## Multi-Standard Radio

- 2.4 GHz Bluetooth Low Energy (Bluetooth LE) version 5.0 compliant supporting up to 8 simultaneous hardware connections
- Generic FSK modulation
  - Data Rate: 250, 500 and 1000 kbps
  - Modulations: GFSK BT = 0.3, 0.5, and 0.7; FSK/MSK
  - Modulation Index: 0.32, 0.5, 0.7, and 1.0
- Typical Receiver Sensitivity (Bluetooth LE 1 Mbps) = -95 dBm
- Typical Receiver Sensitivity (250 kbps GFSK-BT=0.5, h=0.5) = -99 dBm
- Programmable Transmitter Output Power: -30 dBm to 5 dBm
- Low external component counts for low cost application
- On-chip balun with single ended bidirectional RF port

## MCU and Memories

- 256 KB program flash memory plus 256 KB FlexNVM on KW36Z
- 8 KB FlexRAM supporting EEPROM emulation on KW36Z
- 512 KB program flash memory on KW35Z
- Up to 48 MHz Arm® Cortex®-M0+ core
- On-chip 64 KB SRAM

## Low Power Consumption

- Transceiver current (DC-DC buck mode, 3.6 V supply)

## System peripherals

- Nine MCU low-power modes to provide power optimization based on application requirements
- DC-DC Converter supporting Buck and Bypass operating modes
- Direct memory access (DMA) Controller
- Computer operating properly (COP) watchdog
- Serial wire debug (SWD) Interface and Micro Trace buffer
- Bit Manipulation Engine (BME)

## Analog Modules

- 16-bit Analog-to-Digital Converter (ADC)
- 6-bit High Speed Analog Comparator (CMP)
- 1.2 V voltage reference (VREF)

## Timers

- 16-bit low-power timer (LPTMR)
- 3 Timer/PWM Modules (TPM): One 4 channel TPM and two 2 channel TPMs
- Programmable Interrupt Timer (PIT)
- Real-Time Clock (RTC)

## Communication interfaces

- 2 serial peripheral interface (SPI) modules
- 2 inter-integrated circuit (I2C) modules
- Low Power UART (LPUART) module with LIN support (2x LPUART on KW36Z)
- Carrier Modulator Timer (CMT)
- FlexCAN module (with CAN FD support up to 3.2 Mbps baudrate) on KW36Z

- Typical Rx Current: 6.3 mA
- Typical Tx current: 5.7 mA (0 dBm output)
- Low Power Mode (VLLS0) Current: 258 nA

#### Clocks

- 26 and 32 MHz supported for Bluetooth LE and Generic FSK modes
- 32.768 kHz Crystal Oscillator

#### Operating Characteristics

- Voltage range: 1.71 V to 3.6 V
- Ambient temperature range: -40 to 105 °C
- Industrial Qualification

#### Human-machine interface

- General-purpose input/output

#### Security

- AES-128 Hardware Accelerator (AESA)
- True Random Number Generator (TRNG)
- Advanced flash security on Program Flash
- 80-bit unique identification number per chip
- 40-bit unique media access control (MAC) sub-address
- LE Secure Connections

## 1 Introduction

The KW36Z/35Z wireless microcontrollers (MCU), which includes the KW36Z and KW35Z families of devices, are highly integrated single-chip devices that enable Bluetooth Low Energy (Bluetooth LE) and Generic FSK connectivity for industrial and medical/healthcare embedded systems. The target applications center on wirelessly bridging the embedded world with mobile devices to enhance the human interface experience, share embedded data between devices and the cloud and enable wireless firmware updates.

The KW36Z/35Z Wireless MCU integrates an Arm® Cortex®-M0+ CPU with up to 512 KB flash and 64 KB SRAM and a 2.4 GHz radio that supports Bluetooth LE 5.0 and Generic FSK modulations. The Bluetooth LE radio supports up to 8 simultaneous connections in any master/slave combination. The Medical Body Area Network (MBAN) frequencies from 2.36 to 2.4 GHz are also supported enabling wearable or implantable wireless medical devices.

The KW36Z includes an integrated FlexCAN module enabling seamless integration into an industrial CAN communication network, enabling communication with external control and sensor monitoring devices over Bluetooth LE. The FlexCAN module can support CAN's flexible data-rate (CAN FD) protocol for increased bandwidth and lower latency.

The KW36Z/35Z devices can be used as a "BlackBox" modem in order to add Bluetooth LE or Generic FSK connectivity to an existing host MCU or MPU (microprocessor), or may be used as a standalone smart wireless sensor with embedded application where no host controller is required.

The RF circuit of the KW36Z/35Z is optimized to require very few external components, achieving the smallest RF footprint possible on a printed circuit board. Extremely long battery life is achieved through the efficiency of code execution in the Cortex-M0+ CPU core and the multiple low power operating modes of the KW36Z/35Z. For power critical applications, an integrated DC-DC converter enables operation from a single coin cell or Li-ion battery with a significant reduction of peak receive and transmit current consumption.

## 2 Feature Descriptions

This section provides a simplified block diagram and highlights the KW36Z/35Z features.

### 2.1 Block Diagram

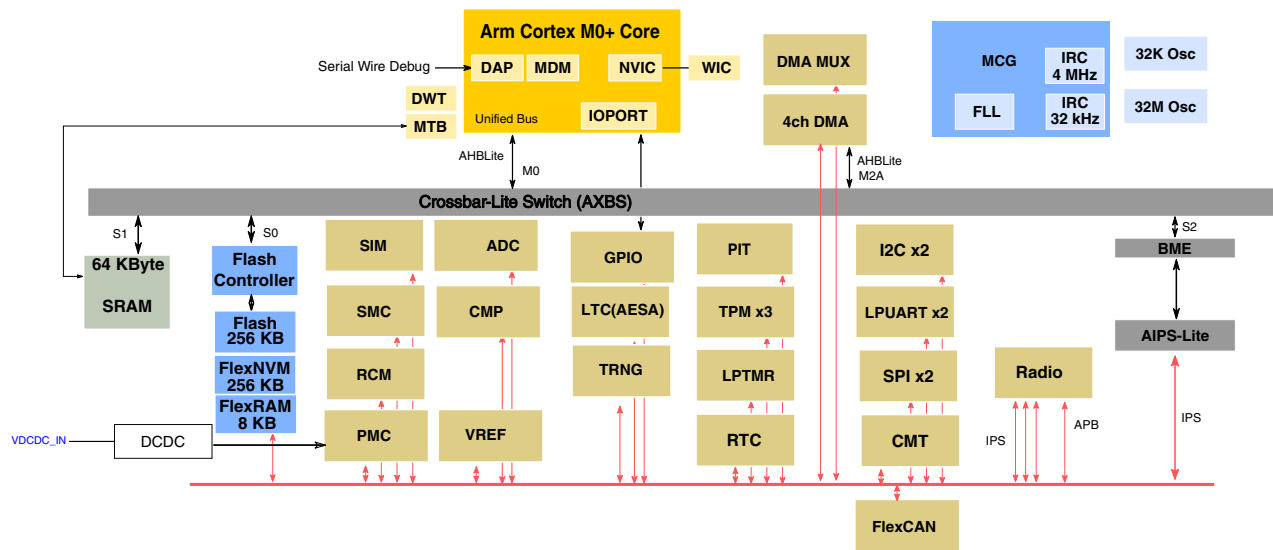

Figure 1. KW36 Detailed Block Diagram

Figure 2. KW35 Detailed Block Diagram

## 2.2 Radio features

### Operating frequencies:

- 2.4 GHz ISM band (2400-2483.5 MHz)
- Medical Body Area Network (MBAN) 2360-2400 MHz

### Supported standards:

- Bluetooth Low Energy Version 5.0 compliant radio
- Generic FSK modulation supporting data rates up to 1 Mbit/s
- Support for up to 8 simultaneous Bluetooth LE hardware connections in any master, slave combination
- Bluetooth LE Application Profiles

### Receiver performance:

- Receive sensitivity of up to  $-95$  dBm for Bluetooth LE
- Receive sensitivity of up to  $-99$  dBm for a 250 kbit/s GFSK mode with a modulation index of 0.5. Receive sensitivity in Generic FSK modes depends on mode selection and data rate.

