IGLOOe Low Power Flash FPGAs
with Flash*Freeze Technology

Features and Benefits

Low Power
- 1.2 V to 1.5 V Core Voltage Support for Low Power
- Supports Single-Voltage System Operation
- Low-Power Active FPGA Operation
- Flash*Freeze Technology Enables Ultra-Low Power Consumption while Maintaining FPGA Content
- Flash*Freeze Pin Allows Easy Entry to / Exit from Ultra-Low-Power Flash*Freeze Mode

High Capacity
- 600 k to 3 Million System Gates
- 108 to 504 kbits of True Dual-Port SRAM
- Up to 341 User I/Os

Reprogrammable Flash Technology
- 130-nm, 7-Layer Metal (6 Copper), Flash-Based CMOS Process
- Instant On Level 0 Support
- Single-Chip Solution
- Retains Programmed Design when Powered Off
- 250 MHz (1.5 V systems) and 160 MHz (1.2 V systems) System Performance

In-System Programming (ISP) and Security
- ISP Using On-Chip 128-Bit Advanced Encryption Standard (AES) Decryption via JTAG (IEEE 1532–compliant)
- FlashLock® Designed to Secure FPGA Contents

High-Performance Routing Hierarchy
- Segmented, Hierarchical Routing and Clock Structure
- High-Performance, Low-Skew Global Network
- Architecture Supports Ultra-High Utilization

Pro (Professional) I/O
- 700 Mbps DDR, LVDS-Capable I/Os
- 1.2 V, 1.5 V, 1.8 V, 2.5 V, and 3.3 V Mixed-Voltage Operation
- Bank-Selectable I/O Voltages—Up to 8 Banks per Chip
- Single-Ended I/O Standards: LVTTL, LVCMOS 3.3 V / 2.5 V / 1.8 V / 1.5 V / 1.2 V, 3.3 V PCI / 3.3 V PCI-X, and LVCMOS 2.5 V / 5.0 V Input
- Differential I/O Standards: LVPECL, LVDS, B-LVDS, and M-LVDS
- Voltage-Referenced I/O Standards: GTL+ 2.5 V / 3.3 V, GTL 2.5 V / 3.3 V, HSTL Class I and II, SSTL2 Class I and II, SSTL3 Class I and II
- Wide Range Power Supply Voltage Support per JESD8-B, Allowing I/Os to Operate from 2.7 V to 3.6 V
- Wide Range Power Supply Voltage Support per JESD8-12, Allowing I/Os to Operate from 1.14 V to 1.575 V
- I/O Registers on Input, Output, and Enable Paths
- Hot-Swappable and Cold-Sparing I/Os
- Programmable Output Slew Rate and Drive Strength
- Programmable Input Delay
- Schmitt Trigger Option on Single-Ended Inputs
- Weak Pull-Up/-Down
- IEEE 1149.1 (JTAG) Boundary Scan Test
- Pin-Compatible Packages across the IGLOO®e Family

Clock Conditioning Circuit (CCC) and PLL
- Six CCC Blocks, Each with an Integrated PLL
- Configurable Phase Shift, Multiply/Divide, Delay Capabilities, and External Feedback
- Wide Input Frequency Range (1.5 MHz up to 250 MHz)

Embedded Memory
- 1 kbit of FlashROM User Nonvolatile Memory
- SRAMs and FIFOs with Variable-Aspect-Ratio 4,608-Bit RAM Blocks (×1, ×2, ×4, ×9, and ×18 organizations available)
- True Dual-Port SRAM (except ×18)

ARM Processor Support in IGLOOe FPGAs
- M1 IGLOOe Devices—Cortex™-M1 Soft Processor Available with or without Debug

Table 1 • IGLOOe Product Family

IGLOOe Devices	AGLE600	AGLE3000
ARM-Enabled IGLOOe Devices		M1AGLE3000
System Gates	600,000	3,000,000
VersaTiles (D-flip-flops)	13,824	75,264
Quiescent Current (typical) in Flash*Freeze Mode (µW)	49	137
RAM kbits (1,024 bits)	108	504
4,608-Bit Blocks	24	112
FlashROM Kbits (1,024 bits)	1	1

Package Pins FBGA	FG256	FG484

Notes:

1. *Refer to the Cortex-M1 Handbook for more information.*
2. *Six chip (main) and twelve quadrant global networks are available.*
3. *For devices supporting lower densities, refer to the IGLOO Low-Power Flash FPGAs with Flash*Freeze Technology datasheet.*

I/Os Per Package [1]

IGLOOe Devices	AGLE600		AGLE3000	
ARM-Enabled IGLOOe Devices			M1AGLE3000	
	I/O Types			
Package	Single-Ended I/O[1]	Differential I/O Pairs	Single-Ended I/O[1]	Differential I/O Pairs
FG256	165	79	–	–
	–	–	341	168

Notes:

1. *When considering migrating your design to a lower- or higher-density device, refer to the IGLOOe FPGA Fabric User's Guide to ensure compliance with design and board migration requirements.*
2. *Each used differential I/O pair reduces the number of single-ended I/Os available by two.*
3. *For AGLE3000 devices, the usage of certain I/O standards is limited as follows:*
   – SSTL3(I) and (II): up to 40 I/Os per north or south bank
   – LVPECL / GTL+ 3.3 V / GTL 3.3 V: up to 48 I/Os per north or south bank
   – SSTL2(I) and (II) / GTL+ 2.5 V/ GTL 2.5 V: up to 72 I/Os per north or south bank
4. *FG256 and FG484 are footprint-compatible packages.*
5. *When using voltage-referenced I/O standards, one I/O pin should be assigned as a voltage-referenced pin (VREF) per minibank (group of I/Os).*
6. *When the Flash*Freeze pin is used to directly enable Flash*Freeze mode and not as a regular I/O, the number of single-ended user I/Os available is reduced by one.*
7. *"G" indicates RoHS-compliant packages. Refer to "IGLOOe Ordering Information" on page III for the location of the "G" in the part number.*

Table of Contents

1 – IGLOOe Device Family Overview

General Description

The IGLOOe family of flash FPGAs, based on a 130-nm flash process, offers the lowest power FPGA, a single-chip solution, small footprint packages, reprogrammability, and an abundance of advanced features.

The Flash*Freeze technology used in IGLOOe devices enables entering and exiting an ultra-low power mode while retaining SRAM and register data. Flash*Freeze technology simplifies power management through I/O and clock management with rapid recovery to operation mode.

The Low Power Active capability (static idle) allows for ultra-low power consumption while the IGLOOe device is completely functional in the system. This allows the IGLOOe device to control system power management based on external inputs (e.g., scanning for keyboard stimulus) while consuming minimal power.

Nonvolatile flash technology gives IGLOOe devices the advantage of being a secure, low power, single-chip solution that is Instant On. IGLOOe is reprogrammable and offers time-to-market benefits at an ASIC-level unit cost.

These features enable designers to create high-density systems using existing ASIC or FPGA design flows and tools.

IGLOOe devices offer 1 kbit of on-chip, programmable, nonvolatile FlashROM storage as well as clock conditioning circuitry based on 6 integrated phase-locked loops (PLLs). IGLOOe devices have up to 3 million system gates, supported with up to 504 kbits of true dual-port SRAM and up to 341 user I/Os.

M1 IGLOOe devices support the high-performance, 32-bit Cortex-M1 processor developed by ARM for implementation in FPGAs. Cortex-M1 is a soft processor that is fully implemented in the FPGA fabric. It has a three-stage pipeline that offers a good balance between low power consumption and speed when implemented in an M1 IGLOOe device. The processor runs the ARMv6-M instruction set, has a configurable nested interrupt controller, and can be implemented with or without the debug block. Cortex-M1 is available for free from Microsemi for use in M1 IGLOOe FPGAs.

The ARM-enabled devices have Microsemi ordering numbers that begin with M1AGLE and do not support AES decryption.

Flash*Freeze Technology

The IGLOOe device offers unique Flash*Freeze technology, allowing the device to enter and exit ultra-low power Flash*Freeze mode. IGLOOe devices do not need additional components to turn off I/Os or clocks while retaining the design information, SRAM content, and registers. Flash*Freeze technology is combined with in-system programmability, which enables users to quickly and easily upgrade and update their designs in the final stages of manufacturing or in the field. The ability of IGLOOe V2 devices to support a wide range of core voltage (1.2 V to 1.5 V) allows further reduction in power consumption, thus achieving the lowest total system power.

When the IGLOOe device enters Flash*Freeze mode, the device automatically shuts off the clocks and inputs to the FPGA core; when the device exits Flash*Freeze mode, all activity resumes and data is retained.

The availability of low power modes, combined with reprogrammability, a single-chip and single-voltage solution, and availability of small-footprint, high pin-count packages, make IGLOOe devices the best fit for portable electronics.

Flash Advantages

Low Power

Flash-based IGLOOe devices exhibit power characteristics similar to those of an ASIC, making them an ideal choice for power-sensitive applications. IGLOOe devices have only a very limited power-on current surge and no high-current transition period, both of which occur on many FPGAs.

IGLOOe devices also have low dynamic power consumption to further maximize power savings; power is even further reduced by the use of a 1.2 V core voltage.

Low dynamic power consumption, combined with low static power consumption and Flash*Freeze technology, gives the IGLOOe device the lowest total system power offered by any FPGA.

Security

The nonvolatile, flash-based IGLOOe devices do not require a boot PROM, so there is no vulnerable external bitstream that can be easily copied. IGLOOe devices incorporate FlashLock, which provides a unique combination of reprogrammability and design security without external overhead, advantages that only an FPGA with nonvolatile flash programming can offer.

IGLOOe devices utilize a 128-bit flash-based lock and a separate AES key to provide the highest level of protection in the FPGA industry for programmed intellectual property and configuration data. In addition, all FlashROM data in IGLOOe devices can be encrypted prior to loading, using the industry-leading AES-128 (FIPS192) bit block cipher encryption standard. AES was adopted by the National Institute of Standards and Technology (NIST) in 2000 and replaces the 1977 DES standard. IGLOOe devices have a built-in AES decryption engine and a flash-based AES key that make them the most comprehensive programmable logic device security solution available today. IGLOOe devices with AES-based security provide a high level of protection for remote field updates over public networks such as the Internet, and are designed to ensure that valuable IP remains out of the hands of system overbuilders, system cloners, and IP thieves.

Security, built into the FPGA fabric, is an inherent component of the IGLOOe family. The flash cells are located beneath seven metal layers, and many device design and layout techniques have been used to make invasive attacks extremely difficult. The IGLOOe family, with FlashLock and AES security, is unique in being highly resistant to both invasive and noninvasive attacks. Your valuable IP is protected with industry-standard security, making remote ISP possible. An IGLOOe device provides the best available security for programmable logic designs.

Single Chip

Flash-based FPGAs store their configuration information in on-chip flash cells. Once programmed, the configuration data is an inherent part of the FPGA structure, and no external configuration data needs to be loaded at system power-up (unlike SRAM-based FPGAs). Therefore, flash-based IGLOOe FPGAs do not require system configuration components such as EEPROMs or microcontrollers to load device configuration data. This reduces bill-of-materials costs and PCB area, and increases security and system reliability.

Instant On

Flash-based IGLOOe devices support Level 0 of the Instant On classification standard. This feature helps in system component initialization, execution of critical tasks before the processor wakes up, setup and configuration of memory blocks, clock generation, and bus activity management. The Instant On feature of flash-based IGLOOe devices greatly simplifies total system design and reduces total system cost, often eliminating the need for CPLDs and clock generation PLLs. In addition, glitches and brownouts in system power will not corrupt the IGLOOe device's flash configuration, and unlike SRAM-based FPGAs, the device will not have to be reloaded when system power is restored. This enables the reduction or complete removal of the configuration PROM, expensive voltage monitor, brownout detection, and clock generator devices from the PCB design. Flash-based IGLOOe devices simplify total system design and reduce cost and design risk while increasing system reliability and improving system initialization time.

Reduced Cost of Ownership

Advantages to the designer extend beyond low unit cost, performance, and ease of use. Unlike SRAM-based FPGAs, Flash-based IGLOOe devices allow all functionality to be Instant On; no external boot PROM is required. On-board security mechanisms prevent access to all the programming information and enable secure remote updates of the FPGA logic. Designers can perform secure remote in-system reprogramming to support future design iterations and field upgrades with confidence that valuable intellectual property cannot be compromised or copied. Secure ISP can be performed using the industry-standard AES algorithm. The IGLOOe family device architecture mitigates the need for ASIC migration at higher user volumes. This makes the IGLOOe family a cost-effective ASIC replacement solution, especially for applications in the consumer, networking/communications, computing, and avionics markets.

Firm-Error Immunity

Firm errors occur most commonly when high-energy neutrons, generated in the upper atmosphere, strike a configuration cell of an SRAM FPGA. The energy of the collision can change the state of the configuration cell and thus change the logic, routing, or I/O behavior in an unpredictable way. These errors are impossible to prevent in SRAM FPGAs. The consequence of this type of error can be a complete system failure. Firm errors do not exist in the configuration memory of IGLOOe flash-based FPGAs. Once it is programmed, the flash cell configuration element of IGLOOe FPGAs cannot be altered by high-energy neutrons and is therefore immune to them. Recoverable (or soft) errors occur in the user data SRAM of all FPGA devices. These can easily be mitigated by using error detection and correction (EDAC) circuitry built into the FPGA fabric.

Advanced Flash Technology

The IGLOOe family offers many benefits, including nonvolatility and reprogrammability, through an advanced flash-based, 130-nm LVCMOS process with seven layers of metal. Standard CMOS design techniques are used to implement logic and control functions. The combination of fine granularity, enhanced flexible routing resources, and abundant flash switches allows for very high logic utilization without compromising device routability or performance. Logic functions within the device are interconnected through a four-level routing hierarchy.

IGLOOe family FPGAs utilize design and process techniques to minimize power consumption in all modes of operation.

Advanced Architecture

The proprietary IGLOOe architecture provides granularity comparable to standard-cell ASICs. The IGLOOe device consists of five distinct and programmable architectural features (Figure 1-1 on page 4):

- Flash*Freeze technology
- FPGA VersaTiles
- Dedicated FlashROM
- Dedicated SRAM/FIFO memory
- Extensive CCCs and PLLs
- Pro I/O structure

The FPGA core consists of a sea of VersaTiles. Each VersaTile can be configured as a three-input logic function, a D-flip-flop (with or without enable), or a latch by programming the appropriate flash switch interconnections. The versatility of the IGLOOe core tile as either a three-input lookup table (LUT) equivalent or a D-flip-flop/latch with enable allows for efficient use of the FPGA fabric. The VersaTile capability is unique to the Microsemi ProASIC® family of third-generation-architecture flash FPGAs. VersaTiles are connected with any of the four levels of routing hierarchy. Flash switches are distributed throughout the device to provide nonvolatile, reconfigurable interconnect programming. Maximum core utilization is possible for virtually any design.

