## IGLOO® 2 FPGA and SmartFusion® 2 SoC FPGA

---

---

### INTRODUCTION

Microchip's mainstream SmartFusion® 2 SoC and IGLOO® 2 FPGA families integrate an industry standard 4-input LookUp Table (LUT)-based FPGA fabric with integrated math blocks, multiple embedded memory blocks, and high-performance SerDes communication interfaces on a single chip. Both families benefit from low-power flash technology and are the most secure and reliable FPGAs in the industry. These next generation devices offer up to 150K Logic Elements, up to 5 MBs of embedded RAM, up to 16 SerDes lanes, up to four PCI Express Gen 2 endpoints, and integrated hard DDR3 memory controllers with error correction.

SmartFusion 2 devices integrate an entire low-power, real-time Microcontroller Subsystem (MSS) with a rich set of industry-standard peripherals including Ethernet, USB, and CAN, while IGLOO 2 devices integrate a high-performance memory subsystem with on-chip flash, 32 KB embedded SRAM, and multiple DMA controllers.

### 3.1.1 OVERSHOOT/UNDERSHOOT LIMITS

For AC signals, the input signal may undershoot during transitions to  $-1.0V$  for no longer than 10% of the period. The current during the transition must not exceed 100 mA.

For AC signals, the input signal may overshoot during transitions to  $V_{CCI} + 1.0V$  for no longer than 10% of the period. The current during the transition must not exceed 100 mA.

**Note:** The preceding specifications do not apply to the PCI standard. The IGLOO 2 and SmartFusion 2 PCI I/Os are compliant with the PCI standard including the PCI overshoot/undershoot specifications.

### 3.1.2 THERMAL CHARACTERISTICS

The temperature variable in the Microchip SoC Products Group Designer software refers to the junction temperature, not the ambient, case, or board temperatures. This is an important distinction because dynamic and static power consumption causes the chip's junction temperature to be higher than the ambient, case, or board temperatures.

EQ1 through EQ3 give the relationship between thermal resistance, temperature gradient, and power.

EQ1

$$\theta_{JA} = \frac{T_J - T_A}{P}$$

EQ2

$$\theta_{JB} = \frac{T_J - T_B}{P}$$

EQ3

$$\theta_{JC} = \frac{T_J - T_C}{P}$$

where:

$\theta_{JA}$	=	Junction-to-air thermal resistance
$\theta_{JB}$	=	Junction-to-board thermal resistance
$\theta_{JC}$	=	Junction-to-case thermal resistance
$T_J$	=	Junction temperature
$T_A$	=	Ambient temperature
$T_B$	=	Board temperature (measured 1.0 mm away from the package edge)
$T_C$	=	Case temperature
$P$	=	Total power dissipated by the device

### 3.1.2.1 Theta-JA

Junction-to-ambient thermal resistance ( $\theta_{JA}$ ) is determined under standard conditions specified by JEDEC (JESD-51), but it has little relevance in the actual performance of the product. It must be used with caution, but it is useful for comparing the thermal performance of one package with another.

The maximum power dissipation allowed is calculated using EQ4.

#### EQ4

$$\text{Maximum power allowed} = \frac{T_{J(\text{MAX})} - T_{A(\text{MAX})}}{\theta_{JA}}$$

The absolute maximum junction temperature is 100 °C. EQ5 shows a sample calculation of the absolute maximum power dissipation allowed for the M2GL050T-FG896 package at commercial temperature and in still air, where:

#### Table 1-1 •

$\theta_{JA}$  = 14.7 °C/W (taken from [Table 3-7](#)).

$T_A$  = 85 °C

#### EQ5

$$\text{Maximum power allowed} = \frac{100\text{ °C} - 85\text{ °C}}{14.7\text{ °C/W}} = 1.088\text{ W}$$

The power consumption of a device can be calculated using the Microchip SoC Products Group power calculator. The device's power consumption must be lower than the calculated maximum power dissipation by the package.

If the power consumption is higher than the device's maximum allowable power dissipation, a heat sink may be attached to the top of the case, or the airflow inside the system must be increased.

### 3.1.2.2 Theta-JB

Junction-to-board thermal resistance ( $\theta_{JB}$ ) measures the ability of the package to dissipate heat from the surface of the chip to the PCB. As defined by the JEDEC (JESD-51) standard, the thermal resistance from the junction to the board uses an isothermal ring cold plate zone concept. The ring cold plate is simply a means to generate an isothermal boundary condition at the perimeter. The cold plate is mounted on a JEDEC standard board with a minimum distance of 5.0 mm away from the package edge.

### 3.1.2.3 Theta-JC

Junction-to-case thermal resistance ( $\theta_{JC}$ ) measures the ability of a device to dissipate heat from the surface of the chip to the top or bottom surface of the package. It is applicable to packages used with external heat sinks. Constant temperature is applied to the surface, which acts as a boundary condition.