### Other features:

- Programmable transmit output power from  $-30$  dBm to  $+5$  dBm
- 26 MHz and 32 MHz crystals supported for Bluetooth LE and Generic FSK modes
- Bluetooth Low Energy version 5.0 Link Layer hardware with 1 Mbit/s PHY support
- Hardware acceleration for Generic FSK packet processing
- Generic FSK modulation at 250, 500 and 1000 kbit/s
- Supports 8 simultaneous Bluetooth LE connections in any master/slave combination
- Enhanced Bluetooth LE automatic deep sleep modes (DSM) supporting Slave Latency
- Up to 26 devices supported by whitelist in hardware
- Up to 8 private resolvable addresses supported in hardware
- Supports DMA capture of IQ data with sampling rate of up to 2 MHz, when using a 32 MHz crystal
- Integrated on-chip balun
- Single ended bidirectional RF port shared by transmit and receive
- Low external component count
- Supports transceiver range extension using external PA and/or LNA

## 2.3 Microcontroller features

### Arm Cortex-M0+ CPU

- Up to 48 MHz CPU
- As compared to Cortex-M0, the Cortex-M0+ uses an optimized 2-stage pipeline microarchitecture for reduced power consumption and improved architectural performance (cycles per instruction)
- Supports up to 32 interrupt request sources
- Binary compatible instruction set architecture with the Cortex-M0 core
- Thumb instruction set combines high code density with 32-bit performance
- Serial Wire Debug (SWD) reduces the number of pins required for debugging
- Micro Trace Buffer (MTB) provides lightweight program trace capabilities using system RAM as the destination memory

### Nested Vectored Interrupt Controller (NVIC)

- 32 vectored interrupts, 4 programmable priority levels
- Includes a single non-maskable interrupt

### Wake-up Interrupt Controller (WIC)

- Supports interrupt handling when system clocking is disabled in low-power modes
- Takes over and emulates the NVIC behavior when correctly primed by the NVIC on entry to very-deep-sleep
- A rudimentary interrupt masking system with no prioritization logic signals for wake-up as soon as a non-masked interrupt is detected

### Debug Controller

- Two-wire Serial Wire Debug (SWD) interface
- Hardware breakpoint unit for 2 code addresses
- Hardware watchpoint unit for 2 data items
- Micro Trace Buffer for program tracing

### On-Chip Memory

- Up to 512 KB Flash
  - KW36Z contains 256 KB program flash with ECC and 256 KB FlexNVM.
  - KW35Z contains 512 KB program flash with ECC.

## Feature Descriptions

- Flash implemented as two equal blocks each of 256 KB block. Code can execute or read from one block while the other block is being erased or programmed on KW35Z only.
- Firmware distribution protection. Program flash can be marked execute-only on a per-sector (8 KB) basis to prevent firmware contents from being read by third parties.
- 64 KB SRAM
- KW36Z contains 8 KB FlexRAM.
- KW35Z contains 8 KB program acceleration RAM.
- Security circuitry to prevent unauthorized access to RAM and flash contents through the debugger

## 2.4 System features

### Power Management Control Unit (PMC)

- Programmable power saving modes
- Available wake-up from power saving modes via internal and external sources
- Integrated Power-on Reset (POR)
- Integrated Low Voltage Detect (LVD) with reset (brownout) capability
- Selectable LVD trip points
- Programmable Low Voltage Warning (LVW) interrupt capability
- Individual peripheral clocks can be gated off to reduce current consumption
- Internal Buffered bandgap reference voltage
- Factory programmed trim for bandgap and LVD
- 1 kHz Low-power Oscillator (LPO)

### DC-DC Converters

- Internal switched mode power supply supporting Buck and Bypass operating modes
- Buck operation supports external voltage sources of 2.1 V to 3.6 V
- When DC-DC is not used, the device supports an external voltage range of 1.5 V to 3.6 V (1.5 - 3.6 V on VDD\_RF1, VDD\_RF2, VDD\_RF3 and VDD\_1P5OUT\_PMCIN pins. 1.71 - 3.6 V on VDD\_0, VDD\_1, and VDDA pins)
- An external inductor is required to support the Buck mode

### Direct Memory Access (DMA) Controller

- All data movement via dual-address transfers: read from source, write to destination

- Programmable source and destination addresses and transfer size
- Support for enhanced addressing modes
- 4-channel implementation that performs complex data transfers with minimal intervention from a host processor
- Internal data buffer, used as temporary storage to support 16- and 32-byte transfers
- Connections to the crossbar switch for bus mastering the data movement
- Transfer Control Descriptor (TCD) organized to support two-deep, nested transfer operations
- 32-byte TCD stored in local memory for each channel
- An inner data transfer loop defined by a minor byte transfer count
- An outer data transfer loop defined by a major iteration count
- Channel activation via one of three methods:
  - Explicit software initiation
  - Initiation via a channel-to-channel linking mechanism for continuous transfers
  - Peripheral-paced hardware requests, one per channel
- Fixed-priority and round-robin channel arbitration
- Channel completion reported via optional interrupt requests
- One interrupt per channel, optionally asserted at completion of major iteration count
- Optional error terminations per channel and logically summed together to form one error interrupt to the interrupt controller
- Optional support for scatter/gather DMA processing
- Support for complex data structures

### **DMA Channel Multiplexer (DMA MUX)**

- 4 independently selectable DMA channel routers
- 2 periodic trigger sources available
- Each channel router can be assigned to 1 of the peripheral DMA sources

### **COP Watchdog Module**

- Independent clock source input (independent from CPU/bus clock)
- Choice between two clock sources
  - LPO oscillator
  - Bus clock

### **System Clocks**

- Both 26 MHz and 32 MHz crystal reference oscillator supported for Bluetooth LE and Generic FSK modes

## Feature Descriptions

- MCU can derive its clock either from the crystal reference oscillator or the Frequency-locked Loop (FLL)<sup>1</sup>
- 32.768 kHz crystal reference oscillator used to maintain precise Bluetooth Low Energy timing in low-power modes
- Multipurpose Clock Generator (MCG)
- Internal reference clocks — Can be used as a clock source for other on-chip peripherals
  - On-chip RC oscillator range of 31.25 kHz to 39.0625 kHz with 2% accuracy across full temperature range
  - On-chip 4 MHz oscillator with 5% accuracy across full temperature range
- Frequency-locked Loop (FLL) controlled by internal or external reference
  - 20 MHz to 48 MHz FLL output

## Unique Identifiers

- 80-bit Unique ID represents a unique identifier for each chip
- 40-bit unique Media Access Control (MAC) address, which can be used to build a unique 48-bit Bluetooth Low Energy MAC address

## 2.5 Peripheral features

### 16-bit Analog-to-Digital Converter (ADC)

- Linear successive approximation algorithm with 16-bit resolution
- Output formatted in differential-ended 16-, 13-, 11-, and 9-bit mode
- Output formatted in single-ended 16-, 12-, 10-, and 8-bit mode
- Single or continuous conversion
- Configurable sample time and conversion speed/power
- Conversion rates in 16-bit mode with no averaging up to ~500Ksamples/sec
- Input clock selection
- Operation in low-power modes for lower noise operation
- Asynchronous clock source for lower noise operation
- Selectable asynchronous hardware conversion trigger
- Automatic compare with interrupt for less-than, or greater than, or equal to programmable value
- Temperature sensor
- Battery voltage measurement
- Hardware average function
- Selectable voltage reference
- Self-calibration mode

