

# MAX987/MAX988/MAX991/ MAX992/MAX995/MAX996

# High-Speed, Micropower, Low-Voltage, Rail-to-Rail I/O Comparators

## General Description

The MAX987/MAX988/MAX991/MAX992/MAX995/MAX996 single/dual/quad micropower comparators feature low-voltage operation and rail-to-rail inputs and outputs. Their operating voltage ranges from +2.5V to +5.5V, making them ideal for both 3V and 5V systems. These comparators also operate with  $\pm 1.25V$  to  $\pm 2.75V$  dual supplies. They consume only 48 $\mu A$  per comparator while achieving a 120ns propagation delay.

Input bias current is typically 1.0pA, and input offset voltage is typically 0.5mV. Internal hysteresis ensures clean output switching, even with slow-moving input signals.

The output stage's unique design limits supply-current surges while switching, virtually eliminating the supply glitches typical of many other comparators. The MAX987/MAX991/MAX995 have a push-pull output stage that sinks as well as sources current. Large internal output drivers allow rail-to-rail output swing with loads up to 8mA. The MAX988/MAX992/MAX996 have an open-drain output stage that can be pulled beyond  $V_{CC}$  to 6V (max) above  $V_{EE}$ . These open-drain versions are ideal for level translators and bipolar to single-ended converters.

The single MAX987/MAX988 are available in tiny 5-pin SC70 packages, while the dual MAX991/MAX992 are available in ultra-small  $\mu MAX^{\circledR}$  package.

## Selector Guide

PART	COMPARATORS PER PACKAGE	OUTPUT STAGE
MAX987	1	Push-Pull
MAX988	1	Open-Drain
MAX991	2	Push-Pull
MAX992	2	Open-Drain
MAX995	4	Push-Pull
MAX996	4	Open-Drain

## Applications

- Portable/Battery-Powered Systems
- Mobile Communications
- Zero-Crossing Detectors
- Window Comparators
- Level Translators
- Threshold Detectors/Discriminators
- Ground/Supply Sensing
- IR Receivers
- Digital Line Receivers

$\mu MAX$  is a registered trademark of Maxim Integrated Products, Inc.

## Benefits and Features

- 120ns Propagation Delay
- 48 $\mu A$  Quiescent Supply Current
- +2.5V to +5.5V Single-Supply Operation
- Common-Mode Input Voltage Range Extends 250mV Beyond the Rails
- Push-Pull Output Stage Sinks and Sources 8mA Current (MAX987/MAX991/MAX995)
- Open-Drain Output Voltage Extends Beyond  $V_{CC}$  (MAX988/MAX992/MAX996)
- Unique Output Stage Reduces Output Switching Current, Minimizing Overall Power Consumption
- 100 $\mu A$  Supply Current at 1MHz Switching Frequency
- No Phase Reversal for Overdriven Inputs
- Available in Space-Saving Packages:
  - 5-Pin SC70 (MAX987/MAX988)
  - 8-Pin  $\mu MAX$  (MAX991/MAX992)

# MAX987/MAX988/MAX991/ MAX992/MAX995/MAX996

# High-Speed, Micropower, Low-Voltage, Rail-to-Rail I/O Comparators

## Detailed Description

The MAX987/MAX988/MAX991/MAX992/MAX995/MAX996 are single/dual/quad low-power, low-voltage comparators. They have an operating supply voltage range between +2.5V and +5.5V and consume only 48 $\mu$ A per comparator, while achieving 120ns propagation delay. Their common-mode input voltage range extends 0.25V beyond each rail. Internal hysteresis ensures clean output switching, even with slow-moving input signals. Large internal output drivers allow rail-to-rail output swing with up to 8mA loads.

The output stage employs a unique design that minimizes supply-current surges while switching, virtually eliminating the supply glitches typical of many other comparators. The MAX987/MAX991/MAX995 have a push-pull output structure that sinks as well as sources current. The MAX988/MAX992/MAX996 have an open-drain output stage that can be pulled beyond  $V_{CC}$  to an absolute maximum of 6V above  $V_{EE}$ .

