performance of the part. In the middle, an optimum ACPR is obtained.

APPLICATIONS INFORMATION

Because of the LT5572's very high dynamic range, the test equipment can limit the accuracy of the ACPR measurement. Consult the factory for advice on the ACPR measurement if needed.

The ACPR performance is sensitive to the amplitude match of the BBIP and BBIM (or BBQP and BBQM) input voltage. This is because a difference in AC voltage amplitude will give rise to a difference in amplitude between the even-order harmonic products generated in the internal V-I converter.

As a result, they will not cancel out entirely. Therefore, it is important to keep the amplitudes at the BBIP and BBIM (or BBQP and BBQM) inputs as equal as possible.

When the temperature is changed after calibration, the LO feedthrough and the image rejection performance will change. This is illustrated in Figure 15. The LO feedthrough and image rejection can also change as a function of the baseband drive level as depicted in Figure 16.

PACKAGE DESCRIPTION

UF Package
16-Lead Plastic QFN (4mm × 4mm)
 (Reference LTC DWG # 05-08-1692)

- NOTE:
1. DRAWING CONFORMS TO JEDEC PACKAGE OUTLINE MO-220 VARIATION (WGGC)
 2. DRAWING NOT TO SCALE
 3. ALL DIMENSIONS ARE IN MILLIMETERS
 4. DIMENSIONS OF EXPOSED PAD ON BOTTOM OF PACKAGE DO NOT INCLUDE MOLD FLASH. MOLD FLASH, IF PRESENT, SHALL NOT EXCEED 0.15mm ON ANY SIDE
 5. EXPOSED PAD SHALL BE SOLDER PLATED
 6. SHADED AREA IS ONLY A REFERENCE FOR PIN 1 LOCATION ON THE TOP AND BOTTOM OF PACKAGE