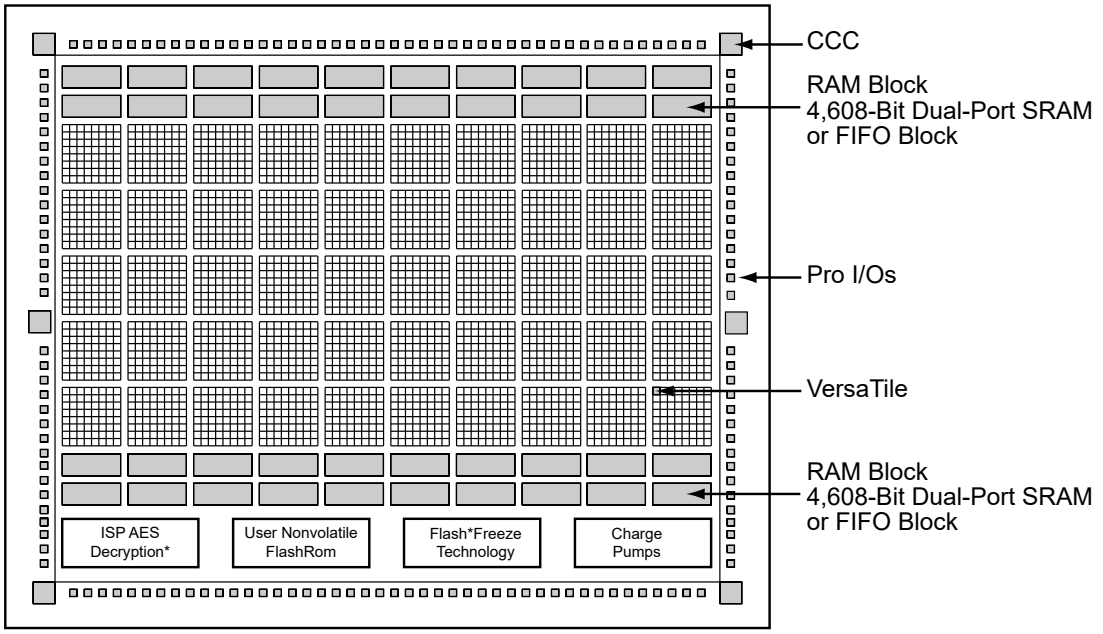

Figure 1-1 • **IGLOOe Device Architecture Overview**

*Flash*Freeze Technology*

The IGLOOe device has an ultra-low power static mode, called Flash*Freeze mode, which retains all SRAM and register information and can still quickly return to normal operation. Flash*Freeze technology enables the user to quickly (within 1 µs) enter and exit Flash*Freeze mode by activating the Flash*Freeze pin while all power supplies are kept at their original values. In addition, I/Os and global I/Os can still be driven and can be toggling without impact on power consumption, clocks can still be driven or can be toggling without impact on power consumption, and the device retains all core registers, SRAM information, and states. I/O states are tristated during Flash*Freeze mode or can be set to a certain state using weak pull-up or pull-down I/O attribute configuration. No power is consumed by the I/O banks, clocks, JTAG pins, or PLL in this mode.

Flash*Freeze technology allows the user to switch to active mode on demand, thus simplifying the power management of the device.

The Flash*Freeze pin (active low) can be routed internally to the core to allow the user's logic to decide when it is safe to transition to this mode. It is also possible to use the Flash*Freeze pin as a regular I/O if Flash*Freeze mode usage is not planned, which is advantageous because of the inherent low power static and dynamic capabilities of the IGLOOe device. Refer to Figure 1-2 for an illustration of entering/exiting Flash*Freeze mode.

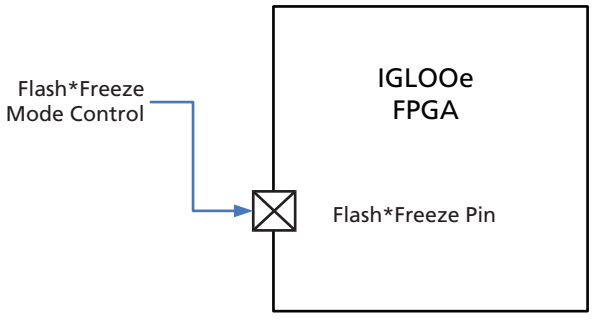

Figure 1-2 • **IGLOOe Flash*Freeze Mode**

VersaTiles

The IGLOOe core consists of VersaTiles, which have been enhanced beyond the ProASIC[PLUS]® core tiles. The IGLOOe VersaTile supports the following:

- All 3-input logic functions—LUT-3 equivalent
- Latch with clear or set
- D-flip-flop with clear or set
- Enable D-flip-flop with clear or set

Refer to Figure 1-3 for VersaTile configurations.

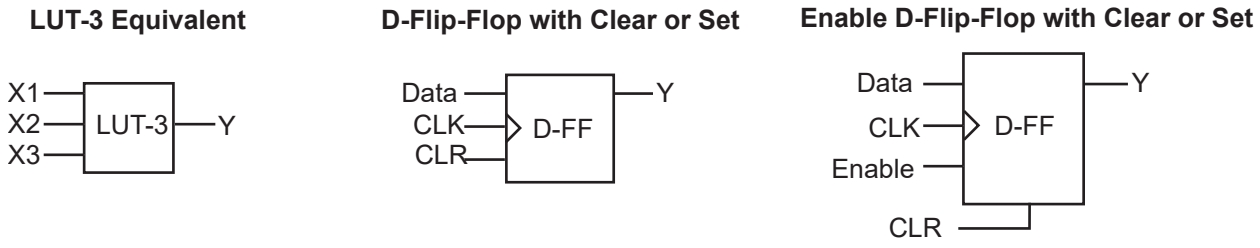

Figure 1-3 • **VersaTile Configurations**

User Nonvolatile FlashROM

IGLOOe devices have 1 kbit of on-chip, user-accessible, nonvolatile FlashROM. The FlashROM can be used in diverse system applications:

- Internet protocol addressing (wireless or fixed)
- System calibration settings
- Device serialization and/or inventory control
- Subscription-based business models (for example, set-top boxes)
- Secure key storage for secure communications algorithms
- Asset management/tracking
- Date stamping
- Version management

The FlashROM is written using the standard IGLOOe IEEE 1532 JTAG programming interface. The core can be individually programmed (erased and written), and on-chip AES decryption can be used selectively to securely load data over public networks, as in security keys stored in the FlashROM for a user design.

The FlashROM can be programmed via the JTAG programming interface, and its contents can be read back either through the JTAG programming interface or via direct FPGA core addressing. Note that the FlashROM can only be programmed from the JTAG interface and cannot be programmed from the internal logic array.

The FlashROM is programmed as 8 banks of 128 bits; however, reading is performed on a byte-by-byte basis using a synchronous interface. A 7-bit address from the FPGA core defines which of the 8 banks and which of the 16 bytes within that bank are being read. The three most significant bits (MSBs) of the FlashROM address determine the bank, and the four least significant bits (LSBs) of the FlashROM address define the byte.

The IGLOOe development software solutions, Libero® System-on-Chip (SoC) and Designer, have extensive support for the FlashROM. One such feature is auto-generation of sequential programming files for applications requiring a unique serial number in each part. Another feature allows the inclusion of static data for system version control. Data for the FlashROM can be generated quickly and easily using Libero SoC and Designer software tools. Comprehensive programming file support is also included to allow for easy programming of large numbers of parts with differing FlashROM contents.

SRAM and FIFO

IGLOOe devices have embedded SRAM blocks along their north and south sides. Each variable-aspect-ratio SRAM block is 4,608 bits in size. Available memory configurations are 256×18, 512×9, 1k×4, 2k×2, and 4k×1 bits. The individual blocks have independent read and write ports that can be configured with different bit widths on each port. For example, data can be sent through a 4-bit port and read as a single bitstream. The embedded SRAM blocks can be initialized via the device JTAG port (ROM emulation mode) using the UJTAG macro.

In addition, every SRAM block has an embedded FIFO control unit. The control unit allows the SRAM block to be configured as a synchronous FIFO without using additional core VersaTiles. The FIFO width and depth are programmable. The FIFO also features programmable Almost Empty (AEMPTY) and Almost Full (AFULL) flags in addition to the normal Empty and Full flags. The embedded FIFO control unit contains the counters necessary for generation of the read and write address pointers. The embedded SRAM/FIFO blocks can be cascaded to create larger configurations.

PLL and CCC

IGLOOe devices provide designers with very flexible clock conditioning capabilities. Each member of the IGLOOe family contains six CCCs, each with an integrated PLL.

The six CCC blocks are located at the four corners and the centers of the east and west sides. One CCC (center west side) has a PLL.

The inputs of the six CCC blocks are accessible from the FPGA core or from one of several inputs located near the CCC that have dedicated connections to the CCC block.

The CCC block has these key features:

- Wide input frequency range (f_{IN_CCC}) = 1.5 MHz up to 250 MHz
- Output frequency range (f_{OUT_CCC}) = 0.75 MHz up to 250 MHz
- 2 programmable delay types for clock skew minimization
- Clock frequency synthesis

Additional CCC specifications:

- Internal phase shift = 0°, 90°, 180°, and 270°. Output phase shift depends on the output divider configuration.
- Output duty cycle = 50% ± 1.5% or better
- Low output jitter: worst case < 2.5% × clock period peak-to-peak period jitter when single global network used
- Maximum acquisition time is 300 µs
- Exceptional tolerance to input period jitter—allowable input jitter is up to 1.5 ns
- Four precise phases; maximum misalignment between adjacent phases of 40 ps × 250 MHz / f_{OUT_CCC}

Global Clocking

IGLOOe devices have extensive support for multiple clocking domains. In addition to the CCC and PLL support described above, there is a comprehensive global clock distribution network.

Each VersaTile input and output port has access to nine VersaNets: six chip (main) and three quadrant global networks. The VersaNets can be driven by the CCC or directly accessed from the core via multiplexers (MUXes). The VersaNets can be used to distribute low-skew clock signals or for rapid distribution of high-fanout nets.

Pro I/Os with Advanced I/O Standards

The IGLOOe family of FPGAs features a flexible I/O structure, supporting a range of voltages (1.2 V, 1.5 V, 1.8 V, 2.5 V, 3.0 V wide range, and 3.3 V). IGLOOe FPGAs support 19 different I/O standards, including single-ended, differential, and voltage-referenced. The I/Os are organized into banks, with eight banks per device (two per side). The configuration of these banks determines the I/O standards supported. Each I/O bank is subdivided into VREF minibanks, which are used by voltage-referenced I/Os. VREF minibanks contain 8 to 18 I/Os. All the I/Os in a given minibank share a common VREF line. Therefore, if any I/O in a given VREF minibank is configured as a VREF pin, the remaining I/Os in that minibank will be able to use that reference voltage.

Each I/O module contains several input, output, and enable registers. These registers allow the implementation of the following:

- Single-Data-Rate applications (e.g., PCI 66 MHz, bidirectional SSTL 2 and 3, Class I and II)
- Double-Data-Rate applications (e.g., DDR LVDS, B-LVDS, and M-LVDS I/Os for point-to-point communications, and DDR 200 MHz SRAM using bidirectional HSTL Class II).

IGLOOe banks support M-LVDS with 20 multi-drop points.

Hot-swap (also called hot-plug, or hot-insertion) is the operation of hot-insertion or hot-removal of a card in a powered-up system.

Cold-sparing (also called cold-swap) refers to the ability of a device to leave system data undisturbed when the system is powered up, while the component itself is powered down, or when power supplies are floating.

Wide Range I/O Support

IGLOOe devices support JEDEC-defined wide range I/O operation. IGLOOe devices support both the JESD8-B specification, covering 3.0 V and 3.3 V supplies, for an effective operating range of 2.7 V to 3.6 V, and JESD8-12 with its 1.2 V nominal, supporting an effective operating range of 1.14 V to 1.575 V.

Wider I/O range means designers can eliminate power supplies or power conditioning components from the board or move to less costly components with greater tolerances. Wide range eases I/O bank management and provides enhanced protection from system voltage spikes, while providing the flexibility to easily run custom voltage applications.

Specifying I/O States During Programming

You can modify the I/O states during programming in FlashPro. In FlashPro, this feature is supported for PDB files generated from Designer v8.5 or greater. See the *FlashPro User's Guide* for more information.

Note: PDB files generated from Designer v8.1 to Designer v8.4 (including all service packs) have limited display of Pin Numbers only.

1. Load a PDB from the FlashPro GUI. You must have a PDB loaded to modify the I/O states during programming.
2. From the FlashPro GUI, click **PDB Configuration**. A FlashPoint – Programming File Generator window appears.
3. Click the **Specify I/O States During Programming** button to display the Specify I/O States During Programming dialog box.
4. Sort the pins as desired by clicking any of the column headers to sort the entries by that header. Select the I/Os you wish to modify (Figure 1-4 on page 1-8).
5. Set the I/O Output State. You can set Basic I/O settings if you want to use the default I/O settings for your pins, or use Custom I/O settings to customize the settings for each pin. Basic I/O state settings:

   1 – I/O is set to drive out logic High

   0 – I/O is set to drive out logic Low

   Last Known State – I/O is set to the last value that was driven out prior to entering the programming mode, and then held at that value during programming

   Z -Tri-State: I/O is tristated

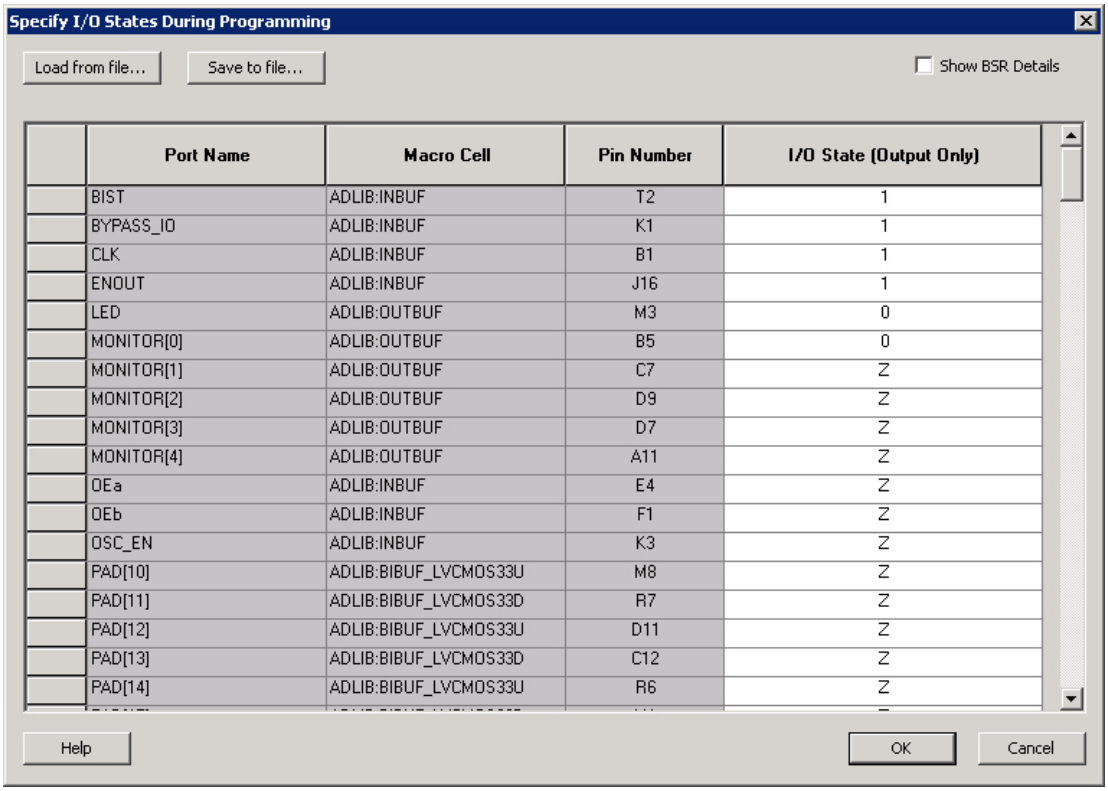

Figure 1-4 • **I/O States During Programming Window**

6. Click OK to return to the FlashPoint – Programming File Generator window.

Note: I/O States During programming are saved to the ADB and resulting programming files after completing programming file generation.

