

MC9S08PA16

MC9S08PA16 Series Data Sheet

Supports: MC9S08PA16(A) and MC9S08PA8(A)

Key features

- 8-Bit S08 central processor unit (CPU)
 - Up to 20 MHz bus at 2.7 V to 5.5 V across operating temperature range of -40 °C to 105 °C for V part and -40 °C to 125 °C for M part.
 - Supporting up to 40 interrupt/reset sources
 - Supporting up to four-level nested interrupt
 - On-chip memory
 - Up to 16 KB flash read/program/erase over full operating voltage and temperature
 - Up to 256 byte EEPROM; 2-byte erase sector; program and erase while executing flash
 - Up to 2048 byte random-access memory (RAM)
 - Flash and RAM access protection
- Power-saving modes
 - One low-power stop mode; reduced power wait mode
 - Peripheral clock enable register can disable clocks to unused modules, reducing currents; allows clocks to remain enabled to specific peripherals in stop3 mode
- Clocks
 - Oscillator (XOSC) - loop-controlled Pierce oscillator; crystal or ceramic resonator range of 31.25 kHz to 39.0625 kHz or 4 MHz to 20 MHz
 - Internal clock source (ICS) - containing a frequency-locked-loop (FLL) controlled by internal or external reference; precision trimming of internal reference allowing 1% deviation across temperature range of 0 °C to 70 °C and 2% deviation across the whole operating temperature; up to 20 MHz
- System protection
 - Watchdog with independent clock source
 - Low-voltage detection with reset or interrupt; selectable trip points
 - Illegal opcode detection with reset
 - Illegal address detection with reset

MC9S08PA16A and MC9S08PA8A are recommended for new design

- Development support
 - Single-wire background debug interface
 - Breakpoint capability to allow three breakpoints setting during in-circuit debugging
 - On-chip in-circuit emulator (ICE) debug module containing two comparators and nine trigger modes
- Peripherals
 - ACMP - one analog comparator with both positive and negative inputs; separately selectable interrupt on rising and falling comparator output; filtering
 - ADC - 12-channel, 12-bit resolution; 2.5 μs conversion time; data buffers with optional watermark; automatic compare function; internal bandgap reference channel; operation in stop mode; optional hardware trigger
 - CRC - programmable cyclic redundancy check module
 - FTM - two flex timer modulators modules including one 6-channel and one 2-channel ones; 16-bit counter; each channel can be configured for input capture, output compare, edge- or center-aligned PWM mode
 - IIC - One inter-integrated circuit module; up to 400 kbps; multi-master operation; programmable slave address; supporting broadcast mode and 10-bit addressing; supporting SMBUS and PMBUS
 - MTIM - One modulo timer with 8-bit prescaler and overflow interrupt
 - RTC - 16-bit real timer counter (RTC)
 - SCI - two serial communication interface (SCI/UART) modules optional 13-bit break; full duplex non-return to zero (NRZ); LIN extension support
 - SPI - one 8-bit serial peripheral interface (SPI) modules; full-duplex or single-wire bidirectional; master or slave mode

- Input/Output
 - Up to 37 GPIOs including one output-only pin
 - One 8-bit keyboard interrupt module (KBI)
 - Two true open-drain output pins
 - Four, ultra-high current sink pins supporting 20 mA source/sink current
- Package options
 - 44-pin LQFP
 - 32-pin LQFP
 - 20-pin SOIC; 20-pin TSSOP
 - 16-pin TSSOP

1 MCU block diagram

The block diagram below shows the structure of the MCUs.

1. PTA2 and PTA3 operate as true-open drain when working as output.
2. PTA4/ACMP0/BKGD/MS is an output-only pin when used as port pin.
3. PTD0, PTD1, PTB4 and PTB5 can provide high sink/source current drive.
4. The secondary power pair of V_{DD} and V_{SS} (pin 11, 27 and 28 in 44-pin package) are not bonded in 32-pin, 20-pin or 16-pin packages.

