

## Features

- Precision supply-voltage monitor
  - 4.63V (PT7A7511, 7521, 7531)
  - 4.38V (PT7A7512, 7522, 7532)
  - 3.08V (PT7A7513, 7523, 7533)
  - 2.93V (PT7A7514, 7524, 7534)
  - 2.63V (PT7A7515, 7525, 7535)
- 200ms reset pulse width
- Debounced TTL/CMOS-compatible manual-reset input
- Independent watchdog timer 1.6sec time-out (not available for PT7A7531 - 7535)
- Reset output signal:
  - Active-low only (PT7A7511 - 7515)
  - Active-high only (PT7A7521 - 7525)
  - Active-high and active-low (PT7A7531 - 7535)
- Voltage monitor for power-fail or low battery warning
- Guaranteed  $\overline{\text{RESET}}/\text{RESET}$  valid at  $V_{CC}=1.2V$

## Description

The PT7A751X/752X/753X family micro-processor (μP) supervisory circuits are targeted to improve reliability and accuracy of power-supply circuitry in μP's systems. These devices reduce the complexity and number of components required to monitor power-supply and battery functions.

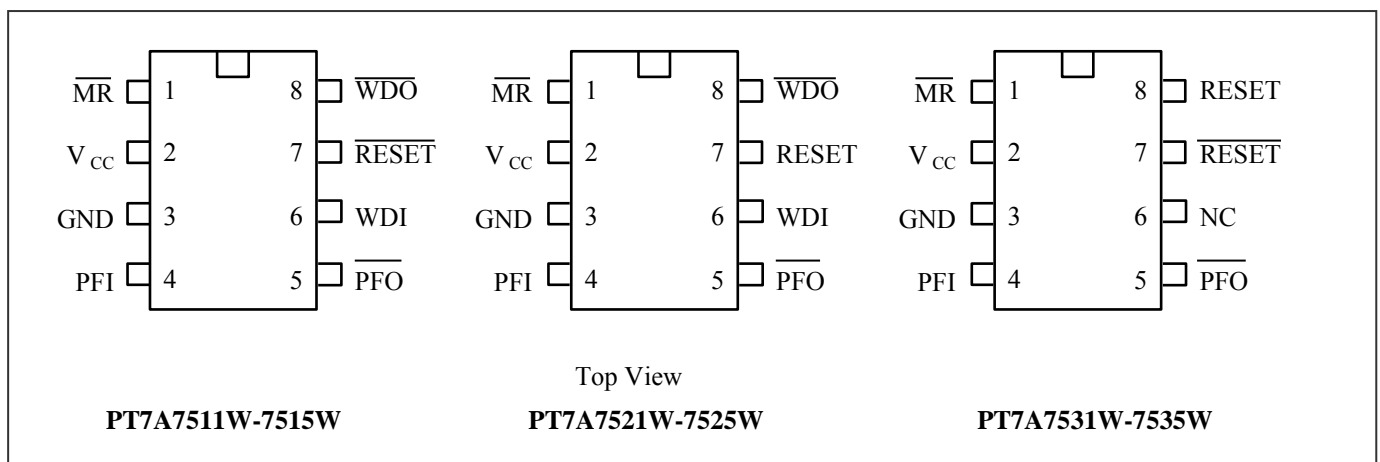

The main functions are:

1. Asserting reset output during power-up, power-down and brownout conditions for μP system.
2. Detecting power failure or low-battery conditions with a 1.25V threshold detector.
3. Watchdog functions (not for PT7A753x)

## Applications

- Power-supply circuitry in μP systems

## Pin Configuration

## Pin Description

| Pin                       | Type   | Description  |
|---------------------------|--------|--|
| $\overline{\text{MR}}$    | I      | <b>Manual-Reset:</b> triggers a reset pulse when pulled below 0.8V, active low. It has an internal 250 $\mu\text{A}$ pull-up current and be driven from a TTL or CMOS logic line as well as shorted to ground with a switch.   |
| $V_{\text{CC}}$           | Power  | <b>Supply Voltage.</b>   |
| GND                       | Ground | <b>Ground Reference</b> for all signals.   |
| PFI                       | I      | <b>Power-Fail Voltage Monitor Input.</b> When PFI is less than 1.25V, PFO goes low. Connect PFI to GND or $V_{\text{CC}}$ when not used.   |
| $\overline{\text{PFO}}$   | O      | <b>Power-Fail Output:</b> it gets low and sinks current when PFI is less than 1.25V; otherwise $\overline{\text{PFO}}$ stays high.   |
| WDI                       | I      | <b>Watchdog Input:</b> If WDI remains high or low for 1.6sec, the internal watchdog timer runs out and $\overline{\text{WDO}}$ goes low. Floating WDI or connecting WDI to a high-impedance three-state buffer disables the watchdog feature. The internal watchdog timer clears whenever reset is asserted. WDI is three-stated, or WDI sees a rising or falling edge.  |
| $\overline{\text{RESET}}$ | O      | <b>Reset Output pulses:</b> low for 200ms when triggered, and stays low whenever $V_{\text{CC}}$ is below the reset threshold. It remains low for 200ms after $V_{\text{CC}}$ rises above the reset threshold or $\overline{\text{MR}}$ goes from low to high. A watchdog timeout will not trigger $\overline{\text{RESET}}$ unless $\overline{\text{WDO}}$ is connected to $\overline{\text{MR}}$ .   |
| $\overline{\text{WDO}}$   | O      | <b>Watchdog Output:</b> pulls low when the internal watchdog timer finishes its 1.6sec count and does not go high again until the watchdog is cleared. $\overline{\text{WDO}}$ also goes low during low-line conditions. Whenever $V_{\text{CC}}$ is below the reset threshold, $\overline{\text{WDO}}$ stays low; however, unlike $\overline{\text{RESET}}$ , $\overline{\text{WDO}}$ does not have minimum pulse width. As soon as $V_{\text{CC}}$ rises above the reset threshold, $\overline{\text{WDO}}$ goes high with no delay. |
| RESET                     | O      | <b>The inverse of <math>\overline{\text{RESET}}</math></b> , active high. Whenever $\overline{\text{RESET}}$ is high, RESET is low.  |