2 – IGLOOe DC and Switching Characteristics

General Specifications

Operating Conditions

Stresses beyond those listed in Table 2-1 may cause permanent damage to the device.

Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Absolute Maximum Ratings are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions specified in Table 2-2 on page 2-2 is not implied.

Table 2-1 • **Absolute Maximum Ratings**

Symbol	Parameter	Limits	Units
VCC	DC core supply voltage	–0.3 to 1.65	V
VJTAG	JTAG DC voltage	–0.3 to 3.75	V
VPUMP	Programming voltage	–0.3 to 3.75	V
VCCPLL	Analog power supply (PLL)	–0.3 to 1.65	V
VCCI and VMV[3]	DC I/O buffer supply voltage	–0.3 to 3.75	V
VI	I/O input voltage	–0.3 V to 3.6 V (when I/O hot insertion mode is enabled) –0.3 V to (VCCI + 1 V) or 3.6 V, whichever voltage is lower (when I/O hot-insertion mode is disabled)	V
T_{STG} [2]	Storage temperature	–65 to +150	°C
T_J [2]	Junction temperature	+125	°C

Notes:

1. *The device should be operated within the limits specified by the datasheet. During transitions, the input signal may undershoot or overshoot according to the limits shown in Table 2-4 on page 2-3.*
2. *For flash programming and retention maximum limits, refer to Table 2-3 on page 2-3, and for recommended operating limits, refer to Table 2-2 on page 2-2.*
3. *VMV pins must be connected to the corresponding VCCI pins. See the "VMVx I/O Supply Voltage (quiet)" section on page 3-1 for further information.*

Table 2-2 • Recommended Operating Conditions [1]

Symbol	Parameter		Commercial	Industrial	Units
T_J	Junction Temperature[2]		0 to + 85	–40 to +100	°C
VCC [3]	1.5 V DC core supply voltage[4]		1.425 to 1.575	1.425 to 1.575	V
	1.2 V–1.5 V wide range DC core voltage[5, 6]		1.14 to 1.575	1.14 to 1.575	V
VJTAG	JTAG DC voltage		1.4 to 3.6	1.4 to 3.6	V
VPUMP	Programming voltage[6]	Programming Mode	3.15 to 3.45	3.15 to 3.45	V
		Operation[7]	0 to 3.6	0 to 3.6	V
VCCPLL[8]	Analog power supply (PLL)	1.5 V DC core supply voltage[4]	1.425 to 1.575	1.425 to 1.575	V
		1.2 V–1.5 V DC core supply voltage[5]	1.14 to 1.575	1.14 to 1.575	V
VCCI and VMV[9]	1.2 V DC supply voltage[5]		1.14 to 1.26	1.14 to 1.26	V
	1.2 V wide range DC supply voltage[5]		1.14 to 1.575	1.14 to 1.575	V
	1.5 V DC supply voltage		1.425 to 1.575	1.425 to 1.575	V
	1.8 V DC supply voltage		1.7 to 1.9	1.7 to 1.9	V
	2.5 V DC supply voltage		2.3 to 2.7	2.3 to 2.7	V
	3.0 V DC supply voltage[10]		2.7 to 3.6	2.7 to 3.6	V
	3.3 V DC supply voltage		3.0 to 3.6	3.0 to 3.6	V
	LVDS differential I/O		2.375 to 2.625	2.375 to 2.625	V
	LVPECL differential I/O		3.0 to 3.6	3.0 to 3.6	V

Notes:

1. *All parameters representing voltages are measured with respect to GND unless otherwise specified.*
2. *Software Default Junction Temperature Range is set to 0°C - 70°C for commercial, and -40°C - 85°C for industrial. To ensure targeted reliability standards are met across the full range of junction temperatures, Microsemi recommends using temperature custom settings for running timing and power analysis tools. For more information regarding custom settings, please refer to the New Project Dialog Box component in the Designer in Libero SOC section of the Libero User Guide.*
3. *The ranges given here are for power supplies only. The recommended input voltage ranges specific to each I/O standard are given in Table 2-21 on page 2-20. VCCI should be at the same voltage within a given I/O bank.*
4. *For IGLOOe V5 devices*
5. *For IGLOOe V2 devices only, operating at VCCI ≥ VCC*
6. *All IGLOOe devices (V5 and V2) must be programmed with the VCC core voltage at 1.5 V. Applications using the V2 devices powered by a 1.2 V supply must switch the core supply to 1.5 V for in-system programming.*
7. *VPUMP can be left floating during operation (not programming mode).*
8. *VCCPLL pins should be tied to VCC pins. See the "VCCPLA/B/C/D/E/F PLL Supply Voltage" section for further information.*
9. *VMV pins must be connected to the corresponding VCCI pins. See the "VMVx I/O Supply Voltage (quiet)" section for further information.*
10. *3.3 V wide range is compliant to the JESD8-B specification and supports 3.0 V VCCI operation.*

Table 2-3 • Flash Programming Limits – Retention, Storage, and Operating Temperature[1]

Product Grade	Programming Cycles	Program Retention (biased/unbiased)	Maximum Storage Temperature T_{STG} (°C) [2]	Maximum Operating Junction Temperature T_J (°C) [2]
Commercial	500	20 years	110	100
Industrial	500	20 years	110	100

Notes:

1. *This is a stress rating only; functional operation at any condition other than those indicated is not implied.*
2. *These limits apply for program/data retention only. Refer to Table 2-1 on page 2-1 and Table 2-2 for device operating conditions and absolute limits.*

Table 2-4 • Overshoot and Undershoot Limits [1, 3]

VCCI	Average VCCI–GND Overshoot or Undershoot Duration as a Percentage of Clock Cycle[2]	Maximum Overshoot/ Undershoot[2]
2.7 V or less	10%	1.4 V
	5%	1.49 V
3 V	10%	1.1 V
	5%	1.19 V
3.3 V	10%	0.79 V
	5%	0.88 V
3.6 V	10%	0.45 V
	5%	0.54 V

Notes:

1. *Based on reliability requirements at junction temperature at 85°C.*
2. *The duration is allowed at one out of six clock cycles. If the overshoot/undershoot occurs at one out of two cycles, the maximum overshoot/undershoot has to be reduced by 0.15 V.*
3. *This table does not provide PCI overshoot/undershoot limits.*

I/O Power-Up and Supply Voltage Thresholds for Power-On Reset (Commercial and Industrial)

Sophisticated power-up management circuitry is designed into every IGLOOe device. These circuits ensure easy transition from the powered-off state to the powered-up state of the device. The many different supplies can power up in any sequence with minimized current spikes or surges. In addition, the I/O will be in a known state through the power-up sequence. The basic principle is shown in Figure 2-1 on page 2-4 and Figure 2-2 on page 2-5.

There are five regions to consider during power-up.

IGLOOe I/Os are activated only if ALL of the following three conditions are met:

1. VCC and VCCI are above the minimum specified trip points (Figure 2-1 on page 2-4 and Figure 2-2 on page 2-5).
2. VCCI > VCC – 0.75 V (typical)
3. Chip is in the operating mode.

VCCI Trip Point:
Ramping up: 0.6 V < trip_point_up < 1.2 V
Ramping down: 0.5 V < trip_point_down < 1.1 V

VCC Trip Point:
Ramping up: 0.6 V < trip_point_up < 1.1 V
Ramping down: 0.5 V < trip_point_down < 1 V

VCC and VCCI ramp-up trip points are about 100 mV higher than ramp-down trip points. This specifically built-in hysteresis prevents undesirable power-up oscillations and current surges. Note the following:

- During programming, I/Os become tristated and weakly pulled up to VCCI.

- JTAG supply, PLL power supplies, and charge pump VPUMP supply have no influence on I/O behavior.

PLL Behavior at Brownout Condition

Microsemi recommends using monotonic power supplies or voltage regulators to ensure proper powerup behavior. Power ramp-up should be monotonic at least until VCC and VCCPLX exceed brownout activation levels. The VCC activation level is specified as 1.1 V worst-case (see Figure 2-1 and Figure 2-2 on page 2-5 for more details).

When PLL power supply voltage and/or VCC levels drop below the VCC brownout levels (0.75 V ± 0.25 V), the PLL output lock signal goes low and/or the output clock is lost. Refer to the "Power-Up/-Down Behavior of Low Power Flash Devices" chapter of the *IGLOOe FPGA Fabric User's Guide* for information on clock and lock recovery.

Internal Power-Up Activation Sequence

1. Core
2. Input buffers

Output buffers, after 200 ns delay from input buffer activation.

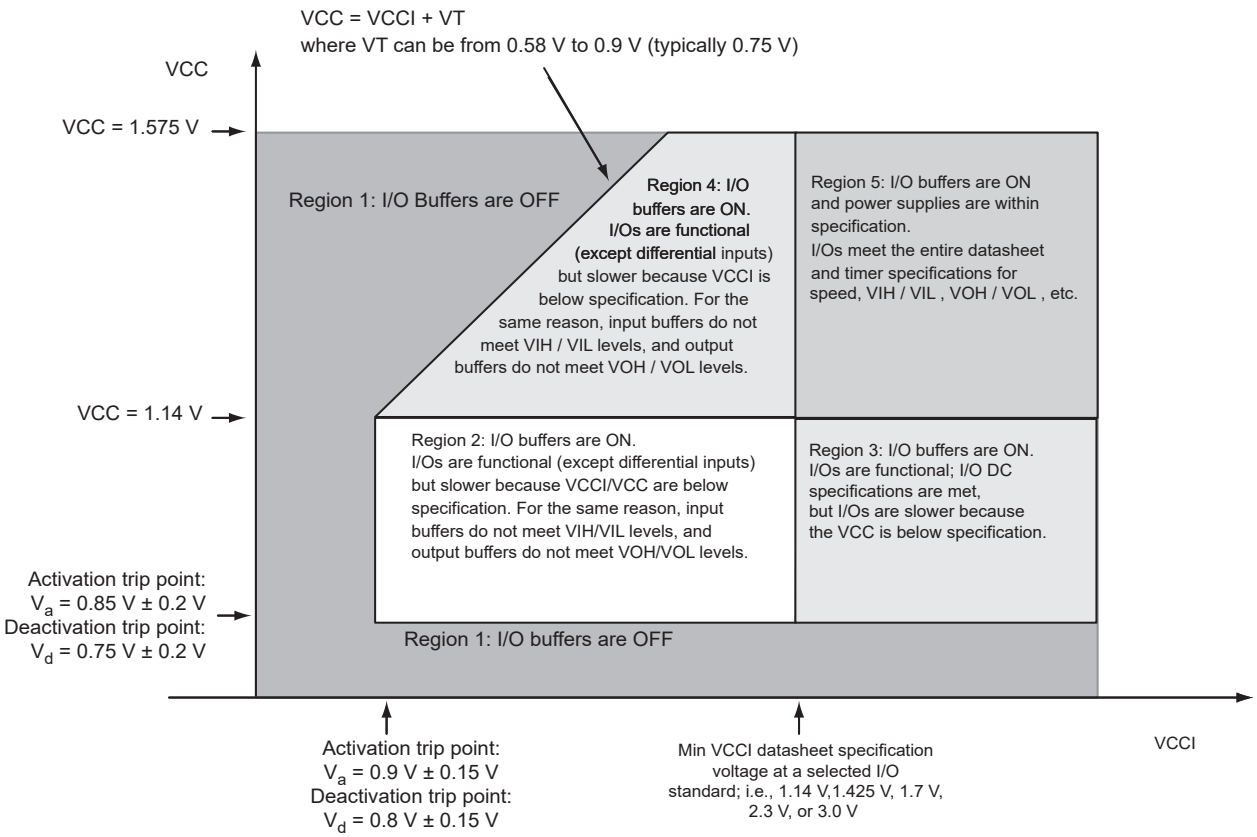

Figure 2-2 • **V2 Devices – I/O State as a Function of VCCI and VCC Voltage Levels**

Thermal Characteristics

Introduction

The temperature variable in Microsemi Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because dynamic and static power consumption cause the chip junction to be higher than the ambient temperature.

EQ 1 can be used to calculate junction temperature.

$$T_J = \text{Junction Temperature} = \Delta T + T_A \qquad \textit{EQ 1}$$

where:

T_A = Ambient Temperature

ΔT = Temperature gradient between junction (silicon) and ambient $\Delta T = \theta_{ja} * P$

θ_{ja} = Junction-to-ambient of the package. θ_{ja} numbers are located in Table 2-5.

P = Power dissipation

Package Thermal Characteristics

The device junction-to-case thermal resistivity is θ_{jc} and the junction-to-ambient air thermal resistivity is θ_{ja}. The thermal characteristics for θ_{ja} are shown for two air flow rates. The absolute maximum junction temperature is 100°C. EQ 2 shows a sample calculation of the absolute maximum power dissipation allowed for an 896-pin FBGA package at commercial temperature and in still air.

$$\text{Maximum Power Allowed} = \frac{\text{Max. junction temp. (°C)} - \text{Max. ambient temp. (°C)}}{\theta_{ja}(\text{°C/W})} = \frac{100\text{°C} - 70\text{°C}}{13.6\text{°C/W}} = 2.206\text{ W}$$

EQ 2

Table 2-5 • **Package Thermal Resistivities**

Package Type	Pin Count	θ_{jc}	θ_{ja}			Units
			Still Air	200 ft./min.	500 ft./min.	
Plastic Quad Flat Package (PQFP)	208	8.0	26.1	22.5	20.8	C/W
Plastic Quad Flat Package (PQFP) with embedded heat spreader	208	3.8	16.2	13.3	11.9	C/W
Fine Pitch Ball Grid Array (FBGA)	256	3.8	26.9	22.8	21.5	C/W
	484	3.2	20.5	17.0	15.9	C/W
	676	3.2	16.4	13.0	12.0	C/W
	896	2.4	13.6	10.4	9.4	C/W

Temperature and Voltage Derating Factors

Table 2-6 • **Temperature and Voltage Derating Factors for Timing Delays (normalized to T_J = 70°C,VCC = 1.425 V) For IGLOOe V2 or V5 devices, 1.5 V DC Core Supply Voltage**

Array Voltage VCC (V)	Junction Temperature (°C)					
	–40°C	0°C	25°C	70°C	85°C	100°C
1.425	0.945	0.965	0.978	1.000	1.008	1.013
1.500	0.876	0.893	0.906	0.927	0.934	0.940
1.575	0.824	0.840	0.852	0.872	0.879	0.884

Table 2-7 • **Temperature and Voltage Derating Factors for Timing Delays (normalized to T_J = 70°C, VCC = 1.14 V) For IGLOOe V2, 1.2 V DC Core Supply Voltage**

Array Voltage VCC (V)	Junction Temperature (°C)					
	–40°C	0°C	25°C	70°C	85°C	100°C
1.14	0.968	0.978	0.991	1.000	1.006	1.010
1.20	0.864	0.873	0.885	0.893	0.898	0.902
1.26	0.793	0.803	0.813	0.821	0.826	0.829

Calculating Power Dissipation

Quiescent Supply Current

Quiescent supply current (IDD) calculation depends on multiple factors, including operating voltages (VCC, VCCI, and VJTAG), operating temperature, system clock frequency, and power modes usage. Microsemi recommends using the PowerCalculator and SmartPower software estimation tools to evaluate the projected static and active power based on the user design, power mode usage, operating voltage, and temperature.

