MOD5441X

Pinout and Signal Description

The 200 version board has a 10-pin header instead of an RJ-45 jack. This header enables you to relocate the jack to another location or to add a different jack with power over ethernet (PoE) capabilities to your module.

Alternate Monitor Boot Jumper

The boot jumper is the unpopulated header 'TP1'. It can be used to recover from a software or configuration fault.

MOD5441X

The module has two dual in-line 50 pin headers which enable you to connect to one of our standard NetBurner Carrier Boards, or a board you create on your own. Table 2 provides descriptions of pin function of the module header. The primary functionality of a pin is not necessarily its default functionality. Most pins that are muxed with GPIO default to their GPIO functionality. See Table 2-1 in section 2.2 of the MCF5441x Reference Manual for a list of the exceptions.

Note:

- Active low signals, such as **RESET**, are indicated with an overbar.
- The TIP signal is the logical AND of *CS1, *CS4 and *CS5. TIP can be used to control an external data bus buffer for the data bus signals. An example circuit design can be found on the Module Development Board schematic. An external data bus buffer is recommended for any designs that use data bus signals D16-D31.
