## MC9S08SE8 Series

**Covers: MC9S08SE8  
MC9S08SE4**

### Features:

- 8-Bit HCS08 Central Processor Unit (CPU)
  - 20 MHz HCS08 CPU (central processor unit)
  - 10 MHz internal bus frequency
  - HC08 instruction set with added BGND
  - Support for up to 32 interrupt/reset sources
- On-Chip Memory
  - Up to 8 KB of on-chip in-circuit programmable flash memory with block protection and security options
  - Up to 512 bytes of on-chip RAM
- Power-Saving Modes
  - Wait plus two stops
- Clock Source Options
  - Oscillator (XOSC) — Loop-control Pierce oscillator; crystal or ceramic resonator range of 31.25 kHz to 38.4 kHz or 1 MHz to 16 MHz
  - Internal Clock Source (ICS) — Internal clock source module containing a frequency-locked-loop (FLL) controlled by internal or external reference; precision trimming of internal reference allows 0.2% resolution and 2% deviation over temperature and voltage; supports bus frequencies from 1 MHz to 10 MHz.
- System Protection
  - Optional computer operating properly (COP) reset with option to run from independent 1 kHz internal clock source or the bus clock
  - Low voltage detection
  - Illegal opcode detection with reset
  - Illegal address detection with reset
- Development Support
  - Single-wire background debug interface
  - Breakpoint capability to allow single breakpoint setting during in-circuit debugging
- Peripherals
  - **SCI** — Full duplex non-return to zero (NRZ); LIN master extended break generation; LIN slave extended break detection; wakeup on active edge
  - **ADC** — 10-channel, 10-bit resolution; 2.5  $\mu$ s conversion time; automatic compare function; 1.7 mV/ $^{\circ}$ C temperature sensor; internal bandgap reference channel; runs in stop3
  - **TPMx** — One 2-channel (TPM1) and one 1-channel (TPM2) 16-bit timer/pulse-width modulator (TPM) modules; selectable input capture, output compare, and edge-aligned PWM capability on each channel; timer module may be configured for buffered, centered PWM (CPWM) on all channels
  - **KBI** — 8-pin keyboard interrupt module
  - **RTC** — Real-time counter with binary- or decimal-based prescaler
- Input/Output
  - Software selectable pullups on ports when used as inputs
  - Software selectable slew rate control on ports when used as outputs
  - Software selectable drive strength on ports when used as outputs
  - Master reset pin and power-on reset (POR)
  - Internal pullup on  $\overline{\text{RESET}}$ , IRQ, and BKGD/MS pins to reduce customer system cost
- Package Options
  - 28-pin PDIP
  - 28-pin SOIC
  - 16-pin TSSOP

Contains extensive product information including modes of operation, memory, resets and interrupts, register definition, port pins, CPU, and all module information.

# 1 MCU Block Diagram

The block diagram, [Figure 1](#), shows the structure of the MC9S08SE8 series MCUs.

Notes:

When PTA4 is configured as BKGD, pin is bi-directional.

For the 16-pin package: V<sub>SSA</sub>/V<sub>REFL</sub> and V<sub>DDA</sub>/V<sub>REFH</sub> are double bonded to V<sub>SS</sub> and V<sub>DD</sub> respectively.

## 3 Electrical Characteristics

This chapter contains electrical and timing specifications.

### 3.1 Parameter Classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding, the following classification is used and the parameters are tagged accordingly in the tables where appropriate:

**Table 2. Parameter Classifications**

P	Those parameters are guaranteed during production testing on each individual device.
C	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
T	Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category.
D	Those parameters are derived mainly from simulations.

#### NOTE

The classification is shown in the column labeled “C” in the parameter tables where appropriate.

### 3.2 Absolute Maximum Ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in [Table 3](#) may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this section.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either  $V_{SS}$  or  $V_{DD}$ ) or the programmable pull-up resistor associated with the pin is enabled.

