

Phase Locked Loop

MC14046B

The MC14046B phase locked loop contains two phase comparators, a voltage-controlled oscillator (VCO), source follower, and zener diode. The comparators have two common signal inputs, PCAin and PCB_{in}. Input PCA_{in} can be used directly coupled to large voltage signals, or indirectly coupled (with a series capacitor) to small voltage signals. The self-bias circuit adjusts small voltage signals in the linear region of the amplifier. Phase comparator 1 (an exclusive OR gate) provides a digital error signal PC1_{out}, and maintains 90° phase shift at the center frequency between PCA_{in} and PCB_{in} signals (both at 50%duty cycle). Phase comparator 2 (with leading edge sensing logic) provides digital error signals, PC2_{out} and LD, and maintains a 0° phase shift between PCA_{in} and PCB_{in} signals (duty cycle is immaterial). The linear VCO produces an output signal VCOout whose frequency is determined by the voltage of input VCO_{in} and the capacitor and resistors connected to pins C1A, C1B, R1, and R2. The source-follower output SFout with an external resistor is used where the VCO_{in} signal is needed but no loading can be tolerated. The inhibit input Inh, when high, disables the VCO and source follower to minimize standby power consumption. The zener diode can be used to assist in power supply regulation.

Applications include FM and FSK modulation and demodulation, frequency synthesis and multiplication, frequency discrimination, tone decoding, data synchronization and conditioning, voltage-to-frequency conversion and motor speed control.

Features

- Buffered Outputs Compatible with Low-Power TTL
- Diode Protection on All Inputs
- Supply Voltage Range = 3.0 to 18 V
- Pin-for-Pin Replacement for CD4046B
- Phase Comparator 1 is an Exclusive OR Gate and is Duty Cycle Limited
- Phase Comparator 2 Switches on Rising Edges and is not Duty Cycle Limited
- NLV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free and are RoHS Compliant

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 6 of this data sheet.

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high–impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range $V_{SS} \leq (V_{in} \text{ or } V_{out}) \leq V_{DD}$.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either V_{SS} or V_{DD}). Unused outputs must be left open.

MAXIMUM RATINGS (Voltages Referenced to V_{SS})

Symbol	Parameter	Value	Unit
V_{DD}	DC Supply Voltage Range	-0.5 to +18.0	V
V _{in}	Input Voltage Range (All Inputs)	-0.5 to V _{DD} + 0.5	V
I _{in}	DC Input Current, per Pin	±10	mA
P_{D}	Power Dissipation, per Package (Note 1)	500	mW
T _A	Operating Temperature Range	-55 to +125	°C
T _{stg}	Storage Temperature Range	-65 to +150	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Temperature Derating: "D/DW" Packages: -7.0 mW/°C From 65°C To 125°C

Refer to Waveforms in Figure 3.

Figure 1. Phase Comparators State Diagrams

Characteristic	Using Phase Comparator 1	Using Phase Comparator 2		
No signal on input PCA _{in} .	VCO in PLL system adjusts to center frequency (f_0) .	VCO in PLL system adjusts to minimum frequency ($f_{\rm min}$).		
Phase angle between PCA _{in} and PCB _{in} .	90° at center frequency (f ₀), approaching 0° and 180° at ends of lock range (2f _L)	Always 0° in lock (positive rising edges).		
Locks on harmonics of center frequency.	Yes	No		
Signal input noise rejection.	High	Low		
Lock frequency range (2f _L).	The frequency range of the input signal on which the loop will stay locked if it was initially in lock; $2f_L = \text{full VCO}$ frequency range = $f_{\text{max}} - f_{\text{min}}$.			
Capture frequency range (2f _C).	The frequency range of the input signal on which the loop will lock if it was initially out of lock.			
	Depends on low–pass filter characteristics (see Figure 3). $f_C \le f_L$	$f_{\mathbb{C}} = f_{\mathbb{L}}$		
Center frequency (f ₀).	The frequency of VCO _{out} , when VCO _{in} = 1/2	V _{DD}		
VCO output frequency (f).	$f_{min} = \frac{1}{R_2(C_1 + 32 \text{ pF})}$ (Vo	_{CO} input = V _{SS})		
Note: These equations are intended to be a design guide. Since calculated component values may be in error by as much as a factor of 4, laboratory experimentation may be required for fixed designs. Part to part frequency variation with identical passive components is typically less than ± 20%.	$f_{max} = \frac{1}{R_1(C_1 + 32 \text{ pF})} + f_{min} \qquad (V_0)$ Where: $10K \le R_1 \le 1 \text{ M}$ $10K \le R_2 \le 1 \text{ M}$ $100\text{pF} \le C_1 \le .01 \mu\text{F}$	_{CO} input = V _{DD})		

Figure 2. Design Information

Typically:
$$\begin{aligned} &R_4\,C_2 &= \frac{6N}{f_{max}} - \frac{N}{2\,\pi\,\Delta\,f} \\ &(R_3\,+\,3,000\Omega)\,C_2 &= \frac{100N\Delta f}{f_{max}2} - R_4\,C_2 \\ &\Delta\,f = f_{max} - f_{min} \end{aligned}$$

NOTE: Sometimes R3 is split into two series resistors each R3 \div 2. A capacitor C_C is then placed from the midpoint to ground. The value for C_C should be such that the corner frequency of this network does not significantly affect Ω_n . In Figure B, the ratio of R3 to R4 sets the damping, R4 \cong (0.1)(R3) for optimum results.

Definitions: N = Total division ratio in feedback loop $K\varphi = V_{DD}/\pi \text{ for Phase Comparator 1}$

 $K\phi = V_{DD}/4 \pi$ for Phase Comparator 2

$$K_{VCO} = \frac{2 \pi \Delta f_{VCO}}{V_{DD} - 2 V}$$
 for a typical design $\Omega_n \cong \frac{2 \pi f_r}{10}$ (at phase detector input)
$$\zeta \cong 0.707$$
