This document describes the hardware features of the Arria[®] 10 SoC development board, including the detailed pin-out and component reference information required to create custom FPGA designs that interface with all components of the board.

General Description

The Arria 10 SoC development board provides a hardware platform for developing and prototyping low-power, high-performance, and logic-intensive designs using Altera's[®] Arria 10 SoC. The board provides a wide range of peripherals and memory interfaces to facilitate the development of Arria 10 SoC designs.

For more information about the Arria 10 SoC device family, refer to the [Arria 10 SoC documentation support page](#).

Related Information

[Arria 10 Documentation](#)

Board Component Blocks

The development board features the following major component blocks:

- Arria 10 Soc (10AS066N3F40E2SGE2) in a 1517-pin FBGA (FineLine Ball-Grid Array) package
- FPGA configuration circuitry
 - Active Serial (AS) x1 or x4 configuration (EPCQ1024L)
 - MAX[®] V CPLD (5M2210ZF256) in a 256-pin FBGA package as the system controller
 - MAX V CPLD (5M2210ZF256) in a 256-pin FBGA package as the I/O multiplier CPLD
- Clocking circuitry
 - SI5338 programmable oscillator
 - LMK04828 clock cleaner
 - HPS clock options: 25 MHz, 33 MHz, and SMA input (2V5 LVCMOS)
 - SI5112 100MHz clock generator for PCIe interface
 - SI516 148.5 MHz voltage control oscillator for SDI interface
- Supported Memory
 - HPS memory size (HiLO card):
 - 2GB DDR3 (256Mb x 40 x dual rank)
 - 1GB DDR3 (256Mb x 40 x single rank)
 - 1GB DDR4 (256Mb x 40 x single rank) - *ships with kit*
 - FPGA memory size (HILO Card):
 - 4GB DDR3 (256Mb x72 x dual rank)
 - 2GB DDR3 (256Mb x72 x single rank)
 - 2GB DDR4 (256Mb x 72 x single rank) - *ships with kit*
 - 16MB QDRV (4Mb x 36)
 - 128MB RLD RAM3(16Mb x 72)
 - HPS Boot Flash (Flash card):
 - NAND flash (x8) : 128MB (MT29F1G08ABBEAH4) - *ships with kit*
 - QSPI flash: 128MB (MT25QU01GBBA8E12-0SIT) - *ships with kit*
 - SD Micro flash card: 4GB (Kingston) - *ships with kit*
 - Optional FPGA File Flash (Flash card):
 - NAND flash (x8): 128MB (MT29F1G08ABBEAH4)
 - QSPI flash: 128MB (MT25QU01GBBA8E12-0SIT)
 - SD Micro flash card: 4GB (Kingston)

- Communication ports
 - HPS Communication ports:
 - USB 2.0 port (PHY PN: USB3320C-EZK)
 - RGMII 10/100/1000 Ethernet port (PHY PN: KSZ9031RNXCA)
 - USB-UART port (FT232R)
 - DB-9 RS-232 Port (MAX3221)
 - I²C port (I2C1 of shared I/O bit 12 and 13)
 - FPGA I/O connections:
 - FPGA V57.1 High Pin Count FMC slot
 - FPGA Altera Low Pin Count FMC slot
 - FMC_PCIe Gen2 x8 EP cable
 - FPGA PCIe GEN1/2/3 x8 RC slot
 - FPGA Communication ports:
 - 2x SGMII Gigabit Ethernet ports (PHY PN: 88E1111-B2-NDC2C000)
 - 2x 10Gb/s SFP+ ports
 - Display port (DP)
 - SDI/SDO video port
 - SPI port
 - UART port
 - FPGA Debug ports:
 - 16-bit Trace port (FPGA Trace)

- General user I/O
 - LEDs and displays
 - 4x FPGA user LEDs
 - 4x HPS user LEDs
 - Configuration load LED
 - Configuration done LED
 - Error LED
 - 3x Configuration select LEDs
 - 4x On-board USB-Blaster II status LEDs
 - 2x FMC interface LEDs
 - 2x UART data transmit and receive LEDs
 - Power on LED
 - Two-line character LCD display
 - Push buttons
 - CPU cold reset push button and one CPU warm reset push button
 - Logic reset push button
 - Program select push button
 - Program configuration push button
 - 4x FPGA user push buttons
 - 4x HPS user push buttons
 - External interrupt push button
 - DIP Switches
 - JTAG chain control DIP switch
 - Board settings DIP switch
 - FPGA configuration mode DIP switch
 - General user DIP switch
 - Power supply
 - 12V DC Input
 - Mechanical
 - 7.175" x 9.3" rectangular form factor

Recommended Operating Conditions

- Recommended ambient operating temperature range: 0C to 45C
- Maximum ICC load current: 36A
- Maximum ICC load transient percentage: 30%
- FPGA maximum power supported by the supplied heatsink/fan: 40W

Handling the Board

When handling the board, it is important to observe static discharge precautions.

Caution: Without proper anti-static handling, the board can be damaged. Therefore, use anti-static handling precautions when touching the board.

Board Inspection

To inspect each board, perform these steps:

1. Place the board on an anti-static surface and inspect it to ensure that it has not been damaged during shipment.

Caution: Without proper anti-static handling, you can damage the board.

2. Verify that all components on the boards appear in place and intact.

For more information about power consumption and thermal modeling, refer to *AN358: Thermal Management for FPGAs*.

Installing the Subscription Edition of the Quartus Prime Design Software

The Quartus[®] Prime Pro Edition software provides the necessary tools used for developing hardware and software for Altera devices.

© 2016 Altera Corporation. All rights reserved. ALTERA, ARRIA, CYCLONE, ENPIRION, MAX, MEGACORE, NIOS, QUARTUS and STRATIX words and logos are trademarks of Altera Corporation and registered in the U.S. Patent and Trademark Office and in other countries. All other words and logos identified as trademarks or service marks are the property of their respective holders as described at www.altera.com/common/legal.html. Altera warrants performance of its semiconductor products to current specifications in accordance with Altera's standard warranty, but reserves the right to make changes to any products and services at any time without notice. Altera assumes no responsibility or liability arising out of the application or use of any information, product, or service described herein except as expressly agreed to in writing by Altera. Altera customers are advised to obtain the latest version of device specifications before relying on any published information and before placing orders for products or services.

ISO
9001:2008
Registered

Included in the Quartus Prime Pro Edition software are the Quartus Prime software, the Nios II EDS, and the MegaCore IP Library. To install the Altera development tools, download the Quartus Prime Pro Edition Software from the Quartus Prime Pro Edition page in the Download Center of the Altera website.

Related Information

[Quartus Prime Software page](#)

Activating Your License

Purchasing this kit entitles you to a one-year license for the Development Kit Edition (DKE) of the Quartus Prime software. After the year, your DKE license will no longer be valid and you will not be permitted to use this version of the Quartus Prime software. To continue using the Quartus Prime software, you should purchase a subscription to Quartus Prime Pro or Standard Edition.

Before using the Quartus Prime software, you must activate your license, identify specific users and computers, and obtain and install a license file. If you already have a licensed version of the subscription edition, you can use that license file with this kit. If not, follow these steps:

1. Log on at the [myAltera Account Sign In](#) web page, and click **Sign In**.
2. On the myAltera Home web page, click the Self-Service Licensing Center link.
3. Locate the serial number printed on the side of the development kit box below the bottom bar code. The number consists of alphanumeric characters and does not contain hyphens.
4. On the Self-Service Licensing Center web page, click the Find it with your License Activation Code link.
5. In the **Find/Activate Products** dialog box, enter your development kit serial number and click **Search**.
6. When your product appears, turn on the check box next to the product name.
7. Click **Activate Selected Products**, and click **Close**.
8. When licensing is complete, Altera emails a **license.dat** file to you. Store the file on your computer and use the License Setup page of the **Options** dialog box in the Quartus Prime software to enable the software.

Installing the Altera SoC Embedded Development Suite (EDS)

The Altera SoC EDS is a comprehensive tool suite for embedded software development on Altera SoC devices. It contains development tools, utility programs, run-time software, and application examples to expedite firmware and application software of SoC embedded systems.

As a part of the Altera SoC EDS, the ARM DS-5 Altera Edition Toolkit provides a comprehensive set of embedded development tools for Altera SoCs.

For more information, refer to the *ARM Development Studio 5 (DS-5) Altera Edition Toolkit*.

For the steps to install the SoC EDS Tool Suite, refer to the *Altera SoC Embedded Design Suite User Guide*.

Related Information

- [ARM Development Studio 5 \(DS-5\) Altera Edition Toolkit](#)
- [Altera SoC Embedded Design Suite User Guide](#)

Development Kit Installer

The development kit installer is an installable archive of supporting documentation. It does not include the software or documentation for the Quartus Prime design software, nor does it include the SoC EDS software development tools.

1. Download the Arria 10 FPGA Development Kit installer from the Arria 10 FPGA Development Kit page of the Altera website. Alternatively, you can request a development kit DVD from the Altera Kit Installations DVD Request Form page of the Altera website.
2. Run the Arria 10 FPGA Development Kit installer.
3. Follow the on-screen instructions to complete the installation process. Be sure that the installation directory you choose is in the same relative location to the Quartus Prime software installation. The installation program creates the development kit directory structure shown in the following figure.

Figure 2-1: Installed Development Kit Directory Structure

Table 2-2: Installed Directory Contents

Directory Name	Description of Contents
board_design_files	Contains schematic, layout, assembly, and bill of material board design files. Use these files as a starting point for a new prototype board design.
demos	Contains demonstration applications when available.
documents	Contains the documentation.
examples	Contains the sample design files for this kit.
factory_recovery	Contains the original data programmed onto the board before shipment. Use this data to restore the board with its original factory contents.

Installing the USB-Blaster Driver

The development board includes integrated USB-Blaster circuitry for FPGA programming. However, for the host computer and board to communicate, you must install the on-board USB-Blaster II driver on the host computer.

Installation instructions for the on-board USB-Blaster II driver for your operating system are available on the Altera website. On the Altera Programming Cable Driver Information page of the Altera website, locate the table entry for your configuration and click the link to access the instructions.

Related Information

[Altera Programming Cable Driver Information](#)

SD Card Image with Example Software

The Arria 10 GSRD (Golden System Reference Design) page on Rocketboards.org has instructions to create an SD card image.

This section describes how to apply power to the board and provides default switch and jumper settings.

Applying Power to the Board

This development kit ships with its board switches preconfigured to support the design examples in the kit.

If you suspect that your board might not be currently configured with the default settings, follow the instructions in the Default Switch and Jumper Settings section of this chapter.

1. Power up the development board by using the included power supply.

Caution: Use only the supplied power supply. Power regulation circuitry on the board can be damaged by power supplies with greater voltage, and a lower-rated power supply may not be able to provide enough power for the board.

2. When configuration is complete, the configuration done green LED (D18) illuminates, signaling that the Arria 10 SoC device is configured successfully.

Default Switch and Jumper Settings

This topic shows you how to restore the default factory settings and explains their functions.

Caution: Do not install or remove jumpers (shunts) while the development board is powered on.

Figure 3-1: Default Switch and Jumper Settings

Note: The Switch position is represented by the black box.

To restore the switches to their factory default settings, perform these steps:

1. Set the DIP switch bank (SW1) to match "SW1 DIP Switch Settings" table and the "Default Switch and Jumper Settings" figure.

Note: In the following table, *ON* indicates the switch is to the upper position according to the board orientation as shown in the "Default Switch and Jumper Settings" figure.

Table 3-1: SW1 Factory Default Settings

Switch	Bit Name	Bit Function	Default Position
1	I ² C flag	Switch 1.1 has the following options: <ul style="list-style-type: none"> ON (0) = System MAX V is the I²C master OFF (1) = HPS is the I²C master 	OFF
2	DC_POWER_CTRL	Switch 1.2 has the following options: <ul style="list-style-type: none"> ON (0) = Power off PCIE slot when it is present OFF (1) = Power up PCIE directly 	OFF
3	factory_load	Switch 1.3 has the following options: <ul style="list-style-type: none"> ON (0) = Load user design from flash at power up OFF (1) = Load factory design from flash at power up 	OFF
4	security_mode	Reserved	OFF

Table 3-2: SW4 Switch Settings

Switch	Bit Name	Bit Function	Default Position
1	Reserved	Reserved	OFF
2	MSEL0	Switch 4.2 has the following options: <ul style="list-style-type: none"> ON (Up) = MSEL0 is 1 OFF (Down) = MSEL0 is 0 	OFF
3	MSEL1	Switch 4.3 has the following options: <ul style="list-style-type: none"> ON (Up) = MSEL1 is 1 OFF (Down) = MSEL1 is 0 	OFF
4	MSEL2	Switch 4.4 has the following options: <ul style="list-style-type: none"> ON (Up) = MSEL2 is 1 OFF (Down) = MSEL2 is 0 	OFF

Table 3-3: MSEL Settings for each Configuration Scheme of Arria 10 SoC Devices

Configuration	V _{ccpgm} (V)	Power-On Reset (POR delay)	Valid MSEL [2:0]
JTAG-based configuration	-	-	Use any valid MSEL pin settings below
AS-Active Serial (x1 and x4)	1.8	Fast	010
		Standard	011
PS-Passive Serial	1.2/1.5/1.8	Fast	000
		Standard	001

- Set the DIP switch bank (SW3) to match the following tables:

Table 3-4: SW3 Factory Default Settings

Switch	Board Label	Function	Default Position
1	Arria 10	ON- Arria 10 JTAG Bypass OFF- Arria 10 JTAG Enable	OFF
2	IO MAX V	ON- MAX V JTAG Bypass OFF- MAX V JTAG Enable	OFF
3	FMCA	ON- FMCA JTAG Bypass OFF- FMCA JTAG Enable	ON
4	FMCB	ON- FMCB JTAG Bypass OFF- FMCB JTAG Enable	ON
5	PCIe	ON- PCIe JTAG Bypass OFF- PCIe JTAG Enable	ON
6	MSTR0	On-Board USB Blaster II JTAG Master	OFF
7	MSTR1	On-Board USB Blaster II JTAG Master	OFF
8	MSTR2	On-Board USB Blaster II JTAG Master	OFF

3. Set the following jumper blocks to match the table below:

Table 3-5: Default Jumper Settings

Board Reference	Board Label	Description	Default Position
J16, J17	OSC2_CLK_SEL	<ul style="list-style-type: none"> 00 (SHORT, SHORT): Selects the on-board 25MHz clock 01 (SHORT, OPEN): Selects SMA clock which connected to J15 10 (OPEN, SHORT): Selects the on-board 33MHz clock 11 (OPEN, OPEN): none 	SHORT, SHORT
J30	HPS Core Voltage	<ul style="list-style-type: none"> SHORT: HPS core 0.95 V OPEN: HPS core 0.9 V 	OPEN
J32	Voltage of FMCBVADJ	<ul style="list-style-type: none"> No SHORT: 1.1 V SHORT 1 and 2: 1.2 V SHORT 3 and 4: 1.25 V SHORT 5 and 6: 1.35 V SHORT 7 and 8: 1.5 V SHORT 9 and 10: 1.8 V 	SHORT 9 and 10

This kit includes an application called the Board Test System (BTS). The BTS provides an easy-to-use interface to alter functional settings and observe the results.

