

## Description

M3xxx316 is a magneto-resistive random-access memory (MRAM). It is offered in density ranging from 4Mbit to 32Mbit. MRAM technology is analogous to Flash technology with SRAM compatible 35ns/35ns and 45ns/45ns read/write timings (Persistent SRAM, P-SRAM). Data is always non-volatile. This makes MRAM a very reliable and fast non-volatile memory solution.

MRAM is a true random-access memory; allowing both reads and writes to occur randomly in memory. MRAM is ideal for applications that must store and retrieve data without incurring large latency penalties. It offers low latency, low power, virtually unlimited endurance and data retention, high performance and scalable memory technology.

M3xxx316 is offered with industrial (-40°C to 85°C) and industrial plus (-40°C to 105°C) operating temperature ranges.

## General Description

M3xxx316 is a magneto-resistive random-access memory (MRAM). It is offered in density ranging from 4Mbit to 32Mbit. MRAM technology is analogous to Flash technology with SRAM compatible 35ns/35ns and 45ns/45ns read/write timings (Persistent SRAM, P-SRAM). Data is always non-volatile. This makes MRAM a very reliable and fast non-volatile memory solution.

<b>Write Performance</b>	√	-	-	√
<b>Read Performance</b>	√	-	-	√

MRAM is a true random-access memory; allowing both reads and writes to occur randomly in memory. MRAM is ideal for applications that must store and retrieve data without incurring large latency penalties. It offers low latency, low power, infinite endurance, high performance and scalable memory technology.

M3xxx316 is available in small footprint 54-pin TSOP (10mm x 22mm) and 48-Ball FBGA (10mm x 10mm) packages supporting densities ranging from 4Mb to 16Mb. The 48-Ball FBGA also supports the 32Mb. Density of 4Mb is also available in a small footprint 44-pin TSOP (10mm x 18mm). These packages are compatible with similar low-power volatile and non-volatile products.

M3xxx316 is offered with industrial (-40°C to 85°C) and industrial plus (-40°C to 105°C) operating temperature ranges.

## Architecture

M3xxx316 is a high performance MRAM device. Writing to and reading from the device as follows:

To write to the device, bring Chip Enable (E#) and Write Enable (W#) inputs Low (Logic '0'). This enables data on I/O pins (DQ[0] to DQ[15]) to be written into the memory location specified by the address pins ADDR[0] through ADDR[20] (48-ball FBGA), ADDR[0] through ADDR[19] (54-pin TSOP) and ADDR[0] through ADDR[17] (44-pin TSOP).

To read from the device, bring Chip Enable (E#) input Low (Logic '0'), Output Enable (G#) input Low (Logic '0') while maintaining Write Enable (W#) High (Logic '1'). This enables data from the memory location specified by the address pins ADDR[0] through ADDR[20] (48-ball FBGA), ADDR[0] through ADDR[19] (54-pin TSOP) and ADDR[0] through ADDR[17] (44-pin TSOP) to appear on I/O pins (DQ[0] to DQ[15]).

### Device Initialization

When powering up, the following procedure is required to initialize the device correctly:

- E#, W#, G#, must follow  $V_{CC}$  during power-up

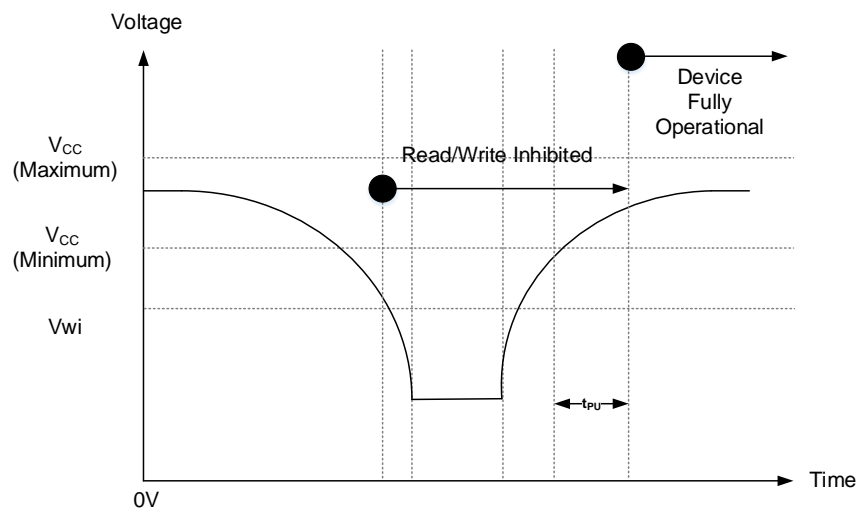

**Figure 4: Power-Up Behavior**

When powering down, the following procedure is required to turn off the device correctly:

- E#, W#, G#, must follow  $V_{CC}$  during power-down
- During power loss or brownout, where  $V_{CC}$  goes below  $V_{wi}$ , read/write operations are prohibited. The power-up timing needs to be observed after  $V_{CC}$  goes above  $V_{CC}$  (minimum)

1. Dimensions in Millimeters.
2. The 'e' represents the basic solder ball grid pitch.
- ③ 'b' is measurable at the maximum solder ball diameter in a plane parallel to datum C.
- ④ Dimension 'ddd' is measured parallel to primary datum C.
- ⑤ Primary datum C (seating plane) is defined by the crowns of the solder balls.
6. Package dimensions refer to JEDEC MO-205 Rev. G.