1. Clock options can have restrictions based on the chosen SoC configuration.

### High-Speed Analog Comparator (CMP)

- 6-bit DAC programmable reference generator output
- Up to eight selectable comparator inputs; each input can be compared with any input by any polarity sequence
- Selectable interrupt on rising edge, falling edge, or either rising or falling edges of comparator output
- Two performance modes:
  - Shorter propagation delay at the expense of higher power
  - Low-power, with longer propagation delay
- Operational in all MCU power modes except VLLS0 mode

### Voltage Reference(VREF1)

- Programmable trim register with 0.5 mV steps, automatically loaded with factory trimmed value upon reset
- Programmable buffer mode selection:
  - Off
  - Bandgap enabled/standby (output buffer disabled)
  - High-power buffer mode (output buffer enabled)
- 1.2 V output at room temperature
- VREF\_OUT output signal

### Low-power Timer (LPTMR)

- One channel
- Operation as timer or pulse counter
- Selectable clock for prescaler/glitch filter
  - 1 kHz internal LPO
  - External low-power crystal oscillator
  - Internal reference clock
- Configurable glitch filter or prescaler
- Interrupt generated on timer compare
- Hardware trigger generated on timer compare
- Functional in all power modes

### Timer/PWM (TPM)

- TPM0: 4 channels, TPM1 and TPM2: 2 channels each
- Selectable source clock
- Programmable prescaler
- 16-bit counter supporting free-running or initial/final value, and counting is up or up-down
- Input capture, output compare, and edge-aligned and center-aligned PWM modes

## Feature Descriptions

- Input capture and output compare modes
- Generation of hardware triggers
- TPM1 and TPM2: Quadrature decoder with input filters
- Global time base mode shares single time base across multiple TPM instances

### Programmable Interrupt Timer (PIT)

- Up to 2 interrupt timers for triggering ADC conversions
- 32-bit counter resolution
- Clocked by bus clock frequency

### Real-Time Clock (RTC)

- 32-bit seconds counter with 32-bit alarm
  - Can be invalidated on detection of tamper detect
- 16-bit prescaler with compensation
- Register write protection
  - Hard Lock requires MCU POR to enable write access
  - Soft lock requires POR or software reset to enable write/read access
- Capable of waking up the system from low-power modes

### Inter-Integrated Circuit (I<sup>2</sup>C)

- Two channels
- Compatible with I2C bus standard and SMBus Specification Version 2 features
- Up to 400 kHz operation
- Multi-master operation
- Software programmable for one of 64 different serial clock frequencies
- Programmable slave address and glitch input filter
- Interrupt driven byte-by-byte data transfer
- Arbitration lost interrupt with automatic mode switching from master to slave
- Calling address identification interrupt
- Bus busy detection broadcast and 10-bit address extension
- Address matching causes wake-up when processor is in low-power mode

### LPUART

- One channel (2 channels on KW36Z)
- Full-duplex operation
- Standard mark/space Non-return-to-zero (NRZ) format
- 13-bit baud rate selection with fractional divide of 32
- Programmable 8-bit or 9-bit data format
- Programmable 1 or 2 stop bits

- Separately enabled transmitter and receiver
- Programmable transmitter output polarity
- Programmable receive input polarity
- 13-bit break character option
- 11-bit break character detection option
- Two receiver wake-up methods:
  - Idle line wake-up
  - Address mark wake-up
- Address match feature in receiver to reduce address mark wake-up ISR overhead
- Interrupt or DMA driven operation
- Receiver framing error detection
- Hardware parity generation and checking
- Configurable oversampling ratio to support from 1/4 to 1/32 bit-time noise detection
- Operation in low-power modes
- Hardware Flow Control RTS\CTS
- Functional in Stop/VLPS modes
- Break detect supporting LIN

### **Serial Peripheral Interface (SPI)**

- Two independent SPI channels
- Master and slave mode
- Full-duplex, three-wire synchronous transfers
- Programmable transmit bit rate
- Double-buffered transmit and receive data registers
- Serial clock phase and polarity options
- Slave select output
- Control of SPI operation during wait mode
- Selectable MSB-first or LSB-first shifting
- Support for both transmit and receive by DMA

### **Carrier Modulator Timer (CMT)**

- Four modes of operation
  - Time; with independent control of high and low times
  - Baseband
  - Frequency shift key (FSK)
  - Direct software control of CMT\_IRO signal
- Extended space operation in time, baseband, and FSK modes
- Selectable input clock divider

## Feature Descriptions

- Interrupt on end of cycle
- Ability to disable CMT\_IRO signal and use as timer interrupt

### General Purpose Input/Output (GPIO)

- Hysteresis and configurable pull up device on all input pins
- Independent pin value register to read logic level on digital pin
- All GPIO pins can generate IRQ and wake-up events
- Configurable drive strength on some output pins
- GPIO can be configured to function as a interrupt driven keyboard scanning matrix
  - In the 48-pin package there are a total of 25 digital pins
  - In the 40-pin package there are a total of 18 digital pins

### FlexCAN (for KW36Z only)

- Full implementation of the CAN with Flexible Data Rate (CAN FD) protocol specification and CAN protocol specification, Version 2.0 B
- Flexible Message Buffers (MBs); there are total 32 MBs of 8 bytes data length each, configurable as Rx or Tx, all supporting standard and extended messages
- Programmable clock source to the CAN Protocol Interface, either peripheral clock or oscillator clock
- Capability to select priority between mailboxes and Rx FIFO during matching process
- Powerful Rx FIFO ID filtering, capable of matching incoming IDs against either 128 extended, 256 standard, or 512 partial (8 bit) IDs, with up to 32 individual masking capability

## 2.6 Security Features

### Advanced Encryption Standard Accelerator(AES-128 Accelerator)

The Advanced Encryption Standard Accelerator (AESA) module is a standalone hardware coprocessor capable of accelerating the 128-bit advanced encryption standard (AES) cryptographic algorithms.

The AESA engine supports the following cryptographic features.

LTC includes the following features:

- Cryptographic authentication
  - Message Authentication Codes (MAC)

- Cipher-based MAC (AES-CMAC)
- Extended cipher block chaining message authentication code (AES-XCBC-MAC)
  - Auto padding
  - Integrity Check Value(ICV) checking
- Authenticated encryption algorithms
  - Counter with CBC-MAC (AES-CCM)
- Symmetric key block ciphers
  - AES (128-bit keys)
  - Cipher modes:
    - AES-128 modes
      - Electronic Codebook (ECB)
      - Cipher Block Chaining (CBC)
      - Counter (CTR)
- Secure scan

### **True Random Number Generator (TRNG)**

True Random Number Generator (TRNG) is a hardware accelerator module that constitutes a high-quality entropy source.

- TRNG generates a 512-bit (4x 128-bit) entropy as needed by an entropy-consuming module, such as a deterministic random number generator.
- TRNG output can be read and used by a deterministic pseudo-random number generator (PRNG) implemented in software.
- TRNG-PRNG combination achieves NIST-compliant true randomness and cryptographic-strength random numbers using the TRNG output as the entropy source.
- A fully FIPS 180 compliant solution can be realized using the TRNG together with a FIPS-compliant deterministic random number generator and the SoC-level security.

### **Flash Memory Protection**

The on-chip flash memory controller enables the following useful features:

- Program flash protection scheme prevents accidental program or erase of stored data.
- Automated, built-in, program and erase algorithms with verify.
- Read access to one program flash block is possible while programming or erasing data in the other program flash block.

