

## Low-Cost, Ultra-Small, 3μA Single-Supply Comparators

### General Description

The MAX9075/MAX9077 single/dual comparators are optimized for 3V and 5V single-supply applications. These comparators have a 580ns propagation delay and consume just 3μA per comparator. The combination of low-power, single-supply operation down to 2.1V, and ultra-small footprint makes these devices ideal for all portable applications.

The MAX9075/MAX9077 have a common-mode input voltage range of -0.2V to  $V_{CC} - 1.2V$ . Unlike many comparators, there is no differential clamp between the inputs, allowing the differential input voltage range to extend rail-to-rail. All inputs and outputs tolerate a continuous short-circuit fault condition to either rail.

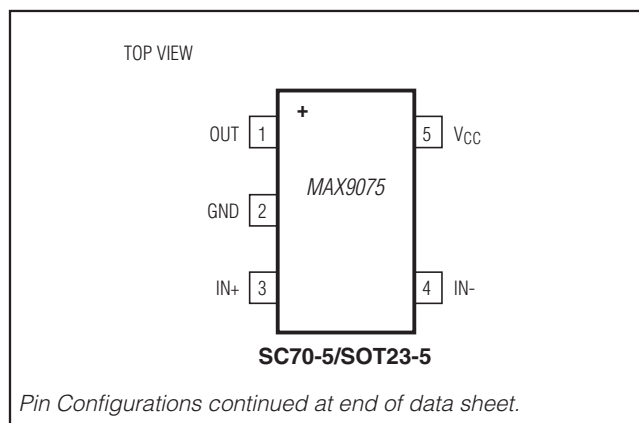

The design of the output stage limits supply-current surges while switching (typical of many other comparators), minimizing power consumption under dynamic conditions. Large internal push-pull output drivers allow rail-to-rail output swing with loads up to 2mA, making these devices ideal for interface with TTL/CMOS logic.

The MAX9075 single comparator is available in 5-pin SC70 and SOT23 packages, while the MAX9077 dual comparator is available in 8-pin SOT23, μMAX®, and SO packages.

### Applications

Battery-Powered Systems  
 Threshold Detectors/Discriminators  
 Keyless Entry Systems  
 IR Receivers  
 Digital Line Receivers

### Pin Configurations

μMAX is a registered trademark of Maxim Integrated Products, Inc.

### Features

- ◆ 580ns Propagation Delay from Only 3μA
- ◆ 2.1V to 5.5V Single-Supply Operation
- ◆ Ground-Sensing Inputs
- ◆ Rail-to-Rail Outputs
- ◆ No Output Phase Inversion for Overdriven Inputs
- ◆ No Differential Clamp Across Inputs
- ◆ Available in Ultra-Small Packages
  - 5-Pin SC70 (MAX9075)
  - 8-Pin SOT23 (MAX9077)

### Ordering Information

PART*	TEMP RANGE	PIN-PACKAGE	TOP MARK
MAX9075EXK+T	-40°C to +85°C	5 SC70	AAC+
MAX9075EUK+T	-40°C to +85°C	5 SOT23	ADLX+
MAX9077EKA+T	-40°C to +85°C	8 SOT23	AAAD+
MAX9077EUA+	-40°C to +85°C	8 μMAX	—
MAX9077ESA+	-40°C to +85°C	8 SO	—
MAX9077MSA/PR2	-55°C to +125°C	8 SO	—

+Denotes a lead(Pb)-free/RoHS-compliant package.

\*Denotes a package containing lead(Pb).

### Typical Operating Circuit

# MAX9075/MAX9077

## Low-Cost, Ultra-Small, 3 $\mu$ A Single-Supply Comparators

### ABSOLUTE MAXIMUM RATINGS

Supply Voltage	8-Pin $\mu$ MAX (derate 4.5mW/°C above +70°C) .....362mW
V <sub>CC</sub> to GND .....6V	8-Pin SO (derate 5.88mW/°C above +70°C) .....471mW
All Other Pins to GND .....-0.3V to (V <sub>CC</sub> + 0.3V)	Operating Temperature Range .....-40°C to +85°C
Current into Input Pins ..... $\pm$ 20mA	Military Operating Temperature Range .....-55°C to +125°C
Duration of Output Short-Circuit to GND or V <sub>CC</sub> .....Continuous	Storage Temperature Range .....-65°C to +150°C
Continuous Power Dissipation (T <sub>A</sub> = +70°C)	Lead Temperature (soldering, 10s) .....+300°C
5-Pin SC70 (derate 3.1mW/°C above +70°C) .....247mW	Soldering Temperature (reflow)
5-Pin SOT23 (derate 3.1mW/°C above +70°C) .....247mW	Lead (Pb)-free .....+260°C
8-Pin SOT23 (derate 5.2mW/°C above +70°C) .....412mW	Containing lead (Pb) .....+240°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### ELECTRICAL CHARACTERISTICS

