

# 3.2Gbps SFP VCSEL Driver with Diagnostic Monitors

## General Description

The MAX3740A is a high-speed VCSEL driver for small-form-factor (SFF) and small-form-factor pluggable (SFP) fiber optic LAN transmitters. It contains a bias generator, a laser modulator, and comprehensive safety features. The automatic power control (APC) adjusts the laser bias current to maintain average optical power over changes in temperature and laser properties. The driver accommodates common cathode and differential configurations.

The MAX3740A operates up to 3.2Gbps. It can switch up to 15mA of laser modulation current and source up to 15mA of bias current. Adjustable temperature compensation is provided to keep the optical extinction ratio within specifications over the operating temperature range. The MAX3740A interfaces with the Dallas DS1858 to meet SFF-8472 timing and diagnostic requirements. The MAX3740A accommodates various VCSEL packages, including low-cost TO-46 headers.

The MAX3740A safety circuit detects faults that could cause hazardous light levels and disables the VCSEL output. The safety circuits are compliant with SFF and SFP multisource agreements (MSA).

The MAX3740A is available in a compact 4mm × 4mm, 24-pin thin QFN package and operates over the -40°C to +85°C temperature range.

## Applications

Multirate (1Gbps to 3.2Gbps) SFP/SFF Modules  
Gigabit Ethernet Optical Transmitters  
Fibre Channel Optical Transmitters  
Infiniband Optical Transmitters

## Features

- ◆ Supports all SFF-8472 Digital Diagnostics
- ◆ 2mA to 15mA Modulation Current
- ◆ 1mA to 15mA Bias Current
- ◆ Optional Peaking Current to Improve VCSEL Edge Speed
- ◆ Supports Common Cathode and Differential Configuration
- ◆ Automatic Power Control
- ◆ Safety Circuits Compliant with SFF and SFP MSAs
- ◆ 4mm × 4mm, 24-Pin Thin QFN Package

## Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX3740AETG	-40°C to +85°C	24 Thin QFN-EP*
MAX3740AETG+	-40°C to +85°C	24 Thin QFN-EP*

+Denotes a lead(Pb)-free/RoHS-compliant package.

\*EP = Exposed pad.

## Typical Application Circuit

## 3.2Gbps SFP VCSEL Driver with Diagnostic Monitors

### ABSOLUTE MAXIMUM RATINGS

Supply Voltage ( $V_{CC}$ ) .....-0.5V to 6.0V  
 Voltage at TX\_DISABLE, IN+, IN-, FAULT,  
 SQUELCH, TC1, TC2, MODSET, PEAKSET, BIASSET,  
 BIAS, BIASMON, COMP, MD, REF,  
 PWRMON .....-0.5V to ( $V_{CC} + 0.5V$ )  
 Voltage at OUT+, OUT- .....( $V_{CC} - 2V$ ) to ( $V_{CC} + 2V$ )  
 Current into FAULT ..... -1mA to +25mA  
 Current into OUT+, OUT- .....60mA

Continuous Power Dissipation ( $T_A = +85^\circ\text{C}$ )  
 24-Lead Thin QFN  
 (derate 20.8mW/ $^\circ\text{C}$  above  $+85^\circ\text{C}$ ).....1354mW  
 Operating Temperature Range .....-40 $^\circ\text{C}$  to  $+85^\circ\text{C}$   
 Storage Temperature Range .....-55 $^\circ\text{C}$  to  $+150^\circ\text{C}$   
 Lead Temperature (soldering, 10s) .....+300 $^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### ELECTRICAL CHARACTERISTICS

( $V_{CC} = +2.97V$  to  $+3.63V$ ,  $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ . Typical values are at  $V_{CC} = +3.3V$ , TC1 and TC2 are shorted, PEAKSET open,  $T_A = +25^\circ\text{C}$ , unless otherwise noted.)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS

## 3.2Gbps SFP VCSEL Driver with Diagnostic Monitors

### Pin Description

PIN	NAME	FUNCTION
1, 10, 13	GND	Ground
2	TX_DISABLE	Transmit Disable. Driver output is disabled when TX_DISABLE is high or left unconnected. The driver output is enabled when the pin is asserted low.
3	IN+	Noninverted Data Input
4	IN-	Inverted Data Input
5	FAULT	Fault Indicator. Open-drain output with ESD protection. FAULT is asserted high during a fault condition.
6	SQUELCH	Squelch Enable. Squelch is enabled when the pin is set high. Squelch is disabled when the pin is set low or left open.
7, 16, 20	VCC	+3.3V Supply Voltage
8	TC1	Temperature Compensation Set Pin 1. A resistor placed between TC1 and TC2 ( $R_{TC}$ ) programs the temperature coefficient of the modulation current.
9	TC2	Temperature Compensation Set Pin 2. A resistor placed between TC1 and TC2 ( $R_{TC}$ ) programs the temperature coefficient of the modulation current.
11	MODSET	Modulation Set. A resistor connected from MODSET to ground ( $R_{MODSET}$ ) sets the desired modulation current amplitude.
12	PEAKSET	Peaking Current Set. A resistor connected between PEAKSET and ground ( $R_{PEAKSET}$ ) programs the peaking current amplitude. To disable peaking, leave PEAKSET open.
14	OUT-	Inverted Modulation-Current Output
15	OUT+	Noninverted Modulation-Current Output
17	BIASSET	Bias Current Set. When a closed-loop configuration is used, connect a $1.7k\Omega$ resistor between ground and BIASSET to set the maximum bias current. When an open configuration is used, connect a resistor between BIASSET and ground ( $R_{BIASSET}$ ) to program the VCSEL bias current.
18	BIAS	Bias Current Output
19	BIASMON	Bias Current Monitor. The output of BIASMON is a sourced current proportional to the bias current. A resistor connected between BIASMON and ground ( $R_{BIASMON}$ ) can be used to form a ground-referenced bias monitor.
21	COMP	Compensation Pin. A capacitor between COMP and MD compensates the APC. A typical value of $0.047\mu F$ is recommended. For open-loop configuration, short the COMP pin to GND to deactivate the APC.
22	MD	Monitor Diode Connection
23	REF	Reference Pin. Reference monitor used for APC. A resistor between REF and MD ( $R_{PWRSET}$ ) sets the photo monitor current when the APC loop is closed.
24	PWRMON	Average Power Monitor. The pin is used to monitor the transmit optical power. For open-loop configuration, connect PWRMON to GND.
—	EP	Exposed Pad. Ground. Must be soldered to the circuit board ground for proper thermal and electrical performance. See the <i>Layout Considerations</i> section.

# 3.2Gbps SFP VCSEL Driver with Diagnostic Monitors

MAX3740A

Figure 1. Bias Generator

## Detailed Description

The MAX3740A contains a bias generator with automatic power control (APC), safety circuit, and a laser modulator with optional peaking compensation.

### Bias Generator

Figure 1 shows the bias generator circuitry that contains a power-control amplifier and smooth-start circuitry. An internal PNP transistor provides DC laser current to bias the laser in a light-emitting state. The APC circuitry adjusts the laser-bias current to maintain average power over temperature and changing laser properties. The smooth-start circuitry prevents current spikes to the laser during power-up or enable, ensuring compliance with safety requirements and extending the life of the laser.

The MD input is connected to the cathode of a monitor diode, which is used to sense laser power. The BIAS output is connected to the anode of the laser through an inductor or ferrite bead. The power-control amplifier drives a current amplifier to control the laser's bias current. During a fault condition, the bias current is disabled.

The PWRMON output provides a voltage proportional to average laser power given by:

$$V_{PWRMON} = 2 \times I_{PD} \times R_{PWRSET}$$

The BIASMOM output provides a current proportional to the laser bias current given by:

$$I_{BIASMOM} = I_{BIAS} / 9$$

When APC is not used (no monitor diode, open-loop configuration) connect the COMP and PWRMON pins to GND. In this mode, the bias current is set by the resistor  $R_{BIASSET}$ . When a closed-loop configuration is used, connect a 1.7kΩ resistor between ground and BIASSET to set the maximum bias current.

### Safety Circuit

The safety circuit contains an input disable (TX\_DISABLE), a latched fault output (FAULT), and fault detectors (Figure 2). This circuit monitors the operation of the laser driver and forces a shutdown (disables laser) if a fault is detected (Table 1). Table 2 contains the circuit's response to various single-point failures. The transmit fault condition is latched until reset by a toggle of TX\_DISABLE or VCC. The FAULT pin should be pulled high with a 4.7kΩ to 10kΩ resistor.

