

MAX4245/MAX4246/ MAX4247

Ultra-Small, Rail-to-Rail I/O with Disable, Single-/Dual-Supply, Low-Power Op Amps

General Description

The MAX4245/MAX4246/MAX4247 family of low-cost op amps offer rail-to-rail inputs and outputs, draw only 320µA of quiescent current, and operate from a single +2.5V to +5.5V supply. For additional power conservation, the MAX4245/MAX4247 offer a low-power shutdown mode that reduces supply current to 50nA, and puts the amplifiers outputs in a high-impedance state. These devices are unity-gain stable with a 1MHz gain-bandwidth product driving capacitive loads up to 470pF.

The MAX4245/MAX4246/MAX4247 family is specified from -40°C to +125°C, making them suitable for use in a variety of harsh environments. The MAX4245 single amplifier is available in ultra-small 6-pin SC70 and space-saving 6-pin SOT23 packages. The MAX4246 dual amplifier is available in 8-pin SOT23, SO, and µMAX® packages. The MAX4247 dual amplifier comes in a tiny 10-pin µMAX package.

Applications

- Portable Communications
- Single-Supply Zero-Crossing Detectors
- Instruments and Terminals
- Electronic Ignition Modules
- Infrared Receivers
- Sensor-Signal Detection

Selector Guide

PART	AMPLIFIERS PER PACKAGE	SHUTDOWN MODE
MAX4245AXT	1	Yes
MAX4245AUT	1	Yes
MAX4246AKA	2	No
MAX4246ASA	2	No
MAX4246AUA	2	No
MAX4247AUB	2	Yes

Features

- Rail-to-Rail Input and Output Voltage Swing
- 50nA (max) Shutdown Mode (MAX4245/MAX4247)
- 320µA (typ) Quiescent Current Per Amplifier
- Single +2.5V to +5.5V Supply Voltage Range
- 110dB Open-Loop Gain with 2kΩ Load
- 0.01% THD with 100kΩ Load
- Unity-Gain Stable up to C_{LOAD} = 470pF
- No Phase Inversion for Overdriven Inputs
- Available in Space-Saving Packages
 - 6-Pin SC70 or 6-Pin SOT23 (MAX4245)
 - 8-Pin SOT23/SO or 8-Pin µMAX (MAX4246)
 - 10-Pin µMAX (MAX4247)

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Electrical Characteristics

Detailed Description

Rail-to-Rail Input Stage

The MAX4245/MAX4246/MAX4247 have rail-to-rail input and output stages that are specifically designed for low-voltage, single-supply operation. The input stage consists of composite NPN and PNP differential stages, which operate together to provide a common-mode range extending to both supply rails. The crossover region of these two pairs occurs halfway between V_{DD} and V_{SS}. The input offset voltage is typically ±400µV. Low-operating supply voltage, low supply current and rail-to-rail outputs make this family of operational amplifiers an excellent choice for precision or general-purpose, low-voltage, battery-powered systems.

Since the input stage consists of NPN and PNP pairs, the input bias current changes polarity as the common-mode voltage passes through the crossover region. Match the effective impedance seen by each input to reduce the offset error caused by input bias currents flowing through external source impedance (Figures 1a and 1b).

The combination of high-source impedance plus input capacitance (amplifier input capacitance plus stray capacitance) creates a parasitic pole that can produce an underdamped signal response. Reducing input capacitance or placing a small capacitor across the feedback resistor improves response in this case.

The MAX4245/MAX4246/MAX4247 family's inputs are protected from large differential input voltages by internal 5.3kΩ series resistors and back-to-back triple-diode stacks across the inputs (Figure 2). For differential-input voltages

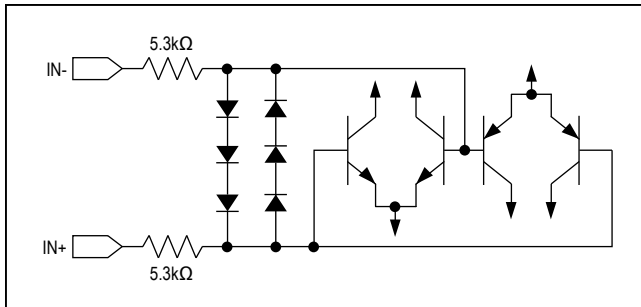

Figure 2. Input Protection Circuit

much less than 2.1V (triple-diode drop), input resistance is typically 4MΩ. For differential voltages greater than 2.1V, input resistance is around 10.6kΩ, and the input bias current can be approximated by the following equation:

$$I_B = (V_{DIFF} - 2.1V)/10.6k\Omega$$

In the region where the differential input voltage approaches 2.1V, the input resistance decreases exponentially from 4MΩ to 10.6kΩ as the diodes begin to conduct. It follows that the bias current increases with the same curve.

In unity-gain configuration, high slew-rate input signals may capacitively couple to the output through the triple-diode stacks.

Rail-to-Rail Output Stage

The MAX4245/MAX4246/MAX4247 can drive a 2kΩ load and still typically swing within 35mV of the supply rails. Figure 3 shows the output voltage swing of the MAX4245 configured with $A_V = -1V/V$.

Figure 3. Rail-to-Rail Input/Output Voltage Range

Applications Information

Power-Supply Considerations

The MAX4245/MAX4246/MAX4247 operate from a single +2.5V to +5.5V supply (or dual ±1.25V to ±2.75V supplies) and consume only 320µA of supply current per amplifier. A 90dB power-supply rejection ratio allows the amplifiers to be powered directly off a decaying battery voltage, simplifying design and extending battery life.

Power-Up

The MAX4245/MAX4246/MAX4247 output typically settles within 4µs after power-up. Figure 4 shows the output voltage on power-up and power-down.

Shutdown Mode

The MAX4245/MAX4247 feature a low-power shutdown mode. When \overline{SHDN} is pulled low, the supply current drops to 50nA per amplifier, the amplifier is disabled, and

Figure 4. Power-Up/Power-Down Waveform

the output enters a high-impedance state. Pulling \overline{SHDN} high enables the amplifier. Figure 5 shows the MAX4245/MAX4247's shutdown waveform.

Due to the output leakage currents of three-state devices and the small internal pullup current for \overline{SHDN} , do not leave \overline{SHDN} open/high-impedance. Leaving \overline{SHDN} open may result in indeterminate logic levels, and could adversely affect op amp operation. The logic threshold for \overline{SHDN} is referred to V_{SS} . When using dual supplies, pull \overline{SHDN} to V_{SS} , not GND, to shut down the op amp.

Driving Capacitive Loads

The MAX4245/MAX4246/MAX4247 are unity-gain stable for loads up to 470pF. Applications that require greater capacitive drive capability should use an isolation resistor

Figure 5. Shutdown Waveform

between the output and the capacitive load (Figures 6a, 6b, 6c). Note that this alternative results in a loss of gain accuracy because R_{ISO} forms a voltage divider with the R_{LOAD} .

Power-Supply Bypassing and Layout

The MAX4245/MAX4246/MAX4247 family operates from either a single +2.5V to +5.5V supply or dual $\pm 1.25V$ to $\pm 2.75V$ supplies. For single-supply operation, bypass the power supply with a 100nF capacitor to V_{SS} (in this case GND). For dual-supply operation, both the V_{DD} and the V_{SS} supplies should be bypassed to ground with separate 100nF capacitors.

Good PC board layout techniques optimize performance by decreasing the amount of stray capacitance at the op amp's inputs and output. To decrease stray capacitance, minimize trace lengths and widths by placing external components as close to the device as possible. Use surface-mount components when possible.
