

# NCP367

## Battery Charge Front-End Protection, USB and AC/DC Supply Compliant

NCP367 is a charge path protection device which allows disconnecting the systems from its output pin in case wrong charging conditions are detected. The system is positive overvoltage protected up to +30 V. Thanks to a very low current consumption, the USB charge is compatible with this integrated component.

This device uses internal PMOS FET, making external devices unnecessary, which reduces the system cost and PCB area of the application board. First, NCP367 is able to instantaneously disconnect the output from the input if the input voltage exceeds the overvoltage threshold. Additional overcurrent protection function allows turning off internal PMOS FET when the charge current exceeds current limit, which is externally selectable.

The current limit value can be modified with control logic pin to divide it by internal gain, allowing USB 100 mA/500 mA charging or USB/Wall adapter charging up to overcurrent threshold. At the same time, Li ion Battery voltage is continuously monitored, providing more safety during the charge. Thermal shutdown protection is also available.

NCP367 provides a negative going flag ( $\overline{\text{FLAG}}$ ) output, which alerts the system that a fault has occurred as overvoltage (power supply or battery voltage), overcurrent or thermal event.

In addition, the device has ESD-protected input (15 kV Air) when bypassed with a 1  $\mu\text{F}$  or larger capacitor.

### Features

- Overvoltage Protection Up to + 30 V
- Fast Turn Off Time
- Very Low Current Consumption/USB Compliant
- Li ion Battery Voltage Monitoring
- Overvoltage Lockout (OVLO)
- Undervoltage Lockout (UVLO)
- Overcurrent Protection Externally Adjustable (OCP) up to 2.8 A
- Thermal Shutdown
- Shutdown  $\overline{\text{EN}}$  and Gain Input Pins
- Soft-Start to Eliminate Inrush Current
- Alert  $\overline{\text{FLAG}}$  Output
- Compliance to IEC61000-4-2 (Level 4)  
8 kV (Contact), 15 kV (Air)
- ESD Ratings: Machine Model = B  
Human Body Model = 2
- 8 Lead DFN 2.2x2 mm Package
- These are Pb-Free Devices

## PIN FUNCTION DESCRIPTION

Pin	Name	Type	Description
1	IN	POWER	Input Voltage Pin. This pin is connected to the power supply: Wall Adapter or USB. A 1 $\mu$ F low ESR ceramic capacitor, or larger, must be connected between this pin and GND.
2	V <sub>BAT</sub>	INPUT	Li ion Battery voltage sense pin. A serial resistor must be placed between this pin and positive pin of the battery pack.
3	NC	OUTPUT	Not Connected
4	I <sub>LIM</sub>	OUTPUT	Current Limit Pin. This pin provides the reference, based on the internal band-gap voltage reference, to limit the overcurrent, across internal PMOSFET, from IN to OUT. A 1% tolerance, or better, resistor shall be used to get the highest accuracy of the Overcurrent Limit.
5	$\overline{\text{EN}}$	INPUT	Enable Mode Pin. The device enters in shutdown mode when this pin is tied to a high level. In this case the output is disconnected from the input. The state of this pin does not have an impact on the fault detection of the FLAG pin.
6	GS	INPUT	Gain Select Pin. When the GS pin is tied to 0 level, the Overcurrent threshold is defined by I <sub>limit</sub> /GS. See logic table. When GS pin is tied to high, the Overcurrent threshold is set to I <sub>limit</sub> /GS
7	$\overline{\text{FLAG}}$	OUTPUT	Fault Indication Pin. This pin allows an external system to detect fault condition. The $\overline{\text{FLAG}}$ pin goes low when input voltage is below UVLO threshold, exceeds OVLO threshold, charge current from wall adapter to battery exceeds programmed current limit, Li ion Battery voltage (4.3 V) is exceeded or internal temperature exceeds thermal shutdown limit. Since the $\overline{\text{FLAG}}$ pin is open drain functionality, an external pull-up resistor to V <sub>Battery</sub> must be added (10 k $\Omega$ minimum value).
8	GND	POWER	Ground.
9	OUT	OUTPUT	Output Voltage Pin. This pin follows IN pin when "no input fault" is detected. The output is disconnected from the Vin power supply when voltage, current or thermal fault events are detected. A 1 $\mu$ F low ESR ceramic capacitor, or larger, must be connected between this pin and GND.

