

# FS5502

## High voltage PMIC with multiple SMPS and LDO

Rev. 4 — 27 October 2021

Product data sheet

## 1 General description

---

This device family is part of a global platform including FS5502/VR5500 (Quality Management), FS84 (fit for ASIL B) and FS85 (fit for ASIL D), pin to pin and software compatible. This data sheet covers FS5502 device only.

The FS5502 is an automotive high voltage multi-output power supply integrated circuit, with focus on radio and radar applications. It includes multiple switch mode and linear voltage regulators. It offers external frequency synchronization input and output, for optimized system EMC performance and it is qualified in compliance with AEC-Q100 rev H (Grade1, MSL3).

Several device versions are available, offering choice in number of output rails, output voltage setting, operating frequency and power up sequencing, to address multiple applications.

## 2 Features and benefits

---

- 60 V DC maximum input voltage for 12 V and 24 V applications
- VPRE synchronous buck controller with external MOSFETs. Configurable output voltage, switching frequency, and current capability up to 10 A peak.
- Low voltage integrated synchronous BUCK1 converter, dedicated to MCU core supply with SVS capability. Configurable output voltage and current capability up to 3.6 A peak.
- Low voltage integrated synchronous BUCK3 converter. Configurable output voltage and current capability up to 3.6 A peak.
- EMC optimization techniques including SMPS frequency synchronization, spread spectrum, slew rate control, manual frequency tuning
- One linear voltage regulator for MCU I/Os and ADC supply, external physical layer. Configurable output voltage and current capability up to 400 mA DC.
- OFF mode with very low sleep current (10  $\mu$ A typ)
- Two input pins for wake-up detection and battery voltage sensing
- Device control via I<sup>2</sup>C interface with CRC
- Power synchronization pin to operate two FS5502 devices or FS5502 plus an external PMIC
- Three voltage monitoring circuits, dedicated interface for MCU monitoring, power good, reset and interrupt outputs
- Configuration by OTP programming. Prototype enablement to support custom setting during project development in engineering mode.

### 3 Applications

- Radio
- V2x
- Infotainment

### 4 Simplified application diagram

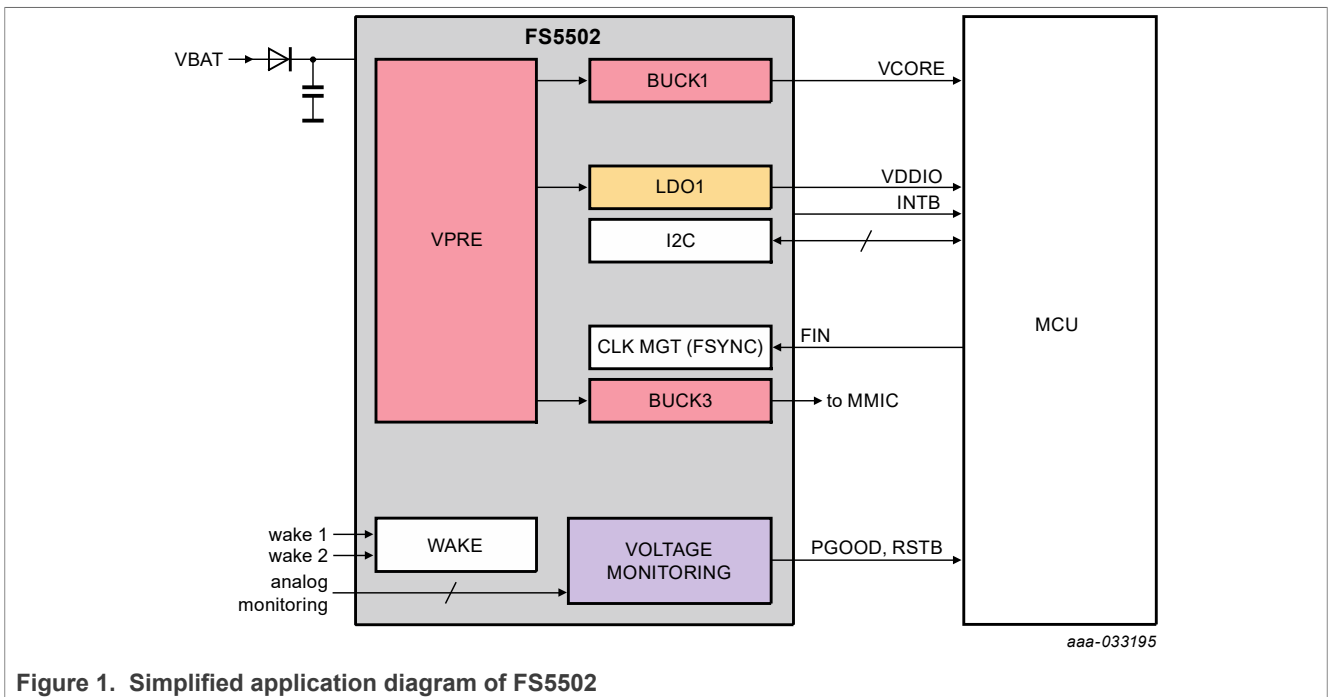

Figure 1. Simplified application diagram of FS5502

### 5 Ordering information

Table 1. Ordering information

Part number <sup>[1] [2] [3]</sup>	Package		Version	OTP ID
	Name	Description		
MC33FS5502Y0ES	HVQFN56	HVQFN56, plastic, thermally enhanced very thin quad flat package, no lead, wettable flanks	SOT684-23	—
MC33FS5502Y3ES				<a href="http://www.nxp.com/MC33FS5502Y3ES-OTP-Report">http://www.nxp.com/MC33FS5502Y3ES-OTP-Report</a>
MC33FS5502Y0KS				—
MC33FS5502Y3KS				<a href="http://www.nxp.com/MC33FS5502Y3KS-OTP-Report">http://www.nxp.com/MC33FS5502Y3KS-OTP-Report</a>

[1] To order parts in tape and reel, add the R2 suffix to the part number.  
 [2] Step-cut wettable flank for part numbers ending in ES. Dimple wettable flank for part numbers ending in KS.  
 [3] The part numbers with KS suffix are recommended for new designs.

Y0 part is a non-programmed OTP configuration. Pre-programmed OTP configurations (other than BUCK regulators) will be managed through suffix Y1 to ZZ.

## 7 Pinning information

### 7.1 Pinning

Figure 3. Pin configuration for HVQFN56

### 7.2 Pin description

See [Section 7.3](#) for connection of unused pins.

Table 2. Pin description

Symbol	Pin	Type	Description
WAKE2	1	A_IN / D_IN	Wake-up input 2 An external serial resistor is required if WAKE2 is a global pin
n.c.	2	n.c.	Not connected pin
BUCK3_INQ	3	A_IN	Low voltage BUCK3 quiet input voltage
VDDI2C	4	A_IN	Input voltage for I <sup>2</sup> C buffers
n.c.	5	n.c.	Not connected pin
BUCK3_IN	6	A_IN	Low voltage BUCK3 input voltage
BUCK3_SW	7	A_OUT	Low voltage BUCK3 switching node
DBG	8	A_IN	Debug mode entry
BUCK3_FB	9	A_IN	Low voltage BUCK3 voltage feedback

Table 2. Pin description...continued

Symbol	Pin	Type	Description
SCL	10	D_IN	I <sup>2</sup> C bus Clock input
SDA	11	D_IN/OUT	I <sup>2</sup> C bus Bidirectional data line
n.c.	12	n.c.	Not connected pin
n.c.	13	n.c.	Not connected pin
n.c.	14	n.c.	Not connected pin
n.c.	15	n.c.	Not connected pin
VMON1	16	A_IN	Voltage monitoring input 1
VCOREMON	17	A_IN	VCORE monitoring input: Must be connected to BUCK1 output voltage
PGOOD	18	D_OUT	Power good output Active low Pull up to VDDIO mandatory
RSTB	19	D_OUT	Reset output Active low The main function is to reset the MCU. Reset input voltage is monitored to detect external reset and fault condition. Pull up to VDDIO mandatory
FIN	20	D_IN	Frequency synchronization input
GND	21	GND	Ground
GND	22	GND	Ground
VDDIO	23	A_IN	Input voltage FOUT buffers Allow voltage compatibility with MCU I/Os
FOUT	24	D_OUT	Frequency synchronization output
n.c.	25	n.c.	Not connected pin
n.c.	26	n.c.	Not connected pin
n.c.	27	GND	External pull down to GND
n.c.	28	n.c.	Not connected pin
n.c.	29	n.c.	Not connected pin
n.c.	30	n.c.	Not connected pin
n.c.	31	n.c.	Not connected pin
n.c.	32	n.c.	Not connected pin
INTB	33	D_OUT	Interrupt output
n.c.	34	n.c.	Not connected pin
n.c.	35	n.c.	Not connected pin
BUCK1_IN	36	A_IN	Low voltage BUCK1 input voltage
BUCK1_SW	37	A_OUT	Low voltage BUCK1 switching node
PSYNC	38	D_IN/OUT	Power synchronization input/output
BUCK1_FB	39	A_IN	Low voltage BUCK1 voltage feedback
n.c.	40	GND	External pull down to GND
PRE_COMP	41	A_IN	VPRE compensation network
PRE_CSP	42	A_IN	VPRE positive current sense input

Table 2. Pin description...continued

Symbol	Pin	Type	Description
PRE_GLS	43	A_OUT	VPRE low-side gate driver for external MOSFET
PRE_SW	44	A_OUT	VPRE switching node
PRE_GHS	45	A_OUT	VPRE high-side gate driver for external MOSFET
PRE_BOOT	46	A_IN/OUT	VPRE bootstrap capacitor
VBOS	47	A_OUT	Best of supply output voltage
PRE_FB	48	A_IN	VPRE voltage feedback and negative current sense input
WAKE1	49	A_IN / D_IN	Wake up input 1 An external serial resistor is required if WAKE1 is a global pin
VSUP1	50	A_IN	Power supply 1 of the device An external reverse battery protection diode in series is mandatory
VSUP2	51	A_IN	Power supply 2 of the device An external reverse battery protection diode in series is mandatory
n.c.	52	n.c.	Not connected pin
VBOOST	53	A_IN	VBOOST voltage feedback Must be connected to PRE_FB
n.c.	54	n.c.	Not connected pin
LDO1	55	A_OUT	Linear regulator 1 output voltage
LDO1_IN	56	A_IN	Linear regulator 1 input voltage
EP	57	GND	Exposed pad (BUCK1 and BUCK3 low-side GNDs are connected to the expose pad)

### 7.3 Connection of unused pins

Table 3. Connection of unused pins

Pin	Name	Type	Connection if not used
1	WAKE2	A_IN / D_IN	External pull down to GND
2	n.c.	n.c.	Open

Pin	Name	Type	Connection if not used
57	EP	GND	Connection mandatory

## 8 Functional description

The FS5502 device has two independent logic blocks. The main state machine manages the power management, the Standby mode and the wake-up sources. The fail-safe state machine manages the voltage monitoring of the power management.

### 8.1 Simplified functional state diagram

### 8.2 Main state machine

The FS5502 start when  $VSUP > VSUP_{UVH}$  and  $WAKE1$  or  $WAKE2 > WAKE12_{VIH}$  with  $VBOS$  first, followed by  $VPRE$ , and the power-up sequencing from the OTP programming for the remaining regulators if  $PSYNC$  pin is pulled up to  $VBOS$ . If during the power-up sequence  $VSUP < VSUP_{UVL}$ , the device goes back to Standby mode. When the power-up is finished, the main state machine is in Normal\_M mode, which is the application running mode with all the regulators ON and  $VSUP_{UVL}$  has no effect even if  $VSUP < VSUP_{UVL}$ . See Figure 29 for the minimum operating voltage.

The power up sequence can be synchronized with another PMIC using the  $PSYNC$  pin in order to stop before or after  $VPRE$  is ON and wait for the PMIC feedback on  $PSYNC$  pin before allowing FS5502 to continue its power up sequence. If the power up sequence

from VPRE ON to NORMAL\_M is not completed within 1 second, the device goes back to Standby mode. VPRE restarts when  $V_{SUP} > V_{SUP\_UVH}$  and  $WAKE1$  or  $WAKE2 > WAKE12_{VIH}$ .

The device goes to Standby mode by an I<sup>2</sup>C command from the MCU. The device goes to Standby mode when both  $WAKE1$  and  $WAKE2 = 0$ . The device goes to Standby mode following the power down sequence to stop all the regulators in the reverse order of the power up sequence. VPRE shutdown can be delayed from 250  $\mu$ s to 32 ms by OTP\_VPRE\_off\_dly bit in case VPRE is supplying an external PMIC to wait its power down sequence completion.

In case of loss of VPRE ( $VPRE < V_{PRE\_UVL}$ ) or loss of VBOS ( $VBOS < V_{BOS\_UVL}$ ), the device stops and goes directly to Standby mode without power down sequence. VPRE restarts when  $V_{SUP} > V_{SUP\_UVH}$  and  $WAKE1$  or  $WAKE2 > WAKE12_{VIH}$ .

In case of VPRE\_FB\_OV detection, or TSD detection on a regulator depending on OTP\_conf\_tsd[5:0] bits configuration, or deep fail-safe request from the fail-safe state machine when DFS = 1, the device stops and goes directly to DEEP-FS mode without power down sequence.

Exit of DEEP-FS mode is only possible by  $WAKE1 = 0$  or after 4 s if the autoretry feature is activated by OTP\_Autoretry\_en bit. The number of autoretry can be limited to 15 or infinite depending on OTP\_Autoretry\_infinite bit. VPRE restarts when  $V_{SUP} > V_{SUP\_UVH}$  and  $WAKE1$  or  $WAKE2 > WAKE12_{VIH}$ .

### 8.3 Fail-safe state machine

The fail-safe state machine starts when  $VBOS > V_{BOS\_POR}$ . RSTB and PGOOD pins are released and the initialization of the device is opened.

When RSTB and PGOOD pins are released, the device is ready for application running mode with all the selected monitoring activated. From now on, the FS5502 reacts by asserting the pins (PGOOD, RSTB) according to its configuration when a fault is detected.

### 8.4 Power sequencing

VPRE is the first regulator to start automatically, before the SLOT\_0. The other regulators are starting from the OTP power sequencing configuration. Seven slots are available to program the start-up sequence of BUCK1, BUCK 3 and LDO1 regulators. The delay between each slot is configurable to 250  $\mu$ s or 1 ms by OTP using OTP\_Tslot bit to accommodate the different ramp up speed of BUCK1 and BUCK3.

The power up sequence starts at SLOT\_0 and ends at SLOT\_7 while the power down sequence is executed in reverse order. All the SLOTS are executed even if there is no regulator assigned to a SLOT. The regulators assigned to SLOT\_7 are not started during the power up sequence. They can be started (or not) later in Normal\_M mode with an I<sup>2</sup>C command to write in M\_REG\_CTRL1 register, if they are enabled by OTP.

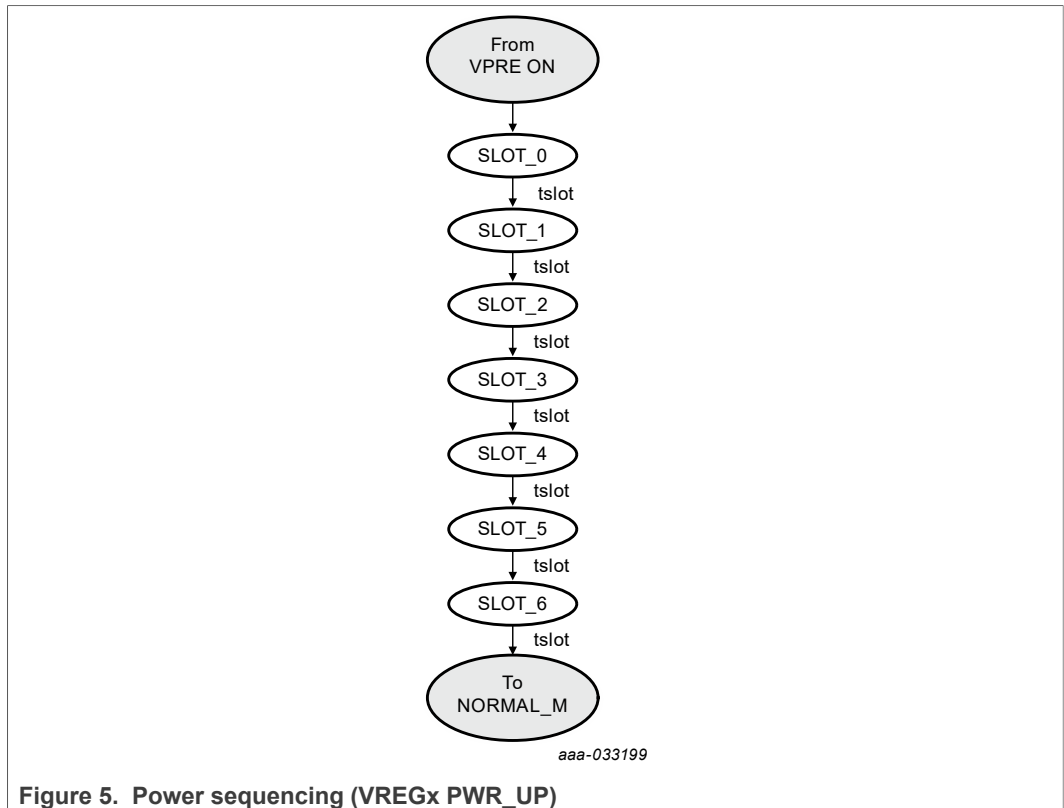

Figure 5. Power sequencing (VREGx PWR\_UP)

Each regulator is assigned to a SLOT by OTP configuration using OTP\_VB1S[2:0] for BUCK1, OTP\_VB3S[2:0] for BUCK3, and OTP\_LDO1S[2:0] for LDO1.

The different soft start duration of the BUCKs and the LDO should be considered in the SLOT assignment to achieve the correct sequence.

