## Evaluates: MAX96717F

## MAX96717 DPHY Evaluation Kit

### General Description

The MAX96717 DPHY evaluation kit (EV kit) provides a proven design to evaluate the MAX96717 high-bandwidth gigabit multimedia serial link (GMSL) serializer with spread spectrum and full-duplex control channel using a standard FAKRA coaxial (Coax) or HMTD cable. The EV kit also includes Windows® 7 and Windows® 10 software that provides a simple graphical user interface (GUI) for exercising features of the device. The EV kit comes with a MAX96717, MAX96717F, MAX96717K or MAX96717R IC installed.

For complete GMSL evaluation using a standard FAKRA coaxial cable or HMTD cable, order the MAX96717 Coax EV kit and a companion deserializer board (MAX96716 Coax EV kit referenced in this document).

**Note:** In the following sections, “serializer” refers to camera serializer interface (CSI) serializer, including MAX96717, MAX96717F, MAX96717K and MAX96717R. “Deserializer” refers to CSI deserializer MAX96716 and its variants.

This document applies to both Coax and HMTD evaluation kits. Coax cable is also referenced in this document.

### Benefits and Features

- Ability for Serializer to send GMSL data to Deserializer, converting it into MIPI CSI-2
- Windows 10 or Higher Compatible Software Support
- USB Controlled Interface (Cable Included)
- Powerful and Simple GUI for Comprehensive Device Feature Evaluation
- Board Powered by USB, 12V Wall Adapter or External Power Supply
- Proven PCB Layout
- Fully Assembled and Tested

**Note:** Coax EV kits are configured to use PoC and FAKRA connectors. For HMTD connector, order HMTD specific EV kits found in the Ordering Information section.

[Ordering Information](#) appears at end of data sheet.

### MAX96717 EV Kit Files

FILE	DESCRIPTION
MAXSerDesEV-GMSL_Vxxxx_Install.exe	Installs the EV kit software (GUI) onto Windows 10 or higher computers. Includes GUI user's guide, microcontroller firmware, and documentation.

Figure 3. MAX96717 EV Kit Picture of Board (Bottom View)

Figure 4. MAX96717 EV Kit Default Jumper

## Quick Start

This procedure applies to both Coax and HMTD EV kits. [Figure 5](#) shows a typical application that uses the CSI serializer with the CSI deserializer.

## Required Equipment

The following equipment is required to successfully use the MAX96717 DPHY EV kit in a serial link coax cable configuration:

- MAX96716 DPHY EV kit rev A
- FAKRA Cable Assembly
- PC with Windows 10 or higher and GMSL2 Software
- PC running GMSL Software
- Power supply source (500mA USB port, 5V/1A DC Supply or 12V barrel jack DC supply [provided])
- Micro-USB cable

## Procedure

- 1) Follow the steps below to verify board operation.
- 2) Download and install the latest GMSL EV kit software from [www.maximintegrated.com](http://www.maximintegrated.com) or contact Maxim Applications. Follow the GMSL GUI User's Guide instructions.
- 3) Verify that jumpers on the serializer board are in their default positions, as shown in [Figure 2](#), and SW1 is in the OFF position.
- 4) Verify that jumpers on the deserializer board are in their default positions, and SW1 is in the OFF position.
- 5) Set up the system as below:
  - Connect FAKRA cable from FAKRA PCB connector from serializer to deserializer (Link A or Link B).
  - Connect +12V wall power supply into the POWER connector.
- 6) Turn SW1 to the ON position on both serializer and deserializer EV kits.
- 7) Verify that all of the power LEDs and red Teensy LED are illuminated, indicating that the board is powered, and Teensy uC is powered on both serializer and deserializer.
- 8) Verify the LOCK LED on both serializer and deserializer EV kits are illuminated, indicating that the link is successfully established. If the LOCK\_LED is OFF or ERR\_LED is ON, refer to the [Troubleshooting](#) section.
- 9) Start the GMSL GUI software.
- 10) When the GUI opens, it automatically searches for any active listener in both I<sup>2</sup>C and UART mode and identifies a valid GMSL product. Once the serializer and deserializer are identified, they are shown as tabs in the GUI.
- 11) Read register 0x00 in both deserializer and serializer to ensure both devices are active.
- 12) Basic bring-up is complete. Refer to the GMSL GUI User's Guide, GMSL Bring-up Guide, the latest data-sheet, or contact Maxim Applications for additional details.

