

## DESCRIPTION

The MP6513 is an H-bridge motor driver used for driving reversible motors, which can drive one DC motor, one winding of a stepper motor, or other loads. The H-bridge consists of four N-channel power MOSFETs. An internal charge pump generates the necessary gate-drive voltages.

The MP6513 operates on a motor power supply voltage from 2.5V to 21V, which can supply an output current of up to 0.8A according to the logic control.

The MP6513 is controlled by two input pins. The two on/off inputs determine the output mode: forward, reverse, coast, or brake. Very low standby circuit current can be achieved when inputs 1 and 2 are both at a low level.

Full protection features include over-current protection (OCP), short-circuit protection (SCP), under-voltage lockout (UVLO), and over-temperature protection (OTP).

The MP6513 requires a minimum number of readily available, standard, external components and is available in a TSOT23-6 package.

## FEATURES

- Wide 2.5V to 21V Operating Input Range
- 0.8A Maximum Output Current
- Low MOSFET On Resistance (HS: 500mΩ; LS: 500mΩ)
- Forward, Reverse, Coast, or Brake Output Modes
- Low Standby Circuit Current when Inputs 1 and 2 are Both Low
- Thermal Shutdown
- Internal Charge Pump
- Cycle-by-Cycle Over-Current Protection (OCP)
- Short-Circuit Protection (SCP)
- Available in a TSOT23-6 Package

## APPLICATIONS

- Cameras
- Toys
- Consumer Products
- Medical Devices

All MPS parts are lead-free, halogen-free, and adhere to the RoHS directive. For MPS green status, please visit the MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology" are registered trademarks of Monolithic Power Systems, Inc.

## TYPICAL APPLICATION

### ORDERING INFORMATION

Part Number*	Package	Top Marking
MP6513GJ	TSOT23-6	See Below

\* For Tape & Reel, add suffix -Z (e.g. MP6513GJ-Z)

### TOP MARKING

|ALPY

ALP: Product code of MP6513GJ  
 Y: Year code

### PACKAGE REFERENCE

**ABSOLUTE MAXIMUM RATINGS** <sup>(1)</sup>

Supply voltage (V <sub>CC</sub> ) .....	-0.3V to +23V
V <sub>OUTX</sub> .....	-0.3V to V <sub>CC</sub> + 0.3V
All other pins .....	-0.3V to +6V
Continuous power dissipation (T <sub>A</sub> = +25°C) <sup>(2)</sup>	
.....	1.14W
Junction temperature .....	150°C
Lead temperature .....	260°C
Storage temperature .....	-60°C to 150°C

**Recommended Operating Conditions** <sup>(3)</sup>

Supply voltage (V <sub>CC</sub> ) .....	2.5V to 21V
Operating junction temp. (T <sub>J</sub> ) ...	-40°C to +125°C

<b>Thermal Resistance</b> <sup>(4)</sup>	<b>θ<sub>JA</sub></b>	<b>θ<sub>JC</sub></b>	
TSOT23-6.....	110.....	55.....	°C/W

**NOTES:**

- 1) Exceeding these ratings may damage the device.
- 2) The maximum allowable power dissipation is a function of the maximum junction temperature T<sub>J</sub> (MAX), the junction-to-ambient thermal resistance θ<sub>JA</sub>, and the ambient temperature T<sub>A</sub>. The maximum allowable continuous power dissipation at any ambient temperature is calculated by P<sub>D</sub> (MAX) = (T<sub>J</sub> (MAX)-T<sub>A</sub>)/θ<sub>JA</sub>. Exceeding the maximum allowable power dissipation produces an excessive die temperature, causing the regulator to go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- 3) The device is not guaranteed to function outside of its operating conditions.
- 4) Measured on JESD51-7, 4-layer PCB.

## ELECTRICAL CHARACTERISTICS

$V_{CC} = 5V$ ,  $T_J = -40^{\circ}C$  to  $125^{\circ}C$ , unless otherwise noted.

Parameters	Symbol	Condition	Min	Typ	Max	Units
Operating supply current				0.82	1.2	mA
Sleep mode supply current	$I_Q$	IN1 = 0V, IN2 = 0V		12	20	$\mu A$
Under-voltage lockout threshold rising				2.2	2.45	V
Under-voltage lockout threshold hysteresis				150		mV
Input high voltage	$V_{IH}$		2			V
Input low voltage	$V_{IL}$				0.8	V
Input high current	$I_{IH}$	VIN = 3.3V			50	$\mu A$
Input low current	$I_{IL}$	VIN = 0V	-5		5	$\mu A$
Input pull-down resistance	$R_{PD}$			100		k $\Omega$
HS switch on resistance	$R_{DS(ON)}$	IO = 100mA, $T_A = 25^{\circ}C$		0.5	0.6	$\Omega$
LS switch on resistance	$R_{DS(ON)}$	IO = 100mA, $T_A = 25^{\circ}C$		0.5	0.6	$\Omega$
Current limit	$I_{OCP}$		1		2	A
OCP retry time	$T_{OCR}$			0.85		ms
Sleep entry time		IN1 = 0V, IN2 = 0V for 2ms		2	5	ms
Sleep recovery time		IN1 or IN2 or both = high level			6.5	$\mu s$
Output enable time	$T1^{(6)}$				200	ns
Output disable time	$T2^{(6)}$				260	ns
Delay time	$T3^{(6)}$	INx high to OUTx high			270	ns
	$T4^{(6)}$	INx low to OUTx low			350	ns
Output rise time			30		220	ns
Output fall time			30		170	ns
Dead time				100		ns
Thermal shutdown threshold <sup>(5)</sup>	$T_{TSD}$			160		$^{\circ}C$
Thermal shutdown hysteresis <sup>(5)</sup>				25		$^{\circ}C$

**NOTES:**

5) Guaranteed by design.