Table 2-8 • **Power Supply State per Mode**

	Power Supply Configurations				
Modes/power supplies	**VCC**	**VCCPLL**	**VCCI**	**VJTAG**	**VPUMP**
Flash*Freeze	On	On	On	On	On/off/floating
Sleep	Off	Off	On	Off	Off
Shutdown	Off	Off	Off	Off	Off
No Flash*Freeze	On	On	On	On	On/off/floating

Note: Off: Power supply level = 0 V

Table 2-9 • **Quiescent Supply Current (IDD), IGLOOe Flash*Freeze Mode***

	Core Voltage	AGLE600	AGLE3000	Units
Typical (25°C)	1.2 V	34	95	µA
	1.5 V	72	310	µA

*Note: *IDD includes VCC, VPUMP, VCCI, VCCPLL, and VMV currents. Values do not include I/O static contribution, which is shown in Table 2-13 on page 2-9 and Table 2-14 on page 2-10 (PDC6 and PDC7).*

Table 2-10 • **Quiescent Supply Current (IDD) Characteristics, IGLOOe Sleep Mode***

	Core Voltage	AGLE600	AGLE3000	Units
VCCI/VJTAG = 1.2 V (per bank) Typical (25°C)	1.2 V	1.7	1.7	µA
VCCI/VJTAG = 1.5 V (per bank) Typical (25°C)	1.2 V / 1.5 V	1.8	1.8	µA
VCCI/VJTAG = 1.8 V (per bank) Typical (25°C)	1.2 V / 1.5 V	1.9	1.9	µA
VCCI/VJTAG = 2.5 V (per bank) Typical (25°C)	1.2 V / 1.5 V	2.2	2.2	µA
VCCI/VJTAG= 3.3 V (per bank) Typical (25°C)	1.2 V / 1.5 V	2.5	2.5	µA

*Note: *IDD = N_{BANKS} × ICCI. Values do not include I/O static contribution, which is shown in Table 2-13 on page 2-9 and Table 2-14 on page 2-10 (PDC6 and PDC7).*

Table 2-11 • **Quiescent Supply Current (IDD) Characteristics, IGLOOe Shutdown Mode***

	Core Voltage	AGLE600	AGLE3000	Units
Typical (25°C)	1.2 V / 1.5 V	0	0	µA

Table 2-12 • Quiescent Supply Current (IDD) Characteristics, No Flash*Freeze Mode[1]

	Core Voltage	AGLE600	AGLE3000	Units
ICCA Current[2]				
Typical (25°C)	1.2 V	28	89	µA
	1.5 V	82	320	µA
ICCI or IJTAG Current[3]				
VCCI/VJTAG = 1.2 V (per bank) Typical (25°C)	1.2 V	1.7	1.7	µA
VCCI/VJTAG = 1.5 V (per bank) Typical (25°C)	1.2 V / 1.5 V	1.8	1.8	µA
VCCI/VJTAG = 1.8 V (per bank) Typical (25°C)	1.2 V / 1.5 V	1.9	1.9	µA
VCCI/VJTAG = 2.5 V (per bank) Typical (25°C)	1.2 V / 1.5 V	2.2	2.2	µA
VCCI/VJTAG= 3.3 V (per bank) Typical (25°C)	1.2 V / 1.5 V	2.5	2.5	µA

Notes:

1. *IDD = N_{BANKS} × ICCI + ICCA. JTAG counts as one bank when powered.*
2. *Includes VCC and VPUMP and VCCPLL currents.*
3. *Values do not include I/O static contribution (PDC6 and PDC7).*

Power per I/O Pin

PDC5	Bank quiescent power (VCCI-dependent)	See Table 2-12 on page 2-8.	
PDC6	I/O input pin static power (standard-dependent)	See Table 2-13 on page 2-9.	
PDC7	I/O output pin static power (standard-dependent)	See Table 2-14 on page 2-10.	

Table 2-17 • Different Components Contributing to the Dynamic Power Consumption in IGLOOe Devices For IGLOOe V2 Devices, 1.2 V DC Core Supply Voltage

Parameter	Definition	Device-Specific Dynamic Contributions (µW/MHz)	
		AGLE600	AGLE3000
PAC1	Clock contribution of a Global Rib	12.61	8.17
PAC2	Clock contribution of a Global Spine	2.66	1.18
PAC3	Clock contribution of a VersaTile row	0.56	
PAC4	Clock contribution of a VersaTile used as a sequential module	0.071	
PAC5	First contribution of a VersaTile used as a sequential module	0.045	
PAC6	Second contribution of a VersaTile used as a sequential module	0.186	
PAC7	Contribution of a VersaTile used as a combinatorial module	0.109	
PAC8	Average contribution of a routing net	0.449	
PAC9	Contribution of an I/O input pin (standard-dependent)	See Table 2-9 on page 2-7.	
PAC10	Contribution of an I/O output pin (standard-dependent)	See Table 2-10 on page 2-7 and Table 2-11 on page 2-7.	
PAC11	Average contribution of a RAM block during a read operation	25.00	
PAC12	Average contribution of a RAM block during a write operation	30.00	
PAC13	Dynamic PLL contribution	2.10	

Note: For a different output load, drive strength, or slew rate, Microsemi recommends using the Microsemi power calculator or SmartPower in Libero SoC software.

Table 2-18 • Different Components Contributing to the Static Power Consumption in IGLOO Devices For IGLOOe V2 Devices, 1.2 V DC Core Supply Voltage

Parameter	Definition	Device Specific Static Power (mW)	
		AGLE600	AGLE3000
PDC1	Array static power in Active mode	See Table 2-12 on page 2-8.	
PDC2	Array static power in Static (Idle) mode	See Table 2-11 on page 2-7.	
PDC3	Array static power in Flash*Freeze mode	See Table 2-9 on page 2-7.	
PDC4	Static PLL contribution	0.90	
PDC5	Bank quiescent power (VCCI-dependent)	See Table 2-12 on page 2-8.	
PDC6	I/O input pin static power (standard-dependent)	See Table 2-13 on page 2-9.	
PDC7	I/O output pin static power (standard-dependent)	See Table 2-14 on page 2-10.	

Power Calculation Methodology

This section describes a simplified method to estimate power consumption of an application. For more accurate and detailed power estimations, use the SmartPower tool in the Libero SoC software.

The power calculation methodology described below uses the following variables:

- The number of PLLs as well as the number and the frequency of each output clock generated
- The number of combinatorial and sequential cells used in the design
- The internal clock frequencies
- The number and the standard of I/O pins used in the design
- The number of RAM blocks used in the design
- Toggle rates of I/O pins as well as VersaTiles—guidelines are provided in Table 2-19 on page 2-15.
- Enable rates of output buffers—guidelines are provided for typical applications in Table 2-20 on page 2-15.
- Read rate and write rate to the memory—guidelines are provided for typical applications in Table 2-20 on page 2-15. The calculation should be repeated for each clock domain defined in the design.

Methodology

Total Power Consumption—P_{TOTAL}

$P_{TOTAL} = P_{STAT} + P_{DYN}$

P_{STAT} is the total static power consumption.

P_{DYN} is the total dynamic power consumption.

Total Static Power Consumption—P_{STAT}

$P_{STAT} = (PDC1 \text{ or } PDC2 \text{ or } PDC3) + N_{BANKS} * PDC5 + N_{INPUTS} * PDC6 + N_{OUTPUTS} * P_{DC7}$

N_{INPUTS} is the number of I/O input buffers used in the design.

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

N_{BANKS} is the number of I/O banks powered in the design.

Total Dynamic Power Consumption—P_{DYN}

$P_{DYN} = P_{CLOCK} + P_{S\text{-}CELL} + P_{C\text{-}CELL} + P_{NET} + P_{INPUTS} + P_{OUTPUTS} + P_{MEMORY} + P_{PLL}$

Global Clock Contribution—P_{CLOCK}

$P_{CLOCK} = (PAC1 + N_{SPINE} * PAC2 + N_{ROW} * PAC3 + N_{S\text{-}CELL} * PAC4) * F_{CLK}$

N_{SPINE} is the number of global spines used in the user design—guidelines are provided in the "Spine Architecture" section of the Global Resources chapter in the *IGLOOe FPGA Fabric User's Guide*.

N_{ROW} is the number of VersaTile rows used in the design—guidelines are provided in the "Spine Architecture" section of the Global Resources chapter in the *IGLOOe FPGA Fabric User's Guide*.

F_{CLK} is the global clock signal frequency.

$N_{S\text{-}CELL}$ is the number of VersaTiles used as sequential modules in the design.

PAC1, PAC2, PAC3, and PAC4 are device-dependent.

Sequential Cells Contribution—$P_{S\text{-}CELL}$

$P_{S\text{-}CELL} = N_{S\text{-}CELL} * (PAC5 + \alpha_1 / 2 * PAC6) * F_{CLK}$

$N_{S\text{-}CELL}$ is the number of VersaTiles used as sequential modules in the design. When a multi-tile sequential cell is used, it should be accounted for as 1.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in Table 2-19 on page 2-15.

F_{CLK} is the global clock signal frequency.

Combinatorial Cells Contribution—$P_{C\text{-}CELL}$

$P_{C\text{-}CELL} = N_{C\text{-}CELL} * \alpha_1 / 2 * PAC7 * F_{CLK}$

$N_{C\text{-}CELL}$ is the number of VersaTiles used as combinatorial modules in the design.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in Table 2-19 on page 2-15.

F_{CLK} is the global clock signal frequency.

Routing Net Contribution—P_{NET}

$P_{NET} = (N_{S\text{-}CELL} + N_{C\text{-}CELL}) * \alpha_1 / 2 * PAC8 * F_{CLK}$

$N_{S\text{-}CELL}$ is the number of VersaTiles used as sequential modules in the design.

$N_{C\text{-}CELL}$ is the number of VersaTiles used as combinatorial modules in the design.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in Table 2-19 on page 2-15.

F_{CLK} is the global clock signal frequency.

I/O Input Buffer Contribution—P_{INPUTS}

$P_{INPUTS} = N_{INPUTS} * \alpha_2 / 2 * PAC9 * F_{CLK}$

N_{INPUTS} is the number of I/O input buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in Table 2-19 on page 2-15.

F_{CLK} is the global clock signal frequency.

I/O Output Buffer Contribution—$P_{OUTPUTS}$

$P_{OUTPUTS} = N_{OUTPUTS} * \alpha_2 / 2 * \beta_1 * PAC10 * F_{CLK}$

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in Table 2-19 on page 2-15.

β_1 is the I/O buffer enable rate—guidelines are provided in Table 2-20 on page 2-15.

F_{CLK} is the global clock signal frequency.

RAM Contribution—P_{MEMORY}

$P_{MEMORY} = PAC11 * N_{BLOCKS} * F_{READ\text{-}CLOCK} * \beta_2 + PAC12 * N_{BLOCK} * F_{WRITE\text{-}CLOCK} * \beta_3$

N_{BLOCKS} is the number of RAM blocks used in the design.

$F_{READ\text{-}CLOCK}$ is the memory read clock frequency.

β_2 is the RAM enable rate for read operations—guidelines are provided in Table 2-20 on page 2-15.

$F_{WRITE\text{-}CLOCK}$ is the memory write clock frequency.

β_3 is the RAM enable rate for write operations—guidelines are provided in Table 2-20 on page 2-15.

PLL Contribution—P_{PLL}

$P_{PLL} = PDC4 + PAC13 * F_{CLKOUT}$

F_{CLKOUT} is the output clock frequency.[1]

1. *If a PLL is used to generate more than one output clock, include each output clock in the formula by adding its corresponding contribution ($P_{AC13} * F_{CLKOUT}$ product) to the total PLL contribution.*

Guidelines

Toggle Rate Definition

A toggle rate defines the frequency of a net or logic element relative to a clock. It is a percentage. If the toggle rate of a net is 100%, this means that this net switches at half the clock frequency. Below are some examples:

- The average toggle rate of a shift register is 100% as all flip-flop outputs toggle at half of the clock frequency.
- The average toggle rate of an 8-bit counter is 25%:
  - Bit 0 (LSB) = 100%
  - Bit 1 = 50%
  - Bit 2 = 25%
  - …
  - Bit 7 (MSB) = 0.78125%
  - Average toggle rate = (100% + 50% + 25% + 12.5% + . . . + 0.78125%) / 8

Enable Rate Definition

Output enable rate is the average percentage of time during which tristate outputs are enabled. When nontristate output buffers are used, the enable rate should be 100%.

Table 2-19 • **Toggle Rate Guidelines Recommended for Power Calculation**

Component	Definition	Guideline
α_1	Toggle rate of VersaTile outputs	10%
α_2	I/O buffer toggle rate	10%

Table 2-20 • **Enable Rate Guidelines Recommended for Power Calculation**

Component	Definition	Guideline
β_1	I/O output buffer enable rate	100%
β_2	RAM enable rate for read operations	12.5%
β_3	RAM enable rate for write operations	12.5%

2.5 V LVCMOS	4 mA	16	18
	8 mA	32	37
	12 mA	65	74
	16 mA	83	87
	24 mA	169	124
1.8 V LVCMOS	2 mA	9	11
	4 mA	17	22
	6 mA	35	44
	8 mA	45	51
	12 mA	91	74
	16 mA	91	74
1.5 V LVCMOS	2 mA	13	16
	4 mA	25	33
	6 mA	32	39
	8 mA	66	55
	12 mA	66	55
1.2 V LVCMOS	2 mA	20	26
1.2 V LVCMOS Wide Range	100 µA	20	26
3.3 V PCI/PCIX	Per PCI/PCI-X Specification	Per PCI Curves	
3.3 V GTL	25 mA	268	181
2.5 V GTL	25 mA	169	124
3.3 V GTL+	35 mA	268	181
2.5 V GTL+	33 mA	169	124
HSTL (I)	8 mA	32	39
HSTL (II)	15 mA	66	55
SSTL2 (I)	15 mA	83	87
SSTL2 (II)	18 mA	169	124
SSTL3 (I)	14 mA	51	54
SSTL3 (II)	21 mA	103	109

Note: T_J = 100°C

The length of time an I/O can withstand IOSH/IOSL events depends on the junction temperature. The reliability data below is based on a 3.3 V, 36 mA I/O setting, which is the worst case for this type of analysis.

For example, at 100°C, the short current condition would have to be sustained for more than six months to cause a reliability concern. The I/O design does not contain any short circuit protection, but such protection would only be needed in extremely prolonged stress conditions.