## Configuration (CFG) Pin Settings

The serializer's CFG pins use the pin voltage latched at power-up to configure the device. On-board I<sup>2</sup>C-configurable digital potentiometers or 0402 resistors set the configuration (CFG) pin voltage levels. By default, the board is wired to use the digital potentiometers.

The CFG states can be configured using the GMSL 2 GUI. Use the following GUI menu path: Tools > Set CFG Pin Levels.

To switch between using the digital potentiometer or resistor network to set CFG states, use 0Ω resistors to connect the CFG0/1 nets. The voltage on the CFG pins can be monitored on the CFG0 and CFG1 test points or on the 2x12 MFP header (J1).

If the serializer is not identified in the GUI, it is still possible to write to the CFG pins. For more information, refer to the [Troubleshooting](#) section.

The voltage levels scale with V<sub>DDIO</sub>. Tables 1-5 indicate the voltage levels necessary to configure the serializer for different modes of operation.

Table 6. Serializer Jumper Descriptions

The following table contains details of all the connectors, jumpers, and test points of the EV kit. The power configuration of the EV kit hardware can be reconfigured to allow external supply connections. [Figure 6](#) shows the power connection options.

JUMPER	SIGNAL	DEFAULT POSITION	FUNCTION
POWER	+12V, EXT PWR, 5V USB,	+12V	Power to supply voltage VSUP.
J1	MFP	Open	Connection for MFP signals.
J2	HMTD SIOA (+/-)	Open	HMTD connector for SIOA GMSL signal.
J3	USB Connection	Open	Connection from PC to TEENSY and +5V USB connection.
J4	SAMTEC Connector	Open	Connector for MIPI signals and MFP (SPI, I2C, GPIOs) signals.
J5	External 12V Input	N/A	12V DC input for board power.
J6	External Supply Input	Open	Header for GND connection and optional external voltage.
$V_{DDIO}$	$V_{DDIO}$ , 1.8V, 3.3V	3.3V	Connection between $V_{DDIO}$ , 1.8V and 3.3V.
$V_{DD}$	$V_{DD}$ , 1V, 1.2V	1.2V	Connection between $V_{DD}$ , 1V and 1.2V.
$V_{DD\_REF}$	$V_{DD\_REF}$	3.3V	Connection between $V_{DD\_REF}$ and 3.3V for I2C/UART lines.
RX_SDA	UART TX, I2C SDA	TNZ_SDA	Selection of I2C or UART connection to TEENSY.
TX_SCL	UART RX, I2C SCL	TNZ_SCL	Selection of I2C or UART connection to TEENSY.
EXP	SDA_RX, SCL_TX	Open	External I2C or UART connections.
EXT_UC	SDA, SCL, GND, $V_{DD\_REF}$	Open	External I2C or UART connections through the levels translator.
JAP	COAX SIOA+	Open	GMSL and PoC connection for COAX Link A.