### Input Stage Circuitry

The devices' input common-mode range extends from -0.25V to ( $V_{CC} + 0.25V$ ). These comparators may operate at any differential input voltage within these limits. Input bias current is typically 1.0pA if the input voltage is between the supply rails. Comparator inputs are protected from overvoltage by internal body diodes connected to the supply rails. As the input voltage exceeds the supply rails, these body diodes become forward biased and begin to conduct. Consequently, bias currents increase exponentially as the input voltage exceeds the supply rails.

### Output Stage Circuitry

These comparators contain a unique output stage capable of rail-to-rail operation with up to 8mA loads. Many comparators consume orders of magnitude more current during switching than during steady-state operation. However, with this family of comparators, the supply-current change during an output transition is extremely small. The Supply Current vs. Output Transition Frequency graph in the [Typical Operating Characteristics](#) section shows the minimal supply-current increase as the output switching frequency approaches 1MHz. This characteristic eliminates the need for power-supply filter capacitors to reduce glitches created by comparator switching currents. Battery life increases substantially in high-speed, battery-powered applications.

## Applications Information

### Additional Hysteresis

#### MAX987/MAX991/MAX995

The MAX987/MAX991/MAX995 have  $\pm 2.5mV$  internal hysteresis. Additional hysteresis can be generated with three resistors using positive feedback (Figure 1). Unfortunately, this method also slows hysteresis response time. Use the following procedure to calculate resistor values for the MAX987/MAX991/MAX995.

- 1) Select R3. Leakage current at  $I_N$  is under 10nA; therefore, the current through R3 should be at least 1 $\mu$ A to minimize errors caused by leakage current. The current through R3 at the trip point is  $(V_{REF} - V_{OUT}) / R3$ . Considering the two possible output states and solving for R3 yields two formulas:  $R3 = V_{REF} / 1\mu A$  or  $R3 = (V_{REF} - V_{CC}) / 1\mu A$ . Use the smaller of the two resulting resistor values. For example, if  $V_{REF} = 1.2V$  and  $V_{CC} = 5V$ , then the two R3 resistor values are 1.2M $\Omega$  and 3.8M $\Omega$ . Choose a 1.2M $\Omega$  standard value for R3.
- 2) Choose the hysteresis band required ( $V_{HB}$ ). For this example, choose 50mV.
- 3) Calculate R1 according to the following equation:

$$R1 = R3 \times (V_{HB} / V_{CC})$$

For this example, insert the values  $R1 = 1.2M\Omega \times (50mV / 5V) = 12k\Omega$ .

- 4) Choose the trip point for  $V_{IN}$  rising ( $V_{THR}$ ;  $V_{THF}$  is the trip point for  $V_{IN}$  falling). This is the threshold voltage at which the comparator switches its output from low to high as  $V_{IN}$  rises above the trip point. For this example, choose 3V.

Figure 1. Additional Hysteresis (MAX987/MAX991/MAX995)

## MAX987/MAX988/MAX991/ MAX992/MAX995/MAX996

- 5) Calculate R2 as shown. For this example, choose an 8.2kΩ standard value:

$$R2 = \frac{1}{\left(\frac{V_{THR}}{V_{REF} \times R1}\right) - \frac{1}{R1} - \frac{1}{R3}}$$

$$R2 = \frac{1}{\left(\frac{3.0V}{1.2 \times 12k\Omega}\right) - \frac{1}{12k\Omega} - \frac{1}{2.2M\Omega}} = 8.03k\Omega$$

- 6) Verify trip voltages and hysteresis as follows:

$$V_{IN \text{ rising}}: V_{THR} = V_{REF} \times R1 \times \left(\frac{1}{R1} + \frac{1}{R2} + \frac{1}{R3}\right)$$

$$V_{IN \text{ falling}}: V_{THF} = V_{THR} - \left(\frac{R1 \times V_{CC}}{R3}\right)$$

$$\text{Hysteresis} = V_{THR} - V_{THF}$$

### MAX988/MAX992/MAX996

The MAX988/MAX992/MAX996 have ±2.5mV internal hysteresis. They have open-drain outputs and require an external pullup resistor (Figure 2). Additional hysteresis can be generated using positive feedback, but the formulas differ slightly from those of the MAX987/MAX991/MAX995.

