

Overvoltage Protector with Active Current Limit

General Description

The MAX4978–MAX4981 overvoltage-protection devices protect low-voltage systems against voltage faults up to +28V and feature a low 85mΩ R_{ON} FET, an active current limiter, and lithium-ion battery overcharge protection (MAX4980/MAX4981). These devices are used to protect the charger input port on a portable device.

The overvoltage protector feature protects against voltages up to 28V with two different trip thresholds: 5.7V (MAX4978/MAX4980/MAX4981) and 6.8V (MAX4979). There is an undervoltage protector with two different trip thresholds: 4.4V (MAX4978) and 2.63V (MAX4979/MAX4980/MAX4981).

The overcurrent limiter and battery voltage monitor features provide a second layer of protection for a lithium-ion battery charger. The overcurrent limiter is available in two different thresholds: 0.9A (MAX4978/MAX4979/MAX4980) and 1.95A (MAX4981). Once current reaches the threshold, it is held for a 20ms blanking time. If the current is still at the limit after the blanking time, the FET is turned off, and the device restarts the cycle after 160ms. The battery voltage monitor measures the voltage of a lithium-ion battery and disables the FET if the battery voltage reaches 4.4V (MAX4980/MAX4981).

The MAX4978–MAX4981 are available in a small 8-pin TDFN (2mm x 3mm) package and are specified over the extended -40°C to +85°C temperature range.

Applications

Cell Phones	PDA's and Palmtop
MP3 Players	Devices
Digital Still Cameras	

Typical Application Circuit appears at end of data sheet.

Features

- ◆ Input Voltage Protection Up to +28V
- ◆ Integrated nFET Switch, 85mΩ (typ)
- ◆ Preset Overvoltage Protection Trip Level
5.7V (typ) (MAX4978/MAX4980/MAX4981)
6.8V (typ) (MAX4979)
- ◆ Low-Current Undervoltage Lockout Mode
- ◆ Overcurrent Protection
- ◆ Internal 160ms (typ) Startup Delay
- ◆ Thermal-Shutdown Protection
- ◆ Battery Overcharge Protection (MAX4980/MAX4981)
- ◆ Startup Debounce Time Indicator (MAX4978/MAX4979)
- ◆ Small, 8-Pin (2mm x 3mm) TDFN Package

Pin Configuration

MAX4978-MAX4981

Ordering Information/Selector Guide

PART	PIN-PACKAGE	CURRENT LIMIT (mA)	BATTERY MONITOR	UVLO (V)	OVLO (V)	TOP MARK	PKG CODE
MAX4978ETA+	8 TDFN-EP*	900	No	4.4	5.7	AAK	T823-1
MAX4979ETA+**	8 TDFN-EP*	900	No	2.63	6.8	AAL	T823-1
MAX4980ETA+	8 TDFN-EP*	900	Yes	2.63	5.7	AAM	T823-1
MAX4981ETA+	8 TDFN-EP*	1950	Yes	2.63	5.7	AAN	T823-1

Note: All devices specified over the -40°C to +85°C operating temperature range.

+Denotes a lead-free package.

*EP = Exposed pad.

Overvoltage Protector with Active Current Limit

ABSOLUTE MAXIMUM RATINGS

(Voltages referenced to GND.)

IN, SDT	-0.3V to +30V
OUT	-0.3V to IN
EN, BAT	-0.3V to +6V
SDT Continuous Current	±50mA
Continuous Power Dissipation (T _A = +70°C) 8-Pin 2mm x 3mm TDFN (derate 16.7mW/°C above +70°C)	1333mW

Junction-to-Case Thermal Resistance (θ _{JC}) (Note 1) 8-Pin 2mm x 3mm TDFN	10.8°C/W
Junction-to-Ambient Thermal Resistance (θ _{JA}) (Note 1) 8-Pin 2mm x 3mm TDFN	60°C/W
Operating Temperature Range	-40°C to +85°C
Junction Temperature	+150°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (soldering, 10s)	+300°C

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a 4-layer board. For detailed information on package thermal considerations, refer to www.maxim-ic.com/thermal-tutorial.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{IN} = 5.0V, V_{EN} = 0V, T_A = -40°C to +85°C, unless otherwise noted. Typical values are at T_A = +25°C.) (Note 2)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS	
Input Voltage Range	V _{IN}		2.3		28	V	
Input Supply Current	I _{IN}	I _{OUT} < I _{LIM_MIN}		130	190	μA	
UVLO Supply Current	I _{UVLO}	V _{IN} = 2.3V		35	60	μA

Pin Description

PIN		NAME	FUNCTION
MAX4978/ MAX4979	MAX4980/ MAX4981		
1	1	IN	Supply Voltage Input. IN powers the charge pump required to turn on the internal FET. When the correct adapter is plugged in, a 160ms debounce timer prevents a false turn-on of the internal FET. Bypass IN to GND with a 1 μ F ceramic capacitor as close to the device as possible to enable $\pm 15kV$ (HBM) ESD protection.
2	—	\overline{SDT}	Startup Debounce Time Indicator. \overline{SDT} is an active-low open-drain output that asserts low during the debounce/autoretry time.
—	2	BAT	Battery Monitor Input. Connect BAT to Li-ion battery terminal. Bypass BAT to GND with a 1 μ F ceramic capacitor as close to the device as possible to enable $\pm 15kV$ (HBM) ESD protection.
3, 6, 7	3, 6, 7	I.C.	Internally Connected. Connect I.C. to GND.
4	4	\overline{EN}	Active-Low Enable Input. Drive \overline{EN} low for normal operation. Drive \overline{EN} high to disable the device.
5	5	GND	Ground
8	8	OUT	Output Voltage. Output of internal FET.
—	—	EP	Exposed Pad. Internally connected to GND. Connect EP to a large ground plane to maximize thermal performance. Do not use EP as the sole GND connection.