**Block Diagram of PT7A7531-35**

**Maximum Ratings**

|   |                                |
|---|--------------------------------|
| Storage Temperature .....   | -65°C to +150°C                |
| Ambient Temperature with Power Applied.....                       | -40°C to +85°C                 |
| Supply Voltage to Ground Potential (V <sub>CC</sub> to GND) ..... | -0.3V to +7.0V                 |
| DC Input Voltage (All inputs except V <sub>CC</sub> and GND)..... | -0.3V to V <sub>CC</sub> +0.3V |
| DC Output Current (All outputs) .....                             | 20mA                           |
| Power Dissipation .....   | 500mW (Depend on package)      |

**Note:**

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

**Recommended Operation Conditions**

#### Watchdog Timing Diagram

#### Watchdog Timing Diagram

## Functional Description

The PT75xx family can assert reset output during power-up, power-down and brownout conditions for  $\mu\text{P}$  system, detect power failure or low-battery conditions with a 1.25V threshold detector and have watchdog functions. Refer to Function Table of PT7A75xx Family for their individual features. The typical application see Figure 4.

### Reset Output

The supervisory circuits can assert reset for a microprocessor during power-up, power-down and brownout to prevent code execution errors.

On power-up, once  $V_{CC}$  reaches about 1.2V,  $\overline{\text{RESET}}$  is a guaranteed logic low of 0.4V or less. As  $V_{CC}$  rises,  $\overline{\text{RESET}}$  stays low. When  $V_{CC}$  rises above the reset threshold, an internal timer releases  $\overline{\text{RESET}}$  after about 200ms.  $\overline{\text{RESET}}$  pulses low whenever  $V_{CC}$  drops below the reset threshold, i.e. brownout condition. If brownout occurs in the middle of a previously initiated reset pulse, the pulse continues for at least another 140ms. On power-down, once  $V_{CC}$  falls below the reset threshold,  $\overline{\text{RESET}}$  stays low and is guaranteed to be 0.4V or less until  $V_{CC}$  drops below 1.0V.

The PT7A752x and PT7A753x active-high RESET output is simply the inverse of the  $\overline{\text{RESET}}$  output, and is guaranteed to be valid with  $V_{CC}$  down to 1.2V. Some  $\mu\text{Ps}$ , such as Intel's 80C51, require an active-high reset pulse.

### Watchdog Timer

The watchdog circuit monitors the  $\mu\text{P}$  activity. If the  $\mu\text{P}$  does not toggle the watchdog input (WDI) within 1.6sec and WDI is not in high impedance, WDO goes low. As long as  $\overline{\text{RESET}}$  is asserted or the WDI input is in high impedance, the watchdog timer will stay cleared and will not count. As soon as reset is released and WDI is driven high or low, the timer will start counting. Pulses as short as 50ns can be detected.

Typically,  $\overline{\text{WDO}}$  will be connected to the non-maskable interrupt input (NMI) of a  $\mu\text{P}$ . When  $V_{CC}$  drops below the reset threshold,  $\overline{\text{WDO}}$  will go low whether or not the watchdog timer has timed out yet. Normally this would trigger an NMI interrupt, but  $\overline{\text{RESET}}$  goes low simultaneously, and thus overrides the NMI interrupt. If WDI is left unconnected,  $\overline{\text{WDO}}$  can be used as a low-line output. Since floating WDI disables the internal timer,  $\overline{\text{WDO}}$  goes low only when  $V_{CC}$  falls below the reset threshold, thus functioning as a low-line output. Do not apply voltage level over  $V_{CC}$ .

### Manual Reset

The manual-reset input ( $\overline{\text{MR}}$ ) allows reset to be triggered by a push button switch. The switch is effectively debounced by the 140ms minimum reset pulse width.  $\overline{\text{MR}}$  is TTL/CMOS logic compatible, so it can be driven by any logic reset output. Do not apply voltage level over  $V_{CC}$ .

### Power-Fail Comparator

The power-fail comparator will send out a Low signal once detects a voltage lowered than 1.25V. It can be used for various purposes because its output and non-inverting input are not internally connected. The inverting input is internally connected to a 1.25V reference.

### Typical Application Circuit
