

# f 3.3V/5V Low Power RS232 3-Driver/5-Receiver Transceiver

### **FEATURES**

- Low Supply Current: 600µA at 3.3V
- Supply Current in Shutdown: 0.2µA
- Supply Current in Receiver Alive Mode: 15µA
- ESD Protection over ±10kV
- Operates from a Single 3V to 5.5V Supply
- Operates to 120kBaud with 0.1µF Flying Capacitors
- Three-State Outputs Are High Impedance When Off
- Output Overvoltage Does Not Force Current Back into Supplies
- RS232 I/O Lines Can Be Forced to ±25V Without Damage
- Flowthrough Architecture

### **APPLICATIONS**

- Notebook Computers
- Palmtop Computers
- Printers
- Portable Instruments

### DESCRIPTION

The LTC®1348 is a 3-driver/5-receiver RS232 transceiver with very low supply current. The charge pump only requires five  $0.1\mu F$  capacitors. The LTC1348 provides full RS232 output levels when operated over a wide supply range of 3V to 5.5V

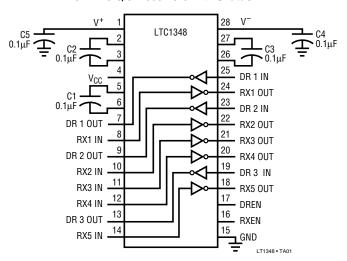

The transceiver operates in one of four modes: Normal, Receiver Disable, Receiver Alive and Shutdown. In Normal or Receiver Disable mode,  $I_{CC}$  is only  $600\mu\text{A}$  at 3.3V and  $800\mu\text{A}$  at 5V in the no load condition. In Shutdown mode, the supply current is further reduced to  $0.2\mu\text{A}$ . In Receiver Alive mode, all five receivers are kept alive and the supply current is  $15\mu\text{A}$ . All RS232 outputs assume a high impedance state in Shutdown or Receiver Alive mode or with the power off. The receiver outputs assume a high impedance state in Receiver Disable or with the power off.

The LTC1348 is fully compliant with all data rate and overvoltage RS232 specifications. The transceiver operates up to 120kbaud with all drivers loaded with 1000pF,  $3k\Omega$ . Both driver outputs and receiver inputs can be forced to  $\pm 25V$  without damage and can survive multiple  $\pm 10kV$  ESD strikes.

T, LTC and LT are registered trademarks of Linear Technology Corporation.

### PIN FUNCTIONS

 $V_{CC}$ : 3V to 5.5V Input Supply Pin. This pin should be decoupled with a 0.1 $\mu$ F ceramic capacitor.

**GND:** Ground Pin.

**RXEN:** TTL/CMOS Compatible Enable Pin. Refer to Table 1 for its functional description.

**DREN:** TTL/CMOS Compatible Enable Pin. Refer to Table 1 for its functional description.

**V+:** Positive Supply Output (RS232 Drivers). This pin requires an external capacitor  $C = 0.1 \mu F$  for charge storage. The capacitor may be tied to ground or  $V_{CC}$ . With multiple devices, the V+ and V<sup>-</sup> pins may be paralleled into common capacitors. For large numbers of devices, increasing the size of the shared common storage capacitors is recommended to reduce ripple.

**V**<sup>-</sup>: Negative Supply Output (RS232 Drivers). This pin requires an external capacitor  $C = 0.1 \mu F$  for charge storage.

C1+, C1-, C2+, C2-, C3+, C3-: Commutating Capacitor Inputs. These pins require three external capacitors  $C = 0.1 \mu F$ : one from C1+ to C1-, another from C2+ to C2- and another from C3+ to C3-. To maintain charge pump

efficiency, the capacitor's effective series resistance should be less than  $1\Omega$ . Ceramic capacitors are recommended.

**DR IN:** RS232 Driver Input Pins. Inputs are TTL/CMOS compatible. The inputs of unused drivers can be left unconnected since 300k input pull-up resistors to  $V_{CC}$  are included on chip. To minimize power consumption, the internal driver pull-up resistors are disconnected from  $V_{CC}$  in the Shutdown or Receiver Alive mode.

**DR OUT:** Driver Outputs at RS232 Voltage Levels. Outputs are in a high impedance state when in the Shutdown, Receiver Alive mode or  $V_{CC}=0V$ . The driver outputs are protected against ESD to  $\pm 10 kV$  for human body model discharges.

**RX IN:** Receiver Inputs. These pins can be forced to  $\pm 25$ V without damage. The receiver inputs are protected against ESD to  $\pm 10$ kV for human body model discharges. Each receiver provides 0.4V of hysteresis for noise immunity. In Receiver Alive mode all receivers have no hysteresis.

**RX OUT:** Receiver Outputs with TTL/CMOS Voltage Levels. Outputs are in a high impedance state when in the Shutdown or Receiver Disable mode to allow data line sharing.

### APPLICATIONS INFORMATION

### **Power Supply**

The LTC1348 includes an onboard voltage-tripling charge pump capable of generating  $\pm 8V$  from a single 3.3V supply. This allows the LTC1348 drivers to provide guaranteed  $\pm 5V$  RS232-compliant voltage levels with a 3.3V supply. With all outputs loaded with  $3k\Omega$ , the LTC1348 can typically swing  $\pm 5V$  with voltages as low as 2.85V. It will meet the  $\pm 3.7V$  EIA562 levels with supply voltages as

low as 2.2V. The charge pump requires three external flying capacitors to operate;  $0.1\mu\text{F}$  ceramic capacitors are adequate for most applications. For applications requiring extremely high data rates or abnormally heavy output loads,  $0.33\mu\text{F}$  flying capacitors are recommended. Bypass and output capacitor values should match those of the flying capacitors and all capacitors should be mounted as close to the package as possible.

### APPLICATIONS INFORMATION

### **High Data Rates**

The LTC1348 maintains true RS232  $\pm$ 5V minimum driver output even at high data rates. Figure 5 shows a test circuit with 2m wires connecting the two test chips. Both chips are run from 3.3V supplies. Figure 6 shows the typical line waveforms with all three drivers, loaded with 1000pF and  $3k\Omega$ , toggling simultaneously at 120kbaud. Figure 7 shows

the same circuit with a single 1000pF/3k $\Omega$  loaded driver driven at 250kbaud, and the other two drivers loaded but not toggling. This closely approximates the actual behavior of an RS232 serial port, with only one driver (TX) driven at high speed and the other two drivers (RTS and DTR) driven at a relatively low data rate or at DC. Under the same conditions, the LTC1348 can go as fast as 350kbaud and still meet EIA562 ( $\pm$ 3.7V) minimum driver output levels.