Figure 4-1: Board Test System GUI

© 2016 Altera Corporation. All rights reserved. ALTERA, ARRIA, CYCLONE, ENPIRION, MAX, MEGACORE, NIOS, QUARTUS and STRATIX words and logos are trademarks of Altera Corporation and registered in the U.S. Patent and Trademark Office and in other countries. All other words and logos identified as trademarks or service marks are the property of their respective holders as described at www.altera.com/common/legal.html. Altera assumes no responsibility or liability arising out of the application or use of any information, product, or service described herein except as expressly agreed to in writing by Altera. Altera customers are advised to obtain the latest version of device specifications before relying on any published information and before placing orders for products or services.

ISO
9001:2008
Registered

You can use the BTS to test board components, modify functional parameters, observe performance, and measure power usage. While using the BTS, you reconfigure the FPGA several times with test designs specific to the functionality you are testing.

Several designs are provided to test the major board features. Each design provides data for one or more tabs in the application. The Configure menu identifies the appropriate design to download to the FPGA for each tab.

After successful FPGA configuration, the appropriate tab appears that allows you to exercise the related board features. Highlights appear in the board picture around the corresponding components.

The BTS communicates over the JTAG bus to a test design running in the FPGA. The Board Test System and Power Monitor share the JTAG bus with other applications like the Nios II debugger and the SignalTap[®] II Embedded Logic Analyzer.

Note: Because the BTS is designed based on the Quartus Prime Programmer and system console, be sure to close the other applications before you use the BTS application.

Preparing the Board

After successful FPGA configuration, follow these steps:

1. Connect the USB cable to your PC and the USB Blaster II port.
2. Change SW1 and SW3 to the following configuration:

Table 4-1: SW1 GUI Mode

Bit1	Bit2	Bit3	Bit4
ON	OFF	OFF	OFF

Table 4-2: SW3 GUI Mode

Bit1	Bit2	Bit3	Bit4	Bit5	Bit6	Bit7	Bit8
OFF	OFF	ON	ON	ON	OFF	ON	OFF

3. Run the BTS with Quartus Prime 15.1 Programmer.

The application cannot run correctly unless Quartus Prime 15.1 Programmer is opened.

Note: Do not use the Auto Detect function in the Quartus Prime Programmer. It may cause the board power to reset.

Running the Board Test System

To run the Board Test System (BTS), navigate to the **<Package Root Dir>\examples\board_test_system** directory and run the **BoardTestSystem.exe** application.

On Windows, you can also run the BTS from the **Start > All Programs > Altera** menu.

The BTS relies on the Quartus Prime software's specific library. Before running the BTS, open the Quartus Prime software to automatically set the environment variable `$QUARTUS_ROOTDIR`. The Board Test System uses this environment variable to locate the Quartus Prime library.

Note: The version of Quartus Prime software set in the `$QUARTUS_ROOTDIR` environment variable should be version 14.1 or later.

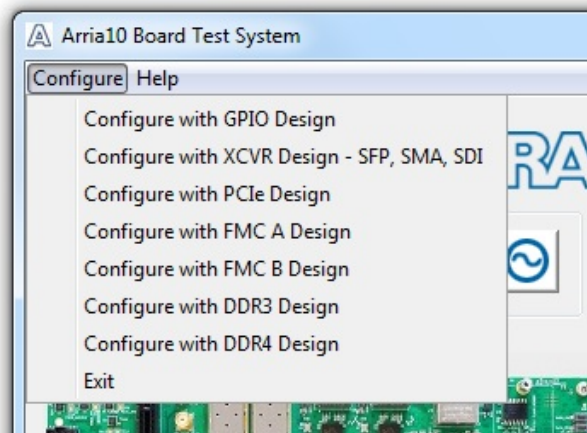

Using the Board Test System

This section describes each control in the Board Test System application.

Using the Configure Menu

Use the Configure menu to select the design you want to use. Each design example tests different board features. Choose a design from this menu and the corresponding tabs become active for testing.

Figure 4-2: The Configure Menu

To configure the FPGA with a test system design, perform the following steps:

1. On the **Configure** menu, click the configure command that corresponds to the functionality you wish to test.
2. In the dialog box that appears, click **Configure** to download the corresponding design to the FPGA.

Figure 4-3: Programmer Dialog Window

The System Info Tab

The System Info tab shows the board's current configuration. The tab displays the JTAG chain, the Qsys memory map, and other details stored on the board.

Figure 4-4: The System Info Tab

Table 4-3: Controls on the System Info Tab

Controls	Description
Board Information	The board information is updated once the GPIO design is configured. Otherwise, this control displays the default static information about your board.
Board Name	Indicates the official name of the board, given by the Board Test System.
Board P/N	Indicates the part number of the board.
Serial Number	Indicates the serial number of the board.

Controls	Description
Factory Test Version	Indicates the version of the Board Test System currently running on the board.
JTAG Chain	Shows all the devices currently in the JTAG chain.
Qsys Memory Map	Shows the memory map of the Qsys system on your board.

The GPIO Tab

The GPIO tab allows you to interact with all the general purpose user I/O components on your board. You can read DIP switch settings, turn LEDs on or off, and detect push button presses.

Figure 4-5: The GPIO Tab

Table 4-4: Controls on the GPIO Tab

User DIP Switch	Displays the current positions of the switches in the user DIP switch bank (SW2). Change the switches on the board to see the graphical display change accordingly.
User LEDs	Displays the current state of the user LEDs for the FPGA. To toggle the board LEDs, click one of the LED [0 to 3] buttons to toggle the 4 green LEDs, or click the All button.

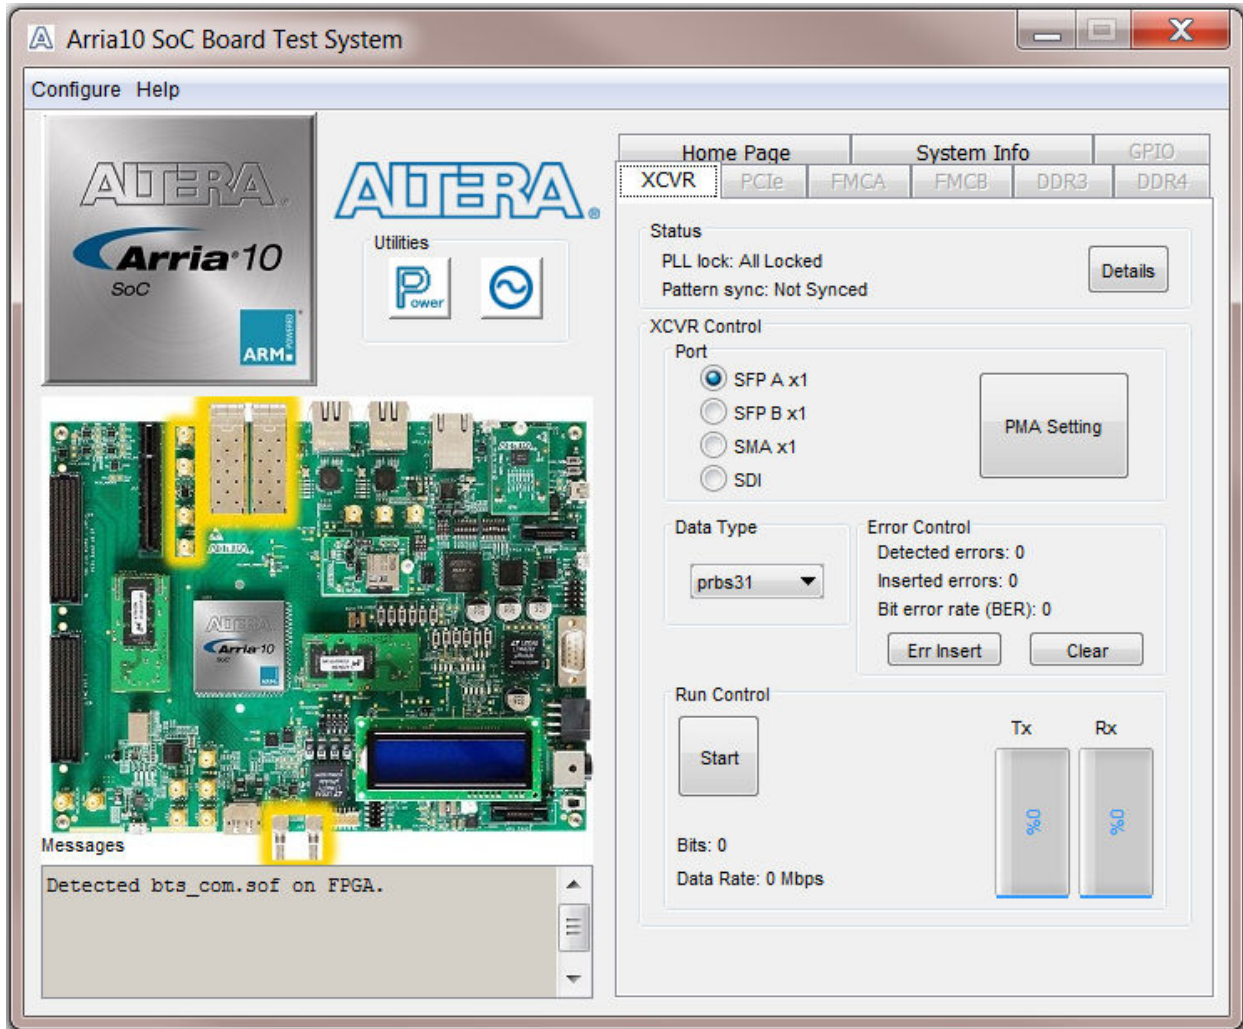

Push Button Switches

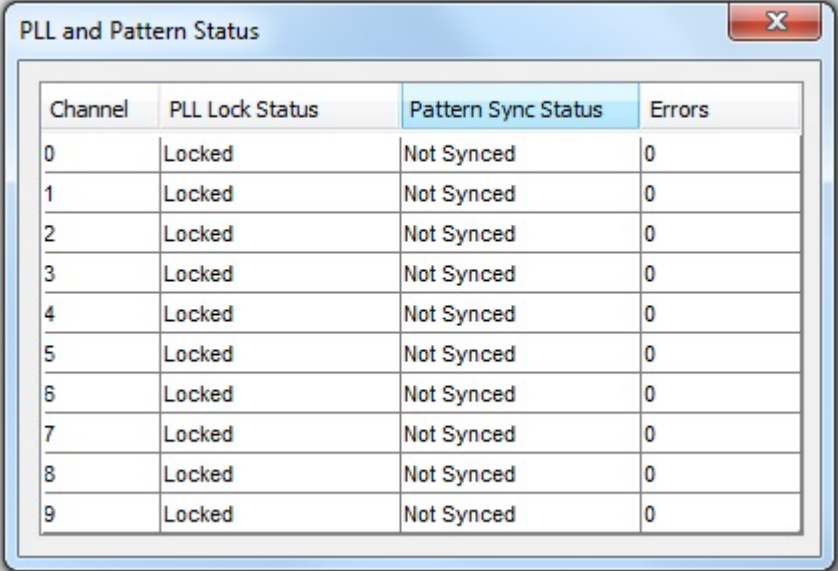

Read-only control displays the current state of the board user push buttons. Press a push button on the board to see the graphical display change accordingly.

The XCVR Tab

This tab allows you to perform loopback tests on the QSFP, SFP, SMA, and SDI ports.

Figure 4-6: The XCVR Tab

Control	Description																																												
Status	<p>Displays the following status information during a loopback test:</p> <p>PLL lock—Shows the PLL locked or unlocked state.</p> <p>Pattern sync—Shows the pattern synced or not synced state. The pattern is considered synced when the start of the data sequence is detected.</p> <p>Details—Shows the PLL lock and pattern sync status, and detected errors of each channels.:</p>  <table border="1" data-bbox="558 548 1357 1020"> <thead> <tr> <th>Channel</th> <th>PLL Lock Status</th> <th>Pattern Sync Status</th> <th>Errors</th> </tr> </thead> <tbody> <tr><td>0</td><td>Locked</td><td>Not Synced</td><td>0</td></tr> <tr><td>1</td><td>Locked</td><td>Not Synced</td><td>0</td></tr> <tr><td>2</td><td>Locked</td><td>Not Synced</td><td>0</td></tr> <tr><td>3</td><td>Locked</td><td>Not Synced</td><td>0</td></tr> <tr><td>4</td><td>Locked</td><td>Not Synced</td><td>0</td></tr> <tr><td>5</td><td>Locked</td><td>Not Synced</td><td>0</td></tr> <tr><td>6</td><td>Locked</td><td>Not Synced</td><td>0</td></tr> <tr><td>7</td><td>Locked</td><td>Not Synced</td><td>0</td></tr> <tr><td>8</td><td>Locked</td><td>Not Synced</td><td>0</td></tr> <tr><td>9</td><td>Locked</td><td>Not Synced</td><td>0</td></tr> </tbody> </table>	Channel	PLL Lock Status	Pattern Sync Status	Errors	0	Locked	Not Synced	0	1	Locked	Not Synced	0	2	Locked	Not Synced	0	3	Locked	Not Synced	0	4	Locked	Not Synced	0	5	Locked	Not Synced	0	6	Locked	Not Synced	0	7	Locked	Not Synced	0	8	Locked	Not Synced	0	9	Locked	Not Synced	0

The DDR3 Tab

This tab allows you to read and write DDR3 memory on your board.

Figure 4-10: The DDR3 Tab

Control	Description
Performance Indicators	<p>These controls display current transaction performance analysis information collected since you last clicked Start:</p> <ul style="list-style-type: none"> • Write, Read, and Total performance bars—Show the percentage of maximum theoretical data rate that the requested transactions are able to achieve. • Write (MBps), Read (MBps), and Total (MBps)—Show the number of bytes of data analyzed per second. • Data bus: 72 bits (8 bits ECC) wide and the frequency is 1066 MHz double data rate. 2133 Megabits per second (Mbps) per pin. Equating to a theoretical maximum bandwidth of 136512 Mbps or 17064 MBps.
Error Control	<p>This control displays data errors detected during analysis and allows you to insert errors:</p> <ul style="list-style-type: none"> • Detected errors—Displays the number of data errors detected in the hardware. • Inserted errors—Displays the number of errors inserted into the transaction stream. • Insert Error—Inserts a one-word error into the transaction stream each time you click the button. Insert Error is only enabled during transaction performance analysis. • Clear—Resets the Detected errors and Inserted errors counters to zeroes.
Number of Addresses to Write and Read	<p>Determines the number of addresses to use in each iteration of reads and writes.</p>

The DDR4 Tab

This tab allows you to read and write DDR4 memory on your board.

