2.5V / 3.3V 1:2 Differential CML Fanout Buffer

Multi-Level Inputs w/ Internal Termination

Description

The NB6L11M is a differential 1:2 CML fanout buffer. The differential inputs incorporate internal 50 Ω termination resistors that are accessed through the V_T pins and will accept LVPECL, LVCMOS, LVTTTL, CML, or LVDS logic levels.

The V_{REFAC} pin is an internally generated voltage supply available to this device only. V_{REFAC} is used as a reference voltage for single-ended PECL or NECL inputs. For all single-ended input conditions, the unused complementary differential input is connected to V_{REFAC} as a switching reference voltage. V_{REFAC} may also rebias capacitor-coupled inputs. When used, decouple V_{REFAC} with a 0.01 μF capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{REFAC} output should be left open.

The device is housed in a small 3x3 mm 16 pin QFN package.

The NB6L11M is a member of the ECLinPS MAX™ family of high performance clock products.

The pad is not electrically connected to the die, but is recommended to be electrically and thermally connected to VEE on the PC board.

1. In the differential configuration when the input termination pins (VTD, \bar{VTD}) are connected to a common termination voltage or left open, and if no signal is applied on D/ \bar{D} input, then, the device will be susceptible to self-oscillation.
2. All VCC and VEE pins must be externally connected to a power supply for proper operation.