**Table 3. Absolute Maximum Ratings**

Rating	Symbol	Value	Unit
Supply voltage	$V_{DD}$	-0.3 to 5.8	V
Maximum current into $V_{DD}$	$I_{DD}$	120	mA
Digital input voltage	$V_{In}$	-0.3 to $V_{DD} + 0.3$	V
Instantaneous maximum current Single pin limit (applies to all port pins) <sup>1, 2, 3</sup>	$I_D$	±25	mA
Storage temperature range	$T_{stg}$	-55 to 150	°C

- <sup>1</sup> Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive ( $V_{DD}$ ) and negative ( $V_{SS}$ ) clamp voltages, then use the larger of the two resistance values.
- <sup>2</sup> All functional non-supply pins are internally clamped to  $V_{SS}$  and  $V_{DD}$ .
- <sup>3</sup> Power supply must maintain regulation within operating  $V_{DD}$  range during instantaneous and operating maximum current conditions. If positive injection current ( $V_{In} > V_{DD}$ ) is greater than  $I_{DD}$ , the injection current may flow out of  $V_{DD}$  and could result in external power supply going out of regulation. Ensure external  $V_{DD}$  load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if the clock rate is very low (which would reduce overall power consumption).

### 3.3 Thermal Characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and voltage regulator circuits, and it is user-determined rather than being controlled by the MCU design. To take  $P_{I/O}$  into account in power calculations, determine the difference between actual pin voltage and  $V_{SS}$  or  $V_{DD}$  and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and  $V_{SS}$  or  $V_{DD}$  will be very small.

**Table 4. Thermal Characteristics**

Rating	Symbol	Value	Unit	
Operating temperature range (packaged)	$T_A$	$T_L$ to $T_H$	°C	
C		-40 to 85		
V		-40 to 105		
M		-40 to 125		
Maximum junction temperature	$T_{JM}$	135	°C	
Thermal resistance single-layer board	$\theta_{JA}$	28-pin SOIC	70	°C/W
		28-pin PDIP	68	
		16-pin TSSOP	129	
Thermal resistance four-layer board		28-pin SOIC	48	°C/W
		28-pin PDIP	49	
		16-pin TSSOP	85	

## Electrical Characteristics

The average chip-junction temperature ( $T_J$ ) in °C can be obtained from:

$$T_J = T_A + (P_D \times \theta_{JA}) \quad \text{Eqn. 1}$$

Where:

$T_A$  = Ambient temperature, °C

$\theta_{JA}$  = Package thermal resistance, junction-to-ambient, °C/W

$P_D = P_{int} + P_{I/O}$

$P_{int} = I_{DD} \times V_{DD}$ , Watts — chip internal power

$P_{I/O}$  = Power dissipation on input and output pins — user-determined

For most applications,  $P_{I/O} \ll P_{int}$  and can be neglected. An approximate relationship between  $P_D$  and  $T_J$  (if  $P_{I/O}$  is neglected) is:

$$P_D = K \div (T_J + 273^\circ\text{C}) \quad \text{Eqn. 2}$$

Solving [Equation 1](#) and [Equation 2](#) for K gives:

$$K = P_D \times (T_A + 273^\circ\text{C}) + \theta_{JA} \times (P_D)^2 \quad \text{Eqn. 3}$$

Where K is a constant pertaining to the particular part. K can be determined from [Equation 3](#) by measuring  $P_D$  (at equilibrium) for a known  $T_A$ . Using this value of K, the values of  $P_D$  and  $T_J$  can be obtained by solving [Equation 1](#) and [Equation 2](#) iteratively for any value of  $T_A$ .

### 3.4 ESD Protection and Latch-Up Immunity

Although damage from electrostatic discharge (ESD) is much less common on these devices than on early CMOS circuits, normal handling precautions should be used to avoid exposure to static discharge. Qualification tests are performed to ensure that these devices can withstand exposure to reasonable levels of static without suffering any permanent damage.

During the device qualification ESD stresses were performed for the human body model (HBM), the machine model (MM) and the charge device model (CDM).