NOTE: Pin out provided for concept purpose only and might change in the final product

## MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Minimum Voltage (IN to GND)	V <sub>min</sub> <sub>in</sub>	-0.3	V
Minimum Voltage (All others to GND)	V <sub>min</sub>	-0.3	V
Maximum Voltage (IN to GND)	V <sub>max</sub> <sub>in</sub>	30	V
Maximum Voltage (All others to GND)	V <sub>max</sub>	7.0	V
Maximum DC Current from Vin to Vout (PMOS)	I <sub>max</sub>	3.4	A
Thermal Resistance, Junction-to-Air (without PCB area)	R <sub><math>\theta</math>JA</sub>	190	$^{\circ}$ C/W
Operating Ambient Temperature Range	T <sub>A</sub>	-40 to +85	$^{\circ}$ C
Storage Temperature Range	T <sub>stg</sub>	-65 to +150	$^{\circ}$ C
Junction Operating Temperature	T <sub>J</sub>	150	$^{\circ}$ C
ESD Withstand Voltage (IEC 61000-4-2) Human Body Model (HBM), Model = 2 (Note 1) Machine Model (MM) Model = B (Note 2)	V <sub>esd</sub>	15 Air, 8.0 Contact 2000 200	kV V V
Latchup	LU	Class 1	-
Moisture Sensitivity	MSL	Level 1	-

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- Human Body Model, 100 pF discharged through a 1.5 k $\Omega$  resistor following specification JESD22/A114.
- Machine Model, 200 pF discharged through all pins following specification JESD22/A115.

## APPLICATION INFORMATION

**Operation**

The NCP367 is an integrated IC which offers a complete protection of the portable devices during the Li ion battery charge.

First, the input pin is protected up to +30 V, protecting the down stream system (charger, transceiver, system...) against the power supply transients such as inrush current or defective functionality. Additional protection level is offered with the overcurrent block which eliminates current peak or opens the charge path if an overcurrent default appears.

More of that, the battery voltage is monitored all along the input power supply is connected, allowing to open charge path if Li ion battery voltage exceeds 4.3 V, caused by CCCV charger or battery pack fault.

The integrated pass element (PMOS FET) is sized to support very high charge DC current up to 2.3 A. The overcurrent threshold can be externally adjusted with a pull-down resistor and gain select pin is available to divide current limit threshold with internal fixed gain. Allowing to adjust with logic pin the overcurrent threshold if USB/500 mA or WA/1.5 A is detected, without changing  $R_{ILIM}$  resistor, in example.

Undervoltage, Overvoltage, Overcurrent and thermal faults are signalized thanks to the open drain FLAG pin, by pulling its down.

**Undervoltage Lockout (UVLO)**

To ensure proper operation under any conditions, the device has a built-in undervoltage lock out (UVLO) circuit. During  $V_{in}$  positive going slope, the output remains disconnected from input until  $V_{in}$  voltage is above 1.85 V plus hysteresis nominal. This circuit has a 80 mV hysteresis to provide noise immunity to transient condition.

**Overvoltage Lockout (OVLO)**

To protect connected systems on  $V_{out}$  pin from overvoltage, the device has a built-in overvoltage lock out (OVLO) circuit. During overvoltage condition, the output remains disabled as long as the input voltage exceeds this threshold.

$\overline{FLAG}$  output is tied to low as long as  $V_{in}$  is higher than OVLO. This circuit has a 100 mV hysteresis to provide noise immunity to transient conditions.

**FLAG Output**

NCP367 provides a  $\overline{FLAG}$  output, which alerts external systems that a fault has occurred.