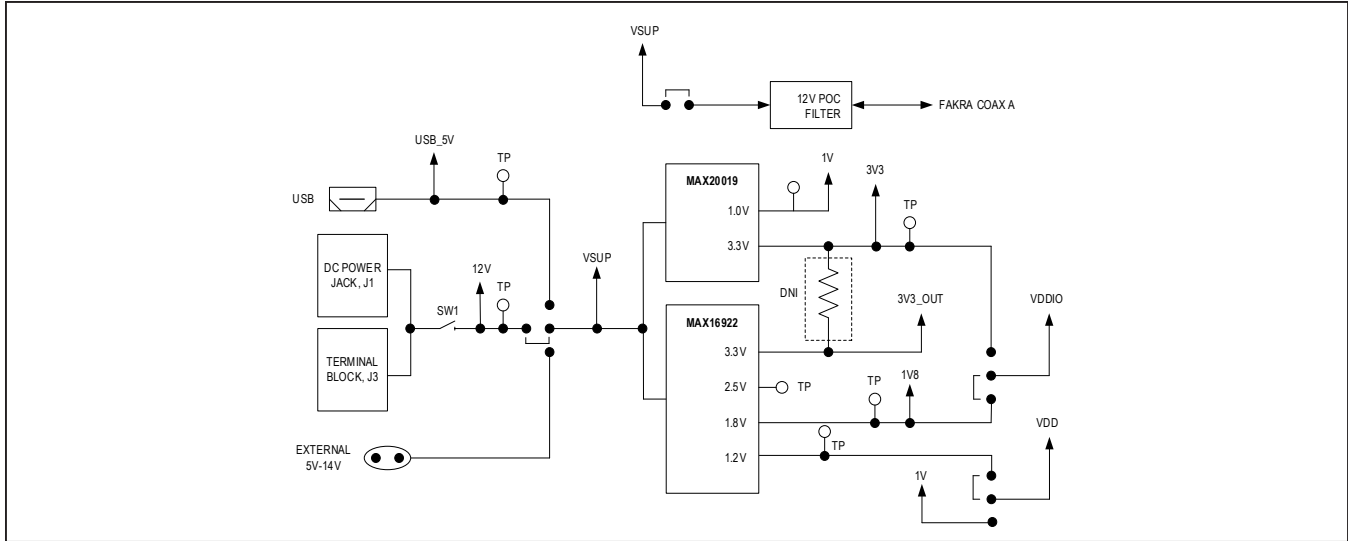

Figure 6. MAX96717 EV Kit Power Diagram

**Troubleshooting**

If the MAX96717 EV kit PCB fails to power-up or does not function properly, try the appropriate remedial actions below.

- 1) Verify the board’s red power switch (SW1) is set to the ON position.
- 2) Verify that the device is powered properly. Ensure that the voltages are within their operating ranges at all device pins. Verify that power LED is illuminated and/or measure voltage rail jumpers.
- 3) Check that all jumpers are correctly set. Refer to the default jumper settings table in the serializer and deserializer EV kit data sheets. Also, ensure that all jumpers are firmly attached. Replace loose or damaged jumpers, if necessary.
- 4) Check that the USB cable is properly seated in the USB port.
- 5) Check that the coax/STP cable connection between serializer and deserializer is properly secured.
- 6) Verify that the DUT has not been inadvertently put into Teensy reset mode. The board’s TEENSY\_RST button should only be pressed when firmware is being flashed to the DUT. If the button is pressed during normal operation, the device goes into Teensy reset mode. Power cycle the board to resume normal operation with the current firmware.
- 7) Validate that the correct CFG pin voltages are being used to configure the serializer. Check the method of biasing the CFG voltage at powerup. Measure the voltages at the pins. For details, refer to the [Configuration \(CFG\) Pin Settings](#) section.
- 8) If the CFG pin settings are incorrect, but the device is not identified in the GUI, proceed to the [Configuration \(CFG\) Pin Settings](#) section and set the desired CFG state values. Reset the part and verify if the GUI automatically identifies the device. If not, use the following menu path to locate the device: Options tab > Identify Devices. The low-level Commands tab can be monitored to see if I<sup>2</sup>C writes to the CFG pots are successful.
- 9) Check that the I<sup>2</sup>C/UART jumpers match the DUT communication mode (SCL/SDA for I<sup>2</sup>C, TX/RX for UART).
- 10) Check that the AC coupling capacitors are populated correctly and routing the serial link to the correct connector for Coax or STP mode. For coax boards, capacitors C12 and C13 should be populated. For STP boards, capacitors C3 and C19 should be populated (MAX96717 EV kit boards are shipped with the correct capacitors installed.).
- 11) Check that the microcontroller firmware is active by observing the blinking red Teensy LED at power-up. If the LED is not blinking, refer to the available software documentation to reprogram the microcontroller.
- 12) Check that the PC is detecting the COM port when the micro-USB cable is connected. Use the Windows Device Manager to check COM port status.
- 13) Power-cycle the board and reopen the GUI.
- 14) Try a new or different serializer or deserializer board.