6) See Figure 1.

**Figure 1: Input/Output Timing**

**TYPICAL PERFORMANCE CHARACTERISTICS**

$V_{CC} = 5V, T_A = 25^{\circ}C$ , unless otherwise noted.

**$R_{DS(ON)}$  vs.  $V_{CC}$**

**$R_{DS(ON)}$  vs. Temperature**

**TYPICAL PERFORMANCE CHARACTERISTICS (continued)**
 $V_{CC} = 5V$ ,  $T_A = 25^\circ C$ , unless otherwise noted.

**Output Enable Time (T1)**
 $V_{CC} = 5V$ , No Load

**Output Disable Time (T2)**
 $V_{CC} = 5V$ , No Load

**Propagation Delay (T3)**
 $V_{CC} = 5V$ ,  $21\Omega + 0.2mH$ 

**Propagation Delay (T4)**
 $V_{CC} = 5V$ ,  $21\Omega + 0.2mH$ 

**Power Start-Up**
 $V_{CC} = 2.5V$ , PWM = 100Hz,  
No Load

**Power Shutdown**
 $V_{CC} = 2.5V$ , PWM = 100Hz,  
No Load

**Sleep Mode Entry**
 $V_{CC} = 12V$ ,  $IN1 = IN2 = 0$ ,  
No Load

**Sleep Mode Recovery**
 $V_{CC} = 12V$ ,  $IN1 = IN2 = H \rightarrow IN1 = H$ ,  
No Load.

## PIN FUNCTIONS

Pin #	Name	Description
1	IN1	<b>Input 1.</b> Internal pull-down resistor.
2	GND	<b>Ground.</b>
3	IN2	<b>Input 2.</b> Internal pull-down resistor.
4	OUT2	<b>Switch output 2.</b> Connect OUT2 to the motor winding.
5	VCC	<b>Supply voltage.</b> An input capacitor is needed to prevent large voltage spikes from appearing at the input.
6	OUT1	<b>Switch output 1.</b> Connect OUT1 to the motor winding.

BLOCK DIAGRAM

Figure 2: Functional Block Diagram

## OPERATION

The MP6513 is an H-bridge motor driver used for driving reversible motors, which can drive one DC motor, one winding of a stepper motor, or other loads. The H-bridge consists of four N-channel power MOSFETs. An internal charge pump generates the necessary gate-drive voltages.

### Input Logic

The MP6513 is controlled by two input pins. The two on/off inputs control the output mode: forward, reverse, coast, or brake. Table 1 shows the logic for the MP6513.

**Table 1: Input Logic Truth Table**

IN1	IN2	OUT1	OUT2	Function (DC Motor)
L	L	Z	Z	Coast
L	H	L	H	Reverse
H	L	H	L	Forward
H	H	L	L	Brake

### Sleep Mode

If the input pins (IN1 and IN2) both remain at a low level within a certain time, the part enters a low-power sleep mode. In this state, all unnecessary internal circuitries are powered down.

### Over-Current Protection (OCP)

The MP6513 has internal overload and short-circuit protection. The currents in both the high-side and low-side MOSFETs are measured. If the current exceeds the current limit, all MOSFETs in the H-bridge are turned off. The bridge is re-enabled after approximately 1ms automatically.

### Thermal Shutdown (TSD)

Thermal monitoring is integrated into the MP6513. If the die temperature rises above 160°C, all switches are turned off. Once the die temperature has fallen back to a safe level, operation resumes automatically.

### Under-Voltage Lockout (UVLO)

If at any time the voltage on VCC falls below the under-voltage lockout threshold voltage, all circuitries in the device are disabled, and the internal logic is reset. Operation resumes when VCC rises above the UVLO threshold.

### Power Dissipation and Recommended Junction Temperature

The recommended maximum junction temperature is 125°C under normal operating conditions. To ensure that the junction temperature is within this limit, calculate the maximum allowable dissipation ( $P_{D(MAX)}$ ) with Equation (1):

$$P_{D(MAX)} = (T_J(max) - T_A) / \theta_{JA} \quad (1)$$

Where  $T_J(max)$  is the maximum recommended operation junction temperature (125°C),  $\theta_{JA}$  is the junction-to-ambient thermal resistance, and  $T_A$  is the ambient temperature (see Table 2).

**Table 2: Dissipation Ratings**

Package	$\theta_{JA}$ (°C/W)	Dissipation Power Rating		
		$T_A = 25^\circ\text{C}$	$T_A = 50^\circ\text{C}$	$T_A = 85^\circ\text{C}$
TSOT23-6	110	0.9W	0.65W	0.35W