## 3 Transceiver Description

- Direct Conversion Receiver (Zero IF)
- Constant Envelope Transmitter
- 2.36 GHz to 2.483 GHz PLL Range
- Low Transmit and Receive Current Consumption
- Low BOM

### 3.1 Key Specifications

KW36Z/35Z meets or exceeds all Bluetooth Low Energy version 5.0 performance specifications. The key specifications for the KW36Z/35Z are:

#### Frequency Band:

- ISM Band: 2400 to 2483.5 MHz
- MBAN Band: 2360 to 2400 MHz

#### Bluetooth Low Energy version 5.0 modulation scheme:

- Symbol rate: 1000 kbit/s
- Modulation: GFSK
- Receiver sensitivity: -95 dBm, typical
- Programmable transmitter output power: -30 dBm to +5 dBm

#### Generic FSK modulation scheme:

- Symbol rate: 250, 500 and 1000 kbit/s
- Modulation(s): GFSK (modulation index = 0.32, 0.5, 0.7 and 1.0, BT = 0.3, 0.5, and 0.7), FSK and MSK
- Receiver Sensitivity: Mode and data rate dependent. -99 dBm typical for GFSK (r=250 kbit/s, BT = 0.5, h = 0.5)

### 3.2 Channel Map Frequency Plans

### 3.2.1 Channel Plan for Bluetooth Low Energy

This section describes the frequency plan / channels associated with 2.4 GHz ISM and MBAN bands for Bluetooth Low Energy.

#### 2.4 GHz ISM Channel numbering:

- $F_c = 2402 + k * 2 \text{ MHz}$ ,  $k=0, \dots, 39$ .

#### MBAN Channel numbering:

- $F_c = 2360 + k \text{ in MHz}$ , for  $k=0, \dots, 39$

where  $k$  is the channel number.

**Table 1. 2.4 GHz ISM and MBAN frequency plan and channel designations**

2.4 GHz ISM <sup>1</sup>		MBAN <sup>2</sup>		2.4GHz ISM + MBAN

1. ISM frequency of operation spans from 2400.0 MHz to 2483.5 MHz

2. Per FCC guideline rules, Bluetooth Low Energy single mode operation is allowed in these channels.

### 3.2.2 Other Channel Plans

The RF synthesizer can be configured to use any channel frequency between 2.36 and 2.487 GHz.

## 3.3 Transceiver Functions

### Receive

The receiver architecture is Zero IF (ZIF) where the received signal after passing through RF front end is down-converted to a baseband signal. The signal is filtered and amplified before it is fed to analog-to-digital converter. The digital signal then decimates to a baseband clock frequency before it digitally processes, demodulates and passes on to packet processing/link-layer processing.

## Transmit

The transmitter transmits GFSK/FSK modulation having power and channel selection adjustment per user application. After the channel of operation is determined, coarse and fine-tuning is executed within the Frac-N PLL to engage signal lock. After signal lock is established, the modulated buffered signal is routed to a multi-stage amplifier for transmission..

## 5 System and Power Management

## 5.1 Power Management

The KW36Z/35Z includes internal power management features that can be used to control the power usage. The power management of the KW36Z/35Z includes Power Management Controller (PMC) and a DC-DC converter which can operate in a buck or bypass configuration. The PMC is designed such that the RF radio remains in state-retention while the core is in various stop modes. It makes sure that the device can stay in low current consumption mode while the RF radio can wake-up quick enough for communication.

### 5.1.1 DC-DC Converter

The features of the DC-DC converter include the following:

- Single inductor, multiple outputs.
- Buck mode (pin selectable; CFG=VDCDC\_IN).
- Continuous or pulsed operation (hardware/software configurable).
- Power switch input to allow external control of power up, and to select DC-DC bypass mode in which all the SoC power supplies (see [Table 3](#)) are externally provided.
- Output signal to indicate power stable. Purpose is for the rest of the chip to be used as a POR.
- Scaled battery output voltage suitable for SAR ADC utilization.
- Internal oscillator for support when the reference oscillator is not present.

## 5.2 Modes of Operation

The Arm Cortex-M0+ core in the KW36Z/35Z has three primary modes of operation: Run, Wait, and Stop modes. For each run mode, there is a corresponding wait and stop mode. Wait modes are similar to Arm sleep modes. Stop modes are similar to Arm deep sleep modes. The very low-power run (VLPR) operation mode can drastically reduce runtime power when the maximum bus frequency is not required to handle the application needs.

The WFI instruction invokes both wait and stop modes. The primary modes are augmented in a number of ways to provide lower power based on application needs.

## 5.2.1 Power modes

The power management controller (PMC) provides multiple power options to allow the user to optimize power consumption for the level of functionality needed.

Depending on the stop requirements of the user application, various stop modes are available that provide state retention, partial power down, or full power down of certain logic and/or memory. I/O states are held in all modes of operation. The following table compares the various power modes available.

For each run mode, there is a corresponding wait and stop mode. Wait modes are similar to Arm sleep modes. Stop modes (VLPS, STOP) are similar to Arm sleep deep mode. The very-low-power run (VLPR) operating mode can drastically reduce runtime power when the maximum bus frequency is not required to handle the application needs.

The three primary modes of operation are run, wait, and stop. The WFI instruction invokes either wait or stop depending on the SLEEPDEEP bit in Cortex-M0+ System Control Register. The primary modes are augmented in a number of ways to provide lower power based on application needs.

**Table 8. Power modes (At 25 deg C)**

Power mode	Description	CPU recovery method	Radio
Normal Run (all peripherals clock off)	Allows maximum performance of chip.	—	Radio can be active
Normal Wait - via WFI	Allows peripherals to function, while allowing CPU to go to sleep reducing power.	Interrupt	
Normal Stop - via WFI	Places chip in static state. Lowest power mode that retains all registers while maintaining LVD protection.	Interrupt	
PStop2 (Partial Stop 2)	Core and system clocks are gated. Bus clock remains active. Masters and slaves clocked by bus clock remain in Run or VLPRun mode. The clock generators in MCG and the on-chip regulator in the PMC also remain in Run or VLPRun mode.	Interrupt	
PStop1 (Partial Stop 1)	Core, system clocks, and bus clock are gated. All bus masters and slaves enter Stop mode. The clock generators in MCG and the on-chip regulator in the PMC also remain in Run or VLPRun mode.	Interrupt	
VLPR (Very Low-power Run) (all peripherals off)	Reduced frequency (1 MHz) Flash access mode, regulator in low-power mode, LVD off. Internal oscillator can provide low-power 4 MHz source for core. (Values @2 MHz core/ 1 MHz bus and flash, module off, execution from flash).  Biasing is disabled when DC-DC is configured for continuous mode in VLPR/W	—	Radio operation is possible only when DC-DC is configured for continuous mode. <sup>1</sup> However, there may be insufficient MIPS with a 4 MHz MCU to support much in the way of radio operation.

