TEST CIRCUITS

Notes: Close S3 for positive gain. Input signal to RF(+Av) connector.
 The gain $A_v = 1 + R_{FB}/R_{IN}$.
 For unity gain, remove R_{IN} and short R_{FB} .
 Open S3 for negative gain. Input signal to RF(-Av) connector.
 The gain $A_v = -R_{FB}/R_{IN}$.
 S1 and S2 are switches for possible resistor and capacitor load connections.

APPLICATION INFORMATION
Power Supply Bypassing

Regular supply bypassing techniques are recommended. A $10\mu\text{F}$ capacitor in parallel with a $0.1\mu\text{F}$ capacitor on both the positive and negative supplies is ideal. For the best performance, all bypassing capacitors should be located as close to the op amp as possible and all capacitors should be low ESL (Equivalent Series Inductance) and low ESR (Equivalent Series Resistance). Surface mount ceramic capacitors are ideal.
