MC74LVX4245

Dual Supply Octal Translating Transceiver

with 3-State Outputs

The 74LVX4245 is a 24-pin dual-supply, octal translating transceiver that is designed to interface between a 5.0 V bus and a 3.0 V bus in a mixed 3.0 V / 5.0 V supply environment such as laptop computers using a 3.3 V CPU and 5.0 V LCD display. The A port interfaces with the 5V bus; the B port interfaces with the 3.0 V bus.

The Transmit/Receive (T/R) input determines the direction of data flow. Transmit (active-High) enables data from the A port to the B port. Receive (active-Low) enables data from the B port to the A port. The Output Enable (OE) input, when High, disables both A and B ports by placing them in 3-State.

Features

- Bi-directional Interface Between 5.0 V and 3.0 V Buses
- Control Inputs Compatible with TTL Level
- 5.0 V Data Flow at A Port and 3.0 V Data Flow at B Port
- Outputs Source/Sink 24 mA at 5.0 V Bus and 12 mA at 3.0 V Bus
- Guaranteed Simultaneous Switching Noise Level and Dynamic Threshold Performance
- Available in SOIC and TSSOP Packages
- Functionally Compatible with the 74 Series 245
- NLV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Condition	Unit
V_{CCA}, V_{CCB}	DC Supply Voltage	-0.5 to +7.0		V
V_I	DC Input Voltage $\overline{OE}, T/R$	-0.5 to $V_{CCA} + 0.5$		V
$V_{I/O}$	DC Input/Output Voltage	An	-0.5 to $V_{CCA} + 0.5$	V
		Bn	-0.5 to $V_{CCB} + 0.5$	V
I_{IK}	DC Input Diode Current $\overline{OE}, T/R$	± 20	$V_I < GND$	mA
I_{OK}	DC Output Diode Current	± 50	$V_O < GND; V_O > V_{CC}$	mA
I_O	DC Output Source/Sink Current	± 50		mA
I_{CC}, I_{GND}	DC Supply Current Per Output Pin Maximum Current at I_{CCA} Maximum Current at I_{CCB}	± 50 ± 200 ± 100		mA
T_{STG}	Storage Temperature Range	-65 to +150		$^{\circ}C$
Latchup	DC Latchup Source/Sink Current	± 300		mA

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Min	Max	Unit
V_{CCA}, V_{CCB}	Supply Voltage V_{CCA} V_{CCB}	4.5 2.7	5.5 3.6	V
V_I	Input Voltage $\overline{OE}, T/R$	0	V_{CCA}	V
$V_{I/O}$	Input/Output Voltage	An	V_{CCA}	V
		Bn	V_{CCB}	V
T_A	Operating Free-Air Temperature	-40	+85	$^{\circ}C$
$\Delta t/\Delta V$	Minimum Input Edge Rate V_{IN} from 30% to 70% of V_{CC} ; V_{CC} at 3.0V, 4.5V, 5.5V	0	8	ns/V

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

t_{OSHL} t_{OSLH}	Output to Output Skew, Data to Output (Note 5)		1.0	1.5		1.5	ns

4. Typical values at $V_{CCA} = 5.0\text{V}$; $V_{CCB} = 3.3\text{V}$ at 25°C .

5. Skew is defined as the absolute value of the difference between the actual propagation delay for any two separate outputs of the same device. The specification applies to any outputs switching in the same direction, either HIGH-to-LOW (t_{OSHL}) or LOW-to-HIGH (t_{OSLH}); parameter guaranteed by design.

Dual Supply Octal Translating Transceiver

The 74LVX4245 is a dual-supply device well capable of bidirectional signal voltage translation. This level shifting ability provides an excellent interface between low voltage CPU local bus and a standard 5.0 V I/O bus. The device control inputs can be controlled by either the low voltage CPU and core logic or a bus arbitrator with 5.0 V I/O levels.

The LVX4245 is ideal for mixed voltage applications such as notebook computers using a 3.3 V CPU and 5.0 V peripheral devices.

Applications:

Mixed Mode Dual Supply Interface Solutions

The LVX4245 is designed to solve 3.0 V / 5.0 V interfaces when CMOS devices cannot tolerate I/O levels above their applied V_{CC} . If an I/O pin of a 3.0 V device is driven by a 5.0 V device, the P-Channel transistor in the 3.0 V device will conduct – causing current flow from the I/O bus to the 3.0 V power supply. The result may be destruction of the 3.0 V device through latchup effects. A current limiting resistor may be used to prevent destruction, but it causes speed degradation and needless power dissipation.

A better solution is provided in the LVX4245. It provides two different output levels that easily handle the dual voltage interface. The A port is a dedicated 5.0 V port; the B port is a dedicated 3.0 V port.

Since the LVX4245 is a '245 transceiver, the user may either use it for bidirectional or unidirectional applications. The center 20 pins are configured to match a '245 pinout. This enables the user to easily replace this level shifter with a 3.0 V '245 device without additional layout work or re-manufacture of the circuit board (when both buses are 3.0 V).

Figure 3. 3.3V/5V Interface Block Diagram

Powering Up the LVX4245

When powering up the LVX4245, please note that if the V_{CCB} pin is powered-up well in advance of the V_{CCA} pin, several milliamps of either I_{CCA} or I_{CCB} current will result. If the V_{CCA} pin is powered-up in advance of the V_{CCB} pin then only nanoamps of I_{CC} current will result. In actuality the V_{CCB} can be powered “slightly” before the V_{CCA} without the current penalty, but this “setup time” is dependent on the power-up ramp rate of the V_{CC} pins. With a ramp rate of approximately 50 mV/ns (50V/ μ s) a 25 ns setup time was observed (V_{CCB} before V_{CCA}). With a 7.0 V/ μ s rate, the setup time was about 140ns. When all is said and done, the safest powerup strategy is to simply power V_{CCA} before V_{CCB} . One more note: if the V_{CCB} ramp rate is faster than the V_{CCA} ramp rate then power problems might still occur, even if the V_{CCA} powerup began prior to the V_{CCB} powerup.