This only applies to situations where all or nearly all the heat is dissipated through the surface in consideration.

### 3.5.5.1 Device Reset

**TABLE 3-27: DEVICE RESET**

Pin	Type	Description	Unused Conditions
<b>Device Reset I/Os</b>			
DEVRST_N	Input	Device reset. Active-low and powered by V <sub>PP</sub> . It is an asynchronous signal and Schmitt trigger input with the maximum slew rate must not exceed 1 us.	Pull-up to V <sub>PP</sub> through a 10 KΩ resistor.

### 3.5.5.2 JTAG Pins

JTAG pins can operate at any voltage: 1.2V/1.5V/1.8V/2.5V or 3.3V (nominal). The debug port is implemented using a Serial Wire JTAG Debug Port (SWJ-DP), than a Serial Wire Debug Port (SW-DP). This enables either the M3 JTAG or the software protocol for debugging.

**TABLE 3-28: JTAG PIN NAMES AND DESCRIPTIONS**

Name	Type	Description	Unused Conditions
JTAGSEL	Input	JTAG controller selection. If JTAGSEL is pulled High, then an external TAP controller connects to the JTAG interface—system controller TAP. If JTAGSEL is pulled Low, then an external TAP controller connects to either the Cortex-M3 JTAG TAP (if debug is enabled) or an auxiliary TAP) if debug is disabled).	Pull-up to $V_{DDI}$ (JTAG bank) through 1 K $\Omega$ resistor.
JTAG_TCK/M3_TCK	Input	Test clock. Serial input for JTAG boundary scan, ISP, and UJTAG. The TCK pin does not have an internal pull-up/pull-down resistor. If JTAG is not used, Microchip recommends tying it off. Connect TCK through the 1 K $\Omega$ resistor to GND or 3.3V through a resistor placed close to the FPGA pin.	Connect to either VDD#(JTAG) or VSS through a 200 K $\Omega$ to 1 K $\Omega$ resistor.
JTAG_TDI/M3_TDI	Input	Test data. Serial input for JTAG boundary scan, ISP, and UJTAG usage. TDI pin has an internal weak pull-up resistor.	Do Not Connect (DNC).
JTAG_TDO/M3_TDO/ M3_SWO	Input	Test data. Serial input for JTAG boundary scan, ISP, and UJTAG usage. The TDO pin does not have an internal pull-up/pull-down resistor. M3_SWO: Serial Wire Viewer Output.	DNC
JTAG_TMS/M3_TMS/ M3SWDIO	Input	Test mode select. The TMS pin has an internal weak pull-up resistor. M3_SWDIO: Serial Wire Debug data Input/Output.	DNC
JTAG_TRSTB/ M3_TRSTB	Input	Boundary Scan Reset Pin. The TRSTB pin functions as an active low input to asynchronously initialize (or reset) the boundary scan circuitry. The TRSTB pin has an internal weak pull-up resistor. In critical applications, an upset in the JTAG circuit can allow entering an undesired JTAG state. In such cases, Microchip recommends that you tie off TRSTB to GND through a resistor (1K) placed close to the FPGA pin.	DNC or pull-down to VSS through a K $\Omega$ resistor for upset immunity.

JTAG pins can operate at any voltage: 1.2V/1.5V/1.8V/2.5V or 3.3V (nominal). The debug port is implemented using a Serial Wire JTAG Debug Port (SWJ-DP), than a Serial Wire Debug Port (SW-DP). This enables either the M3 JTAG or the software protocol for debugging.

### 3.7 Differential I/O Standards

Configuration of the I/O modules as a differential pair is handled by Microchip FPGA Products Group Libero software when the user instantiates a differential I/O macro in the design. Differential I/Os can also be used in conjunction with the embedded Input Register (InReg), Output Register (OutReg), Enable Register (EnReg), and Double Data Rate (DDR) registers.

#### 3.7.1 LVDS

Low-Voltage Differential Signaling (ANSI/TIA/EIA-644) is a high-speed, differential I/O standard.

. when  $V_{ID}$  is < 300 mV, the input signal is delayed by up to an additional 450 ps for LVDS25 and 280 ps for LVDS33. This delay is not accounted in the timing model. Clock insertion delays, propagation delays, and I/O to FF delays are marginally affected. Adding a parallel termination resistor of  $200\Omega \pm 5\%$  across the receiver pins can mitigate this additional delay when  $V_{ID}$  is < 300 mV.

### 3.7.6 LVPECL

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit be carried through two signal lines. Similar to LVDS, two pins are needed. It also requires external resistor termination. IGLOO 2 and SmartFusion 2 SoC FPGAs support only LVPECL receivers and do not support LVPECL transmitters.