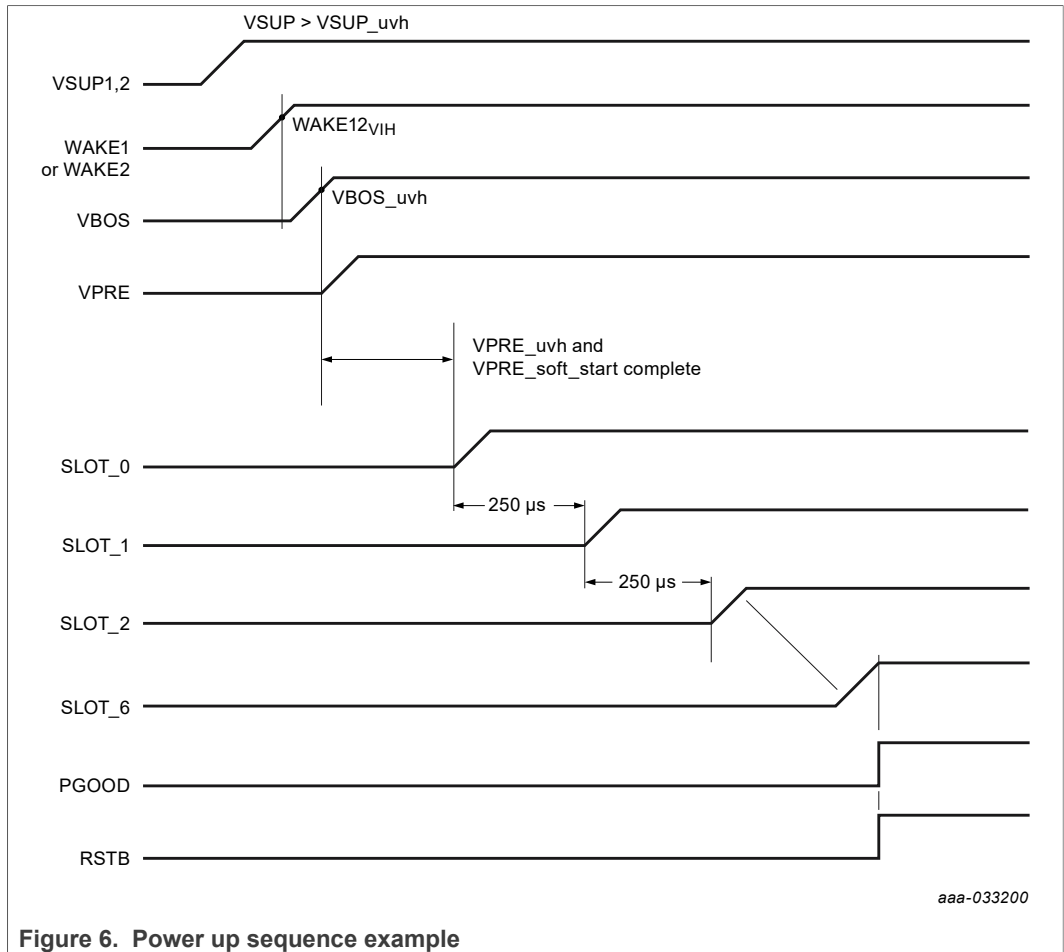

Figure 6. Power up sequence example

The FS5502\_OTP\_Mapping file used to generate the OTP configuration of the device draws the power up sequence of an OTP configuration in the OTP\_conf\_summary sheet.

### 8.5 Debug mode

The FS5502 enter in Debug mode with the sequence described in [Figure 7](#):

1.  $DBG\ pin = V_{DBG}$  and  $VSUP > V_{SUP\_UVH}$
2.  $WAKE1$  or  $WAKE2 > WAKE12_{VIH}$

$V_{DBG}$  and  $VSUP$  can come up at the same time as long as  $WAKE1$  or  $WAKE2$  comes up the last.

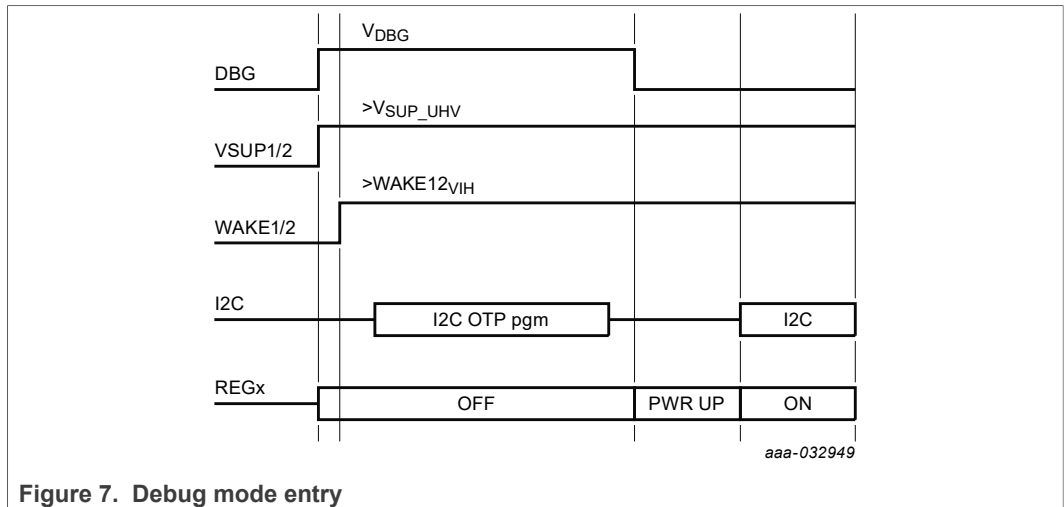

Figure 7. Debug mode entry

When the DBG pin is asserted low after  $T_{DBG}$  without I<sup>2</sup>C command access, the device starts with the internal OTP configuration.

If  $V_{DBG}$  voltage is maintained at DBG pin, a new OTP configuration can be emulated or programmed by I<sup>2</sup>C communication using NXP FlexGUI interface and NXP socket EVB. When the OTP process is completed, the device starts with the new OTP configuration when DBG pin is asserted low. The OTP emulation/programming is possible for during engineering development only. The OTP programming in production is done by NXP only.

In OTP Debug mode (DBG = 5.0 V), the I<sup>2</sup>C address is fixed to 0x20 for the main digital access and 0x21 for the fail-safe digital access.

Table 4. Electrical characteristics

$T_A = -40\text{ }^\circ\text{C}$  to  $125\text{ }^\circ\text{C}$ , unless otherwise specified.  $V_{SUP} = V_{SUP\_UVH}$  to 36 V, unless otherwise specified. All voltages referenced to ground.

Symbol	Parameter	Min	Typ	Max	Unit
$V_{DBG}$	Debug mode entry threshold	4.5	—	5.5	V
$T_{DBG}$	Debug mode entry filtering time (minimum duration of $DBG = V_{DBG}$ after $V_{SUP} > V_{SUP\_UVH}$ and $WAKE1$ or $WAKE2 > WAKE12_{VIH}$ )	7.0	—	—	ms

## 10.3 M\_FLAG register

Table 7. M\_FLAG register bit allocation

Bit	23	22	21	20	19	18	17	16
Write	0	0	0	0	0	0	0	0
Read	COM_ERR	WU_G	VPRE_G	RESERVED	VBUCK1_G	RESERVED	VBUCK3_G	VLDO1_G
Reset	0	1	1	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Write	0	0	0	0	0	0	I2C_M_CRC	I2C_M_REQ
Read	RESERVED	0	0	0	0	0	I2C_M_CRC	I2C_M_REQ
Reset	0	0	0	0	0	0	0	0

Table 8. M\_FLAG register bit description

Bit	Symbol	Description
23	COM_ERR	Report an error in the Communication (I <sup>2</sup> C) <b>COM_ERR</b> = I2C_M_CRC or I2C_M_REQ or FS_COM_G
		0 No failure
		1 Failure
		Reset condition: Real time information - cleared when all individual bits are cleared
22	WU_G	Report a wake-up event by WAKE1 or WAKE2 <b>WU_G</b> = WK1FLG or WK2FLG
		0 No wake event
		1 Wake event
		Reset condition: Real time information - cleared when all individual bits are cleared
21	VPRE_G	Report an event on VPRE (status change or failure) <b>VPRE_G</b> = VPREOC or VPREUVH or VPREUVL or VPRE_FB_OV
		0 No event
		1 Event occurred
		Reset condition: Real time information - cleared when all individual bits are cleared
19	VBUCK1_G	Report an event on BUCK1 (status change or failure) <b>VBUCK1_G</b> = BUCK1OC or BUCK1OT
		0 No event
		1 Event occurred
		Reset condition: Real time information - cleared when all individual bits are cleared
17	VBUCK3_G	Report an event on BUCK3 (status change or failure) <b>VBUCK3_G</b> = BUCK3OC or BUCK3OT
		0 No event
		1 Event occurred
		Reset condition: Real time information - cleared when all individual bits are cleared
16	VLDO1_G	Report an event on LDO1 (status change or failure) <b>VLDO1_G</b> = LDO1OC or LDO1OT
		0 No event
		1 Event occurred
		Reset condition: Real time information
9	I2C_M_CRC	Main domain I <sup>2</sup> C communication CRC issue
		0 No error
		1 Error detected in the I <sup>2</sup> C CRC
		Reset condition: POR / clear on write (write 1)
8	I2C_M_REQ	Invalid main domain I <sup>2</sup> C access (wrong Write or Read, Write to INIT registers in normal mode, wrong address)
		0 No error
		1 I <sup>2</sup> C violation
		Reset condition: POR / clear on Write (write 1)

## 10.4 M\_MODE register

Table 9. M\_MODE register bit allocation

Bit	23	22	21	20	19	18	17	16
Write	0	0	0	0	0	0	0	0
Read	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	PLL_LOCK_RT
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Write	0	EXT_FIN_DIS	0	0	0	W2DIS	W1DIS	GoToSTBY
Read	EXT_FIN_SEL_RT	RESERVED	MAIN_NORMAL	RESERVED	RESERVED	W2DIS	W1DIS	RESERVED
Reset	0	0	1	0	0	0	0	0

Table 10. M\_MODE register bit description

Bit	Symbol	Description
16	PLL_LOCK_RT	Real time status of the PPL
		0 PLL not locked
		1 PLL locked
		Reset condition: POR
15	EXT_FIN_SEL_RT	Real time status of FIN clock selection
		0 Internal clock oscillator is selected
		1 External FIN clock is selected
		Reset condition: POR
14	EXT_FIN_DIS	Disable request of EXT FIN selection at PLL input
		0 No effect
		1 Disable FIN selection
		Reset condition: POR
13	MAIN_NORMAL	Main state machine status
		0 Main state machine is not in Normal mode
		1 Main state machine is in Normal mode
		Reset condition: POR
10	W2DIS	WAKE2 wake up disable
		0 wake up enable
		1 wake up disable
		Reset condition: POR
9	W1DIS	WAKE1 wake up disable
		0 Wake up enable
		1 Wake up disable
		Reset condition: POR

Table 10. M\_MODE register bit description...continued

Bit	Symbol	Description
8	GOTOSTBY	Standby mode request
		0 Device remains in current state
		1 Device enters in Standby mode
		Reset condition: n.a.

## 10.5 M\_REG\_CTRL1 register

Table 11. M\_REG\_CTRL1 register bit allocation

Bit	23	22	21	20	19	18	17	16
<b>Write</b>	VPRE_PD_DIS	VPDIS	0	BUCK1DIS	0	BUCK3DIS	LDO1DIS	0
<b>Read</b>	VPRE_PD_DIS	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED
<b>Reset</b>	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
<b>Write</b>	0	VPEN	0	BUCK1EN	0	BUCK3EN	LDO1EN	0
<b>Read</b>	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED
<b>Reset</b>	0	0	0	0	0	0	0	0

Table 12. M\_REG\_CTRL1 register bit description

Bit	Symbol	Description
23	VPRE_PD_DIS	Force disable of VPRE pull down
		0 No effect (VPRE pull down is automatically controlled by the logic)
		1 VPRE pull down disable request
		Reset condition: POR
22	VPDIS	Disable request of VPRE
		0 No effect (regulator remains in existing state)
		1 VPRE disable request
		Reset condition: POR
20	BUCK1DIS	Disable request of BUCK1
		0 No effect (regulator remains in existing state)
		1 BUCK1 disable request
		Reset condition: POR
18	BUCK3DIS	Disable request of BUCK3
		0 No effect (regulator remains in existing state)
		1 BUCK3 disable request
		Reset condition: POR
17	LDO1DIS	Disable request of LDO1
		0 No effect (regulator remains in existing state)
		1 LDO1 disable request
		Reset condition: POR
14	VPEN	Enable request of VPRE

Table 12. M\_REG\_CTRL1 register bit description...continued

Bit	Symbol	Description
		0 No effect (regulator remains in existing state)
		1 VPRE enable request (after a VPDIS request)
		Reset condition: POR
12	BUCK1EN	Enable request of BUCK1
		0 No effect (regulator remains in existing state)
		1 BUCK1 enable request
		Reset condition: POR
10	BUCK3EN	Enable request of BUCK3
		0 No effect (regulator remains in existing state)
		1 BUCK3 enable request
		Reset condition: POR
9	LDO1EN	Enable request of LDO1
		0 No effect (regulator remains in existing state)
		1 LDO1 enable request
		Reset condition: POR

## 10.6 M\_REG\_CTRL2 register

Table 13. M\_REG\_CTRL2 register bit allocation

Bit	23	22	21	20	19	18	17	16
<b>Write</b>	0	0	0	BUCK1T SDCFG	0	BUCK3T SDCFG	LDO1T SDCFG	0
<b>Read</b>	RESERVED	RESERVED	RESERVED	BUCK1T SDCFG	RESERVED	BUCK3T SDCFG	LDO1T SDCFG	RESERVED
<b>Reset</b>	OTP	OTP	OTP	OTP	OTP	OTP	OTP	OTP

Bit	15	14	13	12	11	10	9	8
<b>Write</b>	0	0	0	VPRESRLS[1:0]		0	VPRESRHS[1:0]	
<b>Read</b>	RESERVED	RESERVED	RESERVED	VPRESRLS[1:0]		RESERVED	VPRESRHS[1:0]	
<b>Reset</b>	0	0	0	1	1	0	OTP	OTP

Table 14. M\_REG\_CTRL2 register bit description

Bit	Symbol	Description
20	BUCK1TSDCFG	BUCK1 behavior in case of TSD
		0 Regulator shutdown
		1 Regulator shutdown and state machine transition to DEEP-FS
		Reset condition: POR
18	BUCK3TSDCFG	BUCK3 behavior in case of TSD
		0 Regulator shutdown
		1 Regulator shutdown and state machine transition to DEEP-FS
		Reset condition: POR

Table 14. M\_REG\_CTRL2 register bit description...continued

Bit	Symbol	Description
17	LDO1TSDCFG	LDO1 behavior in case of TSD
		0 Regulator shutdown
		1 Regulator shutdown and state machine transition to DEEP-FS
		Reset condition: POR
12 to 11	VPRESRLS[1:0]	VPRE low-side slew rate control
		00 130 mA typical drive capability - slow
		01 260 mA typical drive capability - medium
		10 520 mA typical drive capability - fast
		11 900 mA typical drive capability - ultra fast
		Reset condition: POR
9 to 8	VPRESRHS[1:0]	VPRE high-side slew rate control
		00 130 mA typical drive capability - slow
		01 260 mA typical drive capability - medium
		10 520 mA typical drive capability - fast
		11 900 mA typical drive capability - ultra fast
		Reset condition: POR

## 10.7 M\_CLOCK register

Table 15. M\_CLOCK register bit allocation

Bit	23	22	21	20	19	18	17	16
Write	MOD_CONF	FOUT_MUX_SEL[3:0]			FOUT_PHASE[2:0]			
Read	MOD_CONF	FOUT_MUX_SEL[3:0]			FOUT_PHASE[2:0]			
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Write	FOUT_CLK_SEL	EXT_FIN_SEL	FIN_DIV	MOD_EN	CLK_TUNE[3:0]			
Read	FOUT_CLK_SEL	RESERVED	FIN_DIV	MOD_EN	CLK_TUNE[3:0]			
Reset	0	0	0	0	0	0	0	0

Table 16. M\_CLOCK register bit description

Bit	Symbol	Description
23	MOD_CONF	Modulation configuration of main oscillator
		0 range $\pm 5\%$ 23 kHz
		1 range $\pm 5\%$ 94 kHz
		Reset condition: POR
22 to 19	FOUT_MUX_SEL[3:0]	See <a href="#">Table 68</a>

Table 16. M\_CLOCK register bit description...continued

Bit	Symbol	Description
18 to 16	FOUT_PHASE[2:0]	FOUT phase shifting configuration (see <a href="#">Section 18.2 "Phase shifting"</a> )
		000 No shift
		001 Shifted by 1 clock cycle of CLK running at 20 MHz
		010 Shifted by 2 clock cycle of CLK running at 20 MHz
		011 Shifted by 3 clock cycle of CLK running at 20 MHz
		100 Shifted by 4 clock cycle of CLK running at 20 MHz
		101 Shifted by 5 clock cycle of CLK running at 20 MHz
		110 Shifted by 6 clock cycle of CLK running at 20 MHz
		111 Shifted by 7 clock cycle of CLK running at 20 MHz
		Reset condition: POR
15	FOUT_CLK_SEL	FOUT_clk frequency selection (CLK1 or CLK2)
		0 FOUT_clk = CLK1
		1 FOUT_clk = CLK2
		Reset condition: POR
14	EXT_FIN_SEL	Enable request of EXT FIN selection at PLL input
		0 No effect
		1 FIN selection request
		Reset condition: POR
13	FIN_DIV	FIN input signal divider selection
		0 Divider by 1
		1 Divider by 6
		Reset condition: POR
12	MOD_EN	Modulation activation of main oscillator
		0 Modulation disabled
		1 Modulation enabled
		Reset condition: POR
11 to 8	CLK_TUNE[3:0]	See <a href="#">Table 67</a>

## 10.8 M\_INT\_MASK1 register

Table 17. M\_INT\_MASK1 register bit allocation

Bit	23	22	21	20	19	18	17	16
<b>Write</b>	0	VPREOC_M	0	BUCK1OC_M	0	BUCK3OC_M	LDO1OC_M	0
<b>Read</b>	RESERVED	VPREOC_M	RESERVED	BUCK1OC_M	RESERVED	BUCK3OC_M	LDO1OC_M	RESERVED
<b>Reset</b>	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8

### 11.3 FS\_GRL\_FLAGS register

Table 37. FS\_GRL\_FLAGS register bit allocation

Bit	23	22	21	20	19	18	17	16
<b>Read</b>	FS_COM_G	RESERVED	FS_IO_G	FS_REG_OVUV_G	RESERVED	RESERVED	RESERVED	RESERVED
<b>Reset</b>	0	0	0	1	0	0	0	0

Bit	15	14	13	12	11	10	9	8
<b>Read</b>	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED
<b>Reset</b>	0	0	0	0	0	0	0	0

Table 38. FS\_GRL\_FLAGS register bit description

Bit	Symbol	Description
23	FS_COM_G	Report an issue in the communication (I2C) <b>FS_COM_G</b> = I2C_FS_CRC or I2C_FS_REQ
		0 No failure
		1 Failure
		Reset condition: Real time information - cleared when all individual bits are cleared

