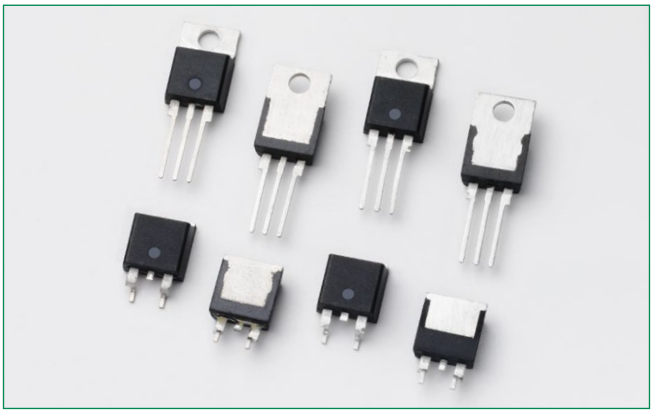
8 Amp Alternistor (High Commutation) Triac for LED dimmer application

Q6008xH1LED Series

RoHS



Description

Q6008xH1LED series is designed to meet low load current characteristics typical in LED lighting applications.

By keeping holding current at 6mA maximum, this Triac series is characterized and specified to perform best with LED loads. The Q6008xH1LED series is best suited for LED dimming controls to obtain the lowest levels of light output with a minimum probability of flickering.

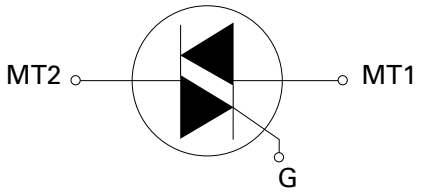
Main Features

Symbol	Value	Unit
$I_{T(RMS)}$	8	A
V_{DRM}/V_{RRM}	600	V
I_{GT}	10	mA

Schematic Symbol



Features

- As low as 6mA max holding current
- L - Package is UL Recognized for 2500Vrms
- 110°C rated junction temperature
- di/dt performance of 70A/µs
- QUADRAC version includes intergrated DIAC
- Provides full control of light out put at the extreme low end of load conditions
- 2500V_{AC} min isolation between mounting tab and active terminals
- Improves margin of safe operation with less heat sinking required
- Enable survivability of typically LED load operating characteristics
- Simplicity of circuit design & layout
- UL Recognized to UL 1557

Applications

Excellent for AC switching and phase control applications such as heating, lighting, and motor speed controls.

Typical applications are AC solid-state switches, lighting controls with LED lamp loads, small low current motor in power tools, and low current motors in home/brown goods appliances.

Internally constructed isolated packages are offered for ease of heat sinking with highest isolation voltage.

Design Considerations

Careful selection of the correct component for the application's operating parameters and environment will go a long way toward extending the operating life of the Thyristor. Good design practice should limit the maximum continuous current through the main terminals to 75% of the component rating. Other ways to ensure long life for a power discrete semiconductor are proper heat sinking and selection of voltage ratings for worst case conditions. Overheating, overvoltage (including dv/dt), and surge currents are the main killers of semiconductors. Correct mounting, soldering, and forming of the leads also help protect against component damage.