Table 2-31 • **Duration of Short Circuit Event before Failure**

Temperature	Time before Failure
–40°C	> 20 years
0°C	> 20 years
25°C	> 20 years
70°C	5 years
85°C	2 years
100°C	6 months

Table 2-32 • **Schmitt Trigger Input Hysteresis**
Hysteresis Voltage Value (Typ.) for Schmitt Mode Input Buffers

Input Buffer Configuration	Hysteresis Value (typ.)
3.3 V LVTTL/LVCMOS/PCI/PCI-X (Schmitt trigger mode)	240 mV
2.5 V LVCMOS (Schmitt trigger mode)	140 mV
1.8 V LVCMOS (Schmitt trigger mode)	80 mV
1.5 V LVCMOS (Schmitt trigger mode)	60 mV
1.2 V LVCMOS (Schmitt trigger mode)	40 mV

Table 2-33 • **I/O Input Rise Time, Fall Time, and Related I/O Reliability***

Input Buffer	Input Rise/Fall Time (min.)	Input Rise/Fall Time (max.)	Reliability
LVTTL/LVCMOS (Schmitt trigger disabled)	No requirement	10 ns*	20 years (100°C)
LVTTL/LVCMOS (Schmitt trigger enabled)	No requirement	No requirement, but input noise voltage cannot exceed Schmitt hysteresis.	20 years (100°C)
HSTL/SSTL/GTL	No requirement	10 ns*	10 years (100°C)
LVDS/B-LVDS/M-LVDS/LVPECL	No requirement	10 ns*	10 years (100°C)

*Note: *The maximum input rise/fall time is related to the noise induced into the input buffer trace. If the noise is low, then the rise time and fall time of input buffers can be increased beyond the maximum value. The longer the rise/fall times, the more susceptible the input signal is to the board noise. Microsemi recommends signal integrity evaluation/characterization of the system to ensure that there is no excessive noise coupling into input signals.*

Single-Ended I/O Characteristics

3.3 V LVTTL / 3.3 V LVCMOS

Low-Voltage Transistor–Transistor Logic is a general purpose standard (EIA/JESD) for 3.3 V applications. It uses an LVTTL input buffer and push-pull output buffer. The 3.3 V LVCMOS standard is supported as part of the 3.3 V LVTTL support.

Table 2-34 • Minimum and Maximum DC Input and Output Levels

3.3 V LVTTL / 3.3 V LVCMOS	VIL		VIH		VOL	VOH	IOL	IOH	IOSH	IOSL	IIL[1]	IIH[2]
Drive Strength	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA	Max. mA[3]	Max. mA[3]	µA[4]	µA[4]
4 mA	–0.3	0.8	2	3.6	0.4	2.4	4	4	25	27	10	10
8 mA	–0.3	0.8	2	3.6	0.4	2.4	8	8	51	54	10	10
12 mA	–0.3	0.8	2	3.6	0.4	2.4	12	12	103	109	10	10
16 mA	–0.3	0.8	2	3.6	0.4	2.4	16	16	132	127	10	10
24 mA	–0.3	0.8	2	3.6	0.4	2.4	24	24	268	181	10	10

Notes:

1. *IIL is the input leakage current per I/O pin over recommended operation conditions where –0.3 V < VIN < VIL.*
2. *IIH is the input leakage current per I/O pin over recommended operating conditions VIH < VIN < VCCI. Input current is larger when operating outside recommended ranges.*
3. *Currents are measured at high temperature (100°C junction temperature) and maximum voltage.*
4. *Currents are measured at 85°C junction temperature.*
5. *Software default selection highlighted in gray.*

3.3 V GTL+

Gunning Transceiver Logic Plus is a high-speed bus standard (JESD8-3). It provides a differential amplifier input buffer and an open-drain output buffer. The VCCI pin should be connected to 3.3 V

Table 2-81 • Minimum and Maximum DC Input and Output Levels

3.3 V GTL+	VIL		VIH		VOL	VOH	IOL	IOH	IOSH	IOSL	IIL[1]	IIH[2]
Drive Strength	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA	Max. mA[3]	Max. mA[3]	µA[4]	µA[4]
35 mA	–0.3	VREF – 0.1	VREF + 0.1	3.6	0.6	–	35	35	268	181	10	10

Notes:

1. *IIL is the input leakage current per I/O pin over recommended operating conditions where –0.3 V < VIN < VIL.*
2. *IIH is the input leakage current per I/O pin over recommended operating conditions VIH < VIN < VCCI. Input current is larger when operating outside recommended ranges.*
3. *Currents are measured at high temperature (100°C junction temperature) and maximum voltage.*
4. *Currents are measured at 85°C junction temperature.*

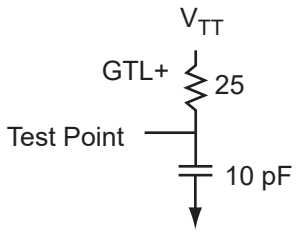

Figure 2-15 • AC Loading

Table 2-82 • AC Waveforms, Measuring Points, and Capacitive Loads

Input Low (V)	Input High (V)	Measuring Point* (V)	VREF (typ.) (V)	VTT (typ.) (V)	C_{LOAD} (pF)
VREF – 0.1	VREF + 0.1	1.0	1.0	1.5	10

*Note: *Measuring point = Vtrip. See Table 2-23 on page 2-23 for a complete table of trip points.*

Timing Characteristics

1.5 V DC Core Voltage

Table 2-83 • 3.3 V GTL+ – Applies to 1.5 V DC Core Voltage
Commercial-Case Conditions: T_J = 70°C, Worst-Case VCC = 1.425 V,
Worst-Case VCCI = 3.0 V VREF = 1.0 V

Speed Grade	t_{DOUT}	t_{DP}	t_{DIN}	t_{PY}	t_{EOUT}	t_{ZL}	t_{ZH}	t_{LZ}	t_{HZ}	t_{ZLS}	t_{ZHS}	Units

Differential I/O Characteristics

Physical Implementation

Configuration of the I/O modules as a differential pair is handled by the Microsemi Designer software when the user instantiates a differential I/O macro in the design.

Differential I/Os can also be used in conjunction with the embedded Input Register (InReg), Output Register (OutReg), Enable Register (EnReg), and DDR. However, there is no support for bidirectional I/Os or tristates with the LVPECL standards.

LVDS

Low-Voltage Differential Signaling (ANSI/TIA/EIA-644) is a high-speed, differential I/O standard. It requires that one data bit be carried through two signal lines, so two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in Figure 2-23. The building blocks of the LVDS transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVPECL implementation because the output standard specifications are different.

Along with LVDS I/O, IGLOOe also supports Bus LVDS structure and Multipoint LVDS (M-LVDS) configuration (up to 40 nodes).

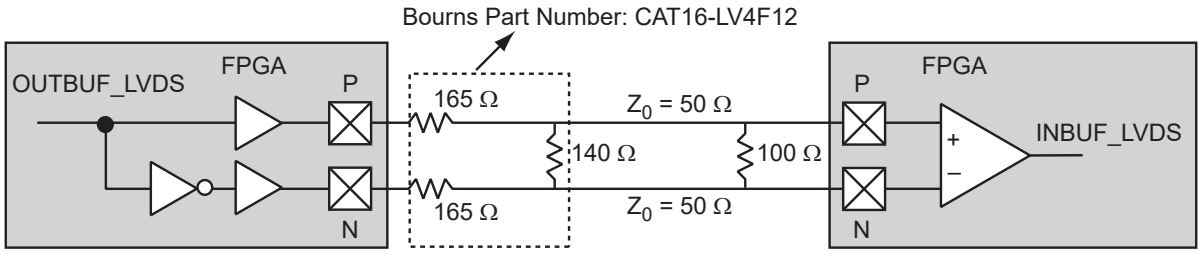

Figure 2-23 • **LVDS Circuit Diagram and Board-Level Implementation**

Table 2-113 • Minimum and Maximum DC Input and Output Levels

DC Parameter	Description	Min.	Typ.	Max.	Units
VCCI	Supply Voltage	2.375	2.5	2.625	V
VOL	Output Low Voltage	0.9	1.075	1.25	V
VOH	Output High Voltage	1.25	1.425	1.6	V
IOL[1]	Output Lower Current	0.65	0.91	1.16	mA
IOH[1]	Output High Current	0.65	0.91	1.16	mA
VI	Input Voltage	0		2.925	V
IIH[2,3]	Input High Leakage Current			10	µA
IIL[2,4]	Input Low Leakage Current			10	µA
VODIFF	Differential Output Voltage	250	350	450	mV
VOCM	Output Common Mode Voltage	1.125	1.25	1.375	V
VICM	Input Common Mode Voltage	0.05	1.25	2.35	V
VIDIFF	Input Differential Voltage	100	350		mV

Notes:

1. *IOL/IOH is defined by VODIFF/(resistor network).*
2. *Currents are measured at 85°C junction temperature.*
3. *IIH is the input leakage current per I/O pin over recommended operating conditions VIH < VIN < VCCI. Input current is larger when operating outside recommended ranges.*
4. *IIL is the input leakage current per I/O pin over recommended operating conditions where –0.3 V < VIN < VIL.*

Table 2-114 • AC Waveforms, Measuring Points, and Capacitive Loads

Input Low (V)	Input High (V)	Measuring Point* (V)	VREF (typ.) (V)
1.075	1.325	Cross point	–

*Note: *Measuring point = Vtrip. See Table 2-23 on page 2-23 for a complete table of trip points.*

Timing Characteristics

1.5 V DC Core Voltage

Table 2-115 • LVDS – Applies to 1.5 V DC Core Voltage
Commercial-Case Conditions: T_J = 70°C, Worst-Case VCC = 1.425 V, Worst-Case VCCI = 2.3 V

Speed Grade	t_{DOUT}	t_{DP}	t_{DIN}	t_{PY}	Units
Std.	0.98	1.77	0.19	1.62	ns

Note: For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.

1.2 V DC Core Voltage

Table 2-116 • LVDS – Applies to 1.2 V DC Core Voltage
Commercial-Case Conditions: T_J = 70°C, Worst-Case VCC = 1.14 V, Worst-Case VCCI = 2.3 V

Speed Grade	t_{DOUT}	t_{DP}	t_{DIN}	t_{PY}	Units
Std.	1.55	2.19	0.26	1.88	ns

Note: For specific junction temperature and voltage supply levels, refer to Table 2-7 on page 2-6 for derating values.

B-LVDS/M-LVDS

Bus LVDS (B-LVDS) and Multipoint LVDS (M-LVDS) specifications extend the existing LVDS standard to high-performance multipoint bus applications. Multidrop and multipoint bus configurations may contain any combination of drivers, receivers, and transceivers. Microsemi LVDS drivers provide the higher drive current required by B-LVDS and M-LVDS to accommodate the loading. The drivers require series terminations for better signal quality and to control voltage swing. Termination is also required at both ends of the bus since the driver can be located anywhere on the bus. These configurations can be implemented using the TRIBUF_LVDS and BIBUF_LVDS macros along with appropriate terminations. Multipoint designs using Microsemi LVDS macros can achieve up to 200 MHz with a maximum of 20 loads. A sample application is given in Figure 2-24. The input and output buffer delays are available in the LVDS section in Table 2-115 on page 2-63 and Table 2-116 on page 2-63.

Example: For a bus consisting of 20 equidistant loads, the following terminations provide the required differential voltage, in worst-case Industrial operating conditions, at the farthest receiver: R_S = 60 Ω and R_T = 70 Ω, given Z_0 = 50 Ω (2") and Z_{stub} = 50 Ω (~1.5").

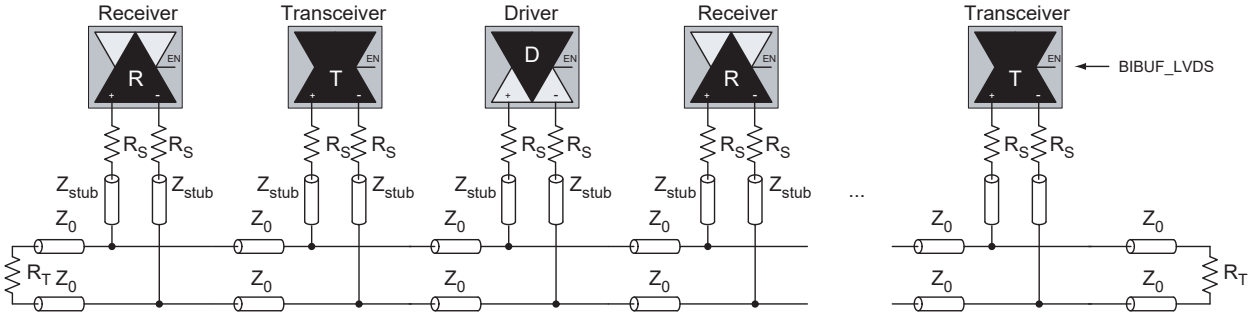

Figure 2-24 • **B-LVDS/M-LVDS Multipoint Application Using LVDS I/O Buffers**

LVPECL

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit be carried through two signal lines. Like LVDS, two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in Figure 2-25. The building blocks of the LVPECL transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVDS implementation because the output standard specifications are different.

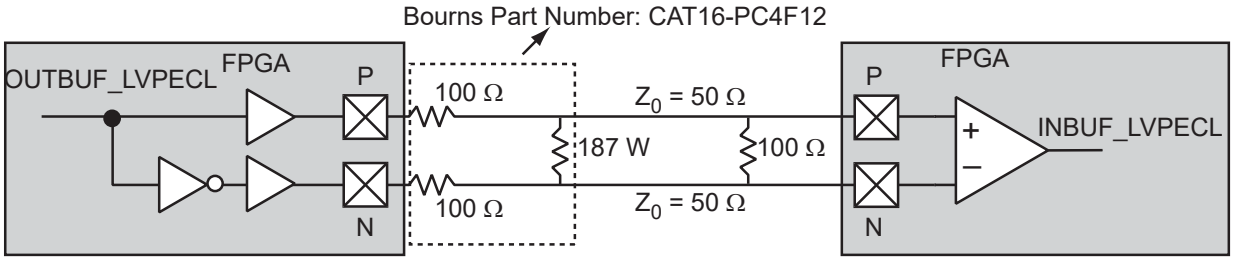

Figure 2-25 • **LVPECL Circuit Diagram and Board-Level Implementation**

Table 2-117 • Minimum and Maximum DC Input and Output Levels

DC Parameter	Description	Min.	Max.	Min.	Max.	Min.	Max.	Units
VCCI	Supply Voltage	3.0		3.3		3.6		V
VOL	Output Low Voltage	0.96	1.27	1.06	1.43	1.30	1.57	V
VOH	Output High Voltage	1.8	2.11	1.92	2.28	2.13	2.41	V
VIL, VIH	Input Low, Input High Voltages	0	3.6	0	3.6	0	3.6	V
VODIFF	Differential Output Voltage	0.625	0.97	0.625	0.97	0.625	0.97	V
VOCM	Output Common Mode Voltage	1.762	1.98	1.762	1.98	1.762	1.98	V
VICM	Input Common Mode Voltage	1.01	2.57	1.01	2.57	1.01	2.57	V
VIDIFF	Input Differential Voltage	300		300		300		mV

Table 2-118 • AC Waveforms, Measuring Points, and Capacitive Loads

Input LOW (V)	Input HIGH (V)	Measuring Point* (V)	VREF (typ.) (V)
1.64	1.94	Cross point	–

*Note: *Measuring point = Vtrip. See Table 2-23 on page 2-23 for a complete table of trip points.*

MUX2	Y = A !S + B S	t_{PD}	2.64	ns
AND3	Y = A · B · C	t_{PD}	2.10	ns

Note: For specific junction temperature and voltage supply levels, refer to Table 2-7 on page 2-6 for derating values.

VersaTile Specifications as a Sequential Module

The IGLOOe library offers a wide variety of sequential cells, including flip-flops and latches. Each has a data input and optional enable, clear, or preset. In this section, timing characteristics are presented for a representative sample from the library. For more details, refer to the *IGLOO, Fusion, and ProASIC3 Macro Library Guide*.

t_{CKMPWH}	Clock Minimum Pulse Width HIGH for the Core Register	0.95	ns
t_{CKMPWL}	Clock Minimum Pulse Width LOW for the Core Register	0.95	ns

Note: For specific junction temperature and voltage supply levels, refer to Table 2-7 on page 2-6 for derating values.