Table 38. FS\_GRL\_FLAGS register bit description...continued

Bit	Symbol	Description
21	FS_IO_G	Report an issue in one of the fail-safe IOs <b>FS_IO_G</b> = PGOOD_DIAG or RSTB_DIAG
		0 No failure
		1 Failure
		Reset condition: real time information - cleared when all individual bits are cleared
20	FS_REG_OVUV_G	Report an issue in one of the voltage monitoring (OV or UV) <b>FS_REG_OVUV_G</b> = VCOREMON_OV or VCOREMON_UV or VDDIO_OV or VDDIO_UV or VMON1_OV or VMON1_UV
		0 No failure
		1 Failure
		Reset condition: real time information - cleared when all individual bits are cleared

### 11.4 FS\_I\_OVUV\_SAFE\_REACTION1 register

Table 39. FS\_I\_OVUV\_SAFE\_REACTION1 register bit allocation

Bit	23	22	21	20	19	18	17	16
<b>Write</b>	VCOREMON_OV_FS_IMPACT[1:0]		VCOREMON_UV_FS_IMPACT[1:0]		0	RESERVED	RESERVED	RESERVED
<b>Read</b>	VCOREMON_OV_FS_IMPACT[1:0]		VCOREMON_UV_FS_IMPACT[1:0]		RESERVED	RESERVED	RESERVED	RESERVED
<b>Reset</b>	1	1	0	1	0	0	0	0

Bit	15	14	13	12	11	10	9	8
<b>Write</b>	RESERVED	RESERVED	RESERVED	0	VDDIO_OV_FS_IMPACT[1:0]		VDDIO_UV_FS_IMPACT[1:0]	
<b>Read</b>	RESERVED	RESERVED	RESERVED	RESERVED	VDDIO_OV_FS_IMPACT[1:0]		VDDIO_UV_FS_IMPACT[1:0]	
<b>Reset</b>	0	0	0	0	1	1	0	1

		1100 12
		Reset condition: Real time information

### 11.7 FS\_I\_SVS register

**Table 45. FS\_I\_SVS register bit allocation**

Bit	23	22	21	20	19	18	17	16
<b>Write</b>	SVS_OFFSET[4:0]					0	0	0
<b>Read</b>	SVS_OFFSET[4:0]					RESERVED	RESERVED	RESERVED
<b>Reset</b>	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
<b>Write</b>	0	0	0	0	0	0	0	0
<b>Read</b>	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED
<b>Reset</b>	0	0	0	0	0	0	0	0

Table 46. FS\_I\_SVS register bit description

Bit	Symbol	Description
23 to 19	SVS_OFFSET[4:0]	Static voltage scaling negative offset
		0 0000 0 mV
		0 0001 -6.25 mV
		0 0010 -12.50 mV
		0 0011 -18.75 mV
		0 0100 -25 mV
		0 0101 -31.25 mV
		0 0110 -37.5 mV
		0 0111 -43.75 mV
		0 1000 -50 mV
		0 1001 -56.25 mV
		0 1010 -62.5 mV
		0 1011 -68.75 mV
		0 1100 -75 mV
		0 1101 -81.25 mV
		0 1110 -87.5 mV
		0 1111 -93.75 mV
		1 0000 -100 mV
		Reset condition: POR

## 11.8 FS\_OVUVREG\_STATUS register

Table 47. FS\_OVUVREG\_STATUS register bit allocation

Bit	23	22	21	20	19	18	17	16
<b>Write</b>	VCOREMON_OV	VCOREMON_UV	VDDIO_OV	VDDIO_UV	RESERVED	RESERVED	RESERVED	RESERVED
<b>Read</b>	VCOREMON_OV	VCOREMON_UV	VDDIO_OV	VDDIO_UV	RESERVED	RESERVED	RESERVED	RESERVED
<b>Reset</b>	0	1	0	1	0	1	0	1

Bit	15	14	13	12	11	10	9	8
<b>Write</b>	RESERVED	RESERVED	VMON1_OV	VMON1_UV	0	FS_DIG_REF_OV	FS_OSC_DRIFT	0
<b>Read</b>	RESERVED	RESERVED	VMON1_OV	VMON1_UV	RESERVED	FS_DIG_REF_OV	FS_OSC_DRIFT	RESERVED
<b>Reset</b>	0	1	0	1	0	0	0	0

Table 48. FS\_OVUVREG\_STATUS register bit description

Bit	Symbol	Description
23	VCOREMON_OV	Overvoltage monitoring on VCOREMON
		0 No overvoltage
		1 Overvoltage reported on VCOREMON
		Reset condition: POR / clear on write (write 1)
22	VCOREMON_UV	Undervoltage monitoring on VCOREMON
		0 No undervoltage
		1 Undervoltage reported on VCOREMON
		Reset condition: POR / clear on write (write 1)
21	VDDIO_OV	Overvoltage monitoring on VDDIO
		0 No overvoltage
		1 Overvoltage reported on VDDIO
		Reset POR / clear on write (write 1) condition
20	VDDIO_UV	Undervoltage monitoring on VDDIO
		0 No undervoltage
		1 Undervoltage reported on VDDIO
		Reset condition: POR / clear on write (write 1)
13	VMON1_OV	Overvoltage monitoring on VMON1
		0 No overvoltage
		1 Overvoltage reported on VMON1
		Reset condition: POR / clear on write (write 1)
12	VMON1_UV	Undervoltage monitoring on VMON1
		0 No undervoltage
		1 Undervoltage reported on VMON1
		Reset condition: POR / clear on write (write 1)
10	FS_DIG_REF_OV	Overvoltage of the internal digital fail-safe reference voltage
		0 No overvoltage
		1 Overvoltage reported of the internal digital fail-safe reference voltage
		Reset condition: POR / clear on write (write 1)
9	FS_OSC_DRIFT	Drift of the fail-safe OSC
		0 No drift
		1 Oscillator drift
		Reset condition: POR / clear on write (write 1)

## 11.9 FS\_SAFE\_IOS register

Table 49. FS\_SAFE\_IOS register bit allocation

Bit	23	22	21	20	19	18	17	16
<b>Write</b>	PGOOD_DIAG	PGOOD_EVENT	0	EXT_RSTB	0	0	RSTB_EVENT	RSTB_DIAG
<b>Read</b>	PGOOD_DIAG	PGOOD_EVENT	PGOOD_SNS	EXT_RSTB	RSTB_DRV	RSTB_SNS	RSTB_EVENT	RSTB_DIAG
<b>Reset</b>	0	1	0	0	0	0	1	0

Bit	15	14	13	12	11	10	9	8
<b>Write</b>	RSTB_REQ	0	0	0	0	0	0	0
<b>Read</b>	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED
<b>Reset</b>	0	0	0	0	0	0	0	0

Table 50. FS\_SAFE\_IOS register bit description

Bit	Symbol	Description
23	PGOOD_DIAG	Report a PGOOD Short to High
		0 No failure
		1 Short circuit HIGH
		Reset condition: POR / clear on write (write 1)
22	PGOOD_EVENT	Report a Power GOOD event
		0 No Power GOOD
		1 Power GOOD event occurred
		Reset condition: POR / clear on write (write 1)
21	PGOOD_SNS	Sense of PGOOD pad
		0 PGOOD pad sensed low
		1 PGOOD pad sensed high
		Reset condition: Real time information
20	EXT_RSTB	Report an external RESET
		0 No external RESET
		1 External RESET
		Reset condition: POR / clear on write (write 1)
19	RSTB_DRV	RSTB driver – digital command
		0 RSTB driver command sensed low
		1 RSTB driver command sensed high
		Reset condition: Real time information
18	RSTB_SNS	Sense of RSTB pad
		0 RSTB pad sensed low
		1 RSTB pad sensed high
		Reset condition: Real time information

Table 50. FS\_SAFE\_IOS register bit description...continued

Bit	Symbol	Description
17	RSTB_EVENT	Report a RSTB event
		0 No RESET
		1 RESET occurred
		Reset condition: POR / clear on write (write 1)
16	RSTB_DIAG	Report a RSTB short to high
		0 No failure
		1 Short circuit high
		Reset condition: POR / clear on write (write 1)
15	RSTB_REQ	Request assertion of RSTB (Pulse)
		0 No assertion
		1 RSTB assertion (pulse)
		Reset condition: POR

## 11.10 FS\_DIAG register

Table 51. FS\_DIAG register bit allocation

Bit	23	22	21	20	19	18	17	16
<b>Write</b>	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED
<b>Read</b>	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED
<b>Reset</b>	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
<b>Write</b>	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	I2C_FS_CRC	I2C_FS_REQ	RESERVED
<b>Read</b>	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	I2C_FS_CRC	I2C_FS_REQ	RESERVED
<b>Reset</b>	1	0	0	0	0	0	0	1

Table 52. FS\_DIAG register bit description

Bit	Symbol	Description
10	I2C_FS_CRC	Fail-safe I <sup>2</sup> C communication CRC issue
		0 No error
		1 Error detected in the CRC
		Reset condition: POR / clear on write (write 1)
9	I2C_FS_REQ	Invalid fail-safe I <sup>2</sup> C access (wrong write or read, write to INIT registers in normal mode, wrong address)
		0 No error
		1 I <sup>2</sup> C violation
		Reset condition: POR / clear on write (write 1)

### 11.11 FS\_INTB\_MASK register

Table 53. FS\_INTB\_MASK register bit allocation

Bit	23	22	21	20	19	18	17	16
Write	0	0	0	0	0	0	RESERVED	RESERVED
Read	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Write	RESERVED	INT_INH_VMON1_OV_UV	INT_INH_VDDIO_OV_UV	INT_INH_VCOREMON_OV_UV	RESERVED	RESERVED	RESERVED	RESERVED
Read	RESERVED	INT_INH_VMON1_OV_UV	INT_INH_VDDIO_OV_UV	INT_INH_VCOREMON_OV_UV	RESERVED	RESERVED	RESERVED	RESERVED
Reset	0	0	0	0	0	0	0	0

Table 54. FS\_INTB\_MASK register bit description

Bit	Symbol	Description
14	INT_INH_VMON1_OV_UV	Inhibit INTERRUPT on VMON1 OV and UV event
		0      Interrupt NOT MASKED
		1      Interrupt MASKED
		Reset condition: POR
13	INT_INH_VDDIO_OV_UV	Inhibit INTERRUPT on VDDIO OV and UV event
		0      Interrupt NOT MASKED
		1      Interrupt MASKED
		Reset condition: POR
12	INT_INH_VCOREMON_OV_UV	Inhibit INTERRUPT on VCOREMON OV and UV event
		0      Interrupt NOT MASKED
		1      Interrupt MASKED
		Reset condition: POR

### 11.12 FS\_STATES register

Table 55. FS\_STATES register bit allocation

Bit	23	22	21	20	19	18	17	16
Write	0	DBG_EXIT	0	0	OTP_CORRUPT	0	REG_CORRUPT	0
Read	RESERVED	RESERVED	DBG_MODE	RESERVED	OTP_CORRUPT	RESERVED	REG_CORRUPT	RESERVED
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Write	0	0	0	0	0	0	0	0
Read	RESERVED	RESERVED	RESERVED	FSM_STATE[4:0]				
Reset	0	0	0	0	0	1	1	0

Table 56. FS\_STATES register bit description

Bit	Symbol	Description
22	DBG_EXIT	Leave DEBUG mode
		0 No action
		1 Leave DEBUG mode
		Reset condition: POR
21	DBG_MODE	DEBUG mode status
		0 NOT in DEBUG mode
		1 In DEBUG mode
		Reset condition: Real time information
19	OTP_CORRUPT	OTP bits corruption detection (5 ms cyclic check)
		0 No error
		1 OTP CRC error detected
		Reset condition: POR / clear on write (write 1)
16 7	REG_CORRUPT	INIT register corruption detection (real time comparison)
		0 No error
		1 INIT register content error detected (mismatch between FS_I_Register / FS_I_NOT_Register)
		Reset condition: POR / clear on write (write 1)
12 to 8	FSM_STATE[4:0]	Report fail-safe state machine current state
		0 0110 INIT_FS
		Reset condition: Real time information

## 12 OTP bits configuration

### 12.1 Overview

**Table 57. Main OTP\_REGISTERS**

Legend: **bold** — Regulator behavior in case of TSD and VPRES slew rate parameters can be changed later by I<sup>2</sup>C.

Name	Address	BIT7	BIT6	BIT5	BIT4	BIT3	BIT2	BIT1	BIT0
OTP_CFG_VPRE_1	14	0	0	VPREV[5:0]					
OTP_CFG_VPRE_2	15	0	0	VPRES[5:0]					
OTP_CFG_VPRE_3	16	VPREILIM[1:0]		1	0	1	1	VPRESRHS[1:0]	
OTP_CFG_BOOST_1	17	0	0	0	0	0000

## 13 Best of supply

### 13.1 Functional description

VBOS regulator manages the best of supply from VSUP and VPRES to efficiently generate 5.0 V output to supply the internal biasing of the device. VBOS is also the supply of VPRES high side.

VBOS undervoltage might not guarantee the full functionality of the device. Consequently, VBOS\_UVL detection powers down the device.

$V_{SUP\_UV7}$  undervoltage threshold is used to enable the path from VSUP to VBOS when  $VSUP < V_{SUP\_UV7}$  to have a low drop path from VSUP, while VPRES is going low and to power up the device when VPRES is not started. When  $VSUP > V_{SUP\_UV7}$ , VBOS is forced to use VPRES to optimize the efficiency.

### 13.2 Best of supply electrical characteristics

**Table 61. Best of supply electrical characteristics**

$T_A = -40\text{ °C to }125\text{ °C}$ , unless otherwise specified.  $V_{SUP} = V_{SUP\_UVH}$  to 36 V, unless otherwise specified. All voltages referenced to ground.

Symbol	Parameter	Min	Typ	Max	Unit
$V_{BOS}$	Best of supply output voltage	3.3	5.0	5.25	V
$V_{BOS\_UVH}$	VBOS undervoltage threshold high (VBOS rising)	4.1	—	4.5	V
$V_{BOS\_UVL}$	VBOS undervoltage threshold low (VBOS falling)	3.2	—	3.4	V
$T_{BOS\_UV}$	$V_{BOS\_UVH}$ and $V_{BOS\_UVL}$ filtering time	6.0	10	15	μs
$V_{BOS\_POR}$	VBOS power on reset threshold	—	—	2.5	V
$T_{BOS\_POR}$	$V_{BOS\_POR}$ filtering time	0.5	—	1.5	μs
$I_{BOS}$	Best of supply current capability	—	—	60	mA
$C_{OUT\_BOS}$	Effective output capacitor	4.7	—	10	μF
	Output decoupling capacitor	—	0.1	—	μF

## 14 High voltage buck: VPRES

### 14.1 Functional description

VPRES block is a high voltage, synchronous, peak current mode buck controller. VPRES is working with external logical level NMOS in force PWM mode at 455 kHz and in Automatic Pulse Skipping (APS) mode at 2.22 MHz. The APS mode helps to maintain the correct output voltage at high input voltage by skipping some turn ON cycles of the HS FET below the minimum duty cycle. VPRES input voltage is naturally limited to  $V_{SUP} = L_{PI\_DCR} \times I_{PRE} + V_{PRE\_UVL} / D_{MAX}$  with  $D_{MAX} = 1 - (F_{PRE\_SW} \times T_{PRE\_OFF\_MIN})$ . A bootstrap capacitor is required to supply the gate drive circuit of the high-side NMOS. The output voltage is configurable by OTP from 3.3 V to 5.0 V, and the switching frequency is configurable by OTP at 455 kHz for 12 V and 24 V transportation applications or 2.22 MHz for 12 V automotive applications. The stability is ensured by an external Type 2 compensation network with slope compensation.

The output current is sensed via an external shunt in series with the inductor and the maximum current capability is defined by the external components (NMOS gate charge, inductor, shunt resistor), the gate driver current capability and the switching frequency. An overcurrent detection is implemented to protect the external MOSFETs. If an overcurrent is detected after the HS minimum TON time, the HS is turned OFF and will be turned ON again at the next rising edge of the switching clock. The overcurrent induces a duty cycle reduction that could lead to the output voltage gradually dropping, causing an undervoltage condition on VPRES and/or one of the cascaded regulators.

The maximum input voltage is 60 V and allows operation in 24 V truck applications without external protection to sustain ISO 16750-2:2012 load dump pulse 5b. VPRES must be the input supply of the BUCK1. VPRES can be the input supply of BUCK3 and LDO1. VPRES can be the supply of local loads remaining inside the ECU.

By default, VPRES switching frequency is derived from the internal oscillator, and can be synchronized with an external frequency signal applied at FIN input pin. The change from internal oscillator to external clock or vice versa is controlled by I<sup>2</sup>C.

$V_{PRE\_UVH}$ ,  $V_{PRE\_UVL}$  and  $V_{PRE\_FB\_OV}$  thresholds are monitored from PRE\_FB pin and manage some transitions of the main state machine described in [Section 8.1 "Simplified functional state diagram"](#).