Figure 4-11: The DDR4 Tab

Control	Description
Start	Initiates DDR4 memory transaction performance analysis.
Stop	Terminates transaction performance analysis.

Control	Description
Performance Indicators	<p>These controls display current transaction performance analysis information collected since you last clicked Start:</p> <ul style="list-style-type: none"> • Write, Read, and Total performance bars—Show the percentage of maximum theoretical data rate that the requested transactions are able to achieve. • Write (MBps), Read (MBps), and Total (MBps)—Show the number of bytes of data analyzed per second. • Data bus: 72 bits (8 bits ECC) wide and the frequency is 1066 MHz double data rate. 2133 Megabits per second (Mbps) per pin. Equating to a theoretical maximum bandwidth of 136512 Mbps or 17064 MBps.
Error Control	<p>This control displays data errors detected during analysis and allows you to insert errors:</p> <ul style="list-style-type: none"> • Detected errors—Displays the number of data errors detected in the hardware. • Inserted errors—Displays the number of errors inserted into the transaction stream. • Insert Error—Inserts a one-word error into the transaction stream each time you click the button. Insert Error is only enabled during transaction performance analysis. • Clear—Resets the Detected errors and Inserted errors counters to zeroes.
Number of Addresses to Write and Read	<p>Determines the number of addresses to use in each iteration of reads and writes.</p>

The Power Monitor

The Power Monitor measures and reports current power information and communicates with the MAX V device on the board through the JTAG bus. A power monitor circuit attached to the MAX V device allows you to measure the power that the FPGA is consuming.

To start the application, click the Power Monitor icon in the Board Test System application. You can also run the Power Monitor as a stand-alone application. The **PowerMonitor.exe** resides in the **<Package Root Dir>\examples\board_test_system** directory.

Note: You cannot run the stand-alone power application and the BTS application at the same time. Also, you cannot run power and clock interface at the same time.

Figure 4-12: Power Monitor Interface

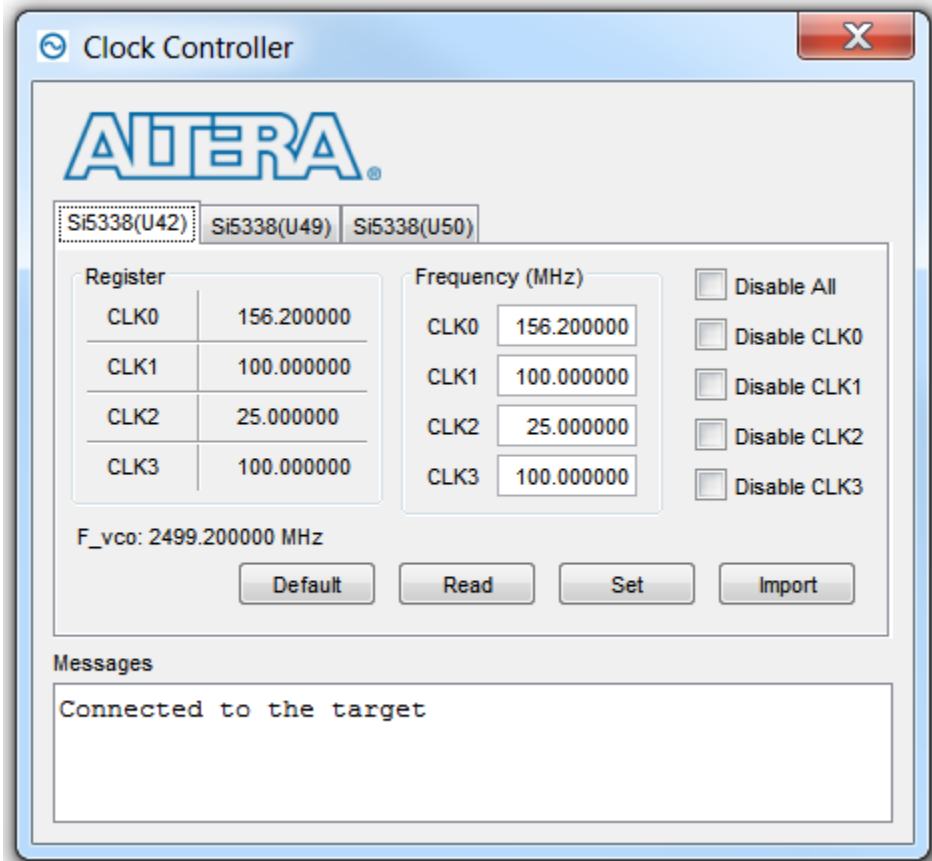

Control	Description
Test Settings	<p>Displays the following controls:</p> <p>Power Rail—Indicates the currently-selected power rail. After selecting the desired rail, click Reset to refresh the screen with updated board readings.</p> <p>Scale—Specifies the amount to scale the power graph. Select a smaller number to zoom in to see finer detail. Select a larger number to zoom out to see the entire range of recorded values.</p> <p>Speed—Specifies how often to refresh the graph.</p>
Power Information	Displays root-mean-square (RMS) current, maximum, and minimum numerical power readings in mA.
Graph	Displays the mA power consumption of your board over time. The green line indicates the current value. The red line indicates the maximum value read since the last reset. The yellow line indicates the minimum value read since the last reset.
General Information	Displays MAX V version and current temperature of the FPGA and board.
Reset	Clears the graph, resets the minimum and maximum values, and restarts the Power Monitor.

The Clock Control

The Clock Control application sets the three programmable oscillators to any frequency between 10 MHz and 810 MHz. The frequencies support eight digits of precision to the right of the decimal point.

The Clock Control communicates with the MAX V device on the board through the JTAG bus. The programmable oscillators are connected to the MAX V device through a 2-wire serial bus.

Figure 4-13: Clock Controller Window

Control	Description
Serial Port Registers	Shows the current values for selected Si5338 registers for frequency configuration.
Target frequency (MHZ)	Allows you to specify the frequency of the clock. Legal values are between 10 and 810 MHz with eight digits of precision to the right of the decimal point. For example, 421.31259873 is possible within 100 parts per million (ppm). The Target frequency control works in conjunction with the Set New Freq control.
fXTAL	Shows the calculated internal fixed-frequency crystal, based on the serial port register values.
Default	Sets the frequency for the oscillator associated with the active tab back to its default value. The default is restored by power cycling the board.

Control	Description
Set New Freq	Sets the programmable oscillator frequency for the selected clock to the value in the Target frequency control for the programmable oscillators. Frequency changes might take several milliseconds to take effect. You might see glitches on the clock during this time. Altera recommends resetting the FPGA logic after changing frequencies.

Each Si5338 tab for U26 and U14 display the same GUI controls for each clock generators. Each tab allows for separate control. The Si5338 is capable of synthesizing four independent user-programmable clock frequencies up to 350 MHz and select frequencies up to 710 MHz.

Control	Description
F_vco	Displays the generating signal value of the voltage-controlled oscillator.
Registers	Display the current frequencies for each oscillator.
Frequency (MHz)	Allows you to specify the frequency of the clock.
Disable all	Disable all oscillators at once.
Read	Reads the current frequency setting for the oscillator associated with the active tab.
Default	Sets the frequency for the oscillator associated with the active tab back to its default value. The default is restored by power cycling the board.
Set New Freq	Sets the programmable oscillator frequency for the selected clock to the value in the CLK0 to CLK3 controls for each Si5338. Frequency changes might take several milliseconds to take effect. You might see glitches on the clock during this time. Altera recommends resetting the FPGA logic after changing frequencies.
Import Reg Map	Import register map file generated from Silicon Laboratories ClockBuilder Desktop.

This chapter introduces the major components on the Arria 10 SoC development board. The board overview figure illustrates the component locations and the board components table provides a brief description of all component features of the board.

A complete set of schematics, a physical layout database, and fabrication files for the development board reside in the Arria 10 SoC development kit board design files directory.

Board Overview

This section provides an overview of the Arria 10 SoC development board, including an annotated board image and component descriptions. The figure below shows an overview of the board features.

Board Reference	Type	Description
SW4	MSEL DIP Switch	Controls the configuration scheme on the board. MSEL pin 0, 1 and 2 connect to the DIP switch.
J22	Mini-USB header	USB interface for FPGA programming and debugging through the on-board USB-Blaster II JTAG via a type-B USB cable.
SW1	Function Dip switch	Selects I ² C Master, Controls PCIE slot power, and selects FGPA image source.
S8	Program select push button	Toggles the program select LEDs, which selects the program image that loads from flash memory to the FPGA.
S7	Configure push button	Load image from flash memory to the FPGA based on the settings of the program select LEDs.
D18	Configuration done LED	Illuminates when the FPGA is configured.
D19	Load LED	Illuminates when the MAX V CPLD 5M2210 System Controller is actively configuring the FPGA.
D17	Error LED	Illuminates when the FPGA configuration from flash memory fails.
D42	Power LED	Illuminates when 3.3-V power is present.
D13, D14	JTAG TX/RX LEDs	Indicates the transmit or receive activity of the JTAG chain. The TX and RX LEDs flicker if the link is in use and active. The LEDs are either off when not in use or on when in use but idle.
D20-D22	Program select LEDs	Illuminates to show which flash memory image loads to the FPGA when you press the program select push button.
D23, D24	FMC port present LEDs	Illuminates when a daughtercard is plugged into the FMC port.
D11, D12	UART LEDs	Illuminates when UART transmitter and receiver are in use.

Clock Circuitry

U42	Multi-output oscillator	Si5338A quad-output fixed oscillator with 156.25 MHz, 100MHz, 25MHz, and 100MHz outputs.
U54	148.5-MHz Oscillator	Programmable oscillator with a default frequency of 148.5 MHz. The frequency is programmable using the clock control GUI running on the MAX V CPLD 5M2210 System Controller.
U51	50-MHz oscillator	50.000-MHz crystal oscillator for general purpose logic
U11	Multi-output oscillator	Two 100 MHz outputs for PCIe application
J13, J14	Clock input SMA connector	External clock inputs for the transceiver test port
J15	HPS SMA clock	Drives LVCMOS to HPS clock multiplexer.
U50	Multi-output oscillator	Si5338A quad-output fixed oscillator with 125MHz, 270MHz, 100MHz, and 100MHz outputs.

Board Reference	Type	Description
U49	Multi-output oscillator	Si5338A quad-output fixed oscillator with four 133.33MHz outputs.
U26	Multi-output clock cleaner	LMK04828 Clock cleaner
General User Input/Output		
D25-D32	User LEDs	Four user LEDs and four HPS LEDs. Illuminate when driven low.
SW2	User DIP switch	User DIP switch. When the switch is ON, a logic 0 is selected.
S10	FPGA reset push button	Reset the FPGA logic
S9	HPS External Interrupt Push button	HPS external interrupt
S3-S6 S11-S14	General user push buttons	Four user push buttons and four HPS push buttons. Driven low when pressed.
S1, S2	HPS reset push buttons	HPS cold/warm reset push buttons
Memory Connectors		
J26	HPS HILO Memory connector	HPS memory card include DDR3 HILO memory card and DDR4 HILO memory card
J23	Boot Flash Connector	Boot flash card options include QSPI flash card, SD micro flash card and NAND flash card
J27	FPGA HILO Connector	FPGA memory card options include DDR3 HILO memory card , and DDR4 HILO memory card
U19	FPCQ Flash	EPCQ flash for FPGA AS configuration
U45	I ² C EEPROM	32-Kb I ² C serial EEPROM
Communication Ports		
J57	PCI Express socket	GEN3 x8 Socket
J29, J19	FMC port	J29 is a V57.1 compatible FMC connector. J19 is a FMC connector defined by Altera 16 transceivers specification
J7, J8	SFP+ port	Two SFP+ ports
U12, J5	Gigabit Ethernet port	RJ-45 connectors that provide HPS 10/100/1000 Ethernet connections via a Micrel KSZ9031RN PHY.
U8, U9, J2, J3	Dual Gigabit Ethernet port	Provide two SGMII Gigabit Ethernet ports through FPGA transceivers
J10, U13	USB-UART Port	USB connector with USB-to-UART bridge for serial UART interface.
J25	DB9 UART port,	DB9 RS-232 UART Port

Board Reference	Type	Description
J4, U22	USB OTG port	USB 2.0 On-The-Go (OTG) interface.
U5	Real-time clock	DS1339 device with built-in power sense circuit that detects power failures and automatically switches to backup battery supply, maintaining time keeping even when the board is not powered.
J43	HPS Trace connector	4-bit Trace for HPS debug
J20	FPGA Trace	FPGA 16-bit Trace
Video and Display Ports		
J35	Character LCD	Connector that interfaces to the included 16 character × 2 line LCD module along with two standoffs.
J36	Display port connector	Display port interface
J48,J49, U29,U30	SDI Video port	HDBNC 75-Ohm SDI video interface
Power Supply		
J36	DC input jack	Accepts 12-V DC power supply
SW5	Power switch	Switch to power on or off the board when power is supplied from the DC input jack.

Featured Device: Arria 10 SoC

The Arria 10 SoC development board features an Arria 10 SoC 10AS066N3F40E2SGE2 device (U23) that includes a hard processor system (HPS) with integrated ARM[®] Cortex[™] - A9 MPCore processor.