(V<sub>CC</sub> = 5V, V<sub>CM</sub> = 0V, T<sub>A</sub> = T<sub>MIN</sub> to T<sub>MAX</sub>, unless otherwise noted. Typical values are at T<sub>A</sub> = +25°C.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS

—	—	7	7	OUTB	Output of Comparator B

### Detailed Description

The MAX9075/MAX9077 feature a 580ns propagation delay from an ultra-low supply current of only 3 $\mu$ A per comparator. These devices are capable of single-supply operation in the 2.1V to 5.5V range. Large internal output drivers allow rail-to-rail output swing with up to 2mA loads. Both comparators offer a push-pull output that sinks and sources current.

#### Comparator Output

The MAX9075/MAX9077 are designed to maintain a low-supply current during repeated transitions by limiting the shoot-through current.

#### Noise Considerations, Comparator Input

The input common-mode voltage range for these devices extends from 0V to  $V_{CC} - 1.2V$ . Unlike many other comparators, the MAX9075/MAX9077 can operate at any differential input voltage within these limits. Input bias current is typically -5nA if the input voltage is between the supply rails.

Although the comparators have a very high gain, useful gain is limited by noise. The comparator has a wide-band peak-to-peak noise of approximately 70 $\mu$ V.

### Applications Information

#### Adding Hysteresis

Hysteresis extends the comparator's noise margin by increasing the upper threshold and decreasing the lower threshold. A voltage divider from the output of the comparator sets the trip voltage. Therefore, the trip voltage is related to the output voltage. Set the hysteresis with three resistors using positive feedback, as shown in Figure 1.

The design procedure is as follows:

- 1) Choose R3. The leakage current of IN+ may cause a small error; however, the current through R3 can be approximately 500nA and still maintain accuracy. The added supply current due to the circuit at the trip point is  $V_{CC}/R3$ ; 10M $\Omega$  is a good practical value for R3, as this keeps the current well below the supply current of the chip.
- 2) Choose the hysteresis voltage ( $V_{HYS}$ ), which is the voltage between the upper and lower thresholds. In this example, choose  $V_{HYS} = 50mV$  and assume  $V_{REF} = 1.2V$  and  $V_{CC} = 5V$ .
- 3) Calculate R1 as follows:

$$R1 = R3 \times V_{HYS}/V_{CC} = 10M\Omega \times 0.05/5 = 100k\Omega$$

# MAX9075/MAX9077

## Low-Cost, Ultra-Small, 3μA Single-Supply Comparators

- 4) Choose the threshold voltage for  $V_{IN}$  rising ( $V_{THR}$ ). In this example, choose  $V_{THR} = 3V$ .
- 5) Calculate  $R_2$  as follows:

$$R_2 = 1 / \left\{ \left[ \frac{V_{THR}}{V_{REF} \times R_1} \right] - \frac{1}{R_1} - \frac{1}{R_3} \right\} = 1 / \left\{ \left[ \frac{3}{1.2 \times 100k\Omega} \right] - \frac{1}{100k\Omega} - \frac{1}{10M\Omega} \right\} = 67.114k\Omega$$

A 1% preferred value is 64.9kΩ.

- 6) Verify the threshold voltages with these formulas:

$V_{IN}$  rising:

$$V_{THR} = V_{REF} \times R_1 \left( \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} \right)$$

$V_{IN}$  falling:

$$V_{THF} = V_{THR} - (R_1 \times V_{CC}) / R_3$$

- 7) Check the error due to input bias current (5nA). If the error is too large, reduce  $R_3$  and recalculate.

$$V_{TH} = I_B (R_1 \times R_2 \times R_3) / (R_1 + R_2 + R_3) = 0.2mV$$

### Board Layout and Bypassing

Use 10nF power-supply bypass capacitors. Use 100nF bypass capacitors when supply impedance is high, when supply leads are long, or when excessive noise is expected on the supply lines. Minimize signal trace lengths to reduce stray capacitance. Minimize the capacitive coupling between IN- and OUT. For slow-moving input signals (rise time > 1ms) use a 1nF capacitor between IN+ and IN-.