3 Part identification

3.1 Description

Part numbers for the chip have fields that identify the specific part. You can use the values of these fields to determine the specific part you have received.

3.2 Format

Part numbers for this device have the following format:

MC 9 S08 PA AA (V) B CC

3.3 Fields

This table lists the possible values for each field in the part number (not all combinations are valid):

| Field | Description | Values |
|-------|----------------------------------|--|
| MC | Qualification status | <ul style="list-style-type: none"> MC = fully qualified, general market flow |
| 9 | Memory | <ul style="list-style-type: none"> 9 = flash based |
| S08 | Core | <ul style="list-style-type: none"> S08 = 8-bit CPU |
| PA | Device family | <ul style="list-style-type: none"> PA |
| AA | Approximate flash size in KB | <ul style="list-style-type: none"> 16 = 16 KB 8 = 8 KB |
| (V) | Mask set version | <ul style="list-style-type: none"> (blank) = Any version A = Rev. 2 or later version, this is recommended for new design |
| B | Operating temperature range (°C) | <ul style="list-style-type: none"> M = -40 to 125 V = -40 to 105 |
| CC | Package designator | <ul style="list-style-type: none"> LD = 44-LQFP LC = 32-LQFP TJ = 20-TSSOP WJ = 20-SOIC TG = 16-TSSOP |

3.4 Example

This is an example part number:

MC9S08PA16AVLD

4 Parameter Classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding, the following classification is used and the parameters are tagged accordingly in the tables where appropriate:

Table 2. Parameter Classifications

| | |
|---|--|
| P | Those parameters are guaranteed during production testing on each individual device. |
| C | Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations. |
| T | Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category. |
| D | Those parameters are derived mainly from simulations. |

NOTE

The classification is shown in the column labeled “C” in the parameter tables where appropriate.

5 Ratings

5.1 Thermal handling ratings

| Symbol | Description | Min. | Max. | Unit | Notes |
|------------------|-------------------------------|------|------|------|-------|
| T _{STG} | Storage temperature | -55 | 150 | °C | 1 |
| T _{SDR} | Solder temperature, lead-free | — | 260 | °C | 2 |

1. Determined according to JEDEC Standard JESD22-A103, *High Temperature Storage Life*.
2. Determined according to IPC/JEDEC Standard J-STD-020, *Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices*.

5.2 Moisture handling ratings

| Symbol | Description | Min. | Max. | Unit | Notes |
|--------|----------------------------|------|------|------|-------|
| MSL | Moisture sensitivity level | — | 3 | — | 1 |

1. Determined according to IPC/JEDEC Standard J-STD-020, *Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices*.

5.3 ESD handling ratings

| Symbol | Description | Min. | Max. | Unit | Notes |
|-----------|--|-------|-------|------|-------|
| V_{HBM} | Electrostatic discharge voltage, human body model | -6000 | +6000 | V | 1 |
| V_{CDM} | Electrostatic discharge voltage, charged-device model | -500 | +500 | V | 2 |
| I_{LAT} | Latch-up current at ambient temperature of 105 °C for V part and 125 °C for M part | -100 | +100 | mA | |

1. Determined according to JEDEC Standard JESD22-A114, *Electrostatic Discharge (ESD) Sensitivity Testing Human Body Model (HBM)*.
2. Determined according to JEDEC Standard JESD22-C101, *Field-Induced Charged-Device Model Test Method for Electrostatic-Discharge-Withstand Thresholds of Microelectronic Components*.