Table 5-2: Arria 10 SoC Features

Resources	10AS066N2F40
LE (K)	660
ALM	250, 540
Register	1,002,160
Memory (Kb)	42,660
18-bit x 18-bit Multiplier	3,356
Transceivers	48

MAX V CPLD 5M2210 System Controller

The board utilizes the 5M2210ZF256 System Controller, an Altera MAX V CPLD, for the following purposes:

- Power sequencer
- System reset controller
- PCIe, FMC slot power sequencer
- FPGA PS configuration controller
- I²C Master controller
- UART Level shifter
- HPS SPI I/O expander
- HPS Shared I/O

Table 5-3: MAX V CPLD System Controller Device Pin Out

I/O Bank	Board Reference	Pin Name	Pin Type	I/O Standard	Description
3	E14	P0V9Pgood	Schmitt trigger input	3.3 V	Power good signal of 0.9 V power rail (Active high)
3	C14	HPS_Pgood	Schmitt trigger input	3.3 V	HPS core voltage power good signal
3	C15	PN0V95pgood	Schmitt trigger input	3.3 V	0.95 V Power supply power good signal (Active high)
3	E13	1V0_Pgood	Schmitt trigger input	3.3 V	1V0 Power supply power good signal (Active high)
3	E12	1V8_Pgood	Schmitt trigger input	3.3 V	1V8 Power supply power good signal (Active high)
3	D15	2V5_Pgood	Schmitt trigger input	3.3 V	2V5 Power supply power good signal (Active high)
3	F14	3V3_Pgood	Schmitt trigger input	3.3 V	3V3 Power supply power good signal (Active high)
3	D16	PGM_LED2	OC	3.3 V	FPGA status LED.
3	F13	5V0_Pgood	Schmitt trigger input	3.3 V	5V0 Power supply power good signal (Active high)
3	E15	HILOHPS_VDDPGood	Schmitt trigger input	3.3 V	HPS_HILO Power supply power good signal
3	E16	HILO_VDDPGood	Schmitt trigger input	3.3 V	HILO VDD power supply power good signal
3	F15	HILO_VDDQPGood	Schmitt trigger input	3.3 V	HILO VDDQ power supply power good signal
3	G14	FMCAVADJPGood	Schmitt trigger input	3.3 V	FMC VADJ Power supply power good signal

I/O Bank	Board Reference	Pin Name	Pin Type	I/O Standard	Description
3	F16	FMCBVADJPGood	Schmitt trigger input	3.3 V	FMC VADJ Power supply power good signal
3	G13	10V_Fail_n	Schmitt trigger input	3.3 V	A10_12V input below 10.11 V (Active low)
3	G15	10V_good	Schmitt trigger input	3.3 V	A10_12V input above 10.62 V (Active low)
3	G12	LTFAUL0	Input/Output	3.3 V	LT2977 Fault signal
3	G16	LTPWRGD	Input/Output	3.3 V	LT2977 Power good input
3	H14	FAC2MPgood	Output	3.3 V	30 ms delay after FMCA_EN and FMCA_AUXEN is enabled.
3	H15	FBC2MPgood	Output	3.3 V	30 ms delay after FMCB_EN and FMCB_AUXEN is enabled.
3	H13	FAM2CPgood	Schmitt trigger input	3.3 V	This flag indicates the power from FMC DC card is good when MAX V I/O CPLD BANK3 power uses FMC POWER.
3	H16	TSENSE_ALERTn	Schmitt trigger input	3.3 V	SMBUS Alert Bit when I ² C hangs
3	J13	OVERTEMPn	Schmitt trigger input	3.3 V	Temperature is above threshold
3	J16	FAN_EN	Output	3.3 V	FAN Enable (Active high)
3	J12	MAXV_USB_CLK	Clock input	3.3 V	Clock input from USB-blaster
3	H12	NC	-	-	-
3	J14	NC	-	-	-
3	J15	A10_EN	Output	3.3 V	Arria 10 12 V input enable (Active high)
3	K16	A10_0V9_EN	Output	3.3 V	0.9 V Power supply enable (Active high)
3	K13	A10_0V95_EN	Output	3.3 V	0.95 V Power supply enable (Active high)
3	K15	A10_1V0_EN	Output	3.3 V	1.0 V Power supply enable (Active high)
3	K14	A10_1V8_EN	Output	3.3 V	1.8 V Power supply enable (Active high)

I/O Bank	Board Reference	Pin Name	Pin Type	I/O Standard	Description
3	L16	IO_EN	Output	3.3 V	Arria 10 I/O power enable (Active high)
3	L11	PCIE_Auxen	Output	3.3 V	PCIE Aux power enable (Active high)
3	L15	PCIE_EN	Output	3.3 V	PCIE 3V3 enable (Active high)
3	L12	FMCA_AUXEN	Output	3.3 V	FMCA Aux power enable (Active high)
3	M16	FMCA_EN	Output	3.3 V	FMCA3V3 enable (Active high)
3	L13	FMCB_AUXEN	Output	3.3 V	FMCB Aux Power enable (Active high)
3	M15	FMCB_EN	Output	3.3 V	FMCB3V3 enable (Active high)
3	L14	Pmbus_Alertn	Schmitt trigger input	3.3 V	Pmbus Alert Bit input when I ² C hangs.
3	N16	IO3V3_Discharge	Output	3.3 V	6A discharge load for IO3V3 (Active high)
3	M13	PLL1V8_discharge	Output	3.3 V	3A discharge load for IO3V3 (Active high)
3	N15	NC			
3	N14	LTCNTRL0	Output	3.3 V	LT2977 Control 0
3	P15	LTCNTRL1	Output	3.3 V	LT2977 Control 1
3	P14	LTWDI_RESETN	Output	3.3 V	LT2977 reset
3	D13	FAPRSNT_n	Schmitt trigger input	3.3 V	Detects signal of FMCA DC card
3	D14	FBPRSNT_N	Schmitt trigger input	3.3 V	Detects signal of FMCB DC card
3	F11	USB_Vflagn	Schmitt trigger input	3.3 V	Overcurrent flag of EXT USB power
3	F12	NC	-		-
3	K12	NC	-		-
3	M14	NC	-		-
3	N13	NC	-		-
4	R1	A10_2L_SDA	Input/OC	3.3 V	I ² C data line.
4	P4	A10_2L_SCL	OC	3.3 V	I ² C clock line.

I/O Bank	Board Reference	Pin Name	Pin Type	I/O Standard	Description
4	T2	A10I2CEN	Output	3.3 V	Enable Arria 10 HPS I ² C. (Active high)
4	P5	A10PMBUSEN	Output	3.3 V	Enable Arria 10 FPGA I ² C. (Active high)
4	R3	A10_PMBUSDIS_N	Output	3.3 V	Disables Arria 10 FPGA PMBus access. (Active low)
4	N5	UARTA_RX	Input	3.3 V	HPS UART RX input from USB-UART.
4	P6	UARTA_TX	Output	3.3 V	HPS UART TX output to USB-UART.
4	N6	PCIE_PRSENT2n	Input	3.3 V	Detects signal from PCIe DC card.
4	R5	SFPA_LOS	Input	3.3 V	SFP+ A socket loss signal. (Active low)
4	M6	SFPA_TXFAULT	Input	3.3 V	SFP+ A socket TX fault signal. (Active low)
4	T5	SFPGA_TXDISABLE	Output	3.3 V	SFP+ A socket TX disable signal. (Active low)
4	P7	SFPA_RATESEL0	Output	3.3 V	SFP+ A RX signaling rate selection, 0<4.25 GBd, 1 > 4.25 GBd
4	R6	SFPA_RATESEL1	Output	3.3 V	SFP+ A TX signaling rate selection, 0<4.25 GBd, 1 > 4.25 GBd
4	N7	SFPB_TXDISABLE	Output	3.3 V	SFP+ B socket TX disable signal. Active low
4	M7	SFPB_RATESEL0	Output	3.3 V	SFP+ B RX signaling rate selection, 0<4.25 GBd, 1 > 4.25 GBd
4	R7	SFPB_RATESEL1	Output	3.3 V	SFP+ B TX signaling rate selection, 0<4.25 GBd, 1 > 4.25 GBd
4	P8	SFPB_LOS	Input	3.3 V	SFP+ A socket loss signal (Active low)
4	T7	SFPB_TXFAULT	Input	3.3 V	SFP+ A socket tx fault signal (Active low)
4	N8	SFPA_MOD0_PRSENTn	Input	3.3 V	Detect signal of SFP+ module in slot A (Active low)

I/O Bank	Board Reference	Pin Name	Pin Type	I/O Standard	Description
4	R8	SFPB_MOD0_PRSENTn	Input	3.3 V	Detect signal of SFP+ module in Slot B. (Active low)
4	T8	NC	-	3.3 V	-
4	T9	NC	-	3.3 V	-
4	R9	Eneta_HPS_Intn	Input	3.3 V	Interrupt input from Ethernet port 3
4	M9	Logic_resetn	Input	3.3 V	FPGA_logic reset input
4	M8	EXT_intn	Input	3.3 V	HPS External interrupt
4	M10	UART1_RX	Input	3.3 V	DB9 RS232 UART RX
4	R10	UART1_TX	Output	3.3 V	DB9 RS232 UART TX
4	N10	NC	Output	3.3 V	-
4	T11	LMK_reset	Output	3.3 V	LMK Clock cleaner reset (Active high)
4	P10	NC	-	3.3 V	-
4	R11	NC	-	3.3 V	-
4	T12	ENET_HPS_RESETn	Output	3.3 V	Ethernet port 3 reset (Active low)
4	N11	USB_RESET	Output	3.3 V	USB PHY reset (Active high)
4	T13	PCIE_PERSTn	Output	3.3 V	This signal needs to be held low if PCIE_auxEn and PCIE_EN are not active. 15 ms delay to set this high after PCIE_EN is active. PCIe RC slot reset, active low.
4	R13	RESET_HPS_UARTA_N	Output	3.3 V	UART_RESET (Active low)
4	R12	MAX2toMAXV0	Input/Output	3.3 V	Interbus between MAX II and MAX V
4	P11	MAX2toMAXV1	Input/Output	3.3 V	Interbus between MAX II and MAX V
4	N12	MAX2toMAXV2	Input/Output	3.3 V	Interbus between MAX II and MAX V
4	R14	MAX2toMAXV3	Input/Output	3.3 V	Interbus between MAX II and MAX V
4	P12	MAX2toMAXV4	Input/Output	3.3 V	Interbus between MAX II and MAX V

I/O Bank	Board Reference	Pin Name	Pin Type	I/O Standard	Description
4	T15	MAX2toMAXV5	Input/Output	3.3 V	Interbus between MAX II and MAX V
4	R16	MAX2toMAXV6	Input/Output	3.3 V	Interbus between MAX II and MAX V
4	P13	MAX2toMAXV7	Input/Output	3.3 V	Interbus between MAX II and MAX V
4	M11	MAX2toMAXV8	Input/Output	3.3 V	Interbus between MAX II and MAX V
4	M12	MAX2toMAXV9	Input/Output	3.3 V	Interbus between MAX II and MAX V
4	N9	MAX2toMAXV10	Input/Output	3.3 V	Interbus between MAX II and MAX V
4	R4	MAX2toMAXV11	Input/Output	3.3 V	Interbus between MAX II and MAX V
4	T10	MAX2toMAXV12	Input/Output	3.3 V	Interbus between MAX II and MAX V
4	T4	MAX2toMAXV13	Input/Output	3.3 V	Interbus between MAX II and MAX V
2	D4	USER_LED_FPGA0	OC	2.5 V	USER FPGA LED 0 output
2	B1	USER_LED_FPGA1	OC	2.5 V	USER FPGA LED 1 output
2	C5	USER_LED_FPGA2	OC	2.5 V	USER FPGA LED 2 output
2	C4	USER_LED_FPGA3	OC	2.5 V	USER FPGA LED 3 output
2	B4	USER_LED_HPS0	OC	2.5 V	HPS LED 0 output
2	D6	USER_LED_HPS1	OC	2.5 V	HPS LED 1 output
2	E6	USER_LED_HPS2	OC	2.5 V	HPS LED 2 output
2	B5	USER_LED_HPS3	OC	2.5 V	HPS LED 3 output
2	A5	MAX_ERROR	OC	2.5 V	Board abnormal indicator
2	D7	MAX_LOAD	OC	2.5 V	FPGA status LED
2	B6	MAX_CONF_DONE	OC	2.5 V	FPGA status LED
2	E7	File_Presentn	Input	2.5 V	File flash present flag
2	C8	FACTORY_LOAD	OC	2.5 V	FPGA status LED
2	B7	PGM_LED0	OC	2.5 V	FPGA status LED
2	D8	PGM_SEL	Input	2.5 V	FPGA external trigger

I/O Bank	Board Reference	Pin Name	Pin Type	I/O Standard	Description
2	A7	BF_Presentn	Input	2.5 V	Boot Flash present flag
2	B8	USER_DIPSW_HPS0	Input	2.5 V	User DIP HPS 0
2	A8	USER_DIPSW_HPS1	Input	2.5 V	User DIP HPS 1
2	A9	USER_DIPSW_HPS2	Input	2.5 V	User DIP HPS 2
2	E9	USER_DIPSW_HPS3	Input	2.5 V	User DIP HPS 3
2	B9	USER_DIPSW_FPGA0	Input	2.5 V	User DIP FPGA 0
2	D9	USER_DIPSW_FPGA1	Input	2.5 V	User DIP FPGA 1
2	A10	USER_DIPSW_FPGA2	Input	2.5 V	User DIP FPGA 2
2	C9	USER_DIPSW_FPGA3	Input	2.5 V	User DIP FPGA 3
2	E10	HPS_WARM_RESET1N	Input	2.5 V	Trace reset from MAX II (Active low)
2	A11	HPS_WAM_RESETn	Input	2.5 V	Warm reset Pushbutton (Active low)
2	B11	HPS_cold_resetn	Input	2.5 V	COLD reset Pushbutton (Active low)
2	A12	DC_Power_CTRL	Input	2.5 V	DC card power on/off switch. 0 turn off DC power 1 turn on DC power
2	E11	I2C_flag	Input	2.5 V	I ² C master selection, '0' MAX V, '1' HPS
2	B12	PGM_CONFIG	Input	2.5 V	FGPA external trigger
2	C11	Security_mode	Input	2.5 V	FPGA mode bit
2	B13	PGM_LED1	OC	2.5 V	FPGA status LED
2	D12	MAXVtoMAXV4	Input/Output	2.5 V	Interbus between MAX Vs
2	B14	MAXVtoMAXV5	Input/Output	2.5 V	Interbus between MAX Vs
2	C13	MAXVtoMAXV6	Input/Output	2.5 V	Interbus between MAX Vs
2	B16	MAXVtoMAXV7	Input/Output	2.5 V	Interbus between MAX Vs
2	A13	MAXVtoMAXV8	Input/Output	2.5 V	Interbus between MAX Vs
2	A15	MAXVtoMAXV9	Input/Output	2.5 V	Interbus between MAX Vs