MAX4980/MAX4981 Functional Diagram

Overvoltage Protector with Active Current Limit

Detailed Description

The MAX4978–MAX4981 family of devices is a combination of an overvoltage protector, overcurrent limiter, and lithium-ion battery overcharge protector (MAX4980/MAX4981). These devices feature a low $85\text{m}\Omega$ (typ) R_{ON} FET and are used to protect the charger input port on a portable device. If the input voltage exceeds the overvoltage threshold (OVLO) or falls below the undervoltage threshold (UVLO), the FET is turned off to prevent damage to the protected components. The internal charge pump's 160ms debounce time prevents false turn-on of the internal FET during startup. $\overline{\text{SDT}}$ is an active-low open-drain output that asserts low during the debounce time after a valid voltage is applied to the input (MAX4978/MAX4979).

The MAX4978–MAX4981 feature an overcurrent limiter as a second layer of protection for a lithium-ion battery charger that limits current to a 900mA (MAX4978/MAX4979/MAX4980) or 1950mA (MAX4981) threshold for a 20ms blanking time. At the end of the blanking time, if current is still at the threshold, the FET is turned off and the device restarts the cycle after 160ms. The battery voltage monitor measures the voltage of a lithium-ion battery and disables the FET if the battery voltage exceeds 4.4V (MAX4980/MAX4981).

Autoretry

When the current-limit threshold is reached, the t_{BLANK} timer begins counting. The timer resets if the overcurrent condition disappears before t_{BLANK} has elapsed. A retry time delay, t_{RETRY} , is started immediately after t_{BLANK} has elapsed and during that time, the FET is off. At the end of t_{RETRY} , the FET is turned on again. If the fault still exists, the cycle is repeated. If the fault has been removed, the FET stays on.

Undervoltage Lockout (UVLO)

The MAX4978 has a 4.4V UVLO threshold, while the MAX4979/MAX4980/MAX4981 have a 2.63V UVLO threshold. When an undervoltage lockout condition occurs with high load current, the voltage at the input to the UVLO comparator may recover due to internal parasitic resistance causing the device to restart.

Overvoltage Lockout (OVLO)

The MAX4979 has a 6.8V OVLO threshold, while the MAX4978/MAX4980/MAX4981 have a 5.7V OVLO threshold.

Battery Overcharge Protector (MAX4980/MAX4981)

The MAX4980/MAX4981 feature a battery overcharge protection input (BAT) that triggers a voltage fault, turning off the FET, when V_{BAT} exceeds 4.4V.

Startup Debounce Time Indicator ($\overline{\text{SDT}}$) (MAX4978/MAX4979)

$\overline{\text{SDT}}$ is an open-drain output that asserts low during the startup debounce time and during the autoretry time. $\overline{\text{SDT}}$ returns to high impedance once the charge pump turns on. This feature is useful for discharging the AC adapter capacitance during the startup debounce time (Figures 1, 2).

Thermal Shutdown Protection

The MAX4978–MAX4981 have a thermal-shutdown feature to protect the devices from overheating. The device immediately turns off when the junction temperature exceeds $+160^\circ\text{C}$ (typ). These devices exit thermal shutdown after the junction temperature cools by 10°C (typ).

$\overline{\text{EN}}$ Input

$\overline{\text{EN}}$ is an active-low enable input. Drive $\overline{\text{EN}}$ low for normal operation. Drive $\overline{\text{EN}}$ high to disable the device.

Applications Information

IN Bypass Capacitor

For most applications, bypass IN to GND with a $1\mu\text{F}$ ceramic capacitor as close to the device as possible to enable $\pm 15\text{kV}$ (HBM) ESD protection on IN. If the power source has significant inductance due to long lead length, take care to prevent overshoots due to the LC tank circuit and provide protection if necessary to prevent exceeding the 30V absolute maximum rating on IN.

BAT Bypass Capacitor

For most applications, bypass BAT to GND with a $1\mu\text{F}$ ceramic capacitor as close to the device as possible to enable $\pm 15\text{kV}$ (HBM) ESD protection on BAT. If high ESD protection is not necessary, no capacitor is required on BAT.

ESD Test Conditions

ESD performance depends on a number of conditions. The MAX4978–MAX4981 are specified for $\pm 15\text{kV}$ (HBM) typical ESD resistance on IN and BAT when IN and BAT are bypassed to ground with a $1\mu\text{F}$ low ESR ceramic capacitor. Contact Maxim for a reliability report that documents test setup, methodology, and results.