A device is defined as a failure if after exposure to ESD pulses the device no longer meets the device specification. Complete DC parametric and functional testing is performed per the applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

**Table 5. ESD and Latch-up Test Conditions**

5	D	DCO output frequency <sup>2</sup> Reference = 32768 Hz and DMX32 = 1	$f_{dco\_DMX32}$	—	59.77	—	MHz
6	C	Resolution of trimmed DCO output frequency at fixed voltage and temperature (using FTRIM)	$\Delta f_{dco\_res\_t}$	—	±0.1	±0.2	% $f_{dco}$
7	C	Resolution of trimmed DCO output frequency at fixed voltage and temperature (not using FTRIM)	$\Delta f_{dco\_res\_t}$	—	± 0.2	± 0.4	% $f_{dco}$
8	C	Total deviation of DCO output from trimmed frequency <sup>3</sup> Over full voltage and temperature range Over fixed voltage and temperature range of 0 to 70 °C	$\Delta f_{dco\_t}$	—	-1.0 to 0.5 ±0.5	± 2 ± 1	% $f_{dco}$
10	C	FLL acquisition time <sup>4</sup>	$t_{Acquire}$	—	—	1	ms
11	C	Long term jitter of DCO output clock (averaged over 2-ms interval) <sup>5</sup>	$C_{Jitter}$	—	0.02	0.2	% $f_{dco}$

<sup>1</sup> Data in Typical column was characterized at 3.0 V, 25 °C or is typical recommended value.

<sup>2</sup> The resulting bus clock frequency should not exceed the maximum specified bus clock frequency of the device.

<sup>3</sup> This parameter is characterized and not tested on each device.

<sup>4</sup> This specification applies to any time the FLL reference source or reference divider is changed, trim value changed or changing from FLL disabled (FBELP, FBILP) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

<sup>5</sup> Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum  $f_{BUS}$ . Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry via  $V_{DD}$  and  $V_{SS}$  and variation in crystal oscillator frequency increase the  $C_{Jitter}$  percentage for a given interval.

## 3.10 AC Characteristics

This section describes ac timing characteristics for each peripheral system.

### 3.10.1 Control Timing

Table 13. Control Timing

Num	C	Rating	Symbol	Min	Typical <sup>1</sup>	Max	Unit
1	D	Bus frequency ( $t_{cyc} = 1/f_{Bus}$ )	$f_{Bus}$	DC	—	10	MHz
2	D	Internal low power oscillator period	$t_{LPO}$	700	—	1300	$\mu s$
3	D	External reset pulse width <sup>2</sup>	$t_{extrst}$	100	—	—	ns
4	D	Reset low drive <sup>3</sup>	$t_{rstdrv}$	$34 \times t_{cyc}$	—	—	ns
5	D	BKGD/MS setup time after issuing background debug force reset to enter user or BDM modes	$t_{MSSU}$	500	—	—	ns
6	D	BKGD/MS hold time after issuing background debug force reset to enter user or BDM modes <sup>4</sup>	$t_{MSH}$	100	—	—	$\mu s$
7	D	IRQ pulse width Asynchronous path <sup>2</sup> Synchronous path <sup>5</sup>	$t_{LIH}, t_{HIL}$	100 $1.5 \times t_{cyc}$	—	—	ns
8	D	Pin interrupt pulse width Asynchronous path <sup>2</sup> Synchronous path <sup>5</sup>	$t_{LIH}, t_{HIL}$	100 $1.5 \times t_{cyc}$	—	—	ns
9	C	Port rise and fall time — Low output drive (PTxDS = 0) (load = 50 pF) <sup>6</sup> Slew rate control disabled (PTxSE = 0) Slew rate control enabled (PTxSE = 1)	$t_{Rise}, t_{Fall}$	—	40 75	—	ns
		Port rise and fall time — High output drive (PTxDS = 1) (load = 50 pF) Slew rate control disabled (PTxSE = 0) Slew rate control enabled (PTxSE = 1)	$t_{Rise}, t_{Fall}$	—	11 35	—	ns

<sup>1</sup> Typical values are based on characterization data at  $V_{DD} = 5.0$  V, 25 °C unless otherwise stated.

<sup>2</sup> This is the shortest pulse that is guaranteed to be recognized as a reset pin request. Shorter pulses are not guaranteed to override reset requests from internal sources.