### 14.2 Application schematic

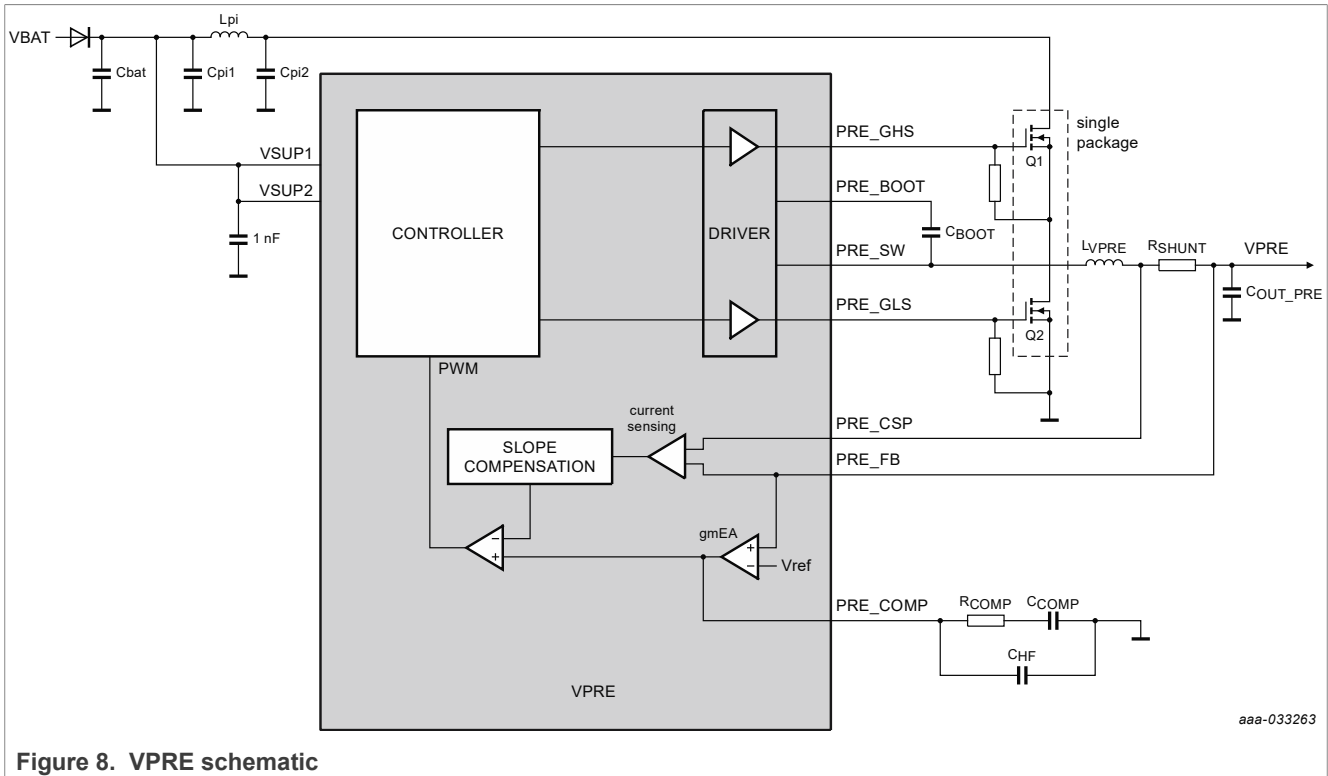

Figure 8. VPRE schematic

A PI filter, with  $F_{RES} = 1 / [2\pi \times \sqrt{LC_{pi1}}]$  and calculated for  $F_{res} < F_{PRE\_SW} / 10$ , is required to filter VPRE switching frequency on the Battery line. VSUP1,2 pins must be connected before the PI filter for a clean biasing of the device. Cpi1 capacitor shall be implemented close to VSUP1,2 pins. Cpi2 capacitor shall be implemented close to Q1. The bootstrap capacitor value should be sized to be >10 times the gate source capacitor of Q1. Gate to source resistor on Q1 and Q2 is recommended in case of pin disconnection to guarantee a passive switch OFF of the transistors.

### 14.3 Compensation network and stability

The external compensation network, made with RCOMP, CCOMP and CHF shall be calculated for best compromise between stability and transient response, based on below conceptual plot of Type 2 compensation network transfer function.

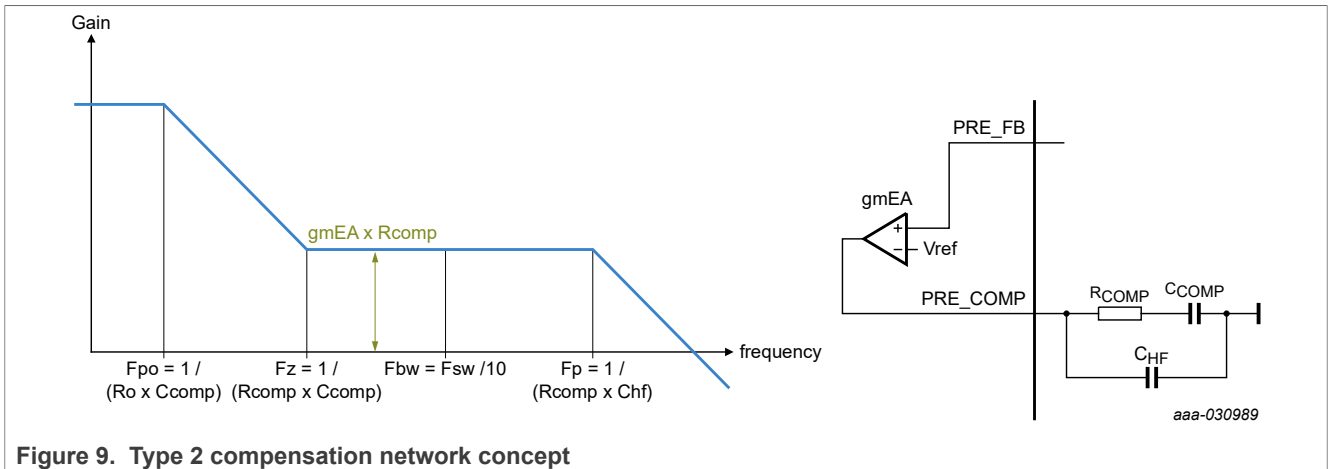

Figure 9. Type 2 compensation network concept

**Calculation guideline**

- System bandwidth for VPRE = 455 kHz:  $F_{bw} = F_{PRE\_SW} / 10$   
System bandwidth for VPRE = 2.22 MHz:  $F_{bw} = F_{PRE\_SW} / 15$
- Compensation zero:  $Fz = F_{bw} / 10$
- Compensation pole for VPRE = 455 kHz:  $Fp = F_{PRE\_SW} / 2$
- Compensation pole for VPRE = 2.22 MHz:  $Fp = F_{PRE\_SW} / 4$
- $F_{GBW} = 1 / (2\pi \times R_{SHUNT} \times V_{PRE\_LIM\_GAIN} \times C_{OUT\_PRE})$
- Error amplifier gain:  $EA\_gain = (V_{REF} / V_{PRE}) \times gmEA_{PRE} \times R_{COMP} = 10^{LOG(F_{BW} / F_{GBW})}$
- $V_{REF} = 1.0\text{ V}$ ,  $R_{COMP} = V_{PRE} \times (EA\_gain / gmEA_{PRE})$
- $C_{COMP} = 1 / (2\pi \times Fz \times R_{COMP})$
- $C_{HF} = 1 / (2\pi \times Fp \times R_{COMP})$
- Slope compensation:  $Se > (V_{PRE} / L_{VPRE}) \times R_{SHUNT} \times V_{PRE\_LIM\_GAIN}$

The compensation network can be automatically calculated in the FS5502\_OTP\_Config.xlsm file which is using the same formulas. A Simplis simulation is recommended to verify the Phase and Gain Margin with normalized components.

**Use case calculation with VPRE = 4.1 V, LVPRE = 6.8 μH, FPRE\_SW = 455 kHz, COUT\_PRE = 66 μF, RSHUNT = 10.0 mΩ**

- System bandwidth:  $F_{bw} = 45\text{ kHz}$
- Compensation zero:  $Fz = 4.5\text{ kHz}$
- Compensation pole:  $Fp = 227.5\text{ kHz}$
- $F_{GBW} = 53\text{ kHz}$
- Error amplifier gain:  $EA\_gain = 10^{LOG(F_{BW} / F_{GBW})} = 0.86$
- $R_{COMP} = 2.34\text{ k}\Omega = 2.2\text{ k}\Omega$
- $C_{COMP} = 15.9\text{ nF} = 16\text{ nF}$
- $C_{HF} = 318\text{ pF} = 330\text{ pF}$
- Slope compensation:  $Se > 30\text{ mV}/\mu\text{s}$

**Use case stability verification**

- Phase margin target  $PM > 45^\circ$  and gain margin target  $GM > 6\text{ dB}$ .

Use case transient response verification

### 14.5 VPRES external MOSFETs

MOSFETs selection:

- Logical level NMOS, gate drive comes from VBOS (5.0 V)
- VDS > 60 V for 24 V truck, bus applications
- VDS > 40 V for 12 V automotive applications
- Qg < 15 nC at Vgs = 5.0 V is recommended for 455 kHz
- Qg < 7 nC at Vgs = 5.0 V is recommended for 2.22 MHz
- Recommended references

**Table 63. VPRES external MOSFETs recommendation**

Applications	F <sub>pre</sub>	I <sub>pre</sub> < 2.0 A	I <sub>pre</sub> < 4.0 A	I <sub>pre</sub> < 6.0 A	I <sub>pre</sub> < 10 A
12 V	455 kHz	BUK9K25-40E, BUK9K18-40E	BUK9K25-40E, BUK9K18-40E	BUK9K18-40E	BUK9K18-40E, NVTFS5C471NLWFTAG, HS = BUK9M9R5-40H, LS = BUK9M3R3-40H
	2.22 MHz	BUK9K25-40E, BUK9Y29-40E	BUK9K25-40E, BUK9Y29-40E	BUK9K25-40E, BUK9Y29-40E	na
24 V	455 kHz	BUK9K35-60E, BUK9K52-60E	BUK9K35-60E, BUK9K52-60E	BUK9K35-60E	BUK9K12-60E

Other MOSFETs are possible but should have similar performances as compared to the recommended references. The maximum current at 2.22 MHz is limited to 6.0 A for which the efficiency is equivalent to 10 A at 455 kHz. The power dissipation in the external MOSFETs is important and the junction temperature may rise above 175 °C.

VPRES switching slew rate can be configured by I<sup>2</sup>C to align with external MOSFET selection, VPRES switching frequency, and to optimize power dissipation and EMC performance. It is recommended to configure the maximum slew rate by OTP and reduce it later by I<sup>2</sup>C if needed. FS5502 is using current source to drive the external MOSFET so adding an external serial resistor with the gate does not affect the slew rate. It is recommended to change the current source selection by I<sup>2</sup>C to change the slew rate.

VPRE MOSFET switching time can be estimated to  $T_{SW} = (Q_{GD} + Q_{GS} / 2) / I_{PRE\_GATE\_DRV}$  using the gate charge definition from Figure 12.  $Q_{GD}$  and  $Q_{GS}$  can be extracted from the MOSFET data sheet.

Figure 12. MOSFET gate charge definition

### 14.6 VPRE efficiency

VPRE efficiency versus current load is given for information based on external component criteria provided and VSUP voltage 14 V. If the conditions change, it has to be recalculated with the FS5502\_PDTCAL tool. The real efficiency has to be verified by measurement at the application level.

Figure 13. VPRE theoretical efficiency

## 14.7 VPRES not populated

When two FS5502 are used, only one VPRES may be required. It is possible to not populate the external components of the second VPRES to optimize the bill of material.

In that case, specific connection of the VPRES2 pins is required:

- PRE\_FB2 must be connected to PRE\_FB1
- PRE\_CSP2 must be connected to PRE\_FB1
- PRE\_COMP2 must be left open
- PRE\_SW2 must be connected to GND
- PRE\_BOOT2 must be connected to VBOS2
- PRE\_GHS2 and PRE\_GLS2 must be left open

After the startup phase, VPRES2 shall be disabled by I<sup>2</sup>C with VPDIS bit.

## 15 Low voltage buck: BUCK1

### 15.1 Functional description

BUCK1 block is low voltage, synchronous, valley current mode buck converters with integrated HS PMOS and LS NMOS. BUCK1 works in force with PWM. The output voltage is configurable by OTP from 0.8 V to 1.8 V, the switching frequency is 2.22 MHz and the output current is limited to 3.6 A peak. The input of these blocks must be connected to the output of VPRES. The stability is ensured by an internal Type 2 compensation network with slope compensation.

By default, BUCK1 switching frequency is derived from the internal oscillator and can be synchronized with an external frequency signal applied on FIN input pin. The change from internal oscillator to external clock or vice versa is controlled by I<sup>2</sup>C.

An overcurrent detection and a thermal shutdown are implemented on BUCK1 to protect the internal MOSFETs. The overcurrent induces a duty cycle reduction that could lead to the output voltage gradually dropping, causing an undervoltage condition.

The ramp up and ramp down of BUCK1 when they are enabled and disabled is configurable with OTP\_DVS\_BUCK1[1:0] bits to accommodate multiple MCU soft start requirements. Static Voltage Scaling (SVS) feature is available to decrease the output voltage after power up during INIT\_FS. Programmable phase shift control is implemented, see [Section 18 "Clock management"](#).

### 15.2 Application schematic: Single phase mode

In this configuration, BUCK1 output is configured and controlled independently by I<sup>2</sup>C.

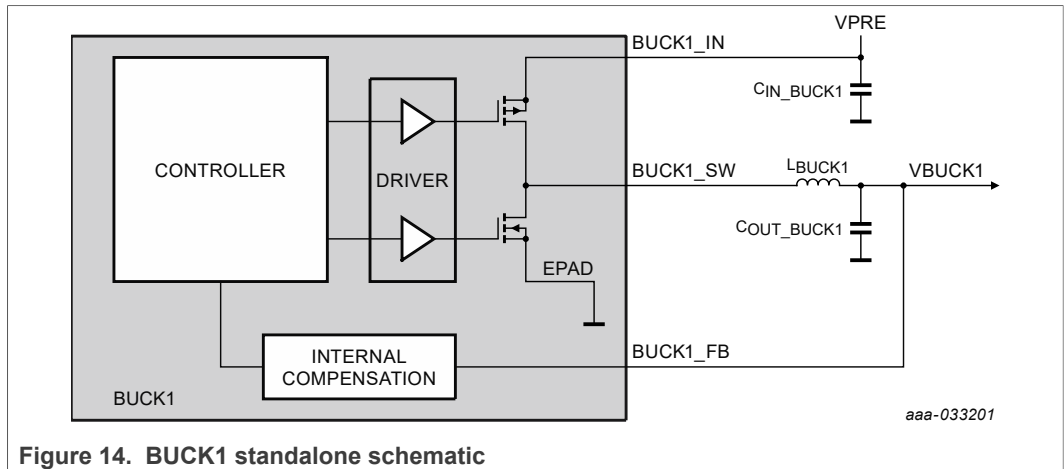

Figure 14. BUCK1 standalone schematic

### 15.3 Compensation network and stability

The internal compensation network ensures the stability and the transient response performance of the buck converter. The error amplifier gain is configurable with OTP\_VB1GMCOMP[2:0] bits for BUCK 1 regulator. It is recommended to use the default value that covers most of the use cases.

Decreasing the gain reduces the regulation bandwidth and increase the phase and gain margin but transient performance is degraded. Increasing the gain enlarges the regulation bandwidth and improves the transient performance but the phase and gain margin is degraded.

OTP\_VB1INDOPT[1:0] scales the slope compensation and the zero cross detection according to the inductor value. 1.0  $\mu\text{H}$  is the recommended inductor value for BUCK1.

**Use case with  $V_{\text{PRE}} = 4.1 \text{ V}$ ,  $V_{\text{BUCK1}} = 1.0 \text{ V}$ ,  $L_{\text{VBUCK1}} = 1.0 \mu\text{H}$ ,  $V_{\text{BUCK1\_SW}} = 2.22 \text{ MHz}$ ,  $C_{\text{OUT\_BUCK1}} = 44 \mu\text{F}$ , default Err Amp gain**

#### Use case stability verification

- Phase margin target  $\text{PM} > 45^\circ$  and gain margin target  $\text{GM} > 6 \text{ dB}$ .

Use case transient response verification

### 15.5 BUCK1 efficiency

BUCK1 efficiency versus current load is given for information based on external component criteria provided and VPRE voltage 4.1 V. If the conditions change, it has to be recalculated with the VR5502\_PDTCAL tool. The real efficiency has to be verified by measurement at the application level.

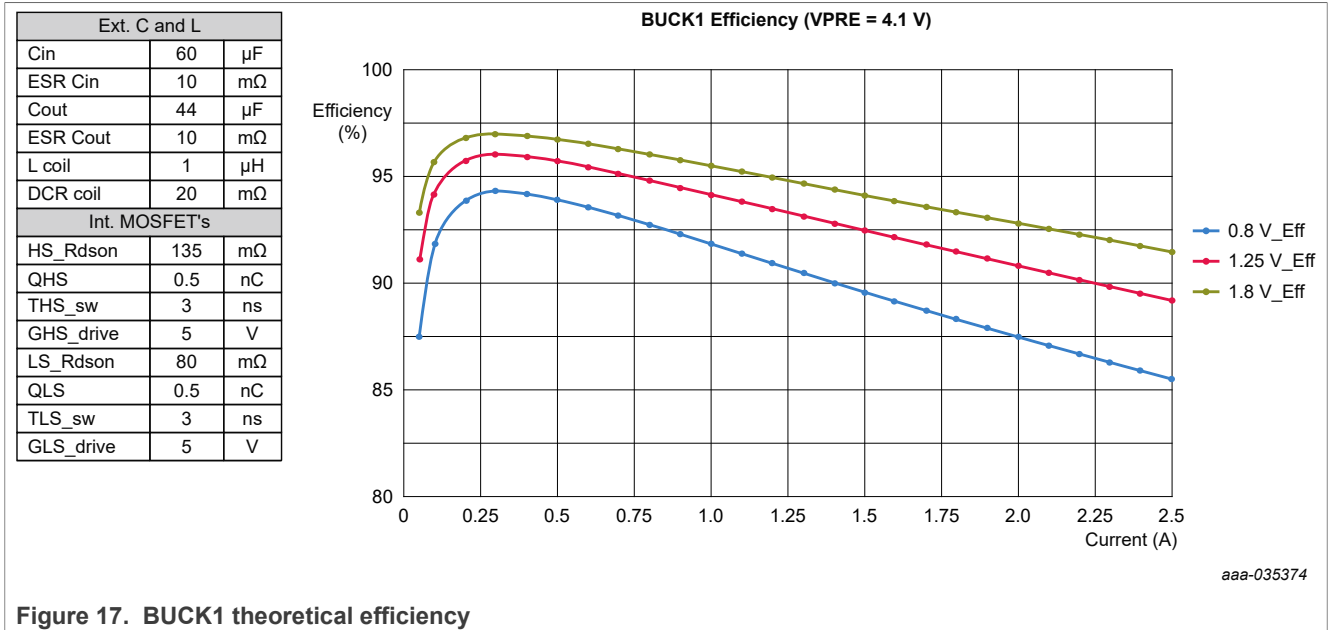

Figure 17. BUCK1 theoretical efficiency

## 16 Low voltage buck: BUCK3

### 16.1 Functional description

BUCK3 block is a low voltage, synchronous, peak current mode buck converter with integrated HS PMOS and LS NMOS. BUCK3 works in force PWM and the output voltage is configurable by OTP from 1.0 V to 3.3 V, the switching frequency is 2.22 MHz and the output current is limited to 3.6 A peak. The input of this block can be connected to the output of VPRES. The stability is ensured by an internal Type 2 compensation network with slope compensation.

By default, BUCK3 switching frequency is derived from the internal oscillator, and can be synchronized with an external frequency signal applied on FIN input pin. The change from internal oscillator to external clock or vice versa is controlled by I<sup>2</sup>C.

An overcurrent detection and a thermal shutdown are implemented on BUCK3 to protect the internal MOSFETs. The overcurrent induces a duty cycle reduction that could lead to the output voltage gradually dropping, causing an undervoltage condition.