Table 1. Fault Conditions

PIN	FAULT CONDITION
BIAS	$V_{BIAS} > V_{CC} - 0.2V$
BIASMOM	$V_{BIASMOM} > 0.8V$
PWRMON	$V_{PWRMON} > 0.8V$

## 3.2Gbps SFP VCSEL Driver with Diagnostic Monitors

Table 2. Circuit Response to Various Single-Point Faults (Closed-Loop APC Configuration)

PIN NAME	CIRCUIT RESPONSE TO V <sub>CC</sub> SHORT	CIRCUIT RESPONSE TO GND SHORT
FAULT	Does not affect laser power.	Does not affect laser power.
TX_DISABLE	Modulation and bias current are disabled.	Normal condition for circuit operation.
IN+	Does not affect laser power.	Does not affect laser power.
IN-	Does not affect laser power.	Does not affect laser power.
SQUELCH	Does not affect laser power.	Does not affect laser power.
TC1	Does not affect laser power.	Does not affect laser power.
TC2	The laser modulation is increased, but average power is not affected.	Modulation current is disabled.
MODSET	Modulation current is disabled.	The laser modulation is increased, but average power is not affected.
PEAKSET	Does not affect laser power.	Does not affect laser power.
OUT+	Modulation current is disabled.	Modulation current is disabled.
OUT-	Does not affect laser power.	Does not affect laser power.
BIASSET	Laser bias is disabled.	Fault state* occurs.
BIAS	Fault state* occurs. Note that VCSEL emissions may continue; care must be taken to prevent this condition.	Disables VCSEL.
BIASMON	Fault state* occurs.	Does not affect laser power.
COMP	The bias current is reduced, and the average power of the laser output is reduced.	I <sub>BIAS</sub> increases to the value determined by R <sub>BIASSET</sub> ; if the bias monitor fault threshold is exceeded, a fault is signaled.
MD	I <sub>BIAS</sub> increases to the value determined by R <sub>BIASSET</sub> ; if the bias-monitor fault threshold is exceeded, a fault is signaled.	The bias current is reduced, and the average power of the laser output is reduced.
REF	I <sub>BIAS</sub> increases to the value determined by R <sub>BIASSET</sub> ; if the bias-monitor fault threshold is exceeded, a fault is signaled.	The bias current is reduced, and the average power of the laser output is reduced.
PWRMON	Fault state* occurs.	Does not affect laser power.

\*A fault state asserts the FAULT pin, disables the modulator output, and disables the bias output.

### Modulation Circuit

The modulation circuitry consists of an input buffer, a current mirror, and a high-speed current switch (Figure 3). The modulator drives up to 15mA of modulation into a 50Ω VCSEL load.

The amplitude of the modulation current is set with resistors at MODSET and temperature coefficient (TC1, TC2) pins. The resistor at MODSET (R<sub>MODSET</sub>) programs the temperature-stable portion of the modulation current, and the resistor between TC1 and TC2 (R<sub>TC</sub>) programs the temperature coefficient of the modulation current. For appropriate R<sub>TC</sub> and R<sub>MODSET</sub> values, see the *Typical Operating Characteristics* section.

### Design Procedure

#### Select Laser

Select a communications-grade laser with a rise time of 260ps or better for 1.25Gbps, or 130ps or better for 2.5Gbps applications. Use a high-efficiency laser that requires low modulation current and generates a low-voltage swing. Trim the leads to reduce laser package inductance. The typical package leads have inductance of 25nH per inch (1nH/mm). This inductance causes a large voltage swing across the laser. A compensation filter network can also be used to reduce ringing, edge speed, and voltage swing (see the *Designing the Compensation Filter Network* section).

# 3.2Gbps SFP VCSEL Driver with Diagnostic Monitors

MAX3740A

Figure 2. Safety Circuit

Figure 3. Modulation Circuit

## 3.2Gbps SFP VCSEL Driver with Diagnostic Monitors

### Programming Modulation Current

The modulation current output of the MAX3740A is controlled by a resistor ( $R_{MODSET}$ ) placed between MODSET and ground. The  $R_{MODSET}$  resistor controls the amount of current being sourced to the VCSEL. The modulation current is given by the following:

$$I_{MOD} = [(I_{MODSET}) \times 30] \times \left[ \frac{R_{OUT+}}{R_{OUT+} + R_{LOAD}} \right]$$

$$I_{MOD} = \left[ \left( \frac{1}{200 + R_{MODSET}} \right) \times 30 \right] \times \left[ \frac{R_{OUT+}}{R_{OUT+} + R_{LOAD}} \right]$$

It is important to note that the modulation current being sourced by the MAX3740A is affected by the load impedance of the VCSEL. The Modulation Current vs.  $R_{MODSET}$  graph in the *Typical Operating Characteristics* shows the current into a  $50\Omega$  electrical load.

### Programming Bias Current

The bias current output of the MAX3740A is controlled by a resistor ( $R_{BIASSET}$ ) placed between BIASSET and ground. In open-loop operation the  $R_{BIASSET}$  controls the bias current level of the VCSEL. In closed-loop operation the  $R_{BIASSET}$  controls the maximum bias current provided by the APC. The bias current is given by the following:

$$I_{BIAS} = (I_{BIASSET}) \times 34$$

$$I_{BIAS} = \left( \frac{1.2}{200 + R_{BIASSET}} \right) \times 34$$

The Bias Current vs.  $R_{BIASSET}$  graph is also shown in the *Typical Operating Characteristics*.