**Table 8. Power modes (At 25 deg C) (continued)**

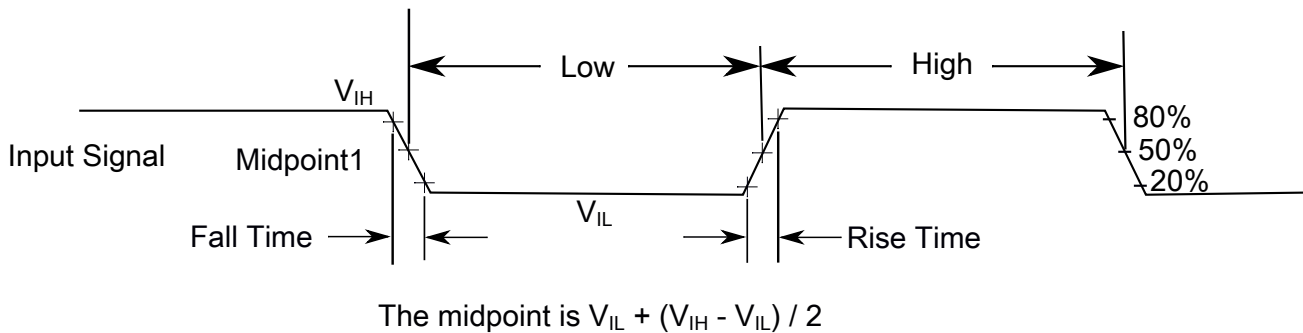

Power mode	Description	CPU recovery method	Radio
VLPW (Very Low-power Wait) - via WFI (all peripherals off)	Similar to VLPR, with CPU in sleep to further reduce power. (Values @4 MHz core/ 1 MHz bus, module off)  Biasing is disabled when DC-DC is configured for continuous mode in VLPR/W	Interrupt	
VLPS (Very Low-power Stop) via WFI	Places MCU in static state with LVD operation off. Lowest power mode with ADC and all pin interrupts functional. LPTMR, RTC, CMP can be operational.  Biasing is disabled when DC-DC is configured for continuous mode in VLPS.	Interrupt	
LLS3 (Low Leakage Stop)	State retention power mode. LLWU, LPTMR, RTC, CMP can be operational. All of the radio Sea of Gates(SOG) logic is in state retention.	Wake-up Interrupt	Radio SOG is in state retention in LLSx. The Bluetooth LE/Generic FSK DSM <sup>2</sup> logic can be active using the 32 kHz clock
LLS2 (Low Leakage Stop)	State retention power mode. LLWU, LPTMR, RTC, CMP can be operational. 16 KB or 32 KB of programmable RAM can be powered on. All of the radio SOG logic is in state retention.	Wake-up Interrupt	
VLLS3 (Very Low Leakage Stop3)	Full SRAM retention. LLWU, LPTMR, RTC, CMP can be operational. All of the radio SOG logic is in state retention.	Wake-up Reset	Radio SOG is in state retention in VLLS3/2. The Bluetooth LE/Generic FSK DSM logic can be active using the 32 kHz clock.
VLLS2 (Very Low Leakage Stop2)	Partial SRAM retention. 16 KB or 32 KB of programmable RAM can be powered on. LLWU, LPTMR, RTC, CMP can be operational. All of the radio SOG logic is in state retention.	Wake-up Reset	
VLLS1 (Very Low Leakage Stop1) with RTC + 32 kHz OSC	All SRAM powered off. The 32-byte system register file remains powered for customer-critical data. LLWU, LPTMR, RTC, CMP can be operational. Radio logic is power gated.	Wake-up Reset	Radio operation not supported. The Radio SOG is power-gated in VLLS1. Radio state is lost at VLLS1 and lower power states.
VLLS1 (Very Low Leakage Stop1) with LPTMR + LPO	All SRAM powered off. The 32-byte system register file remains powered for customer-critical data. LLWU, LPTMR, RTC, CMP can be operational.	Wake-up Reset	
VLLS0 (Very Low Leakage Stop0) with Brown-out Detection	VLLS0 is not supported with DC-DC.  The 32-byte system register file remains powered for customer-critical data. Disable all analog modules in PMC and retains I/O state and DGO state. LPO disabled, POR brown-out detection enabled, Pin interrupt only. Radio logic is power gated.	Wake-up Reset	Radio operation not supported. The Radio digital is power-gated in VLLS0.
VLLS0 (Very Low Leakage Stop0) without Brown-out Detection	VLLS0 is not supported with DC-DC buck configuration but is supported with bypass configuration.  The 32-byte system register file remains powered for customer-critical data. Disable all analog modules in PMC and retains I/O state and DGO state. LPO disabled, POR brown-out detection disabled, Pin interrupt only. Radio logic is power gated.	Wake-up Reset	

1. Biasing is disabled, but the Flash is in a low-power mode for VLPx, so this configuration can realize some power savings over use of Run/Wait/Stop.
2. DSM refers to Radio's deep sleep mode. DSM does not refer to the Arm sleep deep mode.

## 6 KW36Z/35Z Electrical Characteristics

### 6.1 AC electrical characteristics

Unless otherwise specified, propagation delays are measured from the 50% to the 50% point, and rise and fall times are measured at the 20% and 80% points, as shown in the following figure.

**Figure 5. Input signal measurement reference**

All digital I/O switching characteristics, unless otherwise specified, assume that the output pins have the following characteristics.

- $C_L=30$  pF loads
- Slew rate disabled
- Normal drive strength

$I_{ICcont}$	Contiguous pin DC injection current — regional limit, includes sum of negative injection currents of 16 contiguous pins <ul style="list-style-type: none"> <li>• Negative current injection</li> </ul>	-25	—	mA	
$V_{ODPU}$	Open drain pullup voltage level	$V_{DD}$	$V_{DD}$	V	3
$V_{RAM}$	$V_{DD}$ voltage required to retain RAM	1.2	—	V	

1. This limit applies in any DCDC mode.
2. All I/O pins are internally clamped to  $V_{SS}$  through an ESD protection diode. There is no diode connection to  $V_{DD}$ . If  $V_{IN}$  greater than  $V_{IO\_MIN}$  ( $= V_{SS}-0.3\text{ V}$ ) is observed, then there is no need to provide current limiting resistors at the pads. If this limit cannot be observed then a current limiting resistor is required. The negative DC injection current limiting resistor is calculated as  $R = (V_{IO\_MIN} - V_{IN})/|I_{ICIO}|$ .
3. Open drain outputs must be pulled to  $V_{DD}$ .

1. PTB0-1 and PTC0-3, PTC6, PTC7, PTC17, PTC18 I/O have both high drive and normal drive capability selected by the associated PTx\_PCRn[DSE] control bit. All other GPIOs are normal drive only.
2. The reset pin only contains an active pull-up device when configured as the RESET signal or as a GPIO. When configured as a GPIO output, it acts as a pseudo open drain output.
3. Measured at  $V_{DD} = 3.6\text{ V}$ .
4. Measured at  $V_{DD}$  supply voltage =  $V_{DD}$  min and  $V_{input} = V_{SS}$ .

## 6.2.4 Power mode transition operating behaviors

All specifications except  $t_{POR}$  and  $VLLSx \rightarrow \text{RUN}$  recovery times in the following table assume this clock configuration:

- CPU and system clocks = 48 MHz
- Bus and flash clock = 24 MHz
- FEI clock mode

POR and  $VLLSx \rightarrow \text{RUN}$  recovery use FEI clock mode at the default CPU and system frequency of 21 MHz, and a bus and flash clock frequency of 10.5 MHz.

**Table 12. Power mode transition operating behaviors**

	• LLS → RUN	6.3	μs	
	• VLPS → RUN	6.2	μs	
	• STOP → RUN	6.2	μs	

1. Normal boot (FTFA\_FOFT[LPBOOT]=11). When the DC-DC converter is in bypass mode, TPOR will not meet the 300 μs spec when 1) VDD\_1P5 < 1.6 V at 25 °C and 125 °C. 2) 1.5V ≤ VDD\_1P5 ≤ 1.8 V. For the bypass mode special case where VDD\_1P5 = VDD\_1P8, TPOR did not meet the 300 μs maximum spec when the supply slew rate ≤ 100 V/s.

1. The device was configured in buck mode auto-start to perform the measurements. The DCDC\_IN was powered with 3.0 V. VDD\_1P8OUT was configured to output 1.8 V and VDD\_1P5OUT\_PMCIN was configured to output 1.5 V.
2. The analog supply current is the sum of the active or disabled current for each of the analog modules on the device. See each module's specification for its supply current.
3. MCG configured for FEI mode.
4. Radio is off.
5. Incremental current consumption from peripheral activity is not included.
6. MCG configured for BLPI mode.
7. DCDC configured in pulsed mode.

### 6.2.6 Diagram: Typical $I_{DD\_RUN}$ operating behavior

The following data is measured from previous devices with same MCU core (Arm® Cortex-M0+) under these conditions:

- No GPIOs toggled
- Code execution from flash with cache enabled
- For the ALLOFF curve, all peripheral clocks are disabled except FTFA

#### NOTE

The results in the following graphs are obtained using the device in Bypass mode.