BUCK3 is part number dependent according to OTP\_BUCK3EN bit. BUCK3\_INQ pin, used to bias internal BUCK3 driver, and must be connected to the same source pin as BUCK3\_IN pin. The ramp up and ramp down of BUCK3 when it is enabled and disabled is configurable with OTP\_DVS\_BUCK3[1:0] bits to accommodate multiple MCU soft start requirements.

Programmable phase shift control is implemented, see [Section 18 "Clock management"](#).

16.2 Application schematic

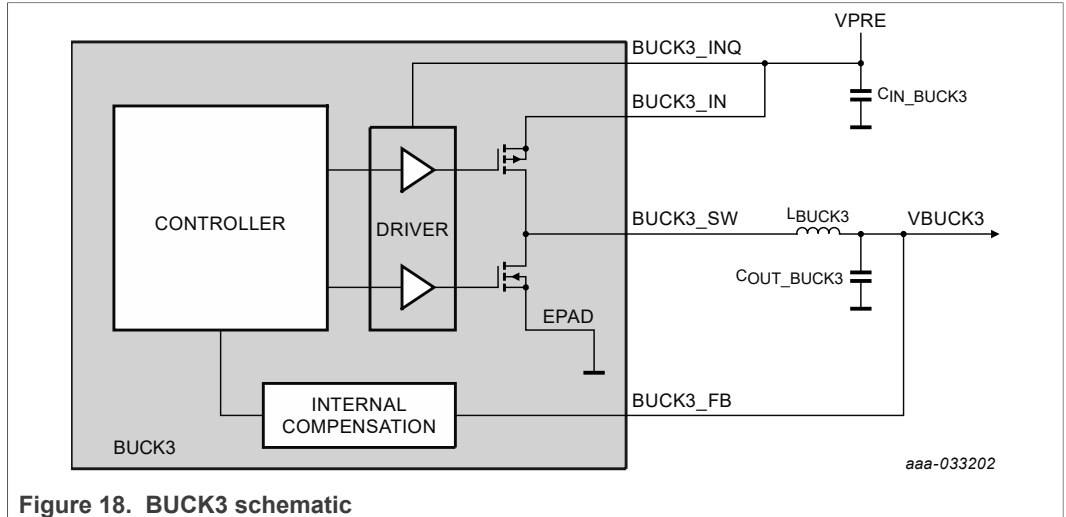

Figure 18. BUCK3 schematic

16.3 Compensation network and stability

The internal compensation network ensures the stability and the transient response performance of the buck converter. OTP\_VB3INDOPT[1:0] scales the slope compensation and the zero cross detection according to inductor value. 1.0  $\mu\text{H}$  is the recommended inductor value for BUCK3.

**Use case with  $V_{PRE} = 4.1\text{ V}$ ,  $V_{BUCK3} = 2.3\text{ V}$ ,  $L_{VBUCK3} = 1.0\ \mu\text{H}$ ,  $V_{BUCK3\_SW} = 2.22\text{ MHz}$ ,  $C_{OUT\_BUCK3} = 44\ \mu\text{F}$**

**Use case stability verification**

- Phase margin target  $PM > 45^\circ$  and gain margin target  $GM > 6\text{ dB}$ .

## 16.5 BUCK3 efficiency

BUCK3 efficiency versus current load is given for information based on external component criteria provided and VPRE voltage 4.1 V. If the conditions change, it has to be recalculated with the FS5502\_PDTCAL tool. The real efficiency has to be verified by measurement at the application level.

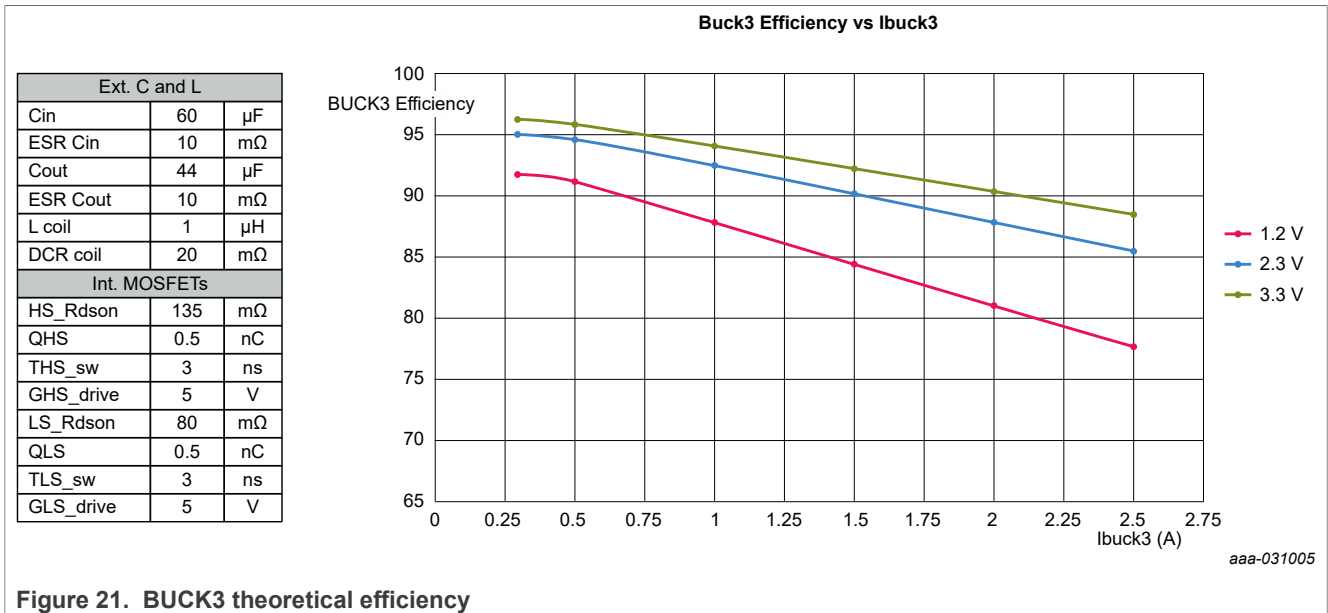

Figure 21. BUCK3 theoretical efficiency

## 17 Linear voltage regulator: LDO1

### 17.1 Functional description

An LDO1 block is a linear voltage regulator. The output voltage is configurable by OTP from 1.1 V to 5.0 V. A minimum voltage drop is required depending on the output current capability (0.5 V for 150 mA and 1.0 V for 400 mA). The LDO current capability is linear with the voltage drop and can be estimated to  $I(\text{mA}) = 500 \times V_{\text{LDO1\_DROP}} - 100$  for intermediate voltage drop between 0.5 V and 1.0 V.

LDO1 input supply is externally connected to VP<sub>PRE</sub> or another supply. An overcurrent detection and a thermal shutdown are implemented on LDO1 to protect the internal pass device.

## 18 Clock management

### 18.1 Clock description

The clock management block is made of the Internal oscillator, the Phase Locked Loop (PLL) and multiple dividers. This block manages the clock generation for the internal digital state machines, the switching regulators and the external clock synchronization.

The internal oscillator is running at 20 MHz by default after start up. The frequency is programmable by I<sup>2</sup>C and a spread spectrum feature can be activated by I<sup>2</sup>C to reduce the emission of the oscillator fundamental frequency.

VPRE switching frequency comes from CLK2 (455 kHz) or CLK1 (2.22 MHz). BUCK1 and BUCK3 switching frequency comes from CLK1 (2.22 MHz). The switching regulators can be synchronized with an external frequency coming from FIN pin. A dedicated watchdog monitoring is implemented to verify and report the correct FIN frequency range. Different clocks can be sent to FOUT pin to synchronize an external IC or for diagnostic.

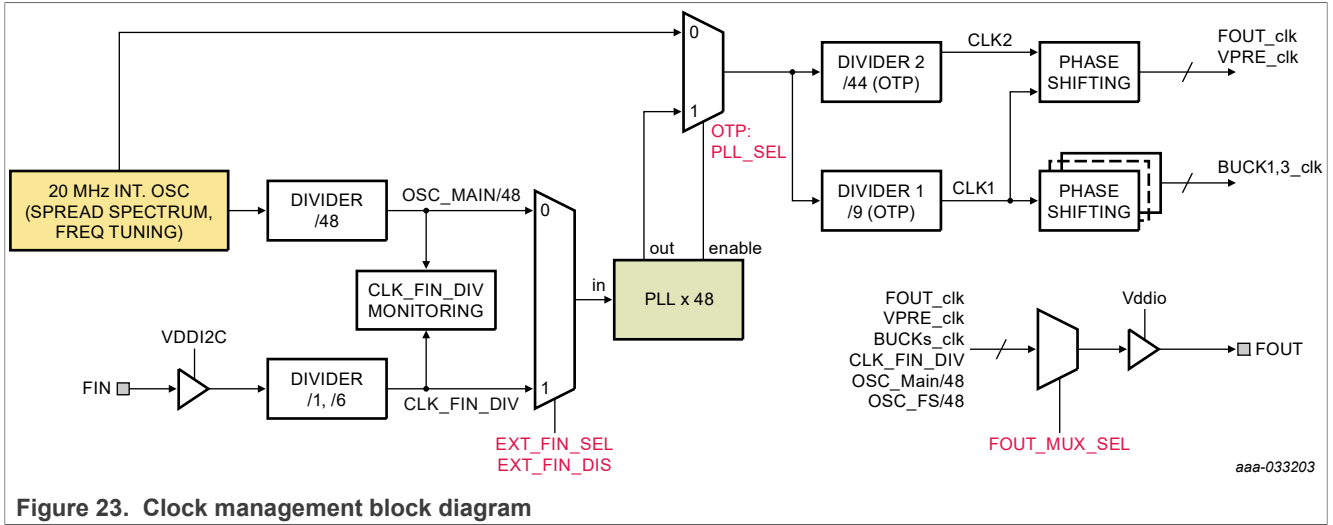

Figure 23. Clock management block diagram

### 18.2 Phase shifting

The clocks of the switching regulators (VPRE\_clk, BUCK1\_clk and BUCK3\_clk) can be delayed in order to avoid all the regulators to turn ON at the same time to reduce peak current and improve EMC performance.

Each clock of each regulator can be shifted from 1 to 7 clock cycles of CLK running at 20 MHz what corresponds to 50 ns. The phase shift configuration is done by OTP configuration using OTP\_VPRE\_ph[2:0], OTP\_BUCK1\_ph[2:0] and OTP\_BUCK3\_ph[2:0].

VPRE and BUCK3 have a peak current detection architecture. The PWM synchronizes the turn ON of the high-side switch. BUCK1 has a valley current detection architecture. The PWM synchronizes the turn ON of the low-side switch.

### 18.3 Manual frequency tuning

The internal oscillator frequency, 20 MHz by default, can be programmed from 16 MHz to 24 MHz with 1.0 MHz frequency step by I<sup>2</sup>C. The oscillator functionality is guaranteed for frequency increment of one step at a time in either direction, with a minimum of 10 μs between two steps. For any unused code of the CLK\_TUNE [3:0] bits, the internal oscillator is set at the default 20 MHz frequency.

To change the internal oscillator frequency from 20 MHz to 24 MHz, four I<sup>2</sup>C commands are required with 10 μs wait time between each command (21 MHz – wait 10 μs – 22 MHz – wait 10 μs – 23 MHz – wait 10 μs – 24 MHz). To change the internal oscillator frequency from 24 MHz to 16 MHz, eight I<sup>2</sup>C commands are required with 10 μs wait time between each command (23 MHz – wait 10 μs – 22 MHz – wait 10 μs – 21 MHz – wait 10 μs – 20 MHz – wait 10 μs – 19 MHz – wait 10 μs – 18 MHz – wait 10 μs – 17 MHz – wait 10 μs – 16MHz).

**Table 67. Manual frequency tuning configuration**

CLK_TUNE [3:0]	Oscillator frequency [MHz]
<b>0000 (default)</b>	20
0001	21
0010	22
0011	23
0100	24
1001	16
1010	17
1011	18
1100	19
Reset condition	POR

### 18.4 Spread spectrum

The internal oscillator can be modulated with a triangular carrier frequency of 23 kHz or 94 kHz with  $\pm 5\%$  deviation range around the oscillator frequency. The spread spectrum feature can be activated by I<sup>2</sup>C with the MOD\_EN bit and the carrier frequency can be selected by I<sup>2</sup>C with the MOD\_CONF bit. By default, the spread spectrum is disabled. The spread spectrum and the manual frequency tuning functions cannot be used at the same time.

The main purpose of the spread spectrum is to improve the EMC performance by spreading the energy of the internal oscillator and VPRE frequency on VBAT frequency spectrum. Consequently, it is recommended to select 23 kHz carrier frequency when VPRE is configured at 455 kHz and 94 kHz when VPRE is configured at 2.2 MHz for the best performance.

### 18.5 External clock synchronization

To synchronize the switching regulators with an external frequency coming from FIN pin, the PLL shall be enabled with OTP\_PLL\_SEL bit. The FIN pin accepts two ranges of frequency depending on the divider selection to always have CLK clock at the output of the PLL in the working range of the digital blocks from 16 MHz to 24 MHz. When FIN\_DIV = 0, the input frequency range must be between 333 kHz and 500 kHz. When FIN\_DIV = 1, the input frequency range must be between 2.0 MHz and 3.0 MHz.

After the FIN clock divider configuration with FIN\_DIV bit, the FIN clock is routed to the PLL input with EXT\_FIN\_SEL bit. The CLK clock changes from the internal oscillator to FIN external clock with EXT\_FIN\_SEL bit. So, the configuration procedure is FIN\_DIV first, then apply FIN and finally set EXT\_FIN\_SEL.

If FIN is out of range, CLK clock moves back to the internal oscillator and reports the error using the CLK\_FIN\_DIV\_OK bit. When FIN comes back in the range, the configuration procedure described above is executed again.

The FOUT pin can be used to synchronize an external device with the FS5502. The frequency sent to FOUT is selected by I<sup>2</sup>C with the FOUT\_MUX\_SEL [3:0] bits.

Table 68. FOUT multiplexer selection

FOUT_MUX_SEL [3:0]	FOUT multiplexer selection
<b>0000 (default)</b>	No signal, FOUT is low
0001	VPRE_clk
0010	RESERVED
0011	BUCK1_clk
0100	RESERVED
0101	BUCK3_clk
0110	FOUT_clk (CLK1 or CLK2 selected with FOUT_CLK_SEL bit)

## 19 I/O interface pins

### 19.1 WAKE1, WAKE2

WAKE pins are used to manage the internal biasing of the device and the main state machine transitions.

- When WAKE1 or WAKE2 is  $> WAKE12_{VIH}$ , the internal biasing is started and the equivalent digital state is 1
- When WAKE1 or WAKE2 is  $< WAKE12_{VIL}$ , the equivalent digital state is 0
- When WAKE1 and WAKE2 are  $< WAKE12_{AVIL}$ , the internal biasing is stopped if the device was in Standby mode

WAKE1 can be, for example, connected to VBAT and WAKE2 to the wake-up output of a CAN or FlexRay transceiver. When a WAKE pin is used as a global pin, a CRC protection is required (see [Section 26 "Application information"](#)).

**Table 70. WAKE1, WAKE2 electrical characteristics**

$T_A = -40\text{ }^\circ\text{C}$  to  $125\text{ }^\circ\text{C}$ , unless otherwise specified.  $VSUP = VSUP\_UVH$  to 36 V, unless otherwise specified. All voltages referenced to ground.

Symbol	Parameter	Min	Typ	Max	Unit
$WAKE12_{AVIL}$	Analog low input voltage threshold	1	—	—	V
$WAKE12_{VIL}$	Digital low input voltage threshold	2	—	—	V
$WAKE12_{VIH}$	Digital high input voltage threshold	—	—	4	V

	Input current leakage at $WAKE12 = 60\text{ V}$	—	—	300	$\mu\text{A}$
$T_{WAKE12}$	Filtering time	50	70	100	$\mu\text{s}$

### 19.2 INTB

INTB is an open drain output pin with internal pull up to VDDIO. This pin generates a pulse when an internal interrupt occurs to inform the MCU. Each interrupt can be masked by setting the corresponding inhibit interrupt bit in M\_INT\_MASK registers.

**Table 71. INTB electrical characteristics**

$T_A = -40\text{ }^\circ\text{C}$  to  $125\text{ }^\circ\text{C}$ , unless otherwise specified.  $VSUP = VSUP\_UVH$  to 36 V, unless otherwise specified. All voltages referenced to ground.

Symbol	Parameter	Min	Typ	Max	Unit

19.3 PSYNC for two FS5502

PSYNC function allows to manage complex start up sequence with multiple power management ICs like two FS5502 (OTP\_PSYNC\_CFG = 0) or one FS5502 plus one PF82 (OTP\_PSYNC\_CFG = 1). This function is enabled with the OTP\_PSYNC\_EN bit.

When PSYNC is used to synchronize two FS5502, PSYNC pin of each device shall be connected together and pulled up to VBOS pin of the FS5502 master device as shown in Figure 24. In this configuration, FS5502 #1 state machine stops before FS5502 #1\_VPRE starts and waits for FS5502 #2 to synchronize FS5502#2\_VPRE start.

