

14 MHz to 190 MHz PLL Clock Multiplier

NB3N502

Description

The NB3N502 is a clock multiplier device that generates a low jitter, TTL/CMOS level output clock which is a precise multiple of the external input reference clock signal source. The device is a cost efficient replacement for the crystal oscillators commonly used in electronic systems. It accepts a standard fundamental mode crystal or an external reference clock signal. Phase-Locked-Loop (PLL) design techniques are used to produce an output clock up to 190 MHz with a 50% duty cycle. The NB3N502 can be programmed via two select inputs (S0, S1) to provide an output clock (CLKOUT) at one of six different multiples of the input frequency source, and at the same time output the input aligned reference clock signal (REF).

Features

- Clock Output Frequency up to 190 MHz
- Operating Range: $V_{DD} = 3\text{ V to }5.5\text{ V}$
- Low Jitter Output of 15 ps One Sigma (rms)
- Zero ppm Clock Multiplication Error
- 45% – 55% Duty Cycle
- 25 mA TTL-level Drive Outputs
- Crystal Reference Input Range of 5 – 27 MHz
- Input Clock Frequency Range of 2 – 50 MHz
- Available in 8-pin SOIC Package or in Die Form
- Full Industrial Temperature Range $-40^{\circ}\text{C to }85^{\circ}\text{C}$
- These are Pb-Free Devices

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

APPLICATIONS INFORMATION

High Frequency CMOS/TTL Oscillators

The NB3N502, along with a low frequency fundamental mode crystal, can build a high frequency CMOS/TTL output oscillator. For example, a 20 MHz crystal connected to the NB3N502 with the 5X output selected (S1 = L, S0 = H) produces a 100 MHz CMOS/TTL output clock.

External Components

Decoupling Instructions

In order to isolate the NB3N502 from system power supply, noise de-coupling is required. The 0.01 μF decoupling capacitor has to be connected between V_{DD} and GND on pins 2 and 3. It is recommended to place de-coupling capacitors as close as possible to the NB3N502 device to minimize lead inductance. Control input pins can be connected to device pins V_{DD} or GND, or to the V_{DD} and GND planes on the board.

Series Termination Resistor Recommendation

A 33 Ω series terminating resistor can be used on the CLKOUT pin.

Crystal Load Capacitors Selection Guide

The total on-chip capacitance is approximately 12 pF per pin (C_{IN1} and C_{IN2}). A parallel resonant, fundamental mode crystal should be used.

The device crystal connections should include pads for small capacitors from X1/CLK to ground and from X2 to ground. These capacitors, C_{L1} and C_{L2}, are used to adjust the stray capacitance of the board to match the nominally required crystal load capacitance (C_{LOAD} (crystal)). Because load capacitance can only be increased in this trimming process, it is important to keep stray capacitance to a minimum by using very short PCB traces (and no vias) between the crystal and device. Crystal load capacitors, if needed, must be connected from each of the pins X1 and X2 to ground. The load capacitance of the crystal (C_{LOAD} (crystal)) must be matched by total load capacitance of the oscillator circuitry network, C_{INX}, C_{SX} and C_{LX}, as seen by the crystal (see Figure 3 and equations below).

$$C_{LOAD1} = C_{IN1} + C_{S1} + C_{L1} \text{ [Total capacitance on X1/CLK]}$$

$$C_{LOAD2} = C_{IN2} + C_{S2} + C_{L2} \text{ [Total capacitance on X2]}$$

$$C_{IN1} \approx C_{IN2} \approx 12 \text{ pF (Typ) [Internal capacitance]}$$

$$C_{S1} \approx C_{S2} \approx 5 \text{ pF (Typ) [External PCB stray capacitance]}$$

$$C_{LOAD1,2} = 2 \cdot C_{LOAD} \text{ (Crystal)}$$

$$C_{L2} = C_{LOAD2} - C_{IN2} - C_{S2} \text{ [External load capacitance on X2]}$$

$$C_{L1} = C_{LOAD1} - C_{IN1} - C_{S1} \text{ [External load capacitance on X1/CLK]}$$

Example 1: Equal stray capacitance on PCB

$$C_{LOAD} \text{ (Crystal)} = 18 \text{ pF (Specified by the crystal manufacturer)}$$

$$C_{LOAD1} = C_{LOAD2} = 36 \text{ pF}$$

$$C_{IN1} = C_{IN2} = 12 \text{ pF}$$

$$C_{S1} = C_{S2} = 6 \text{ pF}$$

$$C_{L1} = 36 - 12 - 6 = 18 \text{ pF}$$

$$C_{L2} = 36 - 12 - 6 = 18 \text{ pF}$$

Example 2: Different stray capacitance on PCB trace X1/CLK vs. X2

$$C_{LOAD} \text{ (Crystal)} = 18 \text{ pF}$$

$$C_{LOAD1} = C_{LOAD2} = 36 \text{ pF}$$

$$C_{IN1} = C_{IN2} = 12 \text{ pF}$$

$$C_{S1} = 4 \text{ pF} \ \& \ C_{S2} = 8 \text{ pF}$$

$$C_{L1} = 36 - 12 - 4 = 20 \text{ pF}$$

$$C_{L2} = 36 - 12 - 8 = 16 \text{ pF}$$
