Description

The PI3USB4000D is a 2-to-1 differential channel multiplexer/demultiplexer switch. C0+/C0- pins can tolerate voltages up to 24V. Over-voltage protection (OVP) is implemented at 4.75V to immediately switch off the channels when over-voltage condition is detected. PI3USB4000D can pass USB2.0 signal with bandwidth 1GHz to maintain signal integrity and eye diagram open.

Applications

- Smart Phone, USB-C application, Tablets, NB, PC

PI3USB4000D application in MHL Switching and provide overvoltage protection for D+/- when high voltage charging

Note:

The capacitor connected to REF pin should have rated voltage higher than maximum voltage applied to C0+/- pins; the max rating of device on C0+/- is 24V, customer can select lower voltage capacitor if system required lower voltage tolerance on C0+/-; capacitance of 1uF.

1. The 1uF capacitor recommend to be placed to the REF and GND pin of the device as close as possible
2. The decoupling capacitor at the VDD recommend to be placed to the device as close as possible.
3. Keep the trace between connector and device as long as possible; if needs inductor between device and connector, it recommend to be placed to the USB connector as close as possible and leaving some trace line between the device and the inductor would help some for the ESD performance.