### 6.2.7 SoC Power Consumption

Full KW36Z/35Z system-on-chip (SoC) power consumption is a function of the many configurations possible for the MCU platform and its peripherals including the 2.4 GHz radio and the DC-DC converter. A few measured SoC configurations are as follows:

Table 16. SoC Power Consumption with default LDO-HF

MCU State	Flash State	Radio State	DC-DC State	Typical Average IC current	Unit
STOP	Doze	Rx	Buck (V <sub>DCDC_IN</sub> =3.6 V)	8.5	mA
STOP	Doze	Tx (at 0 dBm)	Buck (V <sub>DCDC_IN</sub> =3.6 V)	7.8	mA
STOP	Doze	Tx (at +3.5 dBm)	Buck (V <sub>DCDC_IN</sub> =3.6 V)	9.2	mA

## 6.2.8 Designing with radiated emissions in mind

To find application notes that provide guidance on designing your system to minimize interference from radiated emissions:

1. Go to [www.nxp.com](http://www.nxp.com)
2. Perform a keyword search for “EMC design.”

Symbol	Description	Min.	Max.	Unit
$C_{IN}$	Input capacitance	—	7	pF

## 6.3 Switching electrical specifications

### 6.3.1 Device clock specifications

Table 19. Device clock specifications

Symbol	Description	Min.	Max.	Unit
Normal run mode				
$f_{SYS}$	System and core clock	—	48	MHz
$f_{BUS}$	Bus clock	—	24	MHz
$f_{FLASH}$	Flash clock	—	24	MHz
$f_{LPTMR}$	LPTMR clock	—	24	MHz
VLPR and VLPS modes <sup>1</sup>				
$f_{SYS}$	System and core clock	—	4	MHz
$f_{BUS}$	Bus clock	—	1	MHz
$f_{FLASH}$	Flash clock	—	1	MHz
$f_{LPTMR}$	LPTMR clock <sup>2</sup>	—	24	MHz
$f_{ERCLK}$	External reference clock	—	16	MHz
$f_{LPTMR\_ERCLK}$	LPTMR external reference clock	—	16	MHz
$f_{TPM}$	TPM asynchronous clock	—	8	MHz
$f_{LPUART0}$	LPUART0 asynchronous clock	—	12	MHz

1. The frequency limitations in VLPR and VLPS modes here override any frequency specification listed in the timing specification for any other module. These same frequency limits apply to VLPS, whether VLPS entered from RUN or from VLPR.

2. The LPTMR can be clocked at this speed in VLPR or VLPS only when the source is an external pin.

### 6.3.2 General switching specifications

These general-purpose specifications apply to all signals configured for GPIO, LPUART, CAN (for KW36Z only), CMT and I<sup>2</sup>C signals.

**Table 20. General switching specifications**

Description	Min.	Max.	Unit	Notes
GPIO pin interrupt pulse width (digital glitch filter disabled) — Synchronous path	1.5	—	Bus clock cycles	1, 2
NMI_b pin interrupt pulse width (analog filter enabled) — Asynchronous path	200	—	ns	3
GPIO pin interrupt pulse width (digital glitch filter disabled, analog filter disabled) — Asynchronous path	20	—	ns	3
External RESET_b input pulse width (digital glitch filter disabled)	100	—	ns	
Port rise and fall time(high drive strength)				4, 5
• Slew enabled	—	25	ns	
• 1.71 ≤ VDD ≤ 2.7 V	—	16	ns	
• 2.7 ≤ VDD ≤ 3.6 V				
• Slew disabled	—	8	ns	
• 1.71 ≤ VDD ≤ 2.7 V	—	6	ns	
• 2.7 ≤ VDD ≤ 3.6 V				
Port rise and fall time(low drive strength)				6, 7
• Slew enabled		24	ns	
• 1.71 ≤ VDD ≤ 2.7 V	—	16	ns	
• 2.7 ≤ VDD ≤ 3.6 V				
• Slew disabled		10	ns	
• 1.71 ≤ VDD ≤ 2.7 V	—	6	ns	
• 2.7 ≤ VDD ≤ 3.6 V				

1. This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry in run modes.
2. The greater of synchronous and asynchronous timing must be met.
3. This is the minimum pulse width that is guaranteed to be recognized.
4. PTB0, PTB1, PTC0, PTC1, PTC2, PTC3, PTC6, PTC7, PTC17, PTC18.
5. 75 pF load.
6. Ports A, B, and C.
7. 25 pF load.

## 6.4 Thermal specifications

### 6.4.1 Thermal operating requirements

**Table 21. Thermal operating requirements**

Symbol	Description	Min.	Max.	Unit	Notes
T <sub>J</sub>	Die junction temperature	−40	125	°C	
T <sub>A</sub>	Ambient temperature	−40	105	°C	1

1. Maximum T<sub>A</sub> can be exceeded only if the user ensures that T<sub>J</sub> does not exceed the maximum. The simplest method to determine T<sub>J</sub> is: T<sub>J</sub> = T<sub>A</sub> + R<sub>θJA</sub> × chip power dissipation.

## 6.4.2 Thermal attributes

**Table 22. Thermal attributes**

Board type	Symbol	Description	48-pin LQFN	40-pin "Wettable" HVQFN	Unit	Notes
Four-layer (2s2p)	$R_{\theta JA}$	Thermal resistance, junction to ambient (natural convection)	48.3	19.2	°C/W	1, 2
—	$\Psi_{JT}$	Thermal characterization parameter, junction to package top (natural convection)	0.5	0.1	°C/W	1, 3

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board construction.
2. Determined according to JEDEC Standard JESD51-2A.
3. Thermal characterization parameter indicating the temperature difference between the package top and the junction temperature per JEDEC JESD51-2A.

The thermal characterization parameter ( $\Psi_{JT}$ ) is used to determine the junction temperature with a measurement of the temperature at the top of the package case using the following equation:

$$T_J = T_T + \Psi_{JT} \times \text{chip power dissipation}$$

where  $T_T$  is the thermocouple temperature at the top of the package.

There are no specifications necessary for the device's system modules.

## 6.5.3 Clock modules

### 6.5.3.1 MCG specifications

Table 24. MCG specifications

Symbol	Description	Min.	Typ.	Max.	Unit	Notes	
$f_{ints\_ft}$	Internal reference frequency (slow clock) — factory trimmed at nominal $V_{DD}$ and 25 °C	—	32.768	—	kHz		
$f_{ints\_t}$	Internal reference frequency (slow clock) — user trimmed	31.25	—	39.0625	kHz		
$\Delta f_{dco\_res\_t}$	Resolution of trimmed average DCO output frequency at fixed voltage and temperature — using C3[SCTTRIM] and C4[SCFTRIM]	—	$\pm 0.3$	$\pm 0.6$	% $f_{dco}$	1	
$\Delta f_{dco\_t}$	Total deviation of trimmed average DCO output frequency over voltage and temperature	—	+0.5/−0.7	$\pm 3$	% $f_{dco}$	1, 2	
$\Delta f_{dco\_t}$	Total deviation of trimmed average DCO output frequency over fixed voltage and temperature range of 0–70 °C	—	$\pm 0.4$	$\pm 1.5$	% $f_{dco}$	1, 2	
$f_{intf\_ft}$	Internal reference frequency (fast clock) — factory trimmed at nominal $V_{DD}$ and 25 °C	—	4	—	MHz		
$\Delta f_{intf\_ft}$	Frequency deviation of internal reference clock (fast clock) over temperature and voltage — factory trimmed at nominal $V_{DD}$ and 25 °C	—	+1/−2	$\pm 3$	% $f_{intf\_ft}$	2	
$f_{intf\_t}$	Internal reference frequency (fast clock) — user trimmed at nominal $V_{DD}$ and 25 °C	3	—	5	MHz		
$f_{loc\_low}$	Loss of external clock minimum frequency — RANGE = 00	$(3/5) \times f_{ints\_t}$	—	—	kHz		
$f_{loc\_high}$	Loss of external clock minimum frequency — RANGE = 01, 10, or 11	$(16/5) \times f_{ints\_t}$	—	—	kHz		
FLL							
$f_{fil\_ref}$	FLL reference frequency range	31.25	—	39.0625	kHz		
$f_{dco}$	DCO output frequency range	Low range (DRS = 00) $640 \times f_{fil\_ref}$	20	20.97	25	MHz	3, 4
		Mid range (DRS = 01) $1280 \times f_{fil\_ref}$	40	41.94	48	MHz	
$f_{dco\_t\_DMX3}$ 2	DCO output frequency	Low range (DRS = 00) $732 \times f_{fil\_ref}$	—	23.99	—	MHz	5, 6
		Mid range (DRS = 01) $1464 \times f_{fil\_ref}$	—	47.97	—	MHz	

Table continues on the next page...