5.4 Voltage and current operating ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in below table may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this document.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either V_{SS} or V_{DD}) or the programmable pullup resistor associated with the pin is enabled.

| Symbol | Description | Min. | Max. | Unit |
|-----------|---|----------------|----------------|------|
| V_{DD} | Supply voltage | -0.3 | 6.0 | V |
| I_{DD} | Maximum current into V_{DD} | — | 120 | mA |
| V_{DIO} | Digital input voltage (except \overline{RESET} , EXTAL, XTAL, or true open drain pin PTA2 and PTA3) | -0.3 | $V_{DD} + 0.3$ | V |
| | Digital input voltage (true open drain pin PTA2 and PTA3) | -0.3 | 6 | V |
| V_{AIO} | Analog ¹ , \overline{RESET} , EXTAL, and XTAL input voltage | -0.3 | $V_{DD} + 0.3$ | V |
| I_D | Instantaneous maximum current single pin limit (applies to all port pins) | -25 | 25 | mA |
| V_{DDA} | Analog supply voltage | $V_{DD} - 0.3$ | $V_{DD} + 0.3$ | V |

1. All digital I/O pins, except open-drain pin PTA2 and PTA3, are internally clamped to V_{SS} and V_{DD} . PTA2 and PTA3 is only clamped to V_{SS} .

6 General

6.1 Nonswitching electrical specifications

6.1.1 DC characteristics

This section includes information about power supply requirements and I/O pin characteristics.

| C _{in} | C | Input capacitance, all pins | | | — | — | 7 | pF |
| V _{RAM} | C | RAM retention voltage | | | — | — | — | V |

1. Typical values are measured at 25 °C. Characterized, not tested.
2. Only PTB4, PTB5, PTD0, PTD1 support ultra high current output.
3. The specified resistor value is the actual value internal to the device. The pullup value may appear higher when measured externally on the pin.
4. All functional non-supply pins, except for , are internally clamped to V_{SS} and V_{DD}.
5. Input must be current-limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the large one.
6. Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If the positive injection current (V_{in} > V_{DD}) is higher than I_{DD}, the injection current may flow out of V_{DD} and could result in external power supply going out of regulation. Ensure that external V_{DD} load will shunt current higher than maximum injection current when the MCU is not consuming power, such as no system clock is present, or clock rate is very low (which would reduce overall power consumption).

1. Data in Typical column was characterized at 5.0 V, 25 °C or is typical recommended value.
2. RTC adder cause <1 μA I_{DD} increase typically, RTC clock source is 1kHz LPO clock.
3. ACMP adder cause <10 μA I_{DD} increase typically.
4. LVD is periodically woken up from stop3 by 5% duty cycle. The period is equal to or less than 2 ms.

6.1.3 EMC performance

Electromagnetic compatibility (EMC) performance is highly dependent on the environment in which the MCU resides. Board design and layout, circuit topology choices, location and characteristics of external components as well as MCU software operation all play a significant role in EMC performance. The system designer should consult NXP applications notes such as [AN2321](#), [AN1050](#), [AN1263](#), [AN2764](#), and [AN1259](#) for advice and guidance specifically targeted at optimizing EMC performance.

6.1.3.1 EMC radiated emissions operating behaviors

Table 6. EMC radiated emissions operating behaviors for 44-pin LQFP package

| Symbol | Description | Frequency band (MHz) | Typ. | Unit | Notes |
|---------------------|------------------------------------|----------------------|------|------------|-------|
| V _{RE1} | Radiated emissions voltage, band 1 | 0.15–50 | 8 | dB μ V | 1, 2 |
| V _{RE2} | Radiated emissions voltage, band 2 | 50–150 | 8 | dB μ V | |
| V _{RE3} | Radiated emissions voltage, band 3 | 150–500 | 8 | dB μ V | |

| V _{RE_IEC} | IEC level | 0.15–1000 | N | — | 2, 3 |

1. Determined according to IEC Standard 61967-1, *Integrated Circuits - Measurement of Electromagnetic Emissions, 150 kHz to 1 GHz Part 1: General Conditions and Definitions* and IEC Standard 61967-2, *Integrated Circuits - Measurement of Electromagnetic Emissions, 150 kHz to 1 GHz Part 2: Measurement of Radiated Emissions—TEM Cell and Wideband TEM Cell Method*. Measurements were made while the microcontroller was running basic application code. The reported emission level is the value of the maximum measured emission, rounded up to the next whole number, from among the measured orientations in each frequency range.
2. V_{DD} = 5.0 V, T_A = 25 °C, f_{OSC} = 10 MHz (crystal), f_{SYS} = 20 MHz, f_{BUS} = 20 MHz
3. Specified according to Annex D of IEC Standard 61967-2, *Measurement of Radiated Emissions—TEM Cell and Wideband TEM Cell Method*