I/O Bank	Board Reference	Pin Name	Pin Type	I/O Standard	Description
2	A2	USER_PB_HPS0	Input	2.5 V	HPS user push button 0
2	A4	USER_PB_HPS1	Input	2.5 V	HPS user push button 1
2	A6	USER_PB_HPS2	Input	2.5 V	HPS user push button 2
2	B10	USER_PB_HPS3	Input	2.5 V	HPS user push button 3
2	B3	USER_PB_FGPA0	Input	2.5 V	FPGA user push button 0
2	C10	USER_PB_FGPA1	Input	2.5 V	FPGA user push button 1
2	C12	USER_PB_FGPA2	Input	2.5 V	FPGA user push button 2
2	C6	USER_PB_FGPA3	Input	2.5 V	FPGA user push button 3
2	C7	MAXVtoMAXV3	Input/Output	2.5 V	Interbus between MAX Vs
2	D10	MAXVtoMAXV10	Input/Output	2.5 V	Interbus between MAX Vs
2	D11	MAXVtoMAXV11	Input/Output	2.5 V	Interbus between MAX Vs
2	D5	MAXVtoMAXV12	Input/Output	2.5 V	Interbus between MAX Vs
2	E8	MAXVtoMAXV13	Input/Output	2.5 V	Interbus between MAX Vs
1	D3	MSEL0	Input	1.8 V	FPGA program mode selection
1	C2	MSEL1	Input	1.8 V	FPGA program mode selection
1	C3	MSEL2	Input	1.8 V	FPGA program mode selection
1	E3	MFD0	Input/Output	1.8 V	EPCQ data0
1	D2	MFD1	Input/Output	1.8 V	EPCQ data1
1	E4	MFD2	Input/Output	1.8 V	EPCQ data2
1	D1	MFD3	Input/Output	1.8 V	EPCQ data3
1	E5	CLK_50M_MAX	Output	1.8 V	50 MHz clock to FPGA
1	F3	MFCSN	Output	1.8 V	EPCQ chip select.
1	E1	MFCLK	Output	1.8 V	EPCQ chip clock.
1	F4	HPSUARTA_TX	Input	1.8 V	HPS UART TX.
1	F2	HPSUARTA_RX	Output	1.8 V	HPS UART RX.
1	F1	SPIM1_MOSI	Input	1.8 V	SPI data input.
1	F6	SPIM1_SS0_N	Input	1.8 V	SPI chip select 0

I/O Bank	Board Reference	Pin Name	Pin Type	I/O Standard	Description
1	G2	SPIM1_SS1_N	Input	1.8 V	SPI chip select 1
1	G3	SPIM1_MISO	Output	1.8 V	SPI data output.
1	G1	MAXVtoMAXV0	Input/Output	1.8 V	Interbus between MAX Vs
1	G4	MAXVtoMAXV1	Input/Output	1.8 V	Interbus between MAX Vs
1	H2	MAXVtoMAXV2	Input/Output	1.8 V	Interbus between MAX Vs
1	G5	MAX_IO_CLK	Output	1.8 V	50Mhz Clock Output to IO MAXV CPLD
1	H3	A10SH_GPIO0	Input/Output	1.8 V	HPS GPIO 5
1	J1	A10SH_GPIO1	Input/Output	1.8 V	HPS GPIO 13
1	H4	A10SH_GPIO2	Input/Output	1.8 V	HPS GPIO 16
1	J2	A10SH_GPIO3	Input/Output	1.8 V	HPS GPIO 17
1	H5	CLK_50M_MAX	Input	1.8 V	MAX V 50 MHz reference clock
1	J5	SPIM1_CLK	Input	1.8 V	SPIM1_CLK input
1	J4	PS_D0	Output	1.8 V	Passive configure D0
1	K1	Nconfig	Output	1.8 V	Passive configure Nconfig output
1	J3	DCLK	Output	1.8 V	Program Clock
1	K2	CVP_configDone	Input	1.8 V	CVP configure done input during configuration, UART_TX after configuration
1	K5	NSTATUS	Input	1.8 V	Status bit during FPGA configuration
1	L1	conf_done	Input	1.8 V	Configuration done
1	L2	DEV_CLRN	Output	1.8	FPGA reset bit
1	K3	CRCError	Output	1.8 V	CRCError during configuration, UART_RX after configuration
1	M1	Dedicated_tx	Input	1.8 V	Dedicated UART TX input
1	M2	Daticated_RX	Output	1.8 V	Dedicated UART RX Output
1	L4	FPGA_IO5	Input	1.8 V	FPGA_IO5

I/O Bank	Board Reference	Pin Name	Pin Type	I/O Standard	Description
1	L3	FPGA_IO4	Output	1.8 V	FPGA_IO4
1	N1	FPGA_IO3	Output	1.8 V	FPGA_IO3
1	M4	FPGA_IO2	Output	1.8 V	FPGA_IO2
1	N2	FPGA_IO1	Input/Output	1.8 V	FPGA_IO1
1	M3	FPGA_IO0	Input/Output	1.8 V	FPGA_IO0
1	N3	PCIE1V8_PERSTn	Output	1.8 V	15 ms delay PCIE-PHY 0_Reset after PCIE_En is activated if I/O MAX V function is disabled.
1	P2	PCIE1V8_PERST1n	Output	1.8 V	PCIE_PHY1 reset must be connected to the I/O MAX V bit R16 (FBLAP33) via interbus if the I/O MAX V function is disabled.
1	E2	BQSPI_RESETN	Input/Output	1.8 V	Boot flash reset
1	F5	HPS_NPOR	Output	1.8 V	NPOR output of HPS
1	H1	HPS_NRST	Output	1.8 V	NRST output of HPS
1	K4	FILE_RESETN	Output	1.8 V	File flash reset
1	L5	Dedicated_OE	Input	1.8 V	Dedicated UART Enable input
1	P3	M5_JTAG_TCK	Input	1.8 V	JTAG clock
1	L6	M5_JTAG_TDI	Input	1.8 V	JTAG data in
1	M5	M5_JTAG_TDO	Output	1.8 V	JTAG data out
1	N4	M5_JTAG_TMS	Input	1.8 V	JTAG_TMS

FPGA Configuration

This section describes the FPGA, I/O MUX CPLD, and MAX V CPLD 5M2210 System Controller device programming methods supported by the Arria 10 SoC development board.

The Arria 10 SoC development board supports the following configuration methods using JTAG:

- On-board USB-Blaster II is the default method for configuring the FPGA using the Quartus Prime Programmer in JTAG mode with the supplied USB cable.
- External Mictor connector for configuring the HPS using the ARM DS-5 Altera Edition software and DSTREAM or JTAG debug and trace tools such as Lauterbach TRACE32.
- External USB-Blaster for configuring the FPGA when you connect the external USB-Blaster to the JTAG header (J24).

System Controller Configuration

J58 is used to turn off the FPGA power. The following table lists the status of each J58 configuration.

Table 5-4: J58 Jumper Settings

Board Reference	Description
J58	<ul style="list-style-type: none"> • OPEN: Normal application • SHORT: No power to FPGA

Caution: The MAX V system controller controls the power sequence. The wrong configuration file may damage the board.

The following procedure must be followed to program the system controller MAX V:

1. Short J58
2. Set SW3 Bits to:

Table 5-5: SW3 System Configuration Mode for System Controller MAX V Programming

Bit1	Bit2	Bit3	Bit4	Bit5	Bit6	Bit7	Bit8
ON	ON	ON	ON	ON	OFF	OFF	ON

3. Turn on the power; the red LED will be flashing
4. Connect the USB cable to the on-board USB-Blaster II
5. Use “autodetect” in Quartus Prime to detect MAX V
6. Load the MAX V .pof file into Quartus Prime
7. Program the MAX V device
8. Turn off the power and remove J58
9. Set SW3 to normal operation mode

Refer to [#iga1438035477237/table_hx1_jyz_zs](#) for SW3 configuration.

10. Turn on the power; the red LED will always be on

FPGA Programming over On-Board USB-Blaster II

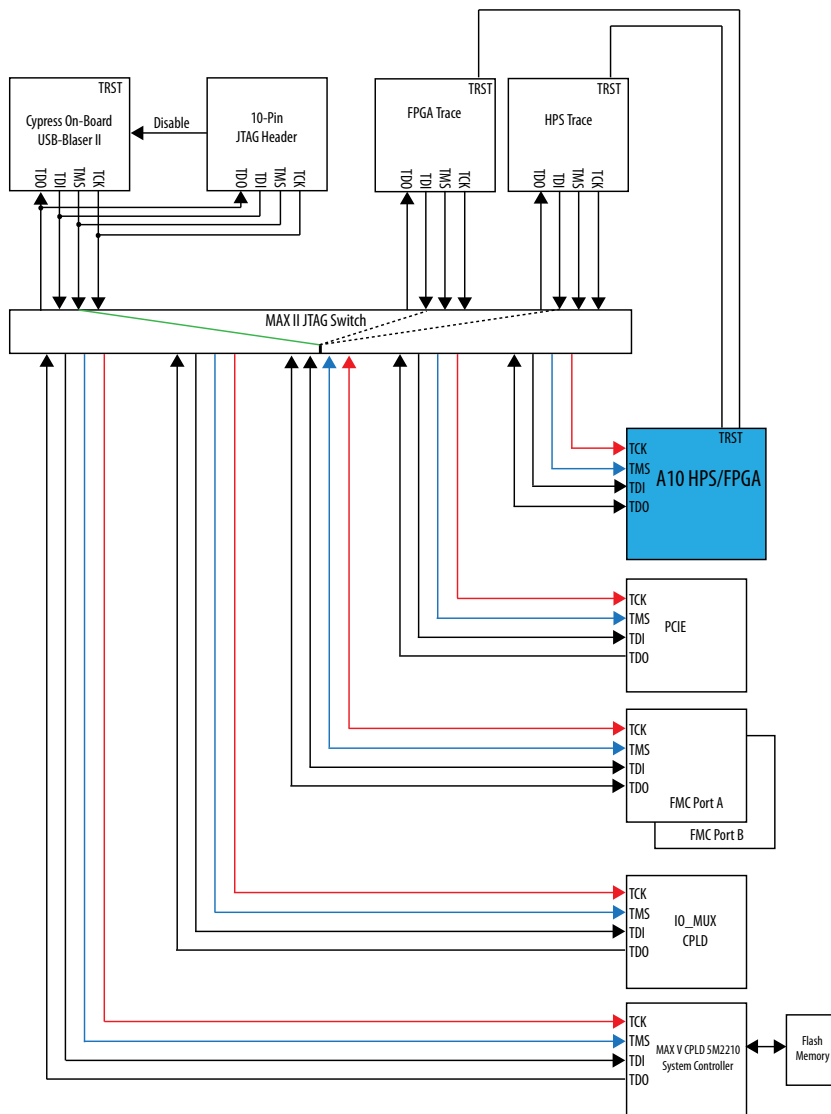

Table 5-6: SW3 Configuration for On-Board USB-Blaster II Mode

Bit1	Bit2	Bit3	Bit4	Bit5	Bit6	Bit7	Bit8
OFF	OFF	ON	ON	ON	OFF	OFF	OFF

This configuration method implements a mini-USB connector (J22), a USB 2.0 PHY device (U18), and an Altera MAX II CPLD EPM1270M256C4N (U17) to allow FPGA configuration using a USB cable. This USB cable connects directly between the USB connector on the board and a USB port on a PC running the Quartus Prime software.

The on-board USB-Blaster II in the MAX II CPLD EPM1270M256C4N normally masters the JTAG chain. The on-board USB-Blaster II shares the pins with the external header and is automatically disabled when you connect an external USB-Blaster to the JTAG chain through the JTAG header (J24). In addition to the JTAG interface, the on-board USB Blaster II has trace capabilities for HPS debug purposes. The trace interface from the HPS routes to the on-board USB-Blaster II connection pins through the FPGA.

Figure 5-2: JTAG Chain

Note: If an external USB-Blaster (I/II) cable is plugged into the EXTERNAL JTAG HEADER, the MAX II automatically uses it as the master despite any DIP switch setting.

The MAX II CPLD (EPM1270M256C4N) is dedicated to the on-board USB-Blaster II functionality only, connecting to the USB 2.0 PHY device on one side and driving JTAG signals out the other side on the GPIO pins. This device's own dedicated JTAG interface is routed to a small surface-mount header only intended for debugging of first article prototypes.

FPGA Programming by HPS

The default method is to use the factory design—Golden Hardware Reference Design (GHRD).

Table 5-7: HPS FPGA Configuration

Configuration	Switch Position
HPS FPGA	SW4.4:OFF(Down)=MSEL2 is 0
	SW4.3:OFF(Down)=MSEL1 is 0
	SW4.2:OFF(Down)=MSEL0 is 0

Table 5-8: AS Configuration

Configuration	Switch Position
Active Serial (AS)	SW4.4:OFF(Down)=MSEL2 is 0
	SW4.3:ON(Up)=MSEL1 is 1
	SW4.2:ON(Up)=MSEL0 is 1

On power-up or by pressing the warm/cold reset push button, the HPS downloads the GHRD design from boot flash to configure the FPGA. The D17 (Error LED) is turned off and D18 (Configuration done LED) is turned on after the FPGA is configured.

By default the FPGA is configured by the HPS.

Refer to the [GSRD User Manual](#) for more information.

FPGA Programming by EPCQ Device

An EPCQ device is used for FPGA configuration in Active Serial (AS) mode on power up. The EPCQ device with non-volatile memory features a simple six-pin interface and a small form factor. The EPCQ supports AS x1 and x4 modes.

FPGA Programming over External USB-Blaster

The JTAG chain header provides another method for configuring the FPGA using an external USB-Blaster device with the Quartus Prime Programmer running on a PC. To prevent contention between the JTAG masters, the on-board USB-Blaster is automatically disabled when you connect an external USB-Blaster to the JTAG chain through the JTAG chain header.

Status Elements

The development board includes status LEDs. This section describes the status elements.

Table 5-9: Board Specific LEDs

Board Reference	Type	Description
D18	Configuration done LED	Illuminates when the FPGA is configured.
D19	Load LED	Illuminates when the MAX V CPLD 5M2210 System Controller is actively configuring the FPGA.
D17	Error LED	Red LED illuminates when the FPGA configuration from flash memory fails.
D42	Power LED	Illuminates when 3.3-V power is present.
D13, D14	JTAG TX/RX LEDs	Indicate the transmit or receive activity of the JTAG chain. The TX and RX LEDs flicker if the link is in use and active. The LEDs are either off when not in use or on when in use but idle.
D20-D22	Program select LEDs	Illuminates to show which flash memory image loads to the FPGA when you press the program select push button.
D23, D24	FMC port present LEDs	Illuminates when a daughtercard is plugged into the FMC port.
D11, D12	UART LEDs	Illuminates when the UART transmitter and receiver are in use.

Setup Elements

The development board includes several different kinds of setup elements. This section describes the following setup elements:

- Board settings DIP switch
- JTAG chain control DIP switch
- FPGA configuration mode DIP switch
- HPS jumpers
- CPU reset push button
- Logic reset push button
- Program configuration push button
- Program select push button

Board Settings DIP Switch

The board settings DIP switches (SW1 and SW4) control various features specific to the board and the MAX V CPLD 5M2210 System Controller logic design. Refer to the "Default Switch and Jumper Settings" section for more information on SW1 and SW4.