Global Resource Characteristics

AGLE600 Clock Tree Topology

Clock delays are device-specific. Figure 2-39 is an example of a global tree used for clock routing. The global tree presented in Figure 2-39 is driven by a CCC located on the west side of the AGLE600 device. It is used to drive all D-flip-flops in the device.

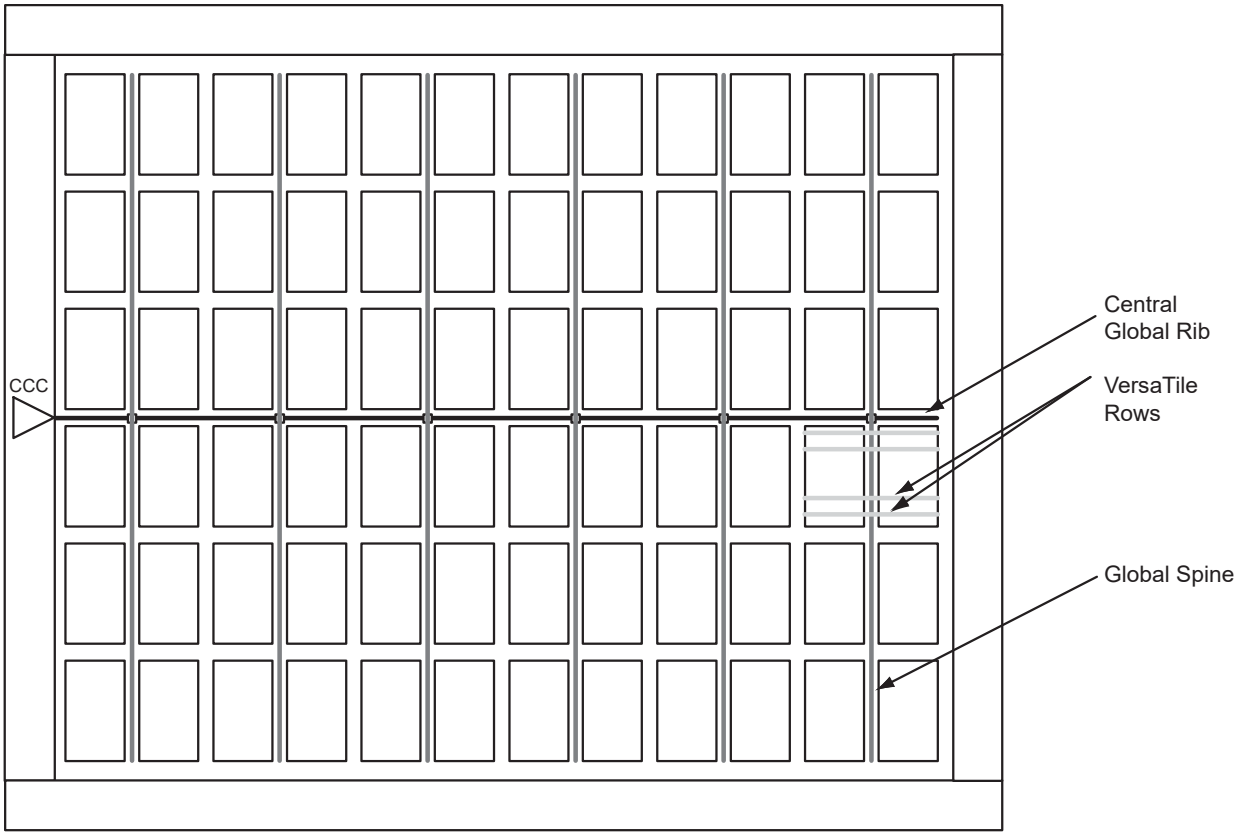

***Figure 2-39* • Example of Global Tree Use in an AGLE600 Device for Clock Routing**

Global Tree Timing Characteristics

Global clock delays include the central rib delay, the spine delay, and the row delay. Delays do not include I/O input buffer clock delays, as these are I/O standard–dependent, and the clock may be driven and conditioned internally by the CCC module. For more details on clock conditioning capabilities, refer to the "Clock Conditioning Circuits" section on page 2-91. Table 2-139 and Table 2-141 present minimum and maximum global clock delays within the device. Minimum and maximum delays are measured with minimum and maximum loading.

Timing Characteristics

1.5 V DC Core Voltage

Table 2-139 • AGLE600 Global Resource
Commercial-Case Conditions: T_J = 70°C, VCC = 1.425 V

Parameter	Description	Std.		Units
		Min.[1]	Max.[2]	
t_{RCKL}	Input Low Delay for Global Clock	1.48	1.82	ns
t_{RCKH}	Input High Delay for Global Clock	1.52	1.94	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock	1.18		ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock	1.15		ns
t_{RCKSW}	Maximum Skew for Global Clock		0.42	ns

Notes:

1. *Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).*
2. *Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).*
3. *For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.*

Table 2-140 • AGLE3000 Global Resource
Commercial-Case Conditions: T_J = 70°C, VCC = 1.425 V

Parameter	Description	Std.		Units
		Min.[1]	Max.[2]	
t_{RCKL}	Input Low Delay for Global Clock	2.00	2.34	ns
t_{RCKH}	Input High Delay for Global Clock	2.09	2.51	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock	1.18		ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock	1.15		ns
t_{RCKSW}	Maximum Skew for Global Clock		0.42	ns

Notes:

1. *Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).*
2. *Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).*
3. *For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.*

1.2 V DC Core Voltage

Table 2-141 • AGLE600 Global Resource
Commercial-Case Conditions: T_J = 70°C, VCC = 1.14 V

Parameter	Description	Std.		Units
		Min.[1]	Max.[2]	
t_{RCKL}	Input Low Delay for Global Clock	2.22	2.67	ns
t_{RCKH}	Input High Delay for Global Clock	2.32	2.93	ns
$t_{RCKMPWH}$	Minimum Pulse Width HIGH for Global Clock	1.40		ns
$t_{RCKMPWL}$	Minimum Pulse Width LOW for Global Clock	1.65		ns
t_{RCKSW}	Maximum Skew for Global Clock		0.61	ns

Notes:

1. *Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).*
2. *Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).*
3. *For specific junction temperature and voltage supply levels, refer to Table 2-7 on page 2-6 for derating values.*

Table 2-142 • AGLE3000 Global Resource
Commercial-Case Conditions: T_J = 70°C, VCC = 1.14 V

Parameter	Description	Std.		Units
		Min.[1]	Max.[2]	
t_{RCKL}	Input Low Delay for Global Clock	2.83	3.27	ns
t_{RCKH}	Input High Delay for Global Clock	3.00	3.61	ns
$t_{RCKMPWH}$	Minimum Pulse Width HIGH for Global Clock	1.40		ns
$t_{RCKMPWL}$	Minimum Pulse Width LOW for Global Clock	1.65		ns
t_{RCKSW}	Maximum Skew for Global Clock		0.61	ns

Notes:

1. *Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).*
2. *Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).*
3. *For specific junction temperature and voltage supply levels, refer to Table 2-7 on page 2-6 for derating values.*

Clock Conditioning Circuits

CCC Electrical Specifications

Timing Characteristics

Table 2-143 • IGLOOe CCC/PLL Specification
For IGLOOe V2 or V5 Devices, 1.5 V DC Core Supply Voltage

Parameter	Min.	Typ.	Max.	Units
Clock Conditioning Circuitry Input Frequency f_{IN_CCC}	1.5		250	MHz
Clock Conditioning Circuitry Output Frequency f_{OUT_CCC}	0.75		250	MHz
Serial Clock (SCLK) for Dynamic PLL[1]			100	MHz
Delay Increments in Programmable Delay Blocks [2, 3]		360[4]		ps
Number of Programmable Values in Each Programmable Delay Block			32	ns
Input Cycle-to-Cycle Jitter (peak magnitude)			1	
CCC Output Peak-to-Peak Period Jitter F_{CCC_OUT}	Max Peak-to-Peak Period Jitter			
	1 Global Network Used	External FB Used	3 Global Networks Used	
0.75 MHz to 24 MHz	0.50%	0.75%	0.70%	
24 MHz to 100 MHz	1.00%	1.50%	1.20%	
100 MHz to 250 MHz	2.50%	3.75%	2.75%	
Acquisition Time				
LockControl = 0			300	µs
LockControl = 1			6.0	ms
Tracking Jitter[5]				
LockControl = 0			2.5	ns
LockControl = 1			1.5	ns
Output Duty Cycle	48.5		51.5	%
Delay Range in Block: Programmable Delay 1 [2, 3, 6]	1.25		15.65	ns
Delay Range in Block: Programmable Delay 2 [2, 3, 6]	0.469		15.65	ns
Delay Range in Block: Fixed Delay [2, 3]		3.5		ns

Notes:

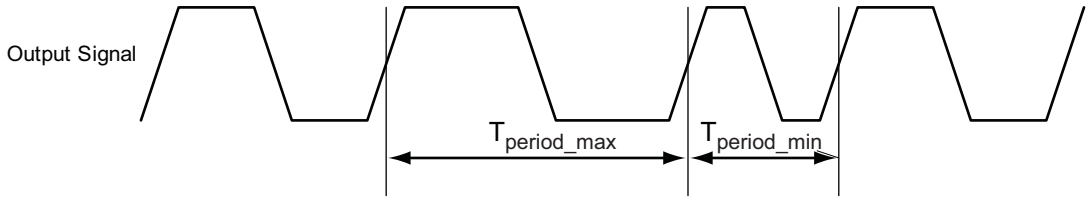
1. *Maximum value obtained for a Std. speed grade device in Worst Case Commercial Conditions. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.*
2. *This delay is a function of voltage and temperature. See Table 2-6 on page 2-6 and Table 2-7 on page 2-6 for deratings.*
3. *T_J = 25°C, VCC = 1.5 V*
4. *When the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available. Refer to the Libero SoC Online Help associated with the core for more information.*
5. *Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to the PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by the period jitter parameter.*
6. *For definitions of Type 1 and Type 2, refer to the PLL Block Diagram in the "Clock Conditioning Circuits in IGLOO and ProASIC3 Devices" chapter of the IGLOOe FPGA Fabric User's Guide.*

Table 2-144 • IGLOOe CCC/PLL Specification
For IGLOOe V2 Devices, 1.2 V DC Core Supply Voltage

Parameter	Min.	Typ.	Max.	Units
Clock Conditioning Circuitry Input Frequency f_{IN_CCC}	1.5		160	MHz
Clock Conditioning Circuitry Output Frequency f_{OUT_CCC}	0.75		160	MHz
Serial Clock (SCLK) for Dynamic PLL[1]			60	MHz
Delay Increments in Programmable Delay Blocks[2, 3]		580[4]		ps
Number of Programmable Values in Each Programmable Delay Block			32	
Input Cycle-to-Cycle Jitter (peak magnitude)			0.25	ns
CCC Output Peak-to-Peak Period Jitter F_{CCC_OUT}[5]	Max Peak-to-Peak Period Jitter			
	1 Global Network Used	External FB Used	3 Global Networks Used	
0.75 MHz to 24 MHz	0.50%	0.75%	0.70%	
24 MHz to 100 MHz	1.00%	1.50%	1.20%	
100 MHz to 160 MHz	2.50%	3.75%	2.75%	
Acquisition Time				
LockControl = 0			300	µs
LockControl = 1			6.0	ms
Tracking Jitter[6]				
LockControl = 0			4	ns
LockControl = 1			3	ns
Output Duty Cycle	48.5		51.5	%
Delay Range in Block: Programmable Delay 1[2, 3, 7]	2.3		20.86	ns
Delay Range in Block: Programmable Delay 2[2, 3, 7]	0.863		20.86	ns
Delay Range in Block: Fixed Delay[2, 3]		5.7		ns

Notes:

1. *Maximum value obtained for a Std. speed grade device in Worst Case Commercial Conditions. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.*
2. *This delay is a function of voltage and temperature. See Table 2-6 on page 2-6 and Table 2-7 on page 2-6 for deratings.*
3. *T_J = 25°C, VCC = 1.5 V*
4. *When the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available. Refer to the Libero SoC Online Help associated with the core for more information.*
5. *VCO output jitter is calculated as a percentage of the VCO frequency. The jitter (in ps) can be calculated by multiplying the VCO period by the per cent jitter. The VCO jitter (in ps) applies to CCC_OUT regardless of the output divider settings. For example, if the jitter on VCO is 300 ps, the jitter on CCC_OUT is also 300 ps, regardless of the output divider settings.*
6. *Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by period jitter parameter.*
7. *For definitions of Type 1 and Type 2, refer to the PLL Block Diagram in the "Clock Conditioning Circuits in IGLOO and ProASIC3 Devices" chapter of the IGLOOe FPGA Fabric User's Guide.*



Note: Peak-to-peak jitter measurements are defined by $T_{peak\text{-}to\text{-}peak} = T_{period\_max} - T_{period\_min}$.

3 – Pin Descriptions and Packaging

Supply Pins

GND **Ground**

Ground supply voltage to the core, I/O outputs, and I/O logic.

GNDQ **Ground (quiet)**

Quiet ground supply voltage to input buffers of I/O banks. Within the package, the GNDQ plane is decoupled from the simultaneous switching noise originated from the output buffer ground domain. This minimizes the noise transfer within the package and improves input signal integrity. GNDQ must always be connected to GND on the board.

VCC **Core Supply Voltage**

Supply voltage to the FPGA core, nominally 1.5 V for IGLOOe V5 devices, and 1.2 V or 1.5 V for IGLOOe V2 devices. VCC is required for powering the JTAG state machine in addition to VJTAG. Even when a device is in bypass mode in a JTAG chain of interconnected devices, both VCC and VJTAG must remain powered to allow JTAG signals to pass through the device.

For IGLOOe V2 devices, VCC can be switched dynamically from 1.2 V to 1.5 V or vice versa. This allows in-system programming (ISP) when VCC is at 1.5 V and the benefit of low power operation when VCC is at 1.2 V.

VCCIBx **I/O Supply Voltage**

Supply voltage to the bank's I/O output buffers and I/O logic. Bx is the I/O bank number. There are up to eight I/O banks on IGLOOe devices plus a dedicated VJTAG bank. Each bank can have a separate VCCI connection. All I/Os in a bank will run off the same VCCIBx supply. VCCI can be 1.2 V, 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VCCI pins tied to GND.

VMVx **I/O Supply Voltage (quiet)**

Quiet supply voltage to the input buffers of each I/O bank. *x* is the bank number. Within the package, the VMV plane biases the input stage of the I/Os in the I/O banks. This minimizes the noise transfer within the package and improves input signal integrity. Each bank must have at least one VMV connection, and no VMV should be left unconnected. All I/Os in a bank run off the same VMVx supply. VMV is used to provide a quiet supply voltage to the input buffers of each I/O bank. VMVx can be 1.2 V, 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VMV pins tied to GND. VMV and VCCI should be at the same voltage within a given I/O bank. Used VMV pins must be connected to the corresponding VCCI pins of the same bank (i.e., VMV0 to VCCIB0, VMV1 to VCCIB1, etc.).

VCCPLA/B/C/D/E/F **PLL Supply Voltage**

Supply voltage to analog PLL, nominally 1.5 V or 1.2 V, depending on the device.