1. Typical values are based on characterization data at $V_{DD} = 5.0\text{ V}$, $25\text{ }^\circ\text{C}$ unless otherwise stated.
2. This is the shortest pulse that is guaranteed to be recognized as a reset pin request.
3. To enter BDM mode following a POR, BKGD/MS must be held low during the powerup and for a hold time of t_{MSH} after V_{DD} rises above V_{LVD} .
4. This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized. In stop mode, the synchronizer is bypassed so shorter pulses can be recognized.
5. Timing is shown with respect to 20% V_{DD} and 80% V_{DD} levels, across operating temperature range.

6.3 Thermal specifications

6.3.1 Thermal characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and voltage regulator circuits, and it is user-determined rather than being controlled by the MCU design. To take $P_{I/O}$ into account in power calculations, determine the difference between actual pin voltage and V_{SS} or V_{DD} and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and V_{SS} or V_{DD} will be very small.

Table 10. Thermal characteristics

| Rating | Symbol | Value | Unit |
|--|-----------------|--|------|
| Operating temperature range (packaged) | T_A^1 | T_L to T_H <ul style="list-style-type: none"> -40 to 125 for M part -40 to 105 for V part | °C |
| Junction temperature range | T_J | <ul style="list-style-type: none"> -40 to 135 for M part -40 to 125 for V part | °C |
| Thermal resistance single-layer board | | | |
| 44-pin LQFP | $R_{\theta JA}$ | 76 | °C/W |
| 32-pin LQFP | $R_{\theta JA}$ | 88 | °C/W |
| 20-pin SOIC | $R_{\theta JA}$ | 82 | °C/W |
| 20-pin TSSOP | $R_{\theta JA}$ | 116 | °C/W |
| 16-pin TSSOP | $R_{\theta JA}$ | 130 | °C/W |
| Thermal resistance four-layer board | | | |
| 44-pin LQFP | $R_{\theta JA}$ | 54 | °C/W |
| 32-pin LQFP | $R_{\theta JA}$ | 59 | °C/W |
| 20-pin SOIC | $R_{\theta JA}$ | 54 | °C/W |
| 20-pin TSSOP | $R_{\theta JA}$ | 76 | °C/W |
| 16-pin TSSOP | $R_{\theta JA}$ | 87 | °C/W |

1. Maximum T_A can be exceeded only if the user ensures that T_J does not exceed the maximum. The simplest method to determine T_J is: $T_J = T_A + R_{\theta JA} \times \text{chip power dissipation}$.

| 13 | C | Long term jitter of DCO output clock (averaged over 2 ms interval) ⁸ | | C_{Jitter} | — | 0.02 | 0.2 | % f_{dco} |

1. Data in Typical column was characterized at 5.0 V, 25 °C or is typical recommended value.
2. When ICS is configured for FEE or FBE mode, input clock source must be divisible using RDIV to within the range of 31.25 kHz to 39.0625 kHz.
3. See crystal or resonator manufacturer's recommendation.
4. Load capacitors (C_1, C_2), feedback resistor (R_F) and series resistor (R_S) are incorporated internally when RANGE = HGO = 0.
5. This parameter is characterized and not tested on each device.
6. Proper PC board layout procedures must be followed to achieve specifications.
7. This specification applies to any time the FLL reference source or reference divider is changed, trim value changed, or changing from FLL disabled (FBELP, FBILP) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.
8. Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum f_{Bus} . Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry via V_{DD} and V_{SS} and variation in crystal oscillator frequency increase the C_{Jitter} percentage for a given interval.