<sup>3</sup> When any reset is initiated, internal circuitry drives the reset pin (if enabled, RSTPE = 1) low for about 34 cycles of  $t_{cyc}$ .

<sup>4</sup> To enter BDM mode following a POR, BKGD/MS should be held low during the power-up and for a hold time of  $t_{MSH}$  after  $V_{DD}$  rises above  $V_{LVD}$ .

<sup>5</sup> This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized. In stop mode, the synchronizer is bypassed so shorter pulses can be recognized in that case.

<sup>6</sup> Timing is shown with respect to 20%  $V_{DD}$  and 80%  $V_{DD}$  levels. Temperature range –40 °C to 125 °C.

Figure 19. Reset Timing

Figure 20. IRQ/Pin Interrupt Timing

### 3.10.2 TPM/MTIM Module Timing

Synchronizer circuits determine the shortest input pulses that can be recognized or the fastest clock that can be used as the optional external source to the timer counter. These synchronizers operate from the current bus rate clock.

Table 14. TPM Input Timing

Num	C	Rating	Symbol	Min	Max	Unit
1	D	External clock frequency	$f_{TPMext}$	DC	$f_{Bus}/4$	MHz
2	D	External clock period	$t_{TPMext}$	4	—	$t_{cyc}$
3	D	External clock high time	$t_{clkh}$	1.5	—	$t_{cyc}$
4	D	External clock low time	$t_{clkl}$	1.5	—	$t_{cyc}$
5	D	Input capture pulse width	$t_{ICPW}$	1.5	—	$t_{cyc}$

## 3.11 Flash Specifications

This section provides details about program/erase times and program-erase endurance for the flash memory.

Program and erase operations do not require any special power sources other than the normal  $V_{DD}$  supply. For more detailed information about program/erase operations, see the Memory section in the reference manual.

**Table 15. Flash Characteristics**

Num	C	Characteristic	Symbol	Min	Typical	Max	Unit
1	D	Supply voltage for program/erase	$V_{\text{prog/erase}}$	2.7	—	5.5	V
2	D	Supply voltage for read operation	$V_{\text{Read}}$	2.7	—	5.5	V
3	D	Internal FCLK frequency <sup>1</sup>	$f_{\text{FCLK}}$	150	—	200	kHz
4	D	Internal FCLK period (1/FCLK)	$t_{\text{Fcyc}}$	5	—	6.67	$\mu\text{s}$
5	P	Byte program time (random location) <sup>2</sup>	$t_{\text{prog}}$	9			$t_{\text{Fcyc}}$
6	P	Byte program time (burst mode) <sup>2</sup>	$t_{\text{Burst}}$	4			$t_{\text{Fcyc}}$
7	P	Page erase time <sup>2</sup>	$t_{\text{Page}}$	4000			$t_{\text{Fcyc}}$
8	P	Mass erase time <sup>2</sup>	$t_{\text{Mass}}$	20,000			$t_{\text{Fcyc}}$
9	C	Program/erase endurance <sup>3</sup> $T_L$ to $T_H = -40\text{ }^\circ\text{C}$ to $125\text{ }^\circ\text{C}$ $T = 25\text{ }^\circ\text{C}$	$n_{\text{FLPE}}$	10,000	— 100,000	—	cycles
10	C	Data retention <sup>4</sup>	$t_{\text{D\_ret}}$	15	100	—	years

<sup>1</sup> The frequency of this clock is controlled by a software setting.

<sup>2</sup> These values are hardware state machine controlled. User code does not need to count cycles. This information supplied for calculating approximate time to program and erase.

<sup>3</sup> **Typical endurance for flash** was evaluated for this product family on the 9S12Dx64. For additional information on how Freescale defines typical endurance, please refer to Engineering Bulletin EB619/D, *Typical Endurance for Nonvolatile Memory*.

<sup>4</sup> **Typical data retention** values are based on intrinsic capability of the technology measured at high temperature and de-rated to  $25\text{ }^\circ\text{C}$  using the Arrhenius equation. For additional information on how Freescale defines typical data retention, please refer to Engineering Bulletin EB618/D, *Typical Data Retention for Nonvolatile Memory*.