This pin is tied to low as soon as the OVLO,  $OV_{BAT}$ ,  $I_{OCP}$  or internal temperature thresholds are exceeded and remains low until between minimum driving voltage and UVLO threshold. When  $V_{in}$  level recovers normal condition,  $\overline{FLAG}$  is held high. The pin is an open drain output, thus a pull up resistor (typically 1 M $\Omega$  – Minimum 10 k $\Omega$ ) must be provided to  $V_{CC}$ .  $\overline{FLAG}$  pin is an open drain output, which is able to support 1 mA maximum.

 **$\overline{EN}$  Input**

To enable normal operation, the  $\overline{EN}$  pin shall be forced to low or connected to ground. A high level on the pin, disconnects OUT pin from IN pin.  $\overline{EN}$  does not overdrive a UVLO or OVLO fault.

**Overcurrent Protection (OCP)**

This device integrates the overcurrent protection function, from wall adapter to battery. That means the current across the internal PMOS is regulated and cut when the value, set by external RSEL resistor, exceeds  $I_{LIM}$  longer than  $t_{REG}$ .

An internal resistor is placed in series with the pin allowing to have a maximum OCP value when  $I_{LIM}$  pin is directly connected to GND.

By adding external resistors in series with  $I_{LIM}$  and GND, the OCP value is decreased.

An additional logic pin,  $\overline{GS}$  (gain select), is very useful in case of different charge rate is necessary (Wall adapter and USB, for example).

By setting  $\overline{GS}$  to 0.4 V, overcurrent thresholds are depending on R select resistor, which is connect between pin 4 and GND. When the  $\overline{GS}$  pin is tied to 1.2 V (high logic level) the preselected current limit is divided by 2.75. Due

to this option, both fast charge or USB charge are authorized with the same device.

Figure 12. I<sub>OCP</sub> versus R<sub>LIM</sub>, GS = low and high, 1.5 A version

Figure 13. Over Current Threshold versus R<sub>LIMIT</sub> 2.85 A Version

Typical R<sub>LIM</sub> calculation is following:  
NCP367DxMUxxTBG

$$R_{LIM} (k\Omega) = 249 / I_{OCP} - 165$$

NCP367OxMUxxTBG

$$R_{LIM} (k\Omega) = 532 / I_{OCP} - 180$$

During overcurrent event, charge area is opened and  $\overline{FLAG}$  output is tied to low, allowing the  $\mu$ Controller to take into account the fault event and then open the charge path.

At power up (accessory is plugged on input pins), the current is limited up to I<sub>LIM</sub> during 1.8 ms (typical), to allow capacitor charge and limit inrush current. If the I<sub>LIM</sub> threshold is exceeded over 1.8 ms, the device enter in OCP burst mode until the overcurrent event disappears.

#### V<sub>BAT</sub> Sense

The connection of the V<sub>BAT</sub> pin to the positive connection of the Li ion battery pack allows preventing overvoltage transient, greater than 4.35 V. In case of wrong charger conditions, the PMOS is then opened, eliminating Battery pack over voltage which could create safety issues and temperature increasing.

The 4.35 V comparator has a 150 mV built-in hysteresis.

More of that, deglitch function of 2 ms is integrated to prevent voltage transients on the Battery voltage. If the battery over voltage condition exceeds deglitch time, the charge path is opened and  $\overline{FLAG}$  pin is tied to low level until the V<sub>BAT</sub> is greater than 4.35 V – hysteresis.

At wall adapter insertion, and if the battery is fully charged, V<sub>bat</sub> comparator stays locked until battery needs to be recharged (4.2 V typ – 4.1 V min).

A serial resistor has to be placed in series with Vbat pin and battery connection, with a 200 kΩ recommended value.