Related Information

[Default Switch and Jumper Settings](#) on page 3-2

JTAG Chain Control DIP Switch

The JTAG chain control DIP switch (SW3) either removes or includes devices in the active JTAG chain.

The SW3 switch select controls the JTAG master/slave select. The DIP switch *MSTR* switches control the master select. The other 5 pins are bypass pins for the various available JTAG slaves. The following slaves are available and can be bypassed by moving the corresponding bypass switch to the 'ON' position.

Table 5-10: JTAG Configuration Modes

Switch 3 Bit	Board Label	Function
1	Arria 10	ON- Arria10 JTAG Bypass OFF- Arria10 JTAG Enable
2	I/O MAX V	ON- MAXV JTAG Bypass OFF- MAXV JTAG Enable
3	FMCA	ON- FMCA JTAG Bypass OFF- FMCA JTAG Enable
4	FMCB	ON- FMCB JTAG Bypass OFF- FMCB JTAG Enable
5	PCIe	ON- PCIe JTAG Bypass OFF- PCIe JTAG Enable
6	MSTR[0]	Refer to Table 5-11
7	MSTR[1]	Refer to Table 5-11
8	MSTR[2]	Refer to Table 5-11

The *MSTR* switch settings and their meanings can be seen in the table below.

Table 5-11: Modes for Master Switches

MSTR2	MSTR1	MSTR0	Modes
ON	ON	ON	BOOT
OFF	ON	ON	FMCA JTAG Master
ON	OFF	ON	FMCB JTAG Master
ON	ON	OFF	FTRACE JTAG Master
OFF	OFF	OFF	On-Board USB-Blaster II JTAG Master
ON	OFF	OFF	System Configuration Mode
OFF	ON	OFF	GUI Test Mode
OFF	OFF	ON	Reserved

The bypass switch settings dictate which slaves are in/out of the chain, but see below for the order if all were enabled in the chain.

1. Arria 10
2. IO_MAXV
3. PCIe
4. FMCA
5. FMCB

Reference Clock Source Selection

The HPS jumpers define the bootstrap options for the HPS—boot source, mode, HPS clocks settings, power-on-reset (POR) mode and peripherals selection.

Table 5-12: HPS Jumpers

Board Reference	Schematic Signal Name	Description
J17, J16	OSC2_CLK_SEL [1:0]	Selects the source of OSC2 clock: 00—Select 25 MHz clock source 01—Select external source via SMA connector 10—Select 33 MHz on-board oscillator
J30	HPS voltage selection	Short—HPS core voltage is 0.95V Open—HPS core voltage is 0.9V

CPU Reset Push Button

Table 5-13: CPU Reset Push Buttons

Push Button	Description
S1	HPS_WARM_RESET push button.
S2	HPS_COLD_RESET push button.

The HPS_NRST input is driven by HPS_WARM_RESET. The HPS_NPOR input is driven by HPS_COLD_RESET.

Logic Reset Push Button

The logic reset push button (S10) is an input to the MAX V CPLD 5M2210 System Controller. This push button is the default reset for the CPLD logic and FPGA.

General User Input/Output

All user-defined push buttons, DIP switches and LEDs are connected to the MAX V System Controller. The IO_MUX CPLD maps user-defined signals to FPGA I/Os as defined in the GHRD. The following section describes the mapping table.

Character LCD

The development board includes a single 10-pin 0.1" pitch single-row header that interfaces to a 2 line × 16 character Lumex character LCD using a standard I²C interface connected to the HPS.

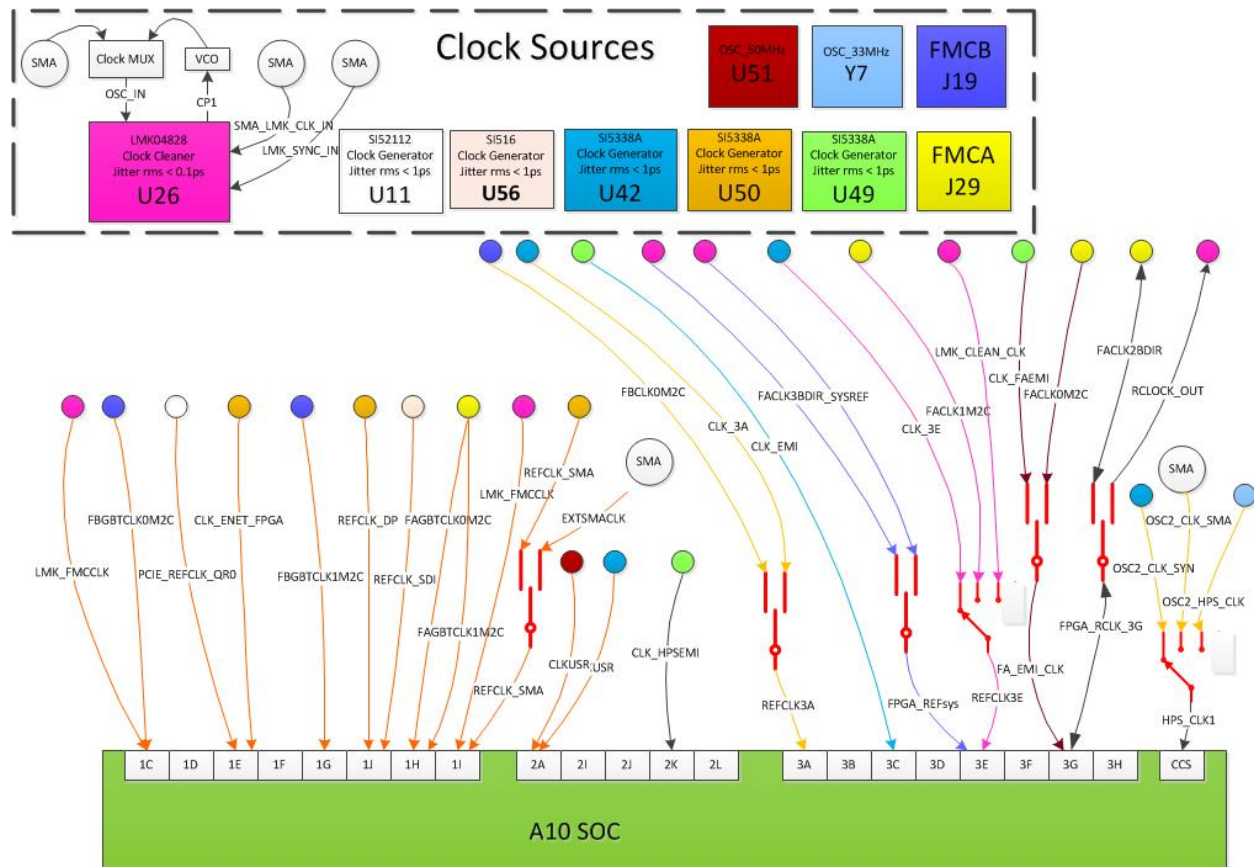

For more information such as timing, character maps, interface guidelines, and other related documentation, visit <http://www.newhavendisplay.com>.

Clock Circuitry

This section describes the board's clock inputs and outputs.

On-Board Oscillators

Figure 5-3: FPGA I/O Bank Clock Connection

Match the colors in the above figure to match the FPGA I/O banks with its corresponding clock sources.

Components and Interfaces

This section describes the development board's communication ports and interface cards relative to the Arria 10 SoC device. The development board supports the following communication ports:

- PCI Express Gen3 root complex and end point
- 10/100/1000 Ethernet (HPS)
- 10/100/1000 Ethernet (FPGA)
- FMC
- RS-232 UART (HPS)
- Real-Time Clock
- SFP+
- I²C interface

PCI Express

The PCIe RC interface on the development board supports auto-negotiating channel width from x1 to x8 as well as the connection speed of Gen3 at 8 Gbps/lane.

The PCI express end point interface is connected to the FMCB slot. A special PCIE-FMC cable (HDR-181157-01-PCIEC) made by SAMTEC must be plugged into the FMCB slot for the PCIe EP application.

For the PCIe RC application, the `PCIE_REFCLK_P/N` signal is a 100-MHz differential input that is driven to the daughtercard through the PCIe edge connector. This signal connects directly to a Arria 10 SoC `REFCLK` input pin pair using DC coupling. The I/O standard is High-Speed Current Steering Logic (HCSL).

Figure 5-4: PCI Express Reference Clock Levels

The PCI Express edge connector also has a presence detect feature for the motherboard to determine if a card is installed.

Table 5-14: PCI Express FPGA Pin Assignments

Arria 10 SoC Pin Name	Schematic Signal Name	Direction	Description
Y38	PCIE_TX_N7	Output	PCIe RC Channel 7 Transmitter
Y39	PCIE_TX_P7	Output	PCIe RC Channel 7 Transmitter
Y34	PCIE_RX_N7	Input	PCIe RC Channel 7 Receiver
Y35	PCIE_RX_P7	Input	PCIe RC Channel 7 Receiver
AA36	PCIE_TX_N6	Output	PCIe RC Channel 6 Transmitter
AA37	PCIE_TX_P6	Output	PCIe RC Channel 6 Transmitter
AA32	PCIE_RX_N6	Input	PCIe RC Channel 6 Receiver
AA33	PCIE_RX_P6	Input	PCIe RC Channel 6 Receiver
AB38	PCIE_TX_N5	Output	PCIe RC Channel 5 Transmitter
AB39	PCIE_TX_P5	Output	PCIe RC Channel 5 Transmitter
AB34	PCIE_RX_N5	Input	PCIe RC Channel 5 Receiver
AB35	PCIE_RX_P5	Input	PCIe RC Channel 5 Receiver
AC36	PCIE_TX_N4	Output	PCIe RC Channel 4 Transmitter
AC37	PCIE_TX_P4	Output	PCIe RC Channel 4 Transmitter
AB30	PCIE_RX_N4	Input	PCIe RC Channel 4 Receiver
AB31	PCIE_RX_P4	Input	PCIe RC Channel 4 Receiver
AD38	PCIE_TX_N3	Output	PCIe RC Channel 3 Transmitter
AD39	PCIE_TX_P3	Output	PCIe RC Channel 3 Transmitter
AC32	PCIE_RX_N3	Input	PCIe RC Channel 3 Receiver
AC33	PCIE_RX_P3	Input	PCIe RC Channel 3 Receiver
AE36	PCIE_TX_N2	Output	PCIe RC Channel 2 Transmitter
AE37	PCIE_TX_P2	Output	PCIe RC Channel 2 Transmitter
AD34	PCIE_RX_N2	Input	PCIe RC Channel 2 Receiver
AD35	PCIE_RX_P2	Input	PCIe RC Channel 2 Receiver
AE28	-	Input	Pull down to Ground, no use
AE29	-	Input	Pull down to Ground, no use

10/100/1000 Ethernet (HPS)

The development board supports an RJ-45 10/100/1000 base-T Ethernet using an external Micrel KSZ9031RN PHY and the HPS EMAC function. The PHY-to-MAC interface employs RGMII connection using four data lines at 250 Mbps each for a connection speed of 1 Gbps.

The PHY interfaces to an RJ-45 model with internal magnetics that can be used for driving copper lines with Ethernet traffic.

Figure 5-5: RGMII Interface between HPS (MAC) and PHY

Table 5-15: Ethernet (HPS) Pin Assignments

FPGA Pin Number	Shared I/O Bit	Schematic Signal Name	Description
H18	GPIO0_IO12	ENET_HPS_GTX_CLK	EMAC0 RGMII TX Clock
H19	GPIO0_IO13	ENET_HPS_TX_EN	EMAC0 RGMII enable
F18	GPIO0_IO14	ENET_HPS_RX_CLK	EMAC0 RGMII RX Clock
G17	GPIO0_IO15	ENET_HPS_RX_DV	EMAC0 RGMII RX DV flag
E20	GPIO0_IO16	ENET_HPS_TXD0	EMAC0 RGMII TXD0
F20	GPIO0_IO17	ENET_HPS_TXD1	EMAC0 RGMII TXD1
G20	GPIO0_IO18	ENET_HPS_RXD0	EMAC0 RGMII RXD0
G21	GPIO0_IO19	ENET_HPS_RXD1	EMAC0 RGMII RXD1
F19	GPIO0_IO20	ENET_HPS_TXD2	EMAC0 RGMII TXD2
G19	GPIO0_IO21	ENET_HPS_TXD3	EMAC0 RGMII TXD3
F22	GPIO0_IO22	ENET_HPS_RXD2	EMAC0 RGMII RXD2
G22	GPIO0_IO23	ENET_HPS_RXD3	EMAC0 RGMII RXD3
H23	GPIO1_IO8	ENETB_MDIO	EMAC2 MDIO
J23	GPIO1_IO9	ENETB_MDC	EMAC2 MDIO
K21	GPIO1_IO10	ENET_HPS_MDIO	EMAC2 MDIO
K20	GPIO1_IO11	ENET_HPS_MDC	EMAC2 MDIO

The Micrel KSZ9031RN PHY uses a multi-level POR bootstrap encoding scheme to allow a small set of I/O pins (7) to set up a very large number of default settings within the device. The related I/O pins have integrated pull-up or pull-down resistors to configure the device.

Table 5-16: Ethernet PHY (HPS) Bootstrap Encoding Scheme

Board Reference (U12)	Schematic Signal Name	Description	Strapping Option
17	ENET_HPS_LED1_LINK	PHY address bit 0	Pulled high
15	ENET_HPS_LED2_LINK	PHY address bit 1	Pulled high
32	ENET_HPS_RXD0	Mode 0	Pulled high
31	ENET_HPS_RXD1	Mode 1	Pulled high
28	ENET_HPS_RXD2	Mode 2	Pulled high
27	ENET_HPS_RXD3	Mode 3	Pulled high
35	ENET_HPS_RX_CLK	PHY address bit 2	Pulled high
33	ENET_HPS_RX_DV	Clock enable	Pulled low
41	CLK125_NDO_LED_MODE	Single LED mode	Pulled high

10/100/1000 Ethernet (FPGA)

The development board supports two RJ45 10/100/1000 base-T Ethernet using Marvell 88E1111. SGMII AC coupling interface is used between PHY and FGPA transceiver.