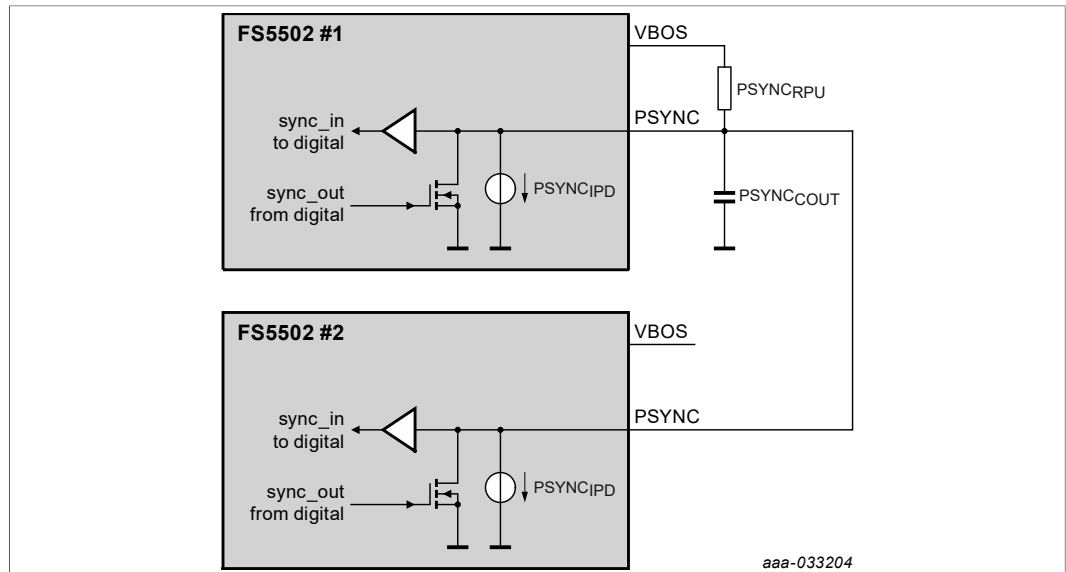

Figure 24. Synchronization of two FS5502

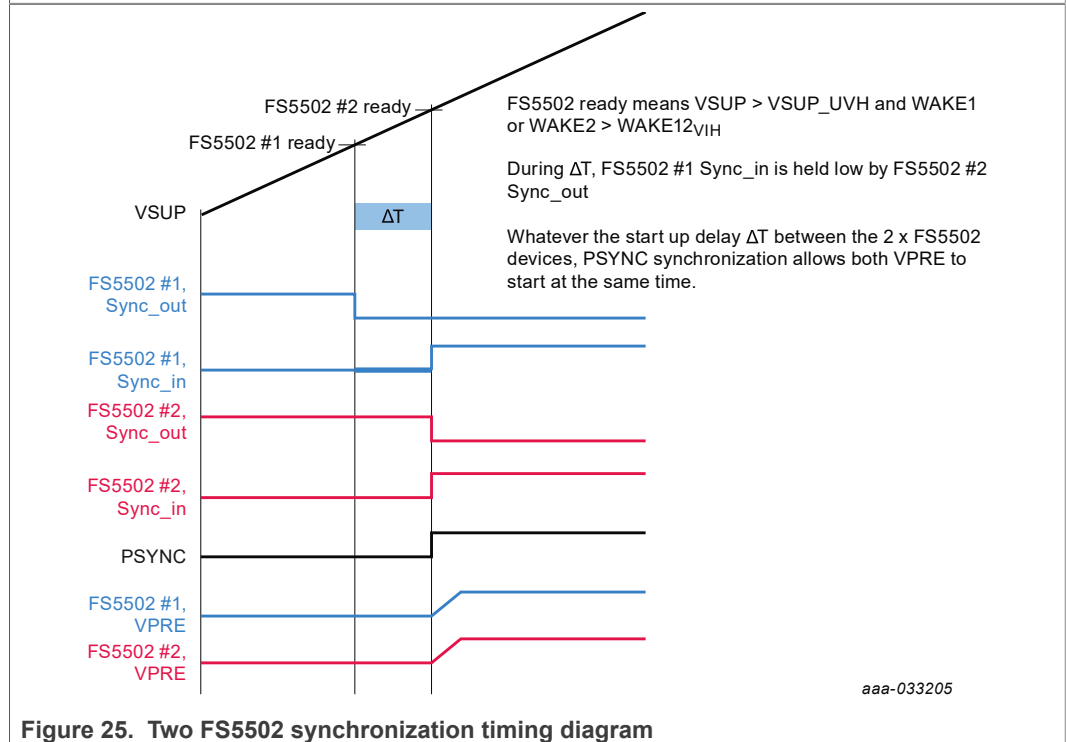

Figure 25. Two FS5502 synchronization timing diagram

19.4 PSYNC for FS5502 and external PMIC

When PSYNC is used to synchronize one FS5502 and one external PMIC, PSYNC pin of FS5502 is connected to PGOOD pin of the external PMIC.

When the external PMIC is PF82 from NXP, it can be pulled up to VSNVS pin of PF82. In this configuration, FS5502 state machine stops after VPRE starts and waits for the PGOOD pin of the external PMIC to be released to continue its own power sequencing. It allows to synchronize the power up sequence of both devices.

During power-down sequence, FS5502 should wait for the external PMIC power-down sequence completion before turning OFF VPRE (VPRE is powering the external PMIC). OTP\_VPRE\_off\_dly bit is configured to extend VPRE turn OFF delay from 250 μs default value to 32 ms.

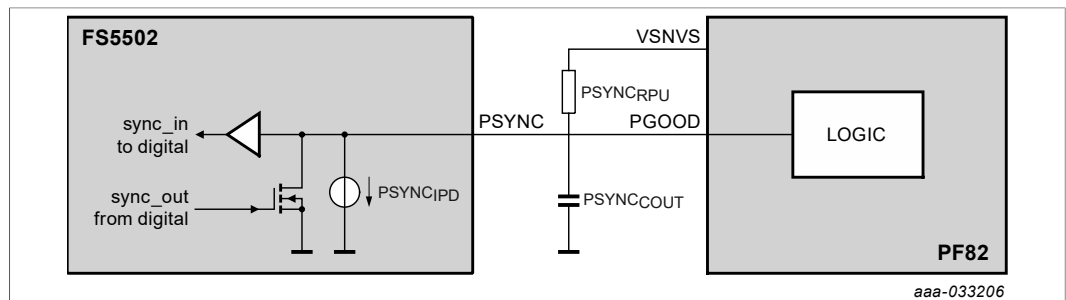

Figure 26. Synchronization of one FS5502 and one external PMIC (PF82)

## 20 I<sup>2</sup>C interface

### 20.1 I<sup>2</sup>C interface overview

The FS5502 use an I<sup>2</sup>C interface following the high-speed mode definition up to 3.4 Mbit/s. I<sup>2</sup>C interface protocol requires a device address for addressing the target IC on a multi-device bus. The FS5502 has two device address: one to access the main logic and one to access the fail-safe logic. These two I<sup>2</sup>C addresses are set by OTP.

The I<sup>2</sup>C interface is using a dedicated power input pin VDDI2C and it's compatible with 1.8 V / 3.3 V input supply. Timing, diagrams, and further details can be found in the NXP I<sup>2</sup>C specification UM10204 rev6.

**Table 75. I<sup>2</sup>C message arrangement**

### 20.2 Device address

The FS5502 has two device address: one to access the Main logic and one to access the Fail-safe logic.

B39	B38	B37	B36	B35	B34	B33
0	1	OTP	OTP	OTP	OTP	M/FS

The I<sup>2</sup>C addresses have the following arrangement:

- Bit 39: 0
- Bit 38: 1
- Bit 37 to 34: OTP value
- Bit 33: 0 to access the main logic, 1 to access the fail-safe logic

20.3 Cyclic redundant check

An 8 bit CRC is required for each Write and Read I2C command. Computation of a cyclic redundancy check is derived from the mathematics of polynomial division, modulo two.

The CRC polynomial used is  $x^8+x^4+x^3+x^2+1$  (identified by 0x1D) with a SEED value of hexadecimal '0xFF'

The following table shows an example of CRC encoding HW implementation:

CRC calculation using XOR:

```

CRC_7 = XOR (B38, B35, B32, B31, B24, B23, B22, B20, B17, B13, B12, B11, 1, 1, 1)
CRC_6 = XOR (B37, B34, B23, B22, B21, B19, B16, B12, B11, B10, 1, 1)
CRC_5 = XOR (B39, B36, B33, B30, B29, B22, B21, B20, B18, B15, B11, B10, B9, 1, 1, 1)
CRC_4 = XOR (B39, B38, B35, B32, B29, B28, B21, B20, B19, B17, B14, B10, B9, B8, 1, 1, 1, 1)
CRC_3 = XOR (B37, B35, B34, B32, B28, B27, B24, B23, B22, B19, B18, B17, B16, B12, B11, B9, B8, 1, 1, 1, 1)
CRC_2 = XOR (B39, B38, B36, B35, B34, B33, B32, B27, B26, B24, B21, B20, B18, B16, B15, B13, B12 B10, B8, 1,1,1,1,1,1,1)
CRC_1 = XOR (B37, B34, B33, B26, B25, B24, B22, B19, B15, B14, B13, B9, 1, 1, 1)
CRC_0 = XOR (B39, B36, B33, B32, B25, B24, B23, B21, B18, B14, B13, B12, B8, 1, 1, 1, 1)
    
```

CRC results examples:

- Main I2C device address: 0x20
- Fail-safe I2C device address: 0x21

Figure 28. CRC encoder example

Table 76. CRC results example

Device address, R/W, 8 bit (Hex)	00, Register address, 8 bit (Hex)	Data MSB, 8 bit (Hex)	Data LSB, 8 bit (Hex)	CRC, 8 bit

## 20.4 I<sup>2</sup>C electrical characteristics

**Table 77. I<sup>2</sup>C electrical characteristics**

$T_A = -40\text{ }^{\circ}\text{C}$  to  $125\text{ }^{\circ}\text{C}$ , unless otherwise specified.  $V_{SUP} = V_{SUP\_UVH}$  to 36 V, unless otherwise specified. All voltages referenced to ground.

Symbol	Parameter	Min	Typ	Max	Unit
VDDI2C	I <sup>2</sup> C interface power input	1.62	1.8	1.98	V
		2.97	3.3	3.63	V
$F_{SCL}$	SCL clock frequency	—	—	3.4	MHz
$I2C_{VIL}$	SCL, SDA low level input voltage threshold	$0.3 \times V_{DDI2C}$	—	—	V
$I2C_{VIH}$	SCL, SDA high level input voltage threshold	—	—	$0.7 \times V_{DDI2C}$	V
$SDA_{VOL}$	Low level output voltage at SDA pin ( $I = 20\text{ mA}$ )	—	—	0.4	V
$C_{I2C}$	Input capacitance at SCL / SDA	—	—	10	pF
$t_{SPSCL}$	SCL pulse width filtering time, when 50 ns filter selected (fast speed, fast speed plus)	50	—	150	ns
$t_{SPSDA}$	SDA pulse width filtering time, when 50 ns filter selected (fast speed, fast speed plus)	50	—	150	ns
$t_{SPHSCL}$	SCL pulse width filtering time, when 10 ns filter selected (high speed)	10	—	25	ns
$t_{SPHSDA}$	SDA pulse width filtering time, when 10 ns filter selected (high speed)	10	—	25	ns

## 21 Maximum ratings

**Table 78. Maximum ratings**

All voltages are with respect to ground, unless otherwise noted. Exceeding these ratings could cause a malfunction or permanent damage to the device.

Symbol	Parameter	Conditions	Min	Max	Unit
Voltage ratings					
VSUP1/2	DC voltage	power supply VSUP1,2 pins	-0.3	60	V
WAKE1/2	DC voltage	WAKE1,2 pins; external serial resistor mandatory	-1.0	60	V
PRE_SW	DC voltage	PRE_SW pin	-2.0	60	V
VMON1, VCOREMON	DC voltage	VMON1, VCOREMON pins	-0.3	60	V
PRE_GHS, PRE_BOOT	DC voltage	PRE_GHS, PRE_BOOT pins	-0.3	65.5	V
DBG	DC voltage	DBG pin	-0.3	10	V
LDO1_IN	DC voltage	LDO1_IN pin	-0.3	6.5	V
BUCKx_IN	DC voltage	BUCK1_IN, BUCK3_IN, BUCK3_INQ	-1.0	5.5	V
BUCKx_IN	Transient voltage < 3 $\mu$ s	BUCK1_IN, BUCK3_IN, BUCK3_INQ	-1.0	6.5	V
BUCKx_SW	Transient voltage < 20 ns	BUCK1_SW, BUCK3_SW	-2.0	6.5	V
All other pins	DC voltage	at all other pins	-0.3	5.5	V
Current ratings					
I_WAKE	Maximum current capability	WAKE1,2	-5.0	5.0	mA
I_SUP	Maximum current capability	VSUP1,2	-5.0	—	mA

## 22 Electrostatic discharge

### 22.1 Human body model (JESD22/A114)

The device is protected up to ±2 kV, according to the human body model standard with 100 pF and 1.5 kΩ. This protection is ensured at all pins.

### 22.2 Charged device model

- The device is protected up to ±500 V, according to AEC-Q100 - 011 charged device model standard. This protection is ensured at all pins.

### 22.3 Discharged contact test

The device is protected up to ±8 kV, according to the following discharged contact tests.

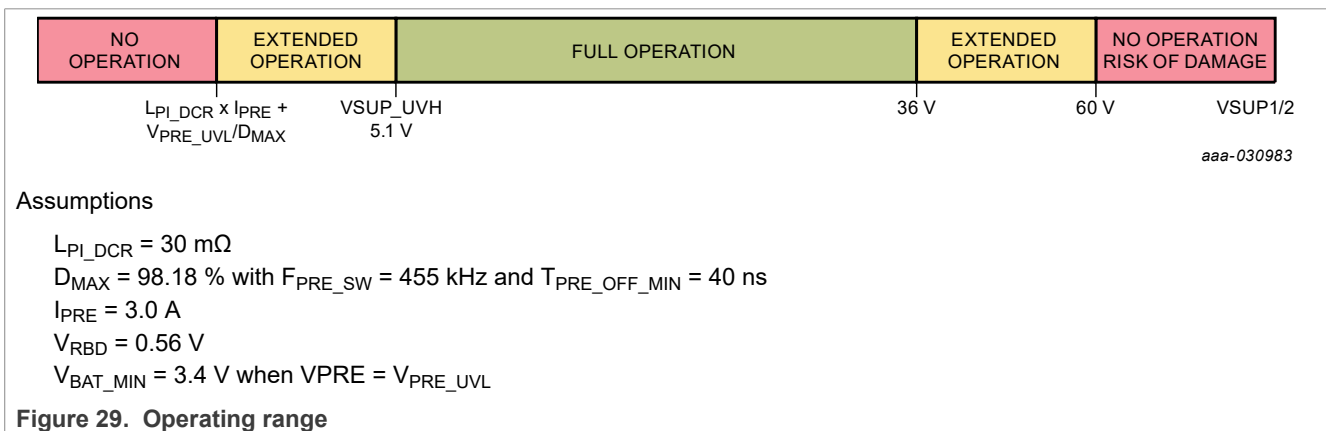

Discharged contact test (IEC61000-4-2) at 150 pF and 330 Ω

Discharged contact test (ISO10605.2008) at 150 pF and 2 kΩ

Discharged contact test (ISO10605.2008) at 330 pF and 2 kΩ

This protection is ensured at VSUP1, VSUP2, WAKE1, WAKE2 pins.

## 23 Operating conditions

- Below VSUP\_UVH threshold, the extended operation range depends on VPRE output voltage configuration and external components.
  - When VPRE is configured at 5.0 V, VPRE may not remain in its regulation range
  - VSUP minimum voltage depends on external components (LPI\_DCR) and application conditions (I\_PRE, F\_PRE\_SW)
- The FS5502 maximum continuous operating voltage is 36 V when VPRE is switching at 455 kHz.
- The FS5502 maximum continuous operating voltage is 36 V when VPRE is switching at 455 kHz. It has been validated at 48 V for limited duration of 15 minutes at room temperature to satisfy the jump-start requirement of 24 V applications. It can sustain 58 V load dump without external protection.
- When VPRE is switching at 2.2 MHz, the FS5502 maximum continuous operating voltage is 18 V. It is validated at 26 V for limited duration of 2 minutes at room

temperature to satisfy the jump-start requirement of 12 V applications and 35 V load dump.

## 24 Thermal characteristics

Table 79. Thermal ratings

Symbol	Parameter	Conditions	Min	Max	Unit
R <sub>θJA</sub>	Thermal resistance junction to ambient	2s2p circuit board <sup>[1]</sup>			°C/W

## 25 Characteristics

**Table 80. Electrical characteristics**

$T_A = -40\text{ °C}$  to  $125\text{ °C}$ , unless otherwise specified.  $V_{SUP} = V_{SUP\_UVH}$  to 36 V, unless otherwise specified. All voltages referenced to ground.

Symbol	Parameter	Min	Typ	Max	Unit
Power supply					
$I_{SUP\_NORMAL}$	Current in Normal mode, all regulators ON ( $I_{OUT} = 0$ )	—	15	25	mA
$I_{SUP\_STANDBY}$	Current in Standby mode, all regulators OFF except VBOS	—	5	10	mA
$I_{SUP\_OFF1}$	Current in OFF mode (Power Down), $T_A < 85\text{ °C}$	—	10	15	$\mu\text{A}$
$I_{SUP\_OFF2}$	Current in OFF mode (Power Down), $T_A = 125\text{ °C}$	—	—	25	$\mu\text{A}$
$V_{SUP\_UV7}$	VSUP undervoltage threshold (7.0 V)	7.2	7.5	7.8	V
$V_{SUP\_UVH}$	VSUP undervoltage threshold high (during power up and Vsup rising) OTP_VSUP_CFG = 0	4.7	—	5.1	V
	VSUP undervoltage threshold high (during power up and Vsup rising) OTP_VSUP_CFG = 1	6.0	—	6.4	V
$V_{SUP\_UVL}$	VSUP undervoltage threshold low (during power up and Vsup falling) OTP_VSUP_CFG = 0	4.0	—	4.4	V
	VSUP undervoltage threshold low (during power up and Vsup falling) OTP_VSUP_CFG = 1	5.3	—	5.7	V
$T_{SUP\_UV}$	$V_{SUP\_UV7}$ , $V_{SUP\_UVH}$ and $V_{SUP\_UVL}$ filtering time	6.0	10	15	$\mu\text{s}$

## 26 Application information

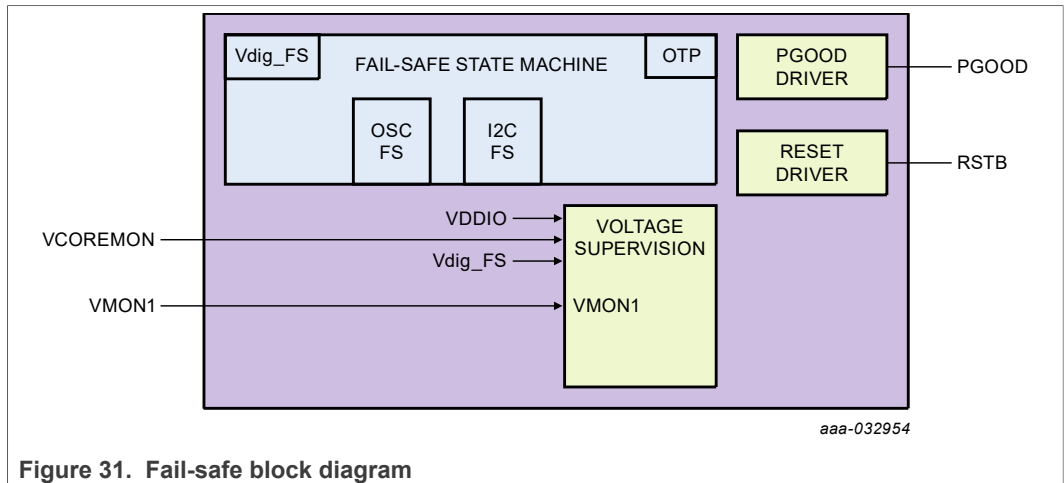

## 27 Fail-safe domain description

### 27.1 Functional description

The fail-safe domain is electrically independent and physically isolated. The fail-safe domain is supplied by its own reference voltages and current, has its own oscillator.