#### PCB Recommendations

The NCP367 integrates low R<sub>DS(on)</sub> PMOS FET, nevertheless PCB layout rules must be respected to properly evacuate the heat out of the silicon. The DFN PAD1 corresponds to the PMOS drain so must be connected to OUT plane to increase the heat transfer. Of course, in any case, this pad shall be not connected to any other potential.

Following figure shows package thermal resistance of a DFN 2.2x2 mm.

# NCP367

Figure 14.

## Internal PMOS FET

NCP367 includes an internal PMOS FET to protect the systems, connected on OUT pin, from positive over-voltage. Regarding electrical characteristics, the  $R_{DS(on)}$ , during normal operation, will create low losses on  $V_{out}$  pin versus  $V_{in}$ , due to very low  $R_{DS(on)}$ .

Figure 15. Typical  $R_{DS(on)}$  versus Temperature

## ESD Tests

NCP367 fully support the IEC61000-4-2, level 4 (Input pin, 1  $\mu$ F mounted on board). That means, in Air condition,  $V_{in}$  has  $\pm 15$  kV ESD protected input. In Contact condition,  $V_{in}$  has  $\pm 8$  kV ESD protected input. Please refer to Figure 16 to see the IEC 61000-4-2 electrostatic discharge waveform.

# NCP367

## ORDERING INFORMATION

Device	Marking	Package	Shipping†
NCP367DPMUECTBG	DC	DFN8 (Pb-Free)	3000 / Tape & Reel
NCP367DPMUEETBG	DE	DFN8 (Pb-Free)	3000 / Tape & Reel
NCP367DPMUELTBG	DL	DFN8 (Pb-Free)	3000 / Tape & Reel
NCP367OPMUEOTBG	P3	DFN8 (Pb-Free)	3000 / Tape & Reel
NCP367OPMUEATBG	EA	DFN8 (Pb-Free)	3000 / Tape & Reel
NCP367DPMEBTBG	PE	DFN8 (Pb-Free)	3000 / Tape & Reel
NCP367OPMUECTBG	EC	DFN8 (Pb-Free)	3000 / Tape & Reel

†For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.

## SELECTION GUIDE

The NCP367 can be available in several undervoltage and overvoltage thresholds versions. Part number is designated as follows:

**NCP367xxMUxxTBG**

Code	Contents
a	Overcurrent threshold a = D: 1.51 A a = O: 2.85 A
b	V <sub>BAT</sub> Voltage b: P = 4.36 V (additional thresholds available for a wide Lithium ion material range)
c	UVLO Typical Threshold c: E = 1.85 V
d	OVLO Typical Threshold (Additional thresholds available) d: C = 5.85 V d: E = 6.07 V d: L = 6.85 V d: O = 7.20 V d: A = 3.80 V d: B = 4.54 V

## PACKAGE DIMENSIONS

ON Semiconductor®

SCALE 4:1

DFN8, 2.0x2.2, 0.5P  
CASE 506BP-01  
ISSUE A

DATE 13 JAN 2010

**DETAIL A**  
ALTERNATE TERMINAL  
CONSTRUCTIONS

**DETAIL B**  
ALTERNATE  
CONSTRUCTIONS

**NOTES:**

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSION: MILLIMETERS.
3. DIMENSION b APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.15 AND 0.30 mm FROM TERMINAL.
4. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.

DIM	MILLIMETERS		
	MIN	TYP	MAX
A	0.80	---	1.00
A1	0.00	---	0.05
A3	0.20 REF		
b	0.20	---	0.30
D	2.00 BSC		
D2	1.43	---	1.53
E	2.20 BSC		
E2	1.05	---	1.25
e	0.50 BSC		
K	0.20	0.22	0.30
L	0.25	---	0.35
L1	---	---	0.15

**GENERIC MARKING DIAGRAM\***

- XX = Specific Device Code
- M = Date Code
- = Pb-Free Device

\*This information is generic. Please refer to device data sheet for actual part marking.  
Pb-Free indicator, "G" or microdot "■", may or may not be present.

**SOLDERING FOOTPRINT\***

\*For additional information on our Pb-Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.