Figure 5-6: MII Interface between FPGA (MAC) and PHY

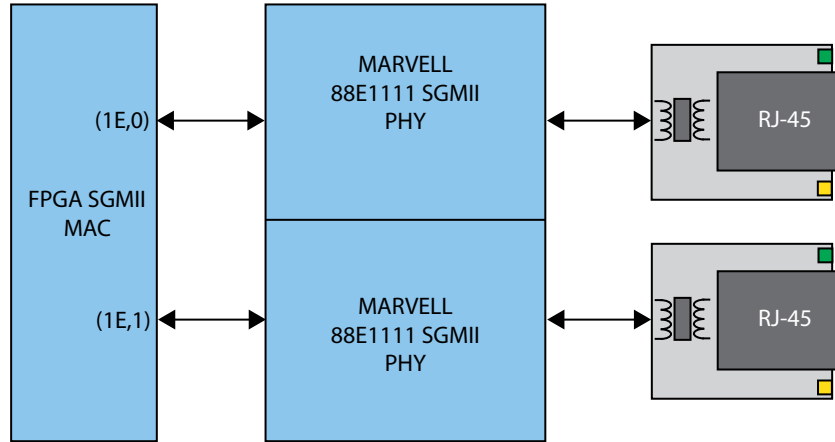

Table 5-17: Ethernet (FPGA) Pin Assignments

FPGA Pin Assignment	Schematic Signal Name	Direction	Description
AK38	ENETA_TX_N	Output	Ethernet Port A Transmitter
AK39	ENETA_TX_P	Output	Ethernet Port A Transmitter
AG32	ENETA_RX_N	Input	Ethernet Port A Receiver
AG33	ENETA_RX_P	Input	Ethernet Port A Receiver
AL36	ENETB_TX_N	Output	Ethernet Port B Transmitter
AL37	ENETB_TX_P	Output	Ethernet Port B Transmitter
AH34	ENETB_RX_N	Input	Ethernet Port B Receiver
AH35	ENETB_RX_P	Input	Ethernet Port B Receiver
AG29	CLK_ENET_FPGA_P	Input	125MHz Reference clock from Clock Synthesizer
AG28	CLK_ENET_FPGA_N	Input	125MHz Reference clock from Clock Synthesizer

FMC

The FMCA slot is compliant with the V57.1 spec. All FMC V57.1 1.8V daughtercards can be plugged into the FMCA slot. The FMCB slot is designed based on the Altera 16-transceiver FMCB specification.

Note: Check the signal connections if your FMC card must be put in the FMCB slot.

Table 5-18: FMC Port A Transceiver Pin Assignments

FPGA Pin Assignment	Schematic Signal Name	Direction	Description
E36	FAD9C2MN	Output	FMCA Slot Channel 9 transmitter

USB 2.0 Port (HPS)

The development supports one USB2.0 interface. The HPS USB interface is connected to a USB3320 PHY that is connected to a micro-USB connector (J4).

Table 5-23: USB 2.0 FPGA Signal Names and Functions

FPGA Pin Assignment	Shared I/O Bit	Schematic Signal Name	Description
D18	GPIO0_IO0	USB_CLK	USB2.0 Clock
E18	GPIO0_IO1	USB_STP	USB2.0 Stop bit
C19	GPIO0_IO2	USB_DIR	USB2.0 direction bit

E22	GPIO0_IO11	USB_DATA7	USB2.0 data line 7

RS-232 UART (HPS)

The development board supports two UART interfaces, the HPS debug UART and the FPGA debug UART interface. The HPS debug UART is connected to a mini-USB connector (J10) using a FT232RQ-REEL USB-to-UART bridge. The maximum supported rate for this interface is 1 Mbps. The FGPA debug UART is connected to the DB9 connector (J25) using a MAX3221 UART PHY. Board reference D11 and D12 are the HPS debug UART LEDs that illuminate to indicate TX and RX activity.

Table 5-24: UART FPGA Signal Names and Functions

FPGA Pin Assignment	Shared I/O Bit	Schematic Signal Name	Description
J18	GPIO1_IO6	UARTA_TX	HPS debug UART port 1 TX
J19	GPIO1_IO7	UARTA_RX	HPS debug UART PORT 1 RX
AV22	-	CVP_CONFDONE	HPS UART0 TX after FPGA configuration
AU21	-	CRCEERROR	HPS UART0 RX after FPGA configuration

Real-Time Clock (HPS)

The HPS system has a battery-backed real-time clock (RTC) connected through the I²C interface. The RTC is implemented using a DS1339 device from Maxim Semiconductor. The device has a built-in power sense circuit that detects power failures and automatically switches to the backup battery supply, maintaining time. The device uses a CR1225 lithium coin battery with a nominal voltage of 3 V.

Note: A battery for the RTC is not shipped with the development kit.

SFP+

The development board include two SFP+ ports that use two transceiver channels from the FPGA. These ports take in serial data from the FPGA and transforms it into optical signals. Both SFP+ ports are active and include the SFP+ cage assembly.

Table 5-25: SFP+ FPGA Transceiver Pin Assignments

FPGA Pin Assignment	Schematic Signal Name	Direction	Description
AW36	SFPB_TX_N	Output	SFP+ B Transmitter
AW37	SFPB_TX_P	Output	SFP+ B Transmitter
AT30	SFPB_RX_N	Input	SFP+ B Receiver
AT31	SFPB_RX_P	Input	SFP+ B Receiver
AW32	SFPA_TX_N	Output	SFP+ A Transmitter
AW33	SFPA_TX_P	Output	SFP+ A Transmitter
AU32	SFPA_RX_N	Input	SFP+ A Receiver
AU33	SFPA_RX_P	Input	SFP+ A Receiver
AR29	LMK_SFPCLK_P	Input	SFP+ clock reference from clock cleaner
AR28	LMK_SFPCLK_N	Input	SFP+ clock reference from clock cleaner

Table 5-26: I²C Device Address

Address	Device
0x14, 0x16	LT2497 ADC
0x51	24LC32A EEPROM
0x68	DS1339C Real time clock circuit
0x4C	MAX1619 Temp monitor
0x71, 0x70, 0x73	Si5338 clock generators

0x0E	3.3VLTM4676A power controller
0x28	LCD

FPGA-I/O MAX V Interface

Thirteen FPGA IO pairs (FPGAIO_NP signals) are connected to FPGA-IO MAXV CPLD for supporting FMC, Display port and SDI applications.

Table 5-27: I/O Assignments of FPGA I/O Pairs

Bank	Pin Number	Schematic Signal Name
3E	M2	FPGAIO9_N
3E	M1	FPGAIO9_P
3E	N4	FPGAIO8_N
3E	N3	FPGAIO8_P

2I	AL20	FPGAIO1_N
2I	AM21	FPGAIO1_P

The figure below illustrates the signal connections between two MAX Vs and FPGA.

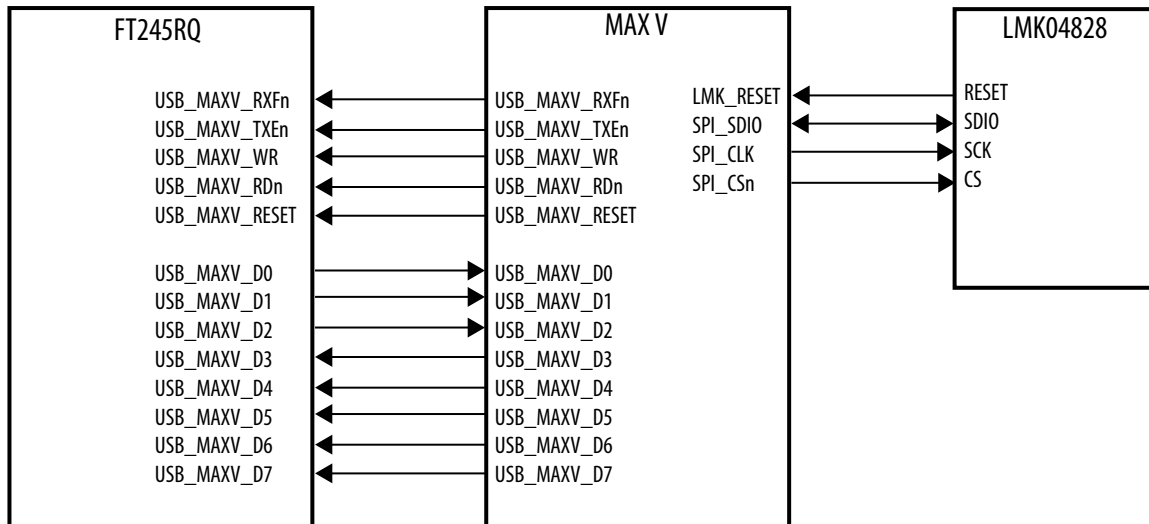

Figure 5-8: Control Signal Connection

LMK04828 Controller

The TI interface uses the USB interface to access the LMK04828 clock cleaner. The LMK04828 controller passes the FT245RQ signals to the SPI interface of LMK04828 clock cleaner chip.

Figure 5-9: LMK04828 Controller

J33 is used to select reference clock sources.

Table 5-28: J33 Reference Clock sources

Description	Clock source of Clock Cleaner
OPEN	VCXO
SHORT	EXT_CLOCK

HPS SPIO Interface

The HPS can monitor and control the following functional signals through the SPI interface:

- HPS LED signals
- HPS Push button and DIP switch signals
- Power good and present signals
- Reset signals
- FMCA/B PCIE power enable signals
- SFP+ control signals
- I²C master indication signal
- HPS warm reset signals
- PMBUS control signals

Table 5-29: SPI Interface Pin Definition

Pin	Description	Function
nCS	Chip Select	Active low signal that enables the slave device to receive or transfer data from the master device
SCK	Serial Clock	The clock signal produced from the master device to synchronize the data transfer
MOSI	Serial Data Input	Receive data serially at the positive SCK clock.
MISO	Serial Data output	Transmit data serially at the negative SCK clock edge.

The HPS SPI controller is the SPI master, and the MAX V works as a slave SPI I/O expander. The SPI interface uses 8-bit frame size. For MOSI, the first byte is used as an instruction byte. Bit [7:1] is the register address. Bit [0] is the operation flag where logic '1' is read flag and logic '0' is the write flag. The second byte is the data byte. For MISO, the first byte are zero byte (pad), second byte is the data byte.

Figure 5-11: HPS SPI Write Timing (Write/Write)

Figure 5-12: HPS SPI Read Timing Diagram

Figure 5-13: HPS SPI Read Timing (Read/Write)

Read followed by Write

In transaction 1 a read instruction (I1) is sent and the read data from a prior instruction is returned.
 In transaction 2, a 0 is written and the read data from I1 is returned. Since the 0 is a write, the read register is not updated.
 In transaction 3, a write instruction (I2) is sent with accompanying data and the read data from I1 is returned.

Figure 5-14: HPS SPI Read Timing (Read/Read)

Read followed by Read

In transaction 1 a read instruction (I1) is sent. The data from the last read is returned.
 On transaction 2, the read data from I1 is returned. Since a 0 is a write so the read data register is not updated for the 3rd transaction.
 In transaction 3, a read instruction (I2) is sent.
 On transaction 4, the read data from I2 is returned. 0 is sent in 2nd byte.

16 8-bit registers are implemented. For MOSI, the first byte is used as an instruction byte. Bit [7:1] is the register address. Bit [0] is the operation flag: Logic one is read flag. Logic zero is write flag. Second byte is data byte. For MISO, the first byte are zero byte (pad), second byte is data byte.

Table 5-30: SPI I/O Expander Register Definition

Instruction (8bits)	Instruction Description	Register Data Description
00000001	CPLD Revision Value	Register 0: Read-only Register Read value is the CPLD revision value
00000010	Write HPS LED Registers	Register 1: Bit[7:4] - USER_LED_HPS[3:0], Active low, default value is "0xF" Bit[3:0] - Reserved, default is "0x0"
00000011	Read HPS LED Registers	Register 1: Bit[7:4] - USER_LED_HPS[3:0] Bit[3:0] - Reserved Default value is "0xF0"
00000101	Read HPS Push Button and DIP switch registers	Register 2: Current Status of USER_PB_HPS and USER_DIPSW_HPS Bit[7:4] - USER_PB_HPS [3:0] Bit[3:0] - USER_DIPSW_HPS [3:0]
00000110	Write HPS Push Button IRQ flag clear registers	Register 3: Bit[7] - Write logic one to clear bit 7 flag in register 2, write logic zero to reset this bit after the flag is cleared Bit[6] - Write logic one to clear bit 6 flag in register 2, write logic zero to reset this bit after the flag is cleared Bit[5] - Write logic one to clear bit 5 flag in register 2 , write logic zero to reset this bit after the flag is cleared Bit[4] - Write logic one to clear bit 4 flag in register 2 , write logic zero to reset this bit after the flag is cleared

Instruction (8bits)	Instruction Description	Register Data Description
00000111	Read HPS Push Button IRQ flag Registers	<p>Register 3: Read-only Register</p> <p>Bit[7:4] - USER_PB_HPS hold registers bits</p> <p>Bit 7: USER_PB_HPS3 IRQ Flag, active low, clear flag by register 3 bit 7.</p> <p>Bit 6: USER_PB_HPS2 IRQ Flag, active low, clear flag by register3 bit 6.</p> <p>Bit 5: USER_PB_HPS1 IRQ Flag, active low, clear flag by register3 bit 5.</p> <p>Bit 4: USER_PB_HPS0 IRQ Flag, active low, clear flag by register3 bit 4.</p> <p>Bit[3:0] - reserved</p> <p>If one of the push buttons is pressed, the corresponding PB's IRQ register bit is set and A10_SH_GPIO0 is configured to '0'.</p> <p>The A10_SH_GPIO0 returns to '1' after the HPS clears the associated bit (even if the PB is still held down).</p> <p>If the second push button is pressed while the HPS is handling the first push button interrupt, the second PB's IRQ register bit remains as a '0' until HPS clears the interrupt. A10_SH_GPIO0 stays low until the HPS clears the second PB's IRQ register bit.</p>

Instruction (8bits)	Instruction Description	Register Data Description
00001001	Read Power good1 Registers	<p>Register 4: Read-only register</p> <p>Bit[7] - operation_flag. '1': Power on finished. '0': The system is in Power down cycle</p> <p>Bit[6] - 1V8_Pgood. '1':1.8V power rail output is normal. '0': 1.8V power rail output is abnormal.</p> <p>Bit[5] - 2V5_Pgood. '1':2.5V power rail output is normal. '0': 2.5V power rail output is abnormal.</p> <p>Bit[4] - 3V3_Pgood. '1':3.3V power rail output is normal. '0': 3.3V power rail output is abnormal.</p> <p>Bit[3] - 5V0_Pgood. '1':5V power rail output is normal. '0': 5V power rail output is abnormal.</p> <p>Bit[2] - 0V9_Pgood. '1':0.9V power rail output is normal. '0': 0.9V power rail output is abnormal.</p> <p>Bit[1] - 0V95_Pgood. '1':0.95V power rail output is normal. '0': 0.95V power rail output is abnormal.</p> <p>Bit[0] - 1V0_Pgood. '1':1.0V power rail output is normal. '0': 1.0V power rail output is abnormal.</p>