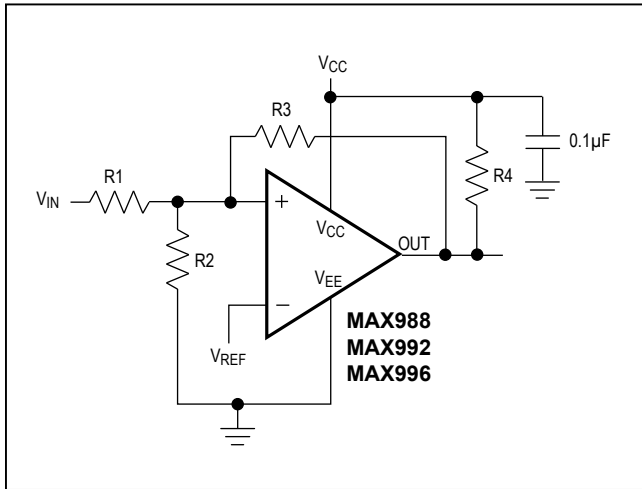

Figure 2. Additional Hysteresis (MAX988/MAX992/MAX996)

## High-Speed, Micropower, Low-Voltage, Rail-to-Rail I/O Comparators

Use the following procedure to calculate resistor values:

- 1) Select R3 according to the formulas  $R3 = V_{REF} / 1\mu A$  or  $R3 = (V_{REF} - V_{CC}) / 1\mu A - R4$ . Use the smaller of the two resulting resistor values.
- 2) Choose the hysteresis band required ( $V_{HB}$ ). For this example, choose 50mV.
- 3) Calculate R1 according to the following equation:  
$$R1 = (R3 + R4) \times (V_{HB} / V_{CC})$$
- 4) Choose the trip point for  $V_{IN}$  rising ( $V_{THR}$ ;  $V_{THF}$  is the trip point for  $V_{IN}$  falling). This is the threshold voltage at which the comparator switches its output from low to high as  $V_{IN}$  rises above the trip point.
- 5) Calculate R2 as follows:

$$R2 = \frac{1}{\left(\frac{V_{THR}}{V_{REF} \times R1}\right) - \frac{1}{R1} - \frac{1}{R3 + R4}}$$

- 6) Verify trip voltages and hysteresis as follows:

$$V_{IN \text{ rising}}: V_{THR} = V_{REF} \times R1 \times$$

$$\left(\frac{1}{R1} + \frac{1}{R2} + \frac{1}{R3 + R4}\right)$$

$$V_{IN \text{ falling}}: V_{THF} = V_{THR} - \left(\frac{R1 \times V_{CC}}{R3 + R4}\right)$$

$$\text{Hysteresis} = V_{THR} - V_{THF}$$

### Circuit Layout and Bypassing

These comparators' high-gain bandwidth requires design precautions to maximize their high-speed capability. The recommended precautions are:

- 1) Use a PCB with an unbroken, low-inductance ground plane.
- 2) Place a decoupling capacitor (a 0.1µF ceramic capacitor is a good choice) as close to  $V_{CC}$  as possible.
- 3) On the inputs and outputs, keep lead lengths short to avoid unwanted parasitic feedback around the comparators.
- 4) Solder the devices directly to the PCB instead of using a socket.

# MAX987/MAX988/MAX991/ MAX992/MAX995/MAX996

# High-Speed, Micropower, Low-Voltage, Rail-to-Rail I/O Comparators

## Zero-Crossing Detector

Figure 3 shows a zero-crossing detector application. The MAX987's inverting input is connected to ground, and its noninverting input is connected to a 100mVp-p signal source. As the signal at the noninverting input crosses 0V, the comparator's output changes state.

Figure 3. Zero-Crossing Detector

## Logic-Level Translator

Figure 4 shows an application that converts 5V logic levels to 3V logic levels. The MAX988 is powered by the +5V supply voltage, and the pullup resistor for the MAX988's open-drain output is connected to the +3V supply voltage. This configuration allows the full 5V logic swing without creating overvoltage on the 3V logic inputs. For 3V to 5V logic-level translation, simply connect the +3V supply to VCC and the +5V supply to the pullup resistor.

Figure 4. Logic-Level Translator