The fail-safe domain and the dedicated pins are represented in [Figure 31](#):

## 27.2 Voltage supervisor

The voltage supervisor is in charge of overvoltage and undervoltage monitoring of VCOREMON, VDDIO and VMON1 input pins. When an overvoltage occurs on a FS5502 regulator monitored by one of these pins, the associated FS5502 regulator is switched off till the fault is removed. The voltage monitoring is active as soon as FS\_ENABLE=1 and UV/OV flags are then reported accordingly.

### 27.2.1 VCOREMON monitoring

VCOREMON input pin is dedicated to BUCK1. When overvoltage or undervoltage fault is detected, the fail-safe reaction on RSTB is configurable with the VCOREMON\_OV/UV\_FS\_IMPACT[1:0] bits during the INIT\_FS phase.

Table 81. VCOREMON error impact configuration

VCOREMON_OV_FS_IMPACT[1:0]	VCOREMON OV impact on RSTB
00	No effect on RSTB
01	Reserved
<b>1x (default)</b>	<b>RSTB is asserted</b>
Reset condition	POR

VCOREMON_UV_FS_IMPACT[1:0]	VCOREMON UV impact on RSTB
00	No effect on RSTB
<b>01 (default)</b>	No effect on RSTB

Reset condition	POR

Table 82. VCOREMON electrical characteristics

$T_A = -40\text{ }^{\circ}\text{C}$  to  $125\text{ }^{\circ}\text{C}$ , unless otherwise specified. VSUP = VSUP\_UVH to 36 V, unless otherwise specified. All voltages referenced to ground.

Symbol	Parameter	Min	Typ	Max	Unit
VCOREMON_OV_min	Overvoltage threshold minimum	—	+4.5	—	%

**Table 82. VCOREMON electrical characteristics...continued**

$T_A = -40\text{ }^\circ\text{C}$  to  $125\text{ }^\circ\text{C}$ , unless otherwise specified.  $VSUP = VSUP\_UVH$  to 36 V, unless otherwise specified. All voltages referenced to ground.

Symbol	Parameter	Min	Typ	Max	Unit
VCOREMON_OV_max	Overvoltage threshold maximum	—	+12	—	%
VCOREMON_OV_step	Overvoltage threshold step (OTP_VCOREOVTH[7:0] bits)	—	+0.5	—	%
VCOREMON_OV_acc	Overvoltage threshold accuracy	-2	—	2	%
TCOREMON_OV	Overvoltage filtering time (OTP_VCORE_OV_DGLT bit)	20	25	30	$\mu\text{s}$
		40	45	50	$\mu\text{s}$
VCOREMON_UV_min	Undervoltage threshold minimum	—	-4.5	—	%
VCOREMON_UV_max	Undervoltage threshold maximum	—	-12	—	%
VCOREMON_UV_step	Undervoltage threshold step (OTP_VCOREUVTH[7:0] bits)	—	-0.5	—	%
VCOREMON_UV_acc	Undervoltage threshold accuracy	-2	—	2	%
TCOREMON_UV	Undervoltage filtering time (OTP_VCORE_UV_DGLT[1:0] bits)	2.5	5	7.5	$\mu\text{s}$
		10	15	20	$\mu\text{s}$
		20	25	30	$\mu\text{s}$
		35	40	45	$\mu\text{s}$

### 27.2.2 Static voltage scaling (SVS)

A static voltage scaling function is implemented to allow the MCU to reduce the output voltage initially configured at start-up of BUCK1. The SVS configuration must be done in INIT\_FS phase. The offset value is configurable by I<sup>2</sup>C with the SVS\_OFFSET[4:0] bits and the exact complemented value shall be written in the NOT\_SVS\_OFFSET[4:0] bits.

**Table 83. SVS offset configuration**

SVS_OFFSET[4:0]	NOT_SVS_OFFSET[4:0]	Offset applied to BUCK1
<b>0 0000 (default)</b>	<b>1 1111</b>	<b>0 mV</b>
0 0001	1 1110	-6.25 mV
...	...	-6.25 mV step per bit
1 0000	0 1111	-100 mV
Reset condition	POR	

The BUCK1 output voltage transition starts when the NOT\_SVS\_OFFSET[4:0] I<sup>2</sup>C command is received and confirmed good. If the NOT\_SVS\_OFFSET[4:0] I<sup>2</sup>C command is not the exact opposite to the SVS\_OFFSET[4:0] I<sup>2</sup>C command, the SVS procedure is not executed and the BUCK1 output voltage remains at its original value. The OV/UV threshold changes immediately when the NOT\_SVS\_OFFSET[4:0] I<sup>2</sup>C command is received and confirmed good. Therefore, the BUCK1 output voltage transition is done within TCOREMON\_OV.

Figure 32. SVS principle

27.2.3 VDDIO monitoring

VDDIO input pin can be connected to VPRE, LDO1, BUCK3 or an external regulator. The regulator connected to VDDIO must be at 3.3 V or 5.0 V to be compatible with overvoltage and undervoltage monitoring thresholds. In order to turn OFF the regulator in case of overvoltage detection, the configuration of which regulator is connected to VDDIO is done with OTP\_VDDIO\_REG\_ASSIGN[2:0] bits. If an external regulator (not delivered by the FS5502) is connected to VDDIO, this regulator cannot be turned OFF, but the overvoltage flag is reported to the MCU, which can take appropriate action. In all cases, the reaction on RSTB is configured with VDDIO\_OV/UV\_FS\_IMPACT[1:0] bits.

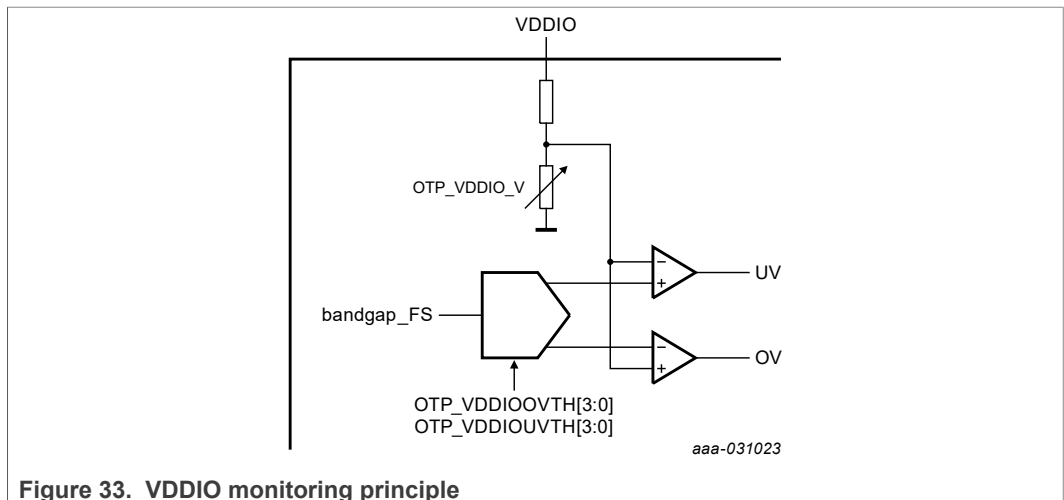

Figure 33. VDDIO monitoring principle

When overvoltage or undervoltage fault is detected, the fail-safe reaction on RSTB is configurable with the VDDIO\_OV/UV\_IMPACT[1:0] bits during the INIT\_FS phase.

Table 84. VDDIO error impact configuration

VDDIO_OV_FS_IMPACT[1:0]	VDDIO OV impact on RSTB
00	No effect on RSTB
01	Reserved
<b>1x (default)</b>	<b>RSTB is asserted</b>
Reset condition	POR

VDDIO_UV_FS_IMPACT[1:0]	VDDIO UV impact on RSTB
00	No effect on RSTB
<b>01 (default)</b>	No effect on RSTB
1x	RSTB is asserted
Reset condition	POR

Table 85. VDDIO electrical characteristics

$T_A = -40\text{ }^{\circ}\text{C}$  to  $125\text{ }^{\circ}\text{C}$ , unless otherwise specified.  $VSUP = VSUP\_UVH$  to 36 V, unless otherwise specified. All voltages referenced to ground.

Symbol	Parameter	Min	Typ	Max	Unit
VDDIO_OV_min	Overvoltage threshold minimum	—	+4.5	—	%
VDDIO_OV_max	Overvoltage threshold maximum	—	+12	—	%
VDDIO_OV_step	Overvoltage threshold step (OTP_VDDIOOVTH[7:0] bits)	—	+0.5	—	%
VDDIO_OV_acc	Overvoltage threshold accuracy	-2	—	2	%
TVDDIO_OV	Overvoltage filtering time (OTP_VDDIO_OV_DGLT bit)	20	25	30	$\mu\text{s}$
		40	45	50	$\mu\text{s}$

		10	15	20	$\mu\text{s}$
		20	25	30	$\mu\text{s}$
		35	40	45	$\mu\text{s}$

### 27.2.4 VMON1 monitoring

Each VMON1 monitoring feature is enabled by OTP. VMON1 input pin can be connected to VPRE, LDO1, BUCK3 or even an external regulator. In order to turn OFF the regulator in case of Overvoltage detection, the configuration of which regulator is connected to VMON1 is done by I<sup>2</sup>C in the register M\_VMON\_REGx. If an external regulator (not delivered by the FS5502) is connected to VMON1, this regulator cannot be turned OFF, but the Overvoltage flag is reported to the MCU, which can take appropriate action. In all cases, the fail-safe reaction on RSTB is configured with VMON1\_OV/UV\_FS\_IMPACT[1:0] bits.

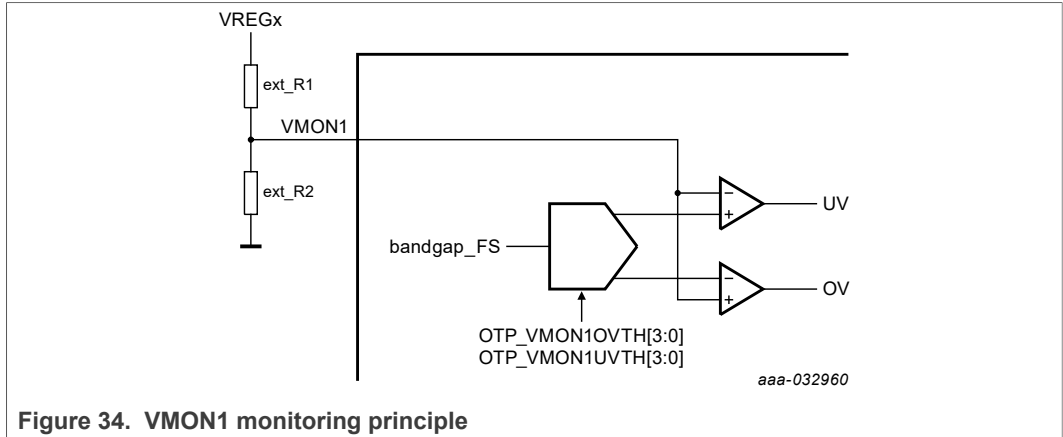

Figure 34. VMON1 monitoring principle

The external resistor bridge connected to VMON1 shall be calculated to deliver a middle point of 0.8V. It is recommended to use ±1 % or less resistor accuracy. When overvoltage or undervoltage fault is detected, the fail-safe reaction on RSTB is configurable with the VMON1\_OV/UV\_FS\_IMPACT[1:0] bits during the INIT\_FS phase.

Table 86. VMONx error impact configuration

VMON1_PD	Internal passive pull down	1	2	4	M $\Omega$

## 27.3 Fault management

### 27.3.1 Fault source and reaction

In normal operation when RSTB is released, the fault error counter is incremented when a fault is detected by the FS5502 fail-safe state machine. [Table 88](#) lists the faults and their impact on PGOOD and RSTB pins according to the device configuration. The faults that are configured to not assert RSTB will not increment the fault error counter. In that case, only the flags are available for MCU diagnostic.

**Table 88. Application related fail-safe fault list and reaction**

In Orange, the reaction is not configurable.

In Green, the reaction is configurable by OTP for PGOOD and  $I^2C$  for RSTB during INIT\_FS.

Apps related fail-safe faults	FLT_ERR_CNT increment	RSTB assertion	PGOOD assertion
VCOREMON_OV	+1	VCOREMON_OV_FS_IMPACT[1]	OTP config
VDDIO_OV	+1	VDDIO_OV_FS_IMPACT[1]	OTP config
VMON1_OV	+1	VMON1_OV_FS_IMPACT[1]	OTP config
VCOREMON_UV	+1	VCOREMON_UV_FS_IMPACT[1]	OTP config
VDDIO_UV	+1	VDDIO_UV_FS_IMPACT[1]	OTP config
VMON1_UV	+1	VMON1_UV_FS_IMPACT[1]	OTP config
External RESET (out of extended RSTB)	+1	Yes (low externally)	No
RSTB pulse request by MCU	No	Yes	No
RSTB short to high	+1	No (high externally)	No
REG_CORRUPT = 1	+1	No	No
OTP_CORRUPT = 1	+1	No	No

If OTP\_PGOOD\_RSTB = 0 (default configuration), RSTB and PGOOD pins work independently according to [Table 88](#). If OTP\_PGOOD\_RSTB = 1, RSTB and PGOOD pins work concurrently and all the faults asserting RSTB will also assert PGOOD.

27.3.2 Fault error counter

The FS5502 integrates a configurable fault error counter that counts the number of faults related to the device itself and also caused by external events. The fault error counter starts at level 1 after a POR or resuming from Standby. The final value of the fault error counter is used to transition in DEEP-FS mode. The maximum value of this counter is configurable with the FLT\_ERR\_CNT\_LIMIT[1:0] bits during the INIT\_FS phase.

Table 89. Fault error counter configuration

FLT_ERR_CNT_LIMIT[1:0]	Fault error counter max value configuration
00	2
<b>01 (default)</b>	<b>6</b>
10	8
11	12
Reset condition	POR

27.4 PGOOD, RSTB

These two output pins have a hierarchical implementation in order to guarantee the safe state.

- PGOOD has the priority one. If PGOOD is asserted, RSTB is asserted.
- RSTB has the priority two. If RSTB is asserted, PGOOD may not be asserted.

27.4.1 PGOOD

PGOOD is an open-drain output that can be connected in the application to the PORB of the MCU. PGOOD requires an external pull-up resistor to VDDIO and a filtering capacitor to GND for immunity. An internal pull-down RPD ensures PGOOD low level in Standby and Power down mode. VCOREMON, VDDIO, VMON1 can be assigned to PGOOD by OTP.

PGOOD is asserted low by the FS\_LOGIC when any of the assigned regulators are in undervoltage or overvoltage. When PGOOD is asserted low, RSTB is also asserted low. An internal pull up on the gate of the low-side MOS ensures PGOOD low level in case of FS\_LOGIC failure.

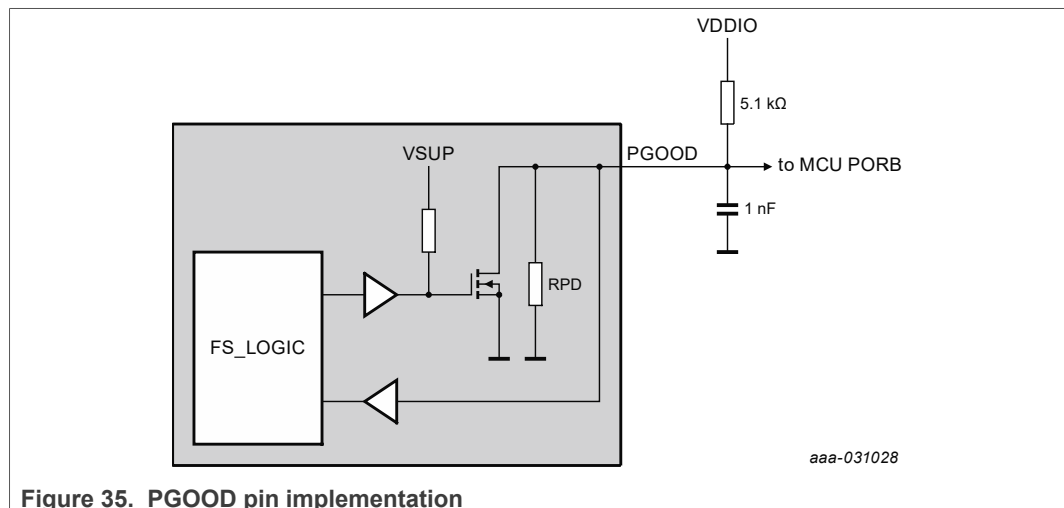

Figure 35. PGOOD pin implementation

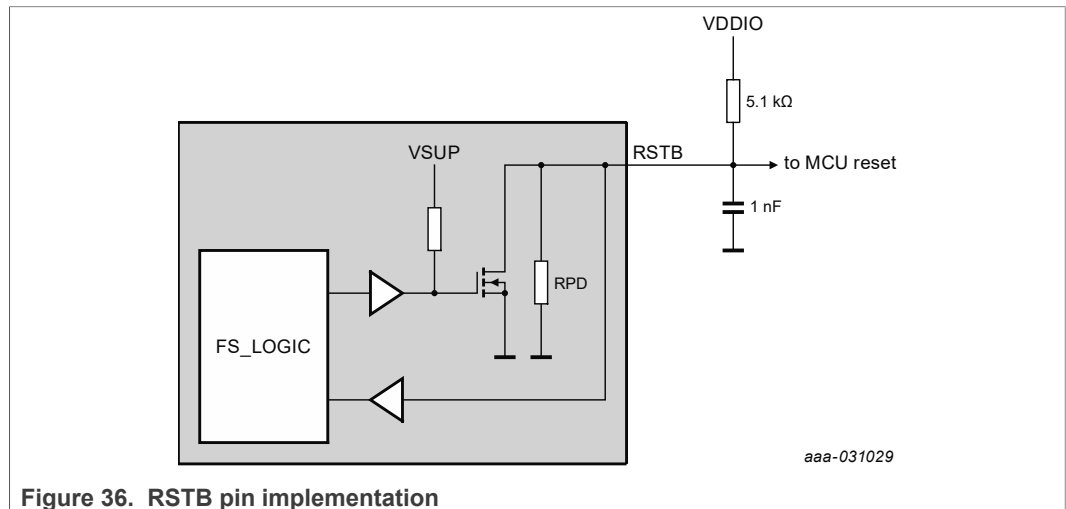

**Table 90. PGOOD electrical characteristics**

$T_A = -40\text{ }^\circ\text{C}$  to  $125\text{ }^\circ\text{C}$ , unless otherwise specified.  $VSUP = VSUP\_UVH$  to 36 V, unless otherwise specified. All voltages referenced to ground.