Instruction (8bits)	Instruction Description	Register Data Description
00001011	Read Power good2 Registers	<p>Register 5: Read-only register</p> <p>Bit[7] - HPS_Pgood. '1': HPS core power rail output is normal. '0': HPS core power rail output is abnormal.</p> <p>Bit[6] - HILOHPS_VDDPgood. '1':HPS memory power rail output is normal. '0': HPS memory power rail output is abnormal.</p> <p>Bit[5] - HILO_VDDPgood. '1':FPGA memory VDD power rail output is normal. '0': FPGA memory VDD power rail output is abnormal.</p> <p>Bit[4] - HILO_VDDQPgood . '1': FPGA memory VDDQ power rail output is normal. '0': FPGA memory VDDQ power rail output is abnormal.</p> <p>Bit[3] - FMCAVADJPGood. '1':FMCAVADJ power rail output is normal. '0': FMCAVADJ power rail output is abnormal.</p> <p>Bit[2] - FMCBVADJPGood. 1':FMCBVADJ power rail output is normal. '0': FMCBVADJ power rail output is abnormal.</p> <p>Bit[1] - FAC2MPgood. 1':FMCA slot powers are normal. '0': FMCA slot powers are abnormal.</p> <p>Bit[0] - FBC2MPgood. 1':FMCB slot powers are normal. '0': FMCB slot powers are abnormal.</p>

Instruction (8bits)	Instruction Description	Register Data Description
00001101	Read Power good3 & present Registers	<p>Register 6: Read-only Register</p> <p>Bit[7] - FAM2CPgood. '1': FMCA slot DC power outputs are normal. '0': FMCA slot DC power outputs are abnormal.</p> <p>Bit[6] - 10V_Fail_n. '1': Input voltage is above 10V. '0': Input voltage is below 10V.</p> <p>Bit[5] - BF_PRESENTn. '1': no boot flash card. '0': boot flash present</p> <p>Bit[4] - FILE_PRESENTn. '1': no file flash card. '0': file flash present</p> <p>Bit[3] - FMCA_PRESENTn. '1': no FMCA card. '0': FMCA card present</p> <p>Bit[2] - FMCB_PRESENTn. '1': no FMCB card. '0': FMCB present</p> <p>Bit[1] - PCIE_PRESENTn. '1': no PCIE card. '0': PCIE card present</p> <p>Bit[0] - Reserved</p>
00001110	Write FMCA/B PCIE Power enable Registers	<p>Register 7</p> <p>Bit[7] - PCIE_EN. '1': Enable PCIE RC slot power. '0': Disable PCIE RC slot power.</p> <p>Bit[6] - PCIE_AUXEN. '1': Enable PCIE RC slot auxiliary power. '0': Disable PCIE RC auxiliary power.</p> <p>Bit[5:0] - Reserved</p>
00001111	Read FMCA/B PCIE Power enable Registers	<p>Register 7</p> <p>Read the status of power enable register.</p>

Instruction (8bits)	Instruction Description	Register Data Description
00010000	Write HPS Resets Registers	<p>Register 8</p> <p>Bit[7] - Reserved</p> <p>Bit[6] - Reserved</p> <p>Bit[5] - Reserved</p> <p>Bit[4] - Reserved</p> <p>Bit[3] - Reserved</p> <p>Bit[2] - Reserved</p> <p>Bit[1] - ENET_HPS_RESETh. Active low to reset the HPS Ethernet port</p> <p>Bit[0] - Reserved</p>
00010001	Read HPS Reset Registers	<p>Register 8</p> <p>Bit[7] - HPS_UARTA_RESETh. Read-only bit. Always '1'</p> <p>Bit[6] - HPS_WARM_RESETh. Read-only bit. '0': WARM_Reset push button is pressed. '1' No action</p> <p>Bit[5] - HPS_WARM_RESETh. Read - only bit. '0': Trace reset is detected. '1' No action</p> <p>Bit[4] - HPS_COLD_RESETh. Read-only bit '0': Cold_Reset push button is pressed. '1' No action</p> <p>Bit[3] - HPS_NPOR. Read-only, NPOR for HPS, active low</p> <p>Bit[2] - HPS_NRST. Read-only, NRST for HPS, active low</p> <p>Bit[1] - ENET_HPS_RESETh. Read the status of ENET_HPS_RESETh</p> <p>Bit[0] - ENET_HPS_INTh. ENET_HPS_INTh current status.</p>

Instruction (8bits)	Instruction Description	Register Data Description
00010010	Write USB & BQSPI& FILE & PCIE Resets Registers	Register 9 Bit[7] - USB_RESET. Active high to reset the HPS USB. Bit[6] - BQSPI_RESETn. Active low to reset the boot flash. Bit[5] - FILE_RESETn. Active low to reset the FILE flash. Bit[4] - PCIE_PERSTn. Active low to reset the PCIE slot. Bit[3:0] - Reserved
00010011	Read USB & BQSPI& FILE & PCIE Resets Registers	Register 9 Read the status of USB & BQSPI& FILE & PCIE Resets Bit[7] - USB_RESET Bit[6] - BQSPI_RESETn Bit[5] - FILE_RESETn Bit[4] - PCIE_RESETn Bit[3:0] - Reserved
00010100	Write SFPA Control Registers	Register 10 Bit[7] - SFPA_TXDISABLE. '1': Disable SFPA TX. '0': Enable SFPA TX. Bit[6:5] - SFPA_RATESEL[1:0].SFPA RX rate selection 0: <4.25GBd1: > 4.25GBd Bit[4:0] - Reserved

Instruction (8bits)	Instruction Description	Register Data Description
00010101	Read SFPA Control Registers	<p>Register 10</p> <p>Bit[7] - SFPA_TXDISABLE. '1': Disable SFPA TX. '0': Enable SFPA TX.</p> <p>Bit[6:5] - SFPA_RATESEL[1:0].SFPA RX rate selection 0: <4.25GBd1: > 4.25GBd</p> <p>Bit[4] - SFPA_LOS. Loss signal of SFPA. '1':LOS, '0':normal.</p> <p>Bit[3] - SFPA_FAULT. Tx fault signal of SFPA. '1':fault, '0':normal.</p> <p>Bit[2] - SFPA_PRESENTn .Detect signal of SFP module in slot A . '1': no SFP module. '0': SFP module present.</p> <p>Bit[1:0] - Reserved</p>
00010110	Write SFPB Control Registers	<p>Register 11</p> <p>Bit[7] - SFPB_TXDISABLE. '1': Disable SFPB TX. '0': Enable SFPB TX.</p> <p>Bit[6:5] - SFPA_RATESEL[1:0].SFPA RX rate selection 0: <4.25GBd1: > 4.25GBd</p> <p>Bit[4:0] - Reserved</p>

Instruction (8bits)	Instruction Description	Register Data Description
00010111	Read SFPB Control Registers	Register 11 Bit[7] - SFPB_TXDISABLE. Read the status of SFPB TXDISABLE. Bit[6:5] - SFPB_RATESEL[1:0]. Read the status of SFPB rate selection. Bit[4] - SFPB_LOS. Read the Los signal of SFPB. '1': Loss '0': Normal. Bit[3] - SFPB_FAULT. Read the Tx Fault signal of SFPB. '1': Fault '0': Normal. Bit[2] - SFPB_PRESENTn. Detect signal of SFP module in slot B. '1': no SFP module. '0': SFP module present Bit[1:0] - Reserved
00011001	Read I ² C master Register	Register 12 Bit[7] - I ² C master indication. '1': HPS is the I ² C master, '0' MAXV is the I ² C master Bit[6:0] - Reserved
00011010	Write HPS Warm reset Register	Register 13 Bit[7:6] - "00" Bit[5] - HPS_SPI_WARM_RESETn. Active low to warm reset HPS; MAX V automatically clears this bit 1us after it becomes active. Bit[4:0] - "00000"
00011011	Read HPS Warm reset Register	Register 13 Bit[7:6] - "00" Bit[5] - HPS_SPI_WARM_RESETn. Read the status of HPS SPI warm reset. Bit[4:0] - "00000"

Instruction (8bits)	Instruction Description	Register Data Description
00011100	Write HPS Warm Reset Key Register	<p>Register 14</p> <p>Bit[7:0] - key register of HPS warm reset. Value of 0xA8 allows bit5 in register13 to be recognized.</p> <p>Software must write a different value to this register after a valid write to bit5 in Register13.</p>
00011101	Read HPS Warm Reset Key Register	<p>Register 14</p> <p>Value currently in HPS Warm Reset Key register.</p>
00011110	Write PM Bus Control Register	<p>Register 15</p> <p>Bit[7] - A10PMBUSEN. '1': Enable the Arria 10 FPGA PMBUS. '0': Disable the Arria 10 FPGA PMBUS.</p> <p>Bit[6] - A10_PMBUSDIS_N. '1': Enable the System MAX5/HPS PMBus.'0': Disable the System MAX5/HPS PMBus.</p> <p>Bit[5:0] - Reserved</p>
00011111	Read PM Bus Control Register	<p>Register 15</p> <p>Bit[7] - A10PMBUSEN. '1': The Arria 10 FPGA PMBUS is enabled. '0': The Arria 10 FPGA PMBUS is disabled.</p> <p>Bit[6] - A10_PMBUSDIS_N. '1': The System MAXV/HPS PMBus is enabled.'0': The System MAXV/HPS PMBus is disabled.</p> <p>Bit[5] - Pmbus_Altertn. '1': I²C is normal.'0' : I²C Hangs</p> <p>Bit[4:0] - Reserved</p>

Memory

This section describes the development board's memory interface support and also the signal names, types, and connectivity relative to the Arria 10 SoC. The development board has the following memory interfaces:

- DDR3/DDR4 (FPGA)
- DDR3/DDR4/QDRIV/RLDRAM3 (HPS)
- Boot Flash:
 - QSPI
 - Micro SD flash
 - NAND
- I²C EEPROM

FPGA External Memory

One 72-bit memory interface connected to a HILO memory card is assigned into three I/O banks (3B, 3C and 3D). A hard memory core is assigned to this interface. The table below lists the memory interface pin assignment of DDR3, DDR4, RLDRAM3 and QDRIV interfaces.

Table 5-31: FPGA External Memory Interface Pin Assignment

BANK	Pin Number	DDR3	DDR4	RLDRAM3	QDRIV
3D	W8	DDR3 DQ36	DDR4 DQ36	RLDRAM3 DQ23	QDRIV DQB4

HPS External Memory

A 40-bit HPS DDR3/4 memory interface (32-bit data and 8-bit ECC data) assigned to FPGA 2K and 2J I/O banks is connected to a HILO memory daughtercard.

Table 5-32: Bank 2K and 2J I/O Pin Assignments for DDR3 and DDR4 Interface

BANK	Pin Number	DDR3 Interface	DDR4 Interface

HPS Boot Flash Interface

The HPS includes dedicated I/O. The dedicated I/O [17:4] are used to connect the following boot flash daughtercards:

- NAND Flash (x8) card: 128MB
- QSPI Flash card: 128MB
- SD Micro flash card: 4GB

Table 5-33: Dedicated I/O Pin Assignments

BANK	Pin Number	NF1.0 Interface	QSPI Interface	SDMMC Interface
Dedicated	E16	NAND_ADQ0	QSPI_CLK	SDMMC_DATA0
Dedicated	H16	NAND_ADQ1	QSPI_ID0	SDMMC_CMD
Dedicated	K16	NAND_Wen	QSPI_SS0	SDMMC_CCLK
Dedicated	G16	NAND_REn	QSPI_IO1	SDMMC_DATA1
Dedicated	H17	NAND ADQ2	QSPI_IO2_WPn	SDMMC_DATA2
Dedicated	F15	NAND ADQ3	QSPI_IO3_HOLD	SDMMC_DATA3
Dedicated	L17	NAND_CLE	No use	SDMMC_PWR
Dedicated	N19	NAND_ALE	No use	No use
Dedicated	M19	NAND_RB	No use	SDMMC_DATA4
Dedicated	E15	NAND_Cen	No use	SDMMC_DATA5
Dedicated	J16	NAND AD4	No use	SDMMC_DATA6
Dedicated	L18	NAND AD5	No use	SDMMC_DATA7
Dedicated	M17	NAND AD6	No use	No use
Dedicated	K17	NAND AD7	No use	No use

The flash mode is selected by the `BOOTSEL` bits defined in the flash daughtercard. `BOOTSEL` values are 0x02, 0x04 and 0x06.

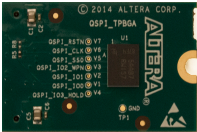

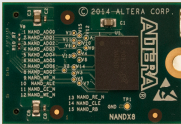

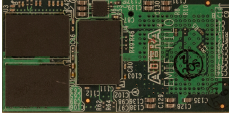

I²C EEPROM

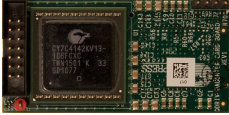

This board includes a 32 Kb EEPROM device. This device has a 2-wire I²C serial interface bus and is organized as four blocks of 4K x 8-bit memory. The main function of the device is for EtherCAT IP usage, but it can be used for other storage purposes as well.

Daughtercards

Altera Corporation and its partners offer a variety of application-specific daughtercards. You can use these daughtercards to expand the functionality of the Arria 10 SoC development board. Reference designs and application-specific software accompany many of the daughtercards, further facilitating the design process. All daughtercards are available for purchase on Altera.com.

Table 5-34: Arria 10 SoC Development Board Daughtercards

Daughtercard	Daughtercard Image	Memory Component	Part Number
Boot Flash Daughtercards			
Micro SD Boot Flash Card		Kingston MBLY10G2/4GB	QSHDC-MSD-A
QSPI Boot Flash Card		Micron MT25QU01GBBA8E12-0SIT	QSHDC-QSPI-A
NAND Boot Flash Card		Micron MT29F1G08ABBEAH4	QSHDC-NAND-A
HILO memory Daughtercards			
RLDRAM3		Micron MT44K16M36RB-093E	HLDC-RLDRAM3-A
DDR3		Micron MT41K512M16TNA-107:E	HLDC-DDR3-A
DDR4		Micron EDY4016AABG-DR-F	HLDC-DDR4-A

Daughtercard	Daughtercard Image	Memory Component	Part Number
QDRIV		Cypress CY7C4142KV13-106FCXC	HLDC-QDRIV-A

Board Power Supply

This section describes the Arria 10 SoC development board's power supply. A laptop style DC power supply is provided with the development kit. Use only the supplied power supply. The power supply has an auto-sensing input voltage range of 100 ~ 240 VAC and outputs 12 VDC power at 16 A to the development board. The 12 VDC input power is then stepped down to various power rails used by the board components.

An on-board multi-channel analog-to-digital converter (ADC) measures both the voltage and current for several specific board rails. The power utilization is displayed on a graphical user interface (GUI) that can graph power consumption versus time.