**Table 24. MCG specifications (continued)**

Symbol	Description	Min.	Typ.	Max.	Unit	Notes
$J_{cyc\_fll}$	FLL period jitter • $f_{VCO} = 48$ MHz	—	180	—	ps	7
$t_{fll\_acquire}$	FLL target frequency acquisition time	—	—	1	ms	8

1. This parameter is measured with the internal reference (slow clock) being used as a reference to the FLL (FEI clock mode).
2. The deviation is relative to the factory trimmed frequency at nominal  $V_{DD}$  and 25 °C,  $f_{ints\_ft}$ .
3. These typical values listed are with the slow internal reference clock (FEI) using factory trim and DMX32 = 0.
4. The resulting system clock frequencies must not exceed their maximum specified values. The DCO frequency deviation ( $\Delta f_{dco\_t}$ ) over voltage and temperature must be considered.
5. These typical values listed are with the slow internal reference clock (FEI) using factory trim and DMX32 = 1.
6. The resulting clock frequency must not exceed the maximum specified clock frequency of the device.
7. This specification is based on standard deviation (RMS) of period or frequency.
8. This specification applies to any time the following changes: FLL reference source or reference divider, trim value, DMX32 bit, DRS bits, or FLL disabled (BLPE, BLPI) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is used as the reference, this specification assumes it is already running.

### 6.5.3.2 Reference Oscillator Specification

The KW36Z/35Z has been designed to meet targeted standard specifications for frequency error over the life of the part, which includes the temperature, mechanical and aging effects.

The table below lists the recommended crystal specifications. Note that these are recommendations only and deviation may be allowed. However, deviations may result in degraded RF performance or possibly a failure to meet RF protocol certification standards. Designers must ensure that the crystal(s) they use meet the requirements of their application.

**Table 25. Recommended Crystal and Oscillator Specification**

Symbol	Description	F0 = 32.0 MHz			F0 = 26.0 MHz			Unit	Notes

T <sub>OSC</sub>	Oscillator Startup Time	—	500	—	—	500	—	μs	9

1. Full temperature range of this device. A reduced range can be chosen to meet application needs.
2. Recommended crystal specification.
3. Measured at 25 °C.
4. Combination of frequency stability variation over desired temperature range and frequency variation due to aging over desired lifetime of system.
5. Variation due to temperature, process, and aging of MCU.
6. Sum of crystal initial frequency tolerance, crystal frequency stability and aging, oscillator variation, and PCB manufacturing variation must not exceed this value.
7. Typical is target. 30% tolerances shown.
8.  $ESR = R_{m1} * (1 + [C_0/C_L])^2$ .
9. Time from oscillator enable to clock ready. Dependent on the complete hardware configuration of the oscillator.

	• EEPROM backup to FlexRAM ratio = 2,048	20 M	50 M	—	writes	

1. Typical data retention values are based on measured response accelerated at high temperature and derated to a constant 25°C use profile. Engineering Bulletin EB618 does not apply to this technology. Typical endurance defined in Engineering Bulletin EB619.
2. Cycling endurance represents number of program/erase cycles at  $-40^{\circ}\text{C} \leq T_j \leq 125^{\circ}\text{C}$ .
3. Write endurance represents the number of writes to each FlexRAM location at  $-40^{\circ}\text{C} \leq T_j \leq 125^{\circ}\text{C}$  influenced by the cycling endurance of the FlexNVM and the allocated EEPROM backup. Minimum and typical values assume all 16-bit or 32-bit writes to FlexRAM; all 8-bit writes result in 50% less endurance.

#### 6.5.4.1.3 Write endurance to FlexRAM for EEPROM

When the FlexNVM partition code is not set to full data flash, the EEPROM data set size can be set to any of several non-zero values.

The bytes not assigned to data flash via the FlexNVM partition code are used by the FTFE to obtain an effective endurance increase for the EEPROM data. The built-in EEPROM record management system raises the number of program/erase cycles that can be attained prior to device wear-out by cycling the EEPROM data through a larger EEPROM NVM storage space.

While different partitions of the FlexNVM are available, the intention is that a single choice for the FlexNVM partition code and EEPROM data set size is used throughout the entire lifetime of a given application.

#### 6.5.5 Security and integrity modules

There are no specifications necessary for the device's security and integrity modules.

#### 6.5.6 Analog

### 6.5.6.1 ADC electrical specifications

All other ADC channels meet the 13-bit differential/12-bit single-ended accuracy specifications. The following specification is defined with the DC-DC converter operating in Bypass mode.

## KW36Z/35Z Electrical Characteristics

- DC potential difference.
- For packages without dedicated VREFH and VREFL pins, VREFH is internally tied to VDDA, and VREFL is internally tied to VSSA.
- This resistance is external to MCU. To achieve the best results, the analog source resistance must be kept as low as possible. The results in this data sheet are derived from a system that had < 8 Ω analog source resistance. The RAS/CAS time constant should be kept to < 1 ns.
- To use the maximum ADC conversion clock frequency, CFG2[ADHSC] must be set and CFG1[ADLPC] must be clear.
- For guidelines and examples of conversion rate calculation, download the [ADC calculator tool](#).

- The ADC supply current depends on the ADC conversion clock speed, conversion rate and ADC\_CFG1[ADLPC] (low-power). For lowest power operation, ADC\_CFG1[ADLPC] must be set, the ADC\_CFG2[ADHSC] bit must be clear with 1 MHz ADC conversion clock speed.
- 1 LSB =  $(V_{REFH} - V_{REFL})/2^N$ .
- ADC conversion clock < 16 MHz, maximum hardware averaging (AVGE = %1, AVGS = %11).
- VREFH = Output of Voltage Reference(VREF).
- Input data is 100 Hz sine wave. ADC conversion clock < 12 MHz.
- Input data is 1 kHz sine wave. ADC conversion clock < 12 MHz.
- ADC conversion clock < 3 MHz.

Rise time of SDA and SCL signals	t <sub>r</sub>	—	1000	20 + 0.1C <sub>b</sub> <sup>5, 6</sup>	300	ns
Fall time of SDA and SCL signals	t <sub>f</sub>	—	300	20 + 0.1C <sub>b</sub> <sup>5, 6</sup>	300	ns
Set-up time for STOP condition	t <sub>SU</sub> ; STO	4	—	0.6	—	μs
Bus free time between STOP and START condition	t <sub>BUF</sub>	4.7	—	1.3	—	μs
Pulse width of spikes that must be suppressed by the input filter	t <sub>SP</sub>	N/A	N/A	0	50	ns

1. The master mode I<sup>2</sup>C deasserts ACK of an address byte simultaneously with the falling edge of SCL. If no slaves acknowledge this address byte, then a negative hold time can result, depending on the edge rates of the SDA and SCL lines.
2. The maximum t<sub>HD</sub>; DAT must be met only if the device does not stretch the LOW period (t<sub>LOW</sub>) of the SCL signal.
3. Input signal Slew = 10 ns and Output Load = 50 pF.
4. Set-up time in slave-transmitter mode is 1 IP Bus clock period, if the TX FIFO is empty.

- A Fast mode I<sup>2</sup>C bus device can be used in a Standard mode I<sup>2</sup>C bus system, but the requirement  $t_{SU; DAT} \geq 250$  ns must then be met. This is automatically the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, then it must output the next data bit to the SDA line  $t_{rmax} + t_{SU; DAT} = 1000 + 250 = 1250$  ns (according to the Standard mode I<sup>2</sup>C bus specification) before the SCL line is released.
- $C_b$  = total capacitance of the one bus line in pF.