Symbol	Parameter	Min	Typ	Max	Unit
PGOOD <sub>VIL</sub>	Low level input voltage threshold	1.0	—	—	V
PGOOD <sub>VIH</sub>	High level input voltage threshold	—	—	2.0	V
PGOOD <sub>HYST</sub>	Input voltage hysteresis	100	—	—	mV
PGOOD <sub>VOL</sub>	Low level output voltage (I = 2.0 mA)	—	—	0.5	V
PGOOD <sub>RPD</sub>	Internal pull-down resistor	200	400	800	kΩ
PGOOD <sub>ILIM</sub>	Current limitation	4.0	—	20	mA
PGOOD <sub>TFB</sub>	Feedback filtering time	8.0	—	15	μs

**27.4.2 RSTB**

RSTB is an open-drain output that can be connected in the application to the RESET of the MCU. RSTB requires an external pull-up resistor to VDDIO and a filtering capacitor to GND for immunity. An internal pull-down RPD ensure RSTB low level in Standby and Power down mode. RSTB assertion depends on the device configuration during INIT\_FS phase. An internal pull up on the gate of the low-side MOS ensures RSTB low level in case of FS\_LOGIC failure. When RSTB is stuck low for more than  $RSTB_{T8S}$ , the device transitions in DEEP-FS mode.

**Figure 36. RSTB pin implementation**

**Table 91. RSTB electrical characteristics**

$T_A = -40\text{ }^{\circ}\text{C}$  to  $125\text{ }^{\circ}\text{C}$ , unless otherwise specified.  $VSUP = VSUP\_UVH$  to 36 V, unless otherwise specified. All voltages referenced to ground.

Symbol	Parameter	Min	Typ	Max	Unit
RSTB <sub>VIL</sub>	Low level input voltage threshold	1.0	—	—	V
RSTB <sub>VIH</sub>	High level input voltage threshold	—	—	2.0	V
RSTB <sub>HYST</sub>	Input voltage hysteresis	100	—	—	mV
RSTB <sub>VOL</sub>	Low level output voltage (I = 2.0 mA)	—	—	0.5	V
RSTB <sub>RPB</sub>	Internal pull-down resistor	200	400	800	k $\Omega$
RSTB <sub>ILIM</sub>	Current limitation	4.0	—	20	mA
RSTB <sub>TFB</sub>	Feedback filtering time	8.0	—	15	$\mu$ s
RSTB <sub>TSC</sub>	Short to high filtering time	500	—	800	us
RSTB <sub>TLG</sub>	Long pulse (configurable with RSTB_DUR bit)	9.0	—	11	ms
RSTB <sub>TST</sub>	Short pulse (configurable with RSTB_DUR bit)	0.9	—	1.1	ms
RSTB <sub>T8S</sub>	8 second timer	7.0	8.0	9.0	s
RSTB <sub>TRELEASE</sub>	Time to release RSTB from Wake-up or POR with all regulators started in Slot 0	—	8	—	ms

## 28 Package information

FS5502 package is a QFN (sawn), thermally enhanced wettable flanks, 8 x 8 x 0.85 mm, 0.5 mm pitch, 56 pins. The assembly can be done at two different NXP assembly sites with slight wettable flank difference but sharing the same PCB footprint.

29 Package outline

29.1 Step-cut wettable flank

29.2 Dimple wettable flank

H-PQFN-56 I/O DIMPLE WETTABLE FLANK  
8 X 8 X 0.85 PKG, 0.5 PITCH

SOT684-23

Figure 40. Package outline detail for HVQFN56 (SOT684-23, Dimple)

NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. DIMENSIONING AND TOLERANCING PER ASME Y14.5M-1994.
3. PIN 1 FEATURE SHAPE, SIZE AND LOCATION MAY VARY.
4. COPLANARITY APPLIES TO LEADS, DIE ATTACH FLAG AND CORNER NON-FUNCTIONAL PADS.
5. MIN. METAL GAP SHOULD BE 0.25 MM.
6. ANCHORING PADS.

Figure 41. Package outline notes for HVQFN56 (SOT684-23)

### 29.3 Package comparison

Table 92. Package comparison

Item	Dimple wettable flank	Step-cut wettable flank
Package size (x,y,z)	8x8x0.85 mm3	8x8x0.85 mm3

Table 92. Package comparison...continued

Item	Dimple wettable flank	Step-cut wettable flank
Package	QFN56 8*8	QFN56 8*8
Epoxy	EN4900G*	EN4900G*
Wire	AuPdCu Wire 1.3mil	AuPdCu Wire 1.3mil
Compound	CEL-9240HF10AN4	G700LA fine catalyst
Lead frame	PPF+RT	SN Plated
Wettable flank	Dimple solution	Step Cut
Part number	MC33FS5502xxKS	MC33FS5502xxES
MSL / Reflow °C	3 / 260	3 / 260

30 Layout and PCB guidelines

30.1 Landing pad information

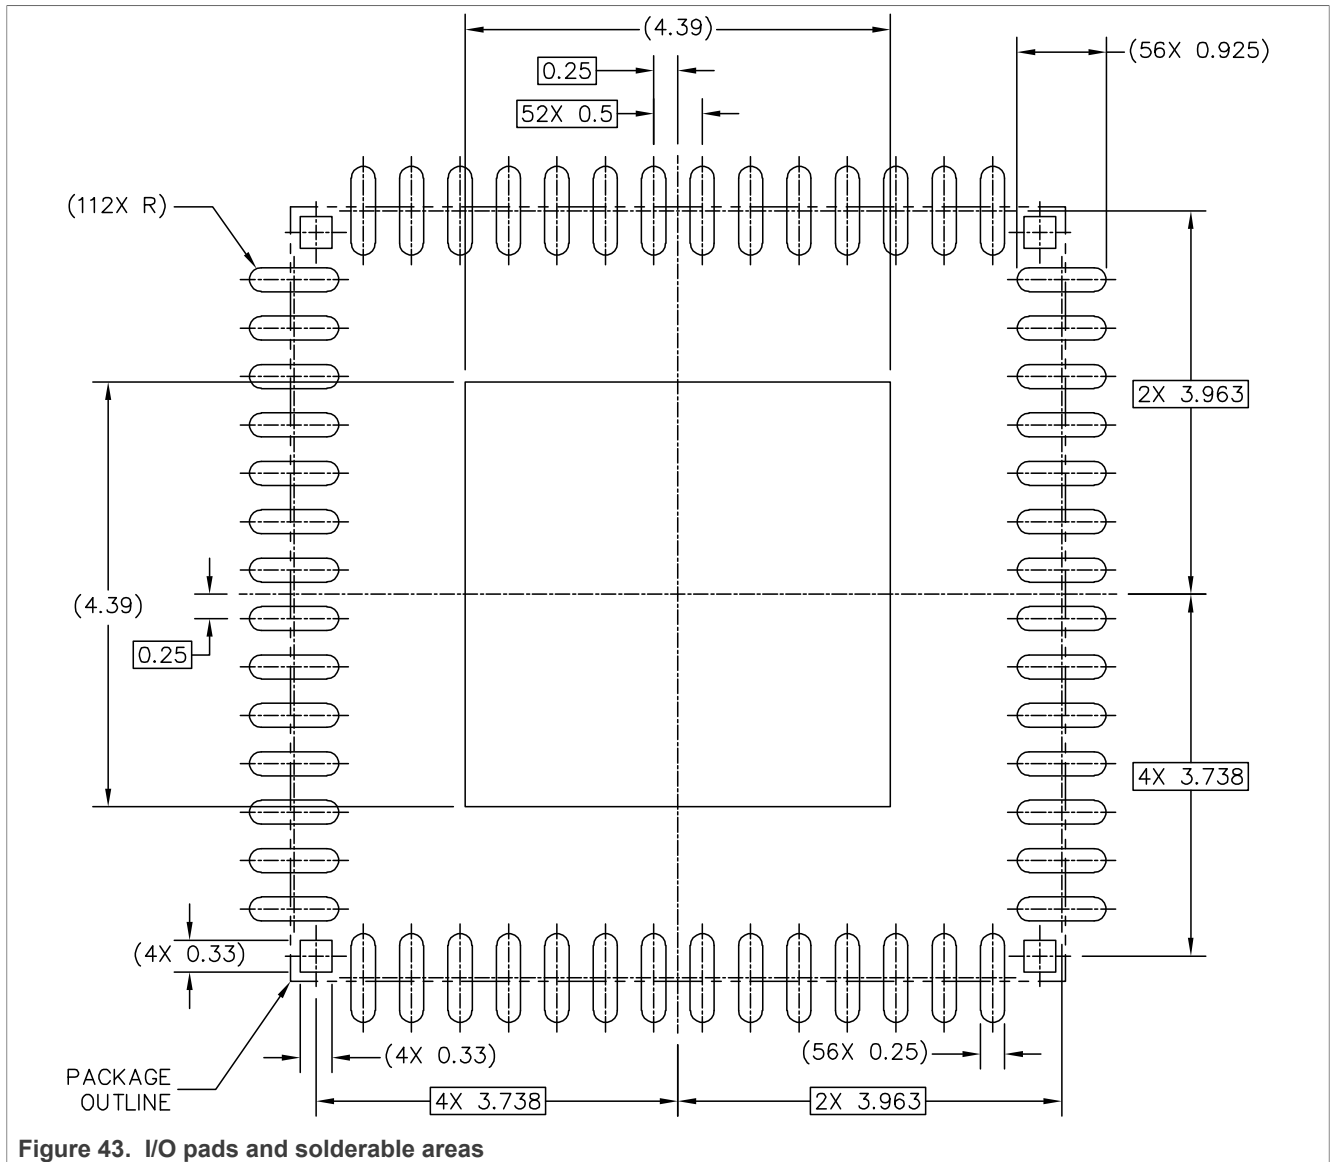

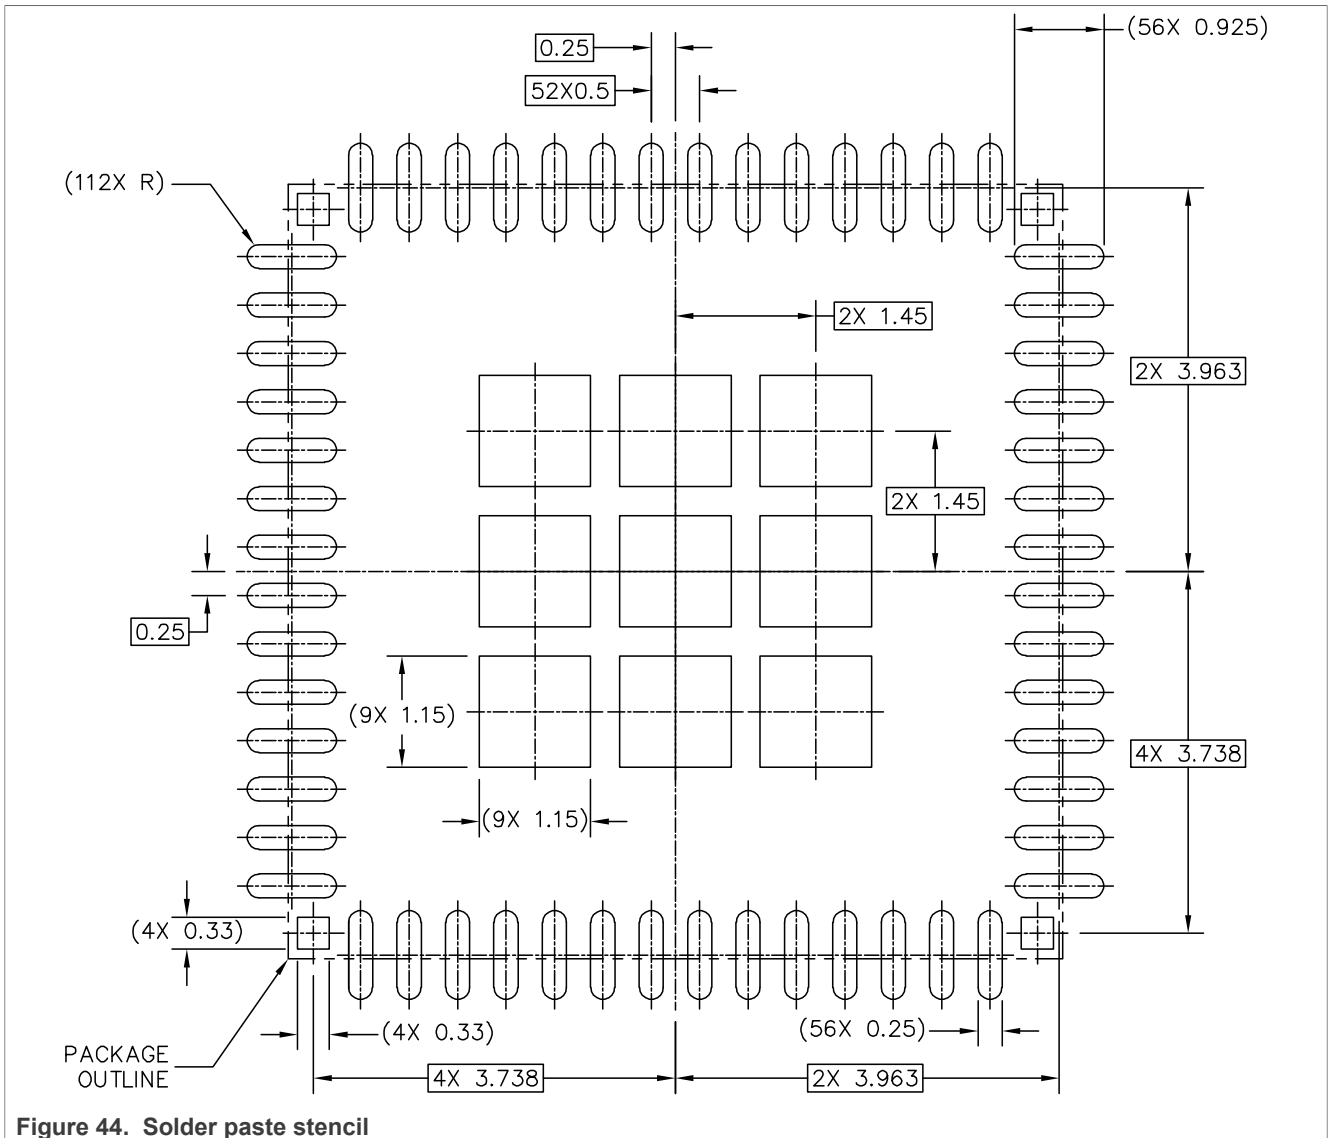

Figure 43. I/O pads and solderable areas

### 30.2 Component selection

- SMPS input and output capacitors shall be chosen with low ESR (ceramic or MLCC type of capacitors). X7R ceramic type is preferred. Input decoupling capacitors shall be placed as close as possible to the device pin. Output capacitor voltage rating shall be selected to be 3x the voltage output value to minimize the DC bias degradation.
- SMPS inductors shall be shielded with ISAT higher than maximum inductor peak current.

### 30.3 VPRES

- Inductor charging and discharging current loop is designed as small as possible.
- Input decoupling capacitors are placed close to the high-side drain transistor pin.
- The boot strap capacitor is placed close to the device pin using wide and short track to connect to the external low-side drain transistor.

- PRE\_GLS, PRE\_GHS and PRE\_SW tracks are wide and short and should not cross any sensitive signal (current sensing, for example).

- PRE\_FB used as voltage feedback and current sense shall be connected to  $R_{SHUNT}$  and routed as a pair with CSP.

- The external transistor thermal shape should be in the range of 25 x 25 mm for optimum  $R_{th}$ .
- The LFPK56 application note can give better insight: <http://assets.nexperia.com/documents/application-note/AN10874.pdf>

### 30.4 VBUCKx

- Inductor charging and discharging current loop is designed as small as possible.

- Input decoupling capacitors are placed close to BUCKx\_IN pins.
- BUCK3\_FB and BUCK3\_INQ pins shall be tied to the same capacitor, VPRES output capacitor depending on BUCK3\_IN supply selected (in the blue path below, the coil is parasitic from tracks). In the package, the coil is parasitic from the bonding.

## 31 EMC compliance

The FS5502 EMC performance will be verified against BISS generic IC EMC test specification version 2.0 from 07.2012 and FMC1278 electromagnetic compatibility specification for electrical/electronic components and subsystems from 2016 with the following specific conditions:

- Conducted emission: IEC 61967-4
  - Global pins: VBAT (Vsup1 and Vsup2), WAKE1/2, 150 Ω method, 12-M level
  - Local pins: VPRES, BUCK1/3, LDO1, 150 Ω method, 10-K level

- Conducted immunity: IEC 62132-4
  - Global pins: VBAT (Vsup1 and Vsup2), 36 dBm, Class A (no state change on RSTB, PGOOD and all regulators in spec)
  - Global pins: WAKE1, WAKE2, 30 dBm, Class A (no state change on RSTB, PGOOD and all regulators in spec)
  - Local pins: RSTB, PGOOD, VDDIO, VDDI2C, VBOS, 12 dBm, Class A (no state change on RSTB, PGOOD and all regulators in spec)
  - Supply pins: VPRE, BUCK1/3, LDO1, 12 dBm, Class A (no state change on RSTB, PGOOD and all regulators in spec)
- Radiated emission: FMC1278 from July 2015
  - Compliance with FMC1278 RE310 Level 2 requirement in Normal mode
- Radiated immunity: FMC1278 from July 2015
  - Injection level per FMC1278 RI112 Level 2 requirement in Normal mode,
  - Injection level per FMC1278 RI112 Level 2 requirement in Normal mode,
  - No wake up when injecting FMC1278 RI112 Level 2 requirement in Standby mode

## 34 Legal information

### 34.1 Data sheet status

Document status <sup>[1][2]</sup>	Product status <sup>[3]</sup>	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

### 34.2 Definitions

**Draft** — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

**Short data sheet** — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

**Product specification** — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

### 34.3 Disclaimers

**Limited warranty and liability** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors. In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory. Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without

notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification. Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products. NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

**Limiting values** — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

**Terms and conditions of commercial sale** — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

**Suitability for use in automotive applications** — This NXP product has been qualified for use in automotive applications. If this product is used by customer in the development of, or for incorporation into, products or services (a) used in safety critical applications or (b) in which failure could lead to death, personal injury, or severe physical or environmental damage (such products and services hereinafter referred to as "Critical Applications"),

then customer makes the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, safety, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP. As such, customer assumes all risk related to use of any products in Critical Applications and NXP and its suppliers shall not be liable for any such use by customer. Accordingly, customer will indemnify and hold NXP harmless from any claims, liabilities, damages and associated costs and expenses (including attorneys' fees) that NXP may incur related to customer's incorporation of any product in a Critical Application.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

**Translations** — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.