- 1.5 V for IGLOOe devices
- 1.2 V or 1.5 V for IGLOOe V2 devices

When the PLLs are not used, the place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground. Microsemi recommends tying VCCPLx to VCC and using proper filtering circuits to decouple VCC noise from the PLLs. Refer to the PLL Power Supply Decoupling section in the "Clock Conditioning Circuits in Low Power Flash FPGAs and Mixed Signal FPGAs" chapter in the *IGLOOe FPGA Fabric User's Guide* for a complete board solution for the PLL analog power supply and ground.

There are six VCCPLX pins on IGLOOe devices.

VCOMPLA/B/C/D/E/F PLL Ground

Ground to analog PLL power supplies. When the PLLs are not used, the place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground.

There are six VCOMPL pins (PLL ground) on IGLOOe devices.

VJTAG JTAG Supply Voltage

Low power flash devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to GND. It should be noted that VCC is required to be powered for JTAG operation; VJTAG alone is insufficient. If a device is in a JTAG chain of interconnected boards, the board containing the device can be powered down, provided both VJTAG and VCC to the part remain powered; otherwise, JTAG signals will not be able to transition the device, even in bypass mode.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

VPUMP Programming Supply Voltage

IGLOOe devices support single-voltage ISP of the configuration flash and FlashROM. For programming, VPUMP should be 3.3 V nominal. During normal device operation, VPUMP can be left floating or can be tied (pulled up) to any voltage between 0 V and the VPUMP maximum. Programming power supply voltage (VPUMP) range is listed in the datasheet.

When the VPUMP pin is tied to ground, it will shut off the charge pump circuitry, resulting in no sources of oscillation from the charge pump circuitry.

For proper programming, 0.01 µF and 0.33 µF capacitors (both rated at 16 V) are to be connected in parallel across VPUMP and GND, and positioned as close to the FPGA pins as possible.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

User-Defined Supply Pins

VREF I/O Voltage Reference

Reference voltage for I/O minibanks. VREF pins are configured by the user from regular I/Os, and any I/O in a bank, except JTAG I/Os, can be designated the voltage reference I/O. Only certain I/O standards require a voltage reference—HSTL (I) and (II), SSTL2 (I) and (II), SSTL3 (I) and (II), and GTL/GTL+. One VREF pin can support the number of I/Os available in its minibank.

User Pins

I/O **User Input/Output**

The I/O pin functions as an input, output, tristate, or bidirectional buffer. Input and output signal levels are compatible with the I/O standard selected.

During programming, I/Os become tristated and weakly pulled up to VCCI. With VCCI, VMV, and VCC supplies continuously powered up, when the device transitions from programming to operating mode, the I/Os are instantly configured to the desired user configuration.

Unused I/Os are configured as follows:

- Output buffer is disabled (with tristate value of high impedance)
- Input buffer is disabled (with tristate value of high impedance)
- Weak pull-up is programmed

GL **Globals**

GL I/Os have access to certain clock conditioning circuitry (and the PLL) and/or have direct access to the global network (spines). Additionally, the global I/Os can be used as regular I/Os, since they have identical capabilities. Unused GL pins are configured as inputs with pull-up resistors.

See more detailed descriptions of global I/O connectivity in the "Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs" chapter of the *IGLOOe FPGA Fabric User's Guide*. All inputs labeled GC/GF are direct inputs into the quadrant clocks. For example, if GAA0 is used for an input, GAA1 and GAA2 are no longer available for input to the quadrant globals. All inputs labeled GC/GF are direct inputs into the chip-level globals, and the rest are connected to the quadrant globals. The inputs to the global network are multiplexed, and only one input can be used as a global input.

Refer to the I/O Structure section of the *IGLOOe FPGA Fabric User's Guide* for an explanation of the naming of global pins.

FF **Flash*Freeze Mode Activation Pin**

Flash*Freeze mode is available on IGLOOe devices. The FF pin is a dedicated input pin used to enter and exit Flash*Freeze mode. The FF pin is active low, has the same characteristics as a single-ended I/O, and must meet the maximum rise and fall times. When Flash*Freeze mode is not used in the design, the FF pin is available as a regular I/O. The FF pin can be configured as a Schmitt trigger input.

When Flash*Freeze mode is used, the FF pin must not be left floating to avoid accidentally entering Flash*Freeze mode. While in Flash*Freeze mode, the Flash*Freeze pin should be constantly asserted.

The Flash*Freeze pin can be used with any single-ended I/O standard supported by the I/O bank in which the pin is located, and input signal levels compatible with the I/O standard selected. The FF pin should be treated as a sensitive asynchronous signal. When defining pin placement and board layout, simultaneously switching outputs (SSOs) and their effects on sensitive asynchronous pins must be considered.

Unused FF or I/O pins are tristated with weak pull-up. This default configuration applies to both Flash*Freeze mode and normal operation mode. No user intervention is required.

Table 3-1 shows the Flash*Freeze pin location on the available packages. The Flash*Freeze pin location is independent of device (except for a PQ208 package), allowing migration to larger or smaller IGLOO devices while maintaining the same pin location on the board. Refer to the "Flash*Freeze Technology and Low Power Modes" chapter of the *IGLOOe FPGA Fabric User's Guide* for more information on I/O states during Flash*Freeze mode.

***Table 3-1* • Flash*Freeze Pin Locations for IGLOOe Devices**

Package	Flash*Freeze Pin
FG256	T3
FG484	W6

JTAG Pins

Low power flash devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). VCC must also be powered for the JTAG state machine to operate, even if the device is in bypass mode; VJTAG alone is insufficient. Both VJTAG and VCC to the part must be supplied to allow JTAG signals to transition the device. Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to GND.

TCK Test Clock

Test clock input for JTAG boundary scan, ISP, and UJTAG. The TCK pin does not have an internal pull-up/-down resistor. If JTAG is not used, Microsemi recommends tying off TCK to GND through a resistor placed close to the FPGA pin. This prevents JTAG operation in case TMS enters an undesired state.

Note that to operate at all VJTAG voltages, 500 Ω to 1 kΩ will satisfy the requirements. Refer to Table 3-2 for more information.

***Table 3-2* • Recommended Tie-Off Values for the TCK and TRST Pins**

VJTAG	Tie-Off Resistance [1,2]
VJTAG at 3.3 V	200 Ω to 1 kΩ
VJTAG at 2.5 V	200 Ω to 1 kΩ
VJTAG at 1.8 V	500 Ω to 1 kΩ
VJTAG at 1.5 V	500 Ω to 1 kΩ

Notes:

1. *The TCK pin can be pulled-up or pulled-down.*
2. *The TRST pin is pulled-down.*
3. *Equivalent parallel resistance if more than one device is on the JTAG chain*

Table 3-3 • **TRST and TCK Pull-Down Recommendations**

VJTAG	Tie-Off Resistance*
VJTAG at 3.3 V	200 Ω to 1 kΩ
VJTAG at 2.5 V	200 Ω to 1 kΩ
VJTAG at 1.8 V	500 Ω to 1 kΩ
VJTAG at 1.5 V	500 Ω to 1 kΩ

Note: Equivalent parallel resistance if more than one device is on the JTAG chain

TDI **Test Data Input**

Serial input for JTAG boundary scan, ISP, and UJTAG usage. There is an internal weak pull-up resistor on the TDI pin.

TDO **Test Data Output**

Serial output for JTAG boundary scan, ISP, and UJTAG usage.

TMS **Test Mode Select**

The TMS pin controls the use of the IEEE 1532 boundary scan pins (TCK, TDI, TDO, TRST). There is an internal weak pull-up resistor on the TMS pin.

TRST **Boundary Scan Reset Pin**

The TRST pin functions as an active-low input to asynchronously initialize (or reset) the boundary scan circuitry. There is an internal weak pull-up resistor on the TRST pin. If JTAG is not used, an external pull-down resistor could be included to ensure the test access port (TAP) is held in reset mode. The resistor values must be chosen from Table 3-2 and must satisfy the parallel resistance value requirement. The values in Table 3-2 correspond to the resistor recommended when a single device is used, and the equivalent parallel resistor when multiple devices are connected via a JTAG chain.

In critical applications, an upset in the JTAG circuit could allow entrance to an undesired JTAG state. In such cases, Microsemi recommends tying off TRST to GND through a resistor placed close to the FPGA pin.

Note that to operate at all VJTAG voltages, 500 Ω to 1 kΩ will satisfy the requirements.

Special Function Pins

NC **No Connect**

This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

DC **Do Not Connect**

This pin should not be connected to any signals on the PCB. These pins should be left unconnected.

Packaging

Semiconductor technology is constantly shrinking in size while growing in capability and functional integration. To enable next-generation silicon technologies, semiconductor packages have also evolved to provide improved performance and flexibility.

Microsemi consistently delivers packages that provide the necessary mechanical and environmental protection to ensure consistent reliability and performance. Microsemi IC packaging technology efficiently supports high-density FPGAs with large-pin-count Ball Grid Arrays (BGAs), but is also flexible enough to accommodate stringent form factor requirements for Chip Scale Packaging (CSP). In addition, Microsemi offers a variety of packages designed to meet your most demanding application and economic requirements for today's embedded and mobile systems.

5 – Datasheet Information

List of Changes

The following table lists critical changes that were made in each revision of the IGLOOe datasheet.

Revision	Changes	Page
Revision 14 (October 2019)	All references to FBGA package FG896 have been removed from this document.	
	The maximum user I/Os specification in "Features and Benefits" and Table 1 • IGLOOe Product Family were revised to reflect current specifications.	I
	The maximum user I/Os specification in "General Description" section was revised to reflect current specifications.	
	The "IGLOOe Ordering Information" and "Temperature Grade Offerings" section ambient temperature specifications were revised to reflect junction temperature specifications.	III, IV
	Ambient Temperature specifications have been removed from Table 2-2 • Recommended Operating Conditions [1]. Note 2 was added.	2-2
Revision 13 (December 2012)	The "IGLOOe Ordering Information" section has been updated to mention "Y" as "Blank" mentioning "Device Does Not Include License to Implement IP Based on the Cryptography Research, Inc. (CRI) Patent Portfolio" (SAR 43176). Also added the missing heading 'Supply Voltage' under V2.	III
	The note in Table 2-143 • IGLOOe CCC/PLL Specification and Table 2-144 • IGLOOe CCC/PLL Specification referring the reader to SmartGen was revised to refer instead to the online help associated with the core (SAR 42568).	2-91, 2-92
	Live at Power-Up (LAPU) has been replaced with 'Instant On'.	NA
Revision 12 (September 2012)	The "Security" section was modified to clarify that Microsemi does not support read-back of programmed data.	1-2
	Libero Integrated Design Environment (IDE) was changed to Libero System-on-Chip (SoC) throughout the document (SAR 40272).	N/A

Revision	Changes	Page
Revision 11 (August 2012)	The drive strength, IOL, and IOH value for 3.3 V GTL and 2.5 V GTL was changed from 25 mA to 20 mA in the following tables (SAR 37180): Table 2-21 • Summary of Maximum and Minimum DC Input and Output Levels, Table 2-25 • Summary of I/O Timing Characteristics—Software Default Settings Table 2-26 • Summary of I/O Timing Characteristics—Software Default Settings Table 2-28 • I/O Output Buffer Maximum Resistances[1] Table 2-73 • Minimum and Maximum DC Input and Output Levels Table 2-77 • Minimum and Maximum DC Input and Output Levels Also added note stating "*Output drive strength is below JEDEC specification.*" for Tables 2-25, 2-26, and 2-28. Additionally, the IOL and IOH values for 3.3 V GTL+ and 2.5 V GTL+ were corrected from 51 to 35 (for 3.3 V GTL+) and from 40 to 33 (for 2.5 V GTL+) in table Table 2-21 (SAR 39713).	 2-20 2-25 2-26 2-28 2-51 2-53
	In Table 2-117 • Minimum and Maximum DC Input and Output Levels, VIL and VIH were revised so that the maximum is 3.6 V for all listed values of VCCI (SAR 37183).	2-65
	The following sentence was removed from the "VMVx I/O Supply Voltage (quiet)" section in the "Pin Descriptions and Packaging" section: "Within the package, the VMV plane is decoupled from the simultaneous switching noise originating from the output buffer VCCI domain" and replaced with “Within the package, the VMV plane biases the input stage of the I/Os in the I/O banks” (SAR 38318). The datasheet mentions that "VMV pins must be connected to the corresponding VCCI pins" for an ESD enhancement.	3-1

Revision	Changes	Page
Revision 10 (April 2012)	In Table 2-2 • Recommended Operating Conditions [1], VPUMP programming voltage for operation was changed from "0 to 3.45 V" to "0 to 3.6 V" (SAR 32256). Values for VCCPLL at 1.2–1.5 V DC core supply voltage were changed from "1.14 to 1.26 V" to "1.14 to 1.575 V" (SAR 34701).	2-2
	The tables in the "Quiescent Supply Current" section were updated with revised notes on IDD. Table 2-8 • Power Supply State per Mode is new (SARs 34745, 36949).	2-7
	t_{DOUT} was corrected to t_{DIN} in Figure 2-4 • Input Buffer Timing Model and Delays (example) (SAR 37105).	2-17
	"TBD" for 3.3 V LVCMOS Wide Range in Table 2-28 • I/O Output Buffer Maximum Resistances[1] and Table 2-30 • I/O Short Currents IOSH/IOSL was replaced by "Same as regular 3.3 V LVCMOS" (SAR 33855). Values were also added for 1.2 V LVCMOS and 1.2 V LVCMOS Wide Range.	2-28, 2-30
	The formulas in the table notes for Table 2-29 • I/O Weak Pull-Up/Pull-Down Resistances were corrected (SAR 34753).	2-29
	IOSH and IOSL values were added to 3.3 V LVCMOS Wide Range Table 2-40 • Minimum and Maximum DC Input and Output Levels, 1.2 V LVCMOS Table 2-64 • Minimum and Maximum DC Input and Output Levels, and 1.2 V LVCMOS Wide Range Table 2-68 • Minimum and Maximum DC Input and Output Levels (SAR 33855).	2-35, 2-47, 2-48
	Figure 2-48 • FIFO Read and Figure 2-49 • FIFO Write have been added (SAR 34844).	2-103
	Values for $F_{DDRIMAX}$ and F_{DDOMAX} were added to the tables in the Input DDR "Timing Characteristics" section and Output DDR "Timing Characteristics" section (SAR 34802).	2-77,2-81
	Minimum pulse width High and Low values were added to the tables in the "Global Tree Timing Characteristics" section. The maximum frequency for global clock parameter was removed from these tables because a frequency on the global is only an indication of what the global network can do. There are other limiters such as the SRAM, I/Os, and PLL. SmartTime software should be used to determine the design frequency (SAR 36952).	2-89
Revision 9 (March 2012)	The "In-System Programming (ISP) and Security" section and "Security" section were revised to clarify that although no existing security measures can give an absolute guarantee, Microsemi FPGAs implement the best security available in the industry (SAR 34665).	I, 1-2
	The Y security option and Licensed DPA Logo were added to the "IGLOOe Ordering Information" section. The trademarked Licensed DPA Logo identifies that a product is covered by a DPA counter-measures license from Cryptography Research (SAR 34725).	III
	The following sentence was removed from the "Advanced Architecture" section: "In addition, extensive on-chip programming circuitry allows for rapid, single-voltage (3.3 V) programming of IGLOOe devices via an IEEE 1532 JTAG interface" (SAR 34685).	1-3
	The "Specifying I/O States During Programming" section is new (SAR 34696).	1-7
	Values for VCCPLL at 1.5 V DC core supply voltage were changed from "1.4 to 1.6 V" to "1.425 to 1.575 V" in Table 2-2 • Recommended Operating Conditions [1] (SAR 32292).	2-2
	The reference to guidelines for global spines and VersaTile rows, given in the "Global Clock Contribution—P_{CLOCK}" section, was corrected to the "Spine Architecture" section of the Global Resources chapter in the *IGLOOe FPGA Fabric User's Guide* (SAR 34731).	2-13