1. In Buck mode, DC-DC converter needs 2.1 V minimum to start, the supply can drop to 1.8 V after DC-DC converter settles.
2. In Buck mode, DC-DC converter generates 1.8 V at VDD\_1P8OUT and 1.5 V at VDD\_1P5OUT\_PMCIN pins. VDD\_1P8OUT should supply to VDD<sub>1</sub>, VDD<sub>2</sub> and VDD<sub>A</sub>. VDD\_1P5OUT\_PMCIN should supply to VDD\_RF<sub>1</sub> and VDD\_RF<sub>2</sub>. VDD\_RF<sub>3</sub> can be either supplied by 1.5 V or 1.8 V.

DC-DC Settling Time for decreasing voltage	C = capacitance attached to the DC-DC V1P8 output rail. V1 = the initial output voltage of the DC-DC V2 = the final output voltage of the DC-DC I2 = the load on the DC-DC output expressed in Amperes. VDD_1P5 ripple	Typical ripple based on NXP recommended hardware configuration and typical loading (MCU only; no extra loads placed on DC-DC outputs)	VDD_1P5 <sub>ripple</sub>	—	30	—	mV

1. This is the steady state DC output power. Excessive transient current load from external device causes 1p8V and 1P5 output voltage unregulated temporary.
2. This is the frequency that is observed at LN and LP pins.
3. DC-DC reference frequency derives from the RF oscillator or the DC-DC internal oscillator.
4. The voltage output level can be controlled by programming DCDC\_VDD1P8CTRL\_TRG field in DCDC\_REG3.
5. In Buck mode, the maximum VDD\_1P8 output is the minimum of either VDCDC\_IN\_BUCK minus 50 mV or 3.5 V. For example, if VDCDC\_IN = 2.1 V, maximum VDD\_1P8 is 2.05 V. If VDCDC\_IN = 3.6 V, maximum VDD\_1P8 is 3.5 V.
6. The output current specification in buck mode represents the maximum current the DC-DC converter can deliver. The KW36Z/35Z radio and MCU blocks current consumption is not excluded. The maximum output power of the DC-DC converter is 140 mW when V<sub>DCDC\_IN</sub> is below 2.7 V and 195 mW when V<sub>DCDC\_IN</sub> is above 2.7 V. The available supply current for external device depends on the energy consumed by the internal peripherals in KW36Z/35Z.
7. When using DC-DC in low-power mode (pulsed mode), current load must be less than 1 mA.
8. User needs to program DCDC\_VDD1P5CTRL\_TRG\_BUCK field in DCDC\_REG3 register to ensure that a worst case minimum of 1.45 V is available as VDD\_1P5\_buck. VDD\_1P5 must not be programmed higher than VDD\_1P8.

## KW36Z/35Z Electrical Characteristics

9. User needs to program DCDC\_VDD1P5CTRL\_TRG\_BUCK field in DCDC\_REG3 register to ensure that a worst case minimum of 1.55 V is available as VDD\_1P5\_buck. VDD\_1P5 must not be programmed higher than VDD\_1P8.
10. 1.5 V is intended to supply power to KW36Z/35Z. It is not designed to supply power to an external device.
11. Turn on time is measured from the application of power (to DCDC\_IN) till the DCDC\_REG0[DCDC\_STS\_DC\_OK] bit is set. Code execution may begin before the DCDC\_REG0[DCDC\_STS\_DC\_OK] bit is set. The full device specification is not guaranteed until the bit sets.

### 7.5.2 Radio Modules

This section contains tables describing the radio signals.

**Table 48. Radio Module Signal Descriptions**

Module Signal Name	Pin Direction	Pin Name	Pin Description
ANT	O	ANT	Antenna
BLE_RF_ACTIVE	O	BLE_RF_ACTIVE	An output which is asserted prior to any Radio event and remains asserted for the duration of the event.
BSM_CLK	O	BSM_CLK	Bit Streaming Mode (BSM) clock signal. 1 MHz bit rate clock. BSM_DATA and BSM_FRAME are synchronized to BSM_CLK. External device should capture BSM_FRAME and BSM_DATA on rising edge of BSM_CLK.
BSM_DATA	O	BSM_DATA	Serial Bluetooth LE packet bit stream, LSB-first. Valid on rising edge of BSM_CLK.
BSM_FRAME	O	BSM_FRAME	Framing signal to indicate the start of reception. Active high.
DTM_RX	I	DTM_RX	Direct Test Mode Receive
DTM_TX	O	DTM_TX	Direct Test Mode Transmit
GANT	I	GANT	Antenna ground

*Table continues on the next page...*

**Table 48. Radio Module Signal Descriptions (continued)**

Module Signal Name	Pin Direction	Pin Name	Pin Description
RF_STATUS	O	RF_STATUS	An output which indicates when the Radio is in an Rx or Tx event; software can also control this signal directly.
RF_PRIORITY	O	RF_PRIORITY	An output which indicates to the external WiFi device that the Radio event is a high priority and it needs access to the 2.4 GHz antenna.
RF_EARLY_WARNING	O	RF_EARLY_WARNING	Bluetooth LE LL generated signal which can be used to wake an external sensor to make a measurement before a Bluetooth LE event.
RF_NOT_ALLOWED	I	RF_NOT_ALLOWED	External signal which causes the internal Radio to cease radio activity.
RF_TX_CONF	I	RF_TX_CONF	Signal from an external Radio which indicates the availability of the 2.4 GHz antenna to the internal Radio. <b>NOTE:</b> This is a GPIO, not a dedicated PIN.
RX_SWITCH	O	RX_SWITCH	Front End Module receive mode signal.
TX_SWITCH	O	TX_SWITCH	Front End Module transmit mode signal.

**Table 49. Radio Module Miscellaneous Pin Descriptions**

Pin Name	Pad Direction	Pin Name	Pin Description
RF_INT_OSC_EN	I	RF_RFOSC_EN	External request to turn on the Radio's internal RF oscillator.
RF_EXT_OSC_EN	O	RF_EXT_OSC_EN	Internal request to turn on an External oscillator for use by the internal Radio. The request can also be from the SoC if it is using the RF oscillator as its clock.

### 7.5.3 System Modules

This section contains tables describing the system signals.

**Table 50. System Module Signal Descriptions**

## 8 Package Information

### 8.1 Obtaining package dimensions

Package dimensions are available in package drawings.

To find a package drawing, go to [nxp.com](http://nxp.com) and perform a keyword search for the document number of the drawing:

**Table 69. Packaging Dimensions**

If you want the drawing for this package	Then use this document number
40-pin "Wettable" HVQFN (6x6)	98ASA01025D
48-pin LQFN (7x7)	98ASA00694D

## 9 Part identification

## 9.1 Description

Part numbers for the chip have fields that identify the specific part. You can use the values of these fields to determine the specific part you have received.

## 9.2 Format

Part numbers for this device have the following format:

Q KW## A FFF R T PP CC N

## 9.3 Fields

This table lists the possible values for each field in the part number (not all combinations are valid):

**Table 70. Part number fields descriptions**

Field	Description	Values
Q	Qualification status	<ul style="list-style-type: none"> <li>• M = Fully qualified, general market flow</li> <li>• P = Prequalification</li> </ul>

**Limited warranty and liability** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors. In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

**Right to make changes** - NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Security** — Customer understands that all NXP products may be subject to unidentified or documented vulnerabilities. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer's applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately.

Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP. NXP has a Product Security Incident Response Team (PSIRT) (reachable at [PSIRT@nxp.com](mailto:PSIRT@nxp.com)) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.

**Suitability for use** — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Non-automotive qualified products** — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product

design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

**Limiting values** — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

**Terms and conditions of commercial sale** — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.