### Photodiode Selection

To ensure stable operation of the APC circuit, the time constant of the MD node should be shorter than the APC time constant. ( $t_{APC} = 5\mu s$  if  $C_{APC} = 0.047\mu F$ ).

$$t_{MD} \leq \frac{t_{APC}}{20}, \quad R_{MD} \times C_{MD} \leq \frac{5\mu s}{20} = 250ns$$

For typical  $I_{PD} = 400\mu A$ ,  $R_{PWRSET} = 500\Omega$ , select a photodiode with capacitance less than  $500pF$ .

### Programming Modulation-Current Tempco

Compute the required modulation tempco from the slope efficiency of the laser at  $T_A = +25^\circ C$  and at a higher temperature. Then select the value of  $R_{TC}$  from the *Typical Operating Characteristics*. For example, suppose a laser has a slope efficiency (SE) of

$0.021mW/mA$  at  $+25^\circ C$ , which reduces to  $0.018mW/mA$  at  $+85^\circ C$ . The temperature coefficient is given by the following:

$$\text{Laser tempco} = \frac{(SE_{85} - SE_{25})}{SE_{25} \times (85 - 25)} \times 1E6$$

$$= -2380ppm/^\circ C$$

From the *Typical Operating Characteristics*, the value of  $R_{TC}$ , which offsets the tempco of the laser, is  $9k\Omega$ . If modulation temperature compensation is not desired, short TC1 and TC2.

### Programming the APC Loop

Program the average optical power by adjusting  $R_{PWRSET}$ . To select the resistance, determine the desired monitor current to be maintained over temperature and lifetime. See the Monitor Diode Current vs.  $R_{PWRSET}$  graph in the *Typical Operating Characteristics* section, and select the value of  $R_{PWRSET}$  that corresponds to the required current.

### Input Termination Requirements

The MAX3740A data inputs are SFP MSA compatible. On-chip  $100\Omega$  differential input impedance is provided for optimal termination (Figure 4). Because of the on-chip biasing network, the MAX3740A inputs self-bias to the proper operating point to accommodate AC-coupling.

Figure 4. Simplified Input Structure

# 3.2Gbps SFP VCSEL Driver with Diagnostic Monitors

MAX3740A

Figure 5. Simplified Output Structure

Figure 6. Fault Circuit Interface

## Applications Information

### Interface Models

Figures 4 and 5 show simplified input and output circuits for the MAX3740A laser driver. Figure 6 shows the fault circuit interface.

### Layout Considerations

To minimize inductance, keep the connections between the MAX3740A output pins and laser diode as short as possible. Use good high-frequency layout techniques and multilayer boards with uninterrupted ground planes to minimize EMI and crosstalk.

### Designing the Compensation Filter Network

Laser package inductance causes the laser impedance to increase at high frequencies, leading to ringing, overshoot, and degradation of the laser output. A laser compensation filter network can be used to reduce the laser impedance at high frequencies, thereby reducing output ringing and overshoot.

Figure 7. Laser Compensation

The compensation components ( $R_F$  and  $C_F$ ) are most easily determined by experimentation. Begin with  $R_F = 50\Omega$  and  $C_F = 1\text{pF}$ . Increase  $C_F$  until the desired transmitter response is obtained (Figure 7). Refer to Application Note HFAN-2-0: *Interfacing Maxim Laser Drives with Laser Diodes* for more information.

### Exposed-Pad (EP) Package

The exposed pad on the 24-pin thin QFN provides a very low thermal resistance path for heat removal from the IC. The pad is also electrical ground on the MAX3740A and must be soldered to the circuit board ground for proper thermal and electrical performance. Refer to Maxim Application Note HFAN-08.1: *Thermal Considerations for QFN and Other Exposed-Pad Packages* for additional information.

### Laser Safety and IEC 825

The International Electrotechnical Commission (IEC) determines standards for hazardous light emissions from fiber optic transmitters. IEC 825 defines the maximum light output for various hazard levels. The MAX3740A provides features that facilitate compliance with IEC 825. A common safety precaution is single-point fault tolerance, whereby one unplanned short, open, or resistive connection does not cause excess light output. Using this laser driver alone does not ensure that a transmitter design is compliant with IEC 825. The entire transmitter circuit and component selections must be considered. Customers must determine the level of fault tolerance required by their applications, recognizing that Maxim products are not designed or authorized for use as components in systems intended for surgical implant into the body, for applications intended to support or sustain life, or for any other application where the failure of a Maxim product could create a situation where personal injury or death may occur.