All timing parameters are a function of the bus clock frequency, F_{NVMBUS} . All program and erase times are also a function of the NVM operating frequency, f_{NVMOP} .

Each command timing is given by:

$$t_{\text{command}} = f_{\text{NVMOP}} \text{ cycle} \times 1/f_{\text{NVMOP}} + f_{\text{NVMBUS}} \text{ cycle} \times 1/f_{\text{NVMBUS}}$$

7.4 Communication interfaces

7.4.1 SPI switching specifications

The serial peripheral interface (SPI) provides a synchronous serial bus with master and slave operations. Many of the transfer attributes are programmable. The following tables provide timing characteristics for classic SPI timing modes. Refer to the SPI chapter of the chip's reference manual for information about the modified transfer formats used for communicating with slower peripheral devices. All timing is shown with respect to 20% V_{DD} and 70% V_{DD} , unless noted, and 100 pF load on all SPI pins. All timing assumes high drive strength is enabled for SPI output pins.

8 Dimensions

8.1 Obtaining package dimensions

Package dimensions are provided in package drawings.

To find a package drawing, go to nxp.com and perform a keyword search for the drawing's document number:

| If you want the drawing for this package | Then use this document number |
|--|-------------------------------|
| 16-pin TSSOP | 98ASH70247A |
| 20-pin SOIC | 98ASB42343B |
| 20-pin TSSOP | 98ASH70169A |
| 32-pin LQFP | 98ASH70029A |
| 44-pin LQFP | 98ASS23225W |

9 Pinout

9.1 Signal multiplexing and pin assignments

The following table shows the signals available on each pin and the locations of these pins on the devices supported by this document. The Port Control Module is responsible for selecting which ALT functionality is available on each pin.

1. This is a high current drive pin when operated as output.
2. This is a true open-drain pin when operated as output.

Note

When an alternative function is first enabled, it is possible to get a spurious edge to the module. User software must clear any associated flags before interrupts are enabled. The table above illustrates the priority if multiple modules are enabled. The highest priority module will have control over the pin. Selecting a higher priority pin function with a lower priority function

already enabled can cause spurious edges to the lower priority module. Disable all modules that share a pin before enabling another module.

9.2 Device pin assignment

Pins in **bold** are not available on less pin-count packages.

10 Revision history

The following table provides a revision history for this document.

Table 20. Revision history

| Rev. No. | Date | Substantial Changes |
|----------|---------|---|
| 1 | 10/2012 | Initial public release |
| 2 | 09/2014 | <ul style="list-style-type: none"> • Updated V_{OH} and V_{OL} in DC characteristics • Updated footnote on the $S3I_{DD}$ in Supply current characteristics • Added EMC radiated emissions operating behaviors • Updated the typical of f_{int_t} to 31.25 kHz and updated footnote to $t_{Acquire}$ in External oscillator (XOSC) and ICS characteristics • Updated the assumption for all the timing values in SPI switching specifications • Updated the rating descriptions for t_{Rise} and t_{Fall} in Control timing • Updated the part number format to add new field for new part numbers in Fields |
| 3 | 06/2015 | <ul style="list-style-type: none"> • Corrected the Min. of the t_{extrst} in Control timing • Updated Thermal characteristics to add footnote to the T_A and removed redundant information. Updated the symbol of θ_{JA} to $R_{\theta JA}$. |
| 4 | 03/2020 | <ul style="list-style-type: none"> • Added MCU block diagram. • Added new parts of MC9S08PA16AMTJ, MC9S08PA16AMTG and MC9S08PA8AMTG and updated related information in the whole book. • Added new section of Orderable part numbers • Updated T_j in the Thermal characteristics. • Updated flash characteristics in the NVM specifications • Updated $S3I_{DD}$ values in the Supply current characteristics |