Revision	Changes	Page
Revision 9 (continued)	The example in the paragraph above Table 2-31 • Duration of Short Circuit Event before Failure was revised to change the maximum temperature from 110°C to 100°C, with an example of six months instead of three months (SAR 32287).	2-31
	The notes regarding drive strength in the "Summary of I/O Timing Characteristics – Default I/O Software Settings" section, "3.3 V LVCMOS Wide Range" section and "1.2 V LVCMOS Wide Range" section tables were revised for clarification. They now state that the minimum drive strength for the default software configuration when run in wide range is ±100 µA. The drive strength displayed in software is supported in normal range only. For a detailed I/V curve, refer to the IBIS models (SAR 34766).	2-23, 2-35, 2-48
	The AC Loading figures in the "Single-Ended I/O Characteristics" section were updated to match tables in the "Summary of I/O Timing Characteristics – Default I/O Software Settings" section (SAR 34886).	2-32
	The following sentence was deleted from the "2.5 V LVCMOS" section (SAR 34793): "It uses a 5 V–tolerant input buffer and push-pull output buffer."	2-38
	Table 2-143 • IGLOOe CCC/PLL Specification and Table 2-144 • IGLOOe CCC/PLL Specification were updated. A note was added to both tables indicating that when the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available (SAR 34818).	2-91, 2-92
	The following figures were deleted. Reference was made to a new application note, *Simultaneous Read-Write Operations in Dual-Port SRAM for Flash-Based cSoCs and FPGAs*, which covers these cases in detail (SAR 34869). Figure 2-46 • Write Access after Write onto Same Address Figure 2-47 • Read Access after Write onto Same Address Figure 2-48 • Write Access after Read onto Same Address The port names in the SRAM "Timing Waveforms", SRAM "Timing Characteristics" tables, Figure 2-50 • FIFO Reset, and the FIFO "Timing Characteristics" tables were revised to ensure consistency with the software names (SAR 35749).	2-95, 2-98, 2-104, 2-106
	The "Pin Descriptions and Packaging" chapter is new (SAR 34768).	3-1
	Package names used in the "Package Pin Assignments" section were revised to match standards given in *Package Mechanical Drawings* (SAR 34768)	4-1
July 2010	The versioning system for datasheets has been changed. Datasheets are assigned a revision number that increments each time the datasheet is revised. The "IGLOOe Device Status" table on page II indicates the status for each device in the device family.	N/A

Revision	Changes	Page
Revision 8 (Nov 2009)	The version changed to v2.0 for IGLOOe datasheet chapters, indicating the datasheet contains information based on final characterization.	N/A
Product Brief v2.0	The "Pro (Professional) I/O" section was revised to add "Hot-swappable and cold-sparing I/Os."	I
	The "Reprogrammable Flash Technology" section was revised to add "250 MHz (1.5 V systems) and 160 MHz (1.2 V systems) System Performance."	I
	Definitions of hot-swap and cold-sparing were added to the "Pro I/Os with Advanced I/O Standards" section.	1-7
DC and Switching Characteristics v2.0	3.3 V LVCMOS and 1.2 V LVCMOS Wide Range support was added to the datasheet. This affects all tables that contained 3.3 V LVCMOS and 1.2 V LVCMOS data.	N/A

Revision	Changes	Page
	IIL and IIH input leakage current information was added to all "Minimum and Maximum DC Input and Output Levels" tables.	N/A
	Values for 1.2 V wide range DC core supply voltage were added to Table 2-2 • Recommended Operating Conditions [1]. Table notes regarding 3.3 V wide range and the core voltage required for programming were added to the table.	2-2
	The data in Table 2-6 • Temperature and Voltage Derating Factors for Timing Delays (1.5 V DC core supply voltage) and Table 2-7 • Temperature and Voltage Derating Factors for Timing Delays (1.2 V DC core supply voltage) was revised.	2-6
	3.3 V LVCMOS wide range data was included in Table 2-13 • Summary of I/O Input Buffer Power (per pin) – Default I/O Software Settings and Table 2-14 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings[1]. Table notes were added in connection with this data.	2-9, 2-10
	The temperature was revised from 110ºC to 100ºC in Table 2-31 • Duration of Short Circuit Event before Failure and Table 2-33 • I/O Input Rise Time, Fall Time, and Related I/O Reliability*.	2-31, 2-31
	The tables in the "Overview of I/O Performance" section and "Detailed I/O DC Characteristics" sectionwere revised to include 3.3 V LVCMOS and 1.2 V LVCMOS wide range.	2-20, 2-28
	Most tables were updated in the following sections, revising existing values and adding information for 3.3 V and 1.2 V wide range: "Single-Ended I/O Characteristics" "Voltage-Referenced I/O Characteristics" "Differential I/O Characteristics"	2-32, 2-51, 2-62
	The value for "Delay range in block: fixed delay" was revised in Table 2-143 • IGLOOe CCC/PLL Specification and Table 2-144 • IGLOOe CCC/PLL Specification.	2-91, 2-92
	The timing characteristics tables for RAM4K9 and RAM512X18 were updated, including renaming of the address collision parameters.	2-98 – 2-101
Revision 7 (Apr 2009) Product Brief v1.4 DC and Switching Characteristics Advance v0.4	The –F speed grade is no longer offered for IGLOOe devices and was removed from the documentation. The speed grade column and note regarding –F speed grade were removed from "IGLOOe Ordering Information". The "Speed Grade and Temperature Grade Matrix" section was removed.	III, IV

Revision	Changes	Page
Revision 6 (Feb 2009) Product Brief v1.3	The "Pro (Professional) I/O" section was revised to add two bullets regarding wide range power supply voltage support.	I
	3.0 V was added to the list of supported voltages in the "Pro I/Os with Advanced I/O Standards" section. The "Wide Range I/O Support" section is new.	1-7
Revision 5 (Oct 2008) Product Brief v1.2	The Quiescent Current values in Table 1 • IGLOOe Product Family table were updated.	I
Revision 4 (Jul 2008) Product Brief v1.1 DC and Switching Characteristics Advance v0.3	As a result of the Libero IDE v8.4 release, Actel now offers a wide range of core voltage support. The document was updated to change 1.2 V / 1.5 V to 1.2 V to 1.5 V.	N/A
Revision 3 (Jun 2008) DC and Switching Characteristics Advance v0.2	Tables have been updated to reflect default values in the software. The default I/O capacitance is 5 pF. Tables have been updated to include the LVCMOS 1.2 V I/O set. DDR Tables have two additional data points added to reflect both edges for Input DDR setup and hold time. The power data table has been updated to match SmartPower data rather then simulation values.	N/A
	Table 2-144 • IGLOOe CCC/PLL Specification was updated to add VMV to the VCCI parameter row and remove the word "output" from the parameter description for VCCI. Table note 3 was added.	2-92
	Table 2-2 • Recommended Operating Conditions [1] was updated to include the T_J parameter. Table note 9 is new.	2-2
	In Table 2-3 • Flash Programming Limits – Retention, Storage, and Operating Temperature1, the maximum operating junction temperature was changed from 110° to 100°.	2-3
	VMV was removed from Table 2-4 • Overshoot and Undershoot Limits 1, 3. The title of the table was revised to remove "as measured on quiet I/Os." Table note 2 was revised to remove "estimated SSO density over cycles." Table note 3 was deleted.	2-3
	The "PLL Behavior at Brownout Condition" section is new.	2-4
	Figure 2-2 • V2 Devices – I/O State as a Function of VCCI and VCC Voltage Levels is new.	2-5
	EQ 2 was updated. The temperature was changed to 100°C, and therefore the end result changed.	2-6
	The table notes for Table 2-9 • Quiescent Supply Current (IDD), IGLOOe Flash*Freeze Mode*, Table 2-10 • Quiescent Supply Current (IDD) Characteristics, IGLOOe Sleep Mode*, and Table 2-11 • Quiescent Supply Current (IDD) Characteristics, IGLOOe Shutdown Mode* were updated to remove VMV and include PDC6 and PDC7. VCCI and VJTAG were removed from the statement about IDD in the table note for Table 2-11 • Quiescent Supply Current (IDD) Characteristics, IGLOOe Shutdown Mode*.	2-7
	Note 2 of Table 2-12 • Quiescent Supply Current (IDD) Characteristics, No Flash*Freeze Mode[1] was updated to include VCCPLL. Note 4 was updated to include PDC6 and PDC7.	2-8
	Table note 3 was added to Table 2-13 • Summary of I/O Input Buffer Power (per pin) – Default I/O Software Settings and referenced for 1.2 V LVCMOS.	2-9

Revision	Changes	Page
Revision 3 (cont'd)	Table 2-14 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings[1] was updated to change PDC3 to PDC7. The table notes were updated to reflect that power was measured on VCCI. Table note 4 is new.	2-10
	Table 2-16 • Different Components Contributing to the Static Power Consumption in IGLOO Devices and Table 2-18 • Different Components Contributing to the Static Power Consumption in IGLOO Devices were updated to add PDC6 and PDC7, and to change the definition for PDC5 to bank quiescent power.	2-11, 2-12
	A table subtitle was added for Table 2-18 • Different Components Contributing to the Static Power Consumption in IGLOO Devices.	2-12
	The "Total Static Power Consumption—P_{STAT}" section was updated to revise the calculation of P_{STAT}, including PDC6 and PDC7.	2-13
	Footnote 1 was updated to include information about P_{AC13}. The PLL Contribution equation was changed from: $P_{PLL} = P_{AC13} + P_{AC14} * FCLKOUT$ to $PPLL = P_{DC4} + P_{AC13} * F_{CLKOUT}$.	2-14
	The "Timing Model" was updated to be consistent with the revised timing numbers.	2-16
	In Table 2-22 • Summary of Maximum and Minimum DC Input Levels, T_J was changed to T_A in notes 1 and 2.	2-22
	Table 2-22 • Summary of Maximum and Minimum DC Input Levels was updated to included a hysteresis value for 1.2 V LVCMOS (Schmitt trigger mode).	2-22
	All AC Loading figures for single-ended I/O standards were changed from Datapaths at 35 pF to 5 pF.	N/A
	The "1.2 V LVCMOS (JESD8-12A)" section is new.	2-47
Revision 2 (Jun 2008) Product Brief v1.0	The product brief section of the datasheet was divided into two sections and given a version number, starting at v1.0. The first section of the document includes features, benefits, ordering information, and temperature and speed grade offerings. The second section is a device family overview.	N/A
Revision 2 (cont'd) Packaging v1.1	The naming conventions changed for the following pins in the "FG484" for the A3GLE600: Pin Number — New Function Name J19 — IO45PPB2V1 K20 — IO45NPB2V1 M2 — IO114NPB6V1 N1 — IO114PPB6V1 N4 — GFC2/IO115PPB6V1 P3 — IO115NPB6V1	N/A
Revision 1 (Mar 2008) Product Brief rev. 1	The "Low Power" section was updated to change "1.2 V and 1.5 V Core Voltage" to "1.2 V and 1.5 V Core and I/O Voltage." The text "(from 25 µW)" was removed from "Low Power Active FPGA Operation." 1.2_V was added to the list of core and I/O voltages in the "Pro (Professional) I/O" and "Pro I/Os with Advanced I/O Standards" section sections.	I I, 1-7
Revision 0 (Jan 2008)	This document was previously in datasheet Advance v0.4. As a result of moving to the handbook format, Actel has restarted the version numbers. The new version number is 51700096-001-0.	N/A

Revision	Changes	Page
Advance v0.4 (December 2007)	The Table 1 • IGLOOe Product Family table was updated to change the maximum number of user I/Os for AGLE3000.	I
	The "IGLOOe FPGAs Package Sizes Dimensions" table table is new. Package dimensions were removed from the "I/Os Per Package[1]" table. The number of I/Os was updated for FG896.	II
	A note regarding marking information was added to the "IGLOOe Ordering Information" table.	III
	Table 2-4 • IGLOOe CCC/PLL Specification and Table 2-5 • IGLOOe CCC/PLL Specification were updated.	2-18, 2-19
	The "During Flash*Freeze Mode" section was updated to include information about the output of the I/O to the FPGA core.	2-60
	Figure 2-38 • Flash*Freeze Mode Type 1 – Timing Diagram was updated to modify the LSICC signal.	2-56
	Table 2-32 • Flash*Freeze Pin Location in IGLOOe Family Packages (device-independent) was updated for the FG896 package.	2-64
	Figure 2-40 • Flash*Freeze Mode Type 2 – Timing Diagram was updated to modify the LSICC Signal.	2-58
	Information regarding calculation of the quiescent supply current was added to the "Quiescent Supply Current" section.	3-6
	Table 3-8 • Quiescent Supply Current (IDD), IGLOOe Flash*Freeze Mode† was updated.	3-6
	Table 3-9 • Quiescent Supply Current (IDD), IGLOOe Sleep Mode (VCC = 0 V)† was updated.	3-6
	Table 3-11 • Quiescent Supply Current, No IGLOOe Flash*Freeze Mode1 was updated.	3-6
	Table 3-99 • Minimum and Maximum DC Input and Output Levels was updated.	3-51
	Table 3-136 • JTAG 1532 and Table 3-135 • JTAG 1532 were updated.	3-95
	The "484-Pin FBGA" table for AGLE3000 is new.	4-11
	The "896-Pin FBGA" package and table for AGLE3000 is new.	4-16
Advance v0.3 (September 2007)	Cortex-M1 device information was added to the Table 1 • IGLOOe Product Family table, the "I/Os Per Package [1]" table, "IGLOOe Ordering Information", and "Temperature Grade Offerings".	I, II, III, IV
Advance v0.2	The words "ambient temperature" were added to the temperature range in the "IGLOOe Ordering Information", "Temperature Grade Offerings", and "Speed Grade and Temperature Grade Matrix" sections.	III, IV
	The T_J parameter in Table 3-2 • Recommended Operating Conditions was changed to T_A, ambient temperature, and table notes 6–8 were added.	3-2

Datasheet Categories

Categories

In order to provide the latest information to designers, some datasheet parameters are published before data has been fully characterized from silicon devices. The data provided for a given device, as highlighted in the "IGLOOe Device Status" table, is designated as either "Product Brief," "Advance," "Preliminary," or "Production." The definitions of these categories are as follows:

Product Brief

The product brief is a summarized version of a datasheet (advance or production) and contains general product information. This document gives an overview of specific device and family information.

Advance

This version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production. This label only applies to the DC and Switching Characteristics chapter of the datasheet and will only be used when the data has not been fully characterized.

Preliminary

The datasheet contains information based on simulation and/or initial characterization. The information is believed to be correct, but changes are possible.

Production

This version contains information that is considered to be final.

Export Administration Regulations (EAR)

The products described in this document are subject to the Export Administration Regulations (EAR). They could require an approved export license prior to export from the United States. An export includes release of product or disclosure of technology to a foreign national inside or outside the United States.

Safety Critical, Life Support, and High-Reliability Applications Policy

The products described in this advance status document may not have completed the Microsemi qualification process. Products may be amended or enhanced during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult the Microsemi SoC Products Group Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of the SoC Products Group’s products is available at http://www.microsemi.com/soc/documents/ORT_Report.pdf. Microsemi also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local sales office for additional reliability information.
