I.C. : Indicator contact.
S.C.O. : Self Cut Off
A.R. : Automatic Reset

- (1) : These models are already equipped with suppression diodes.
- (2) : Standard products are equipped with common minus.
- (3) : Latching BCD driver enables also a manual reset through driver code 0000.
- (4) : Available only up to 6 positions.

- Latching models have a RESET pin which commands the reset of all positions. This command should be used before switching from one position to another. If not, two positions will be set at the same time.
 Note: During the RESET operation the current is : Setting current x number of positions.
- Latching models with AUTOMATIC RESET are available; these products have an internal SET/RESET circuit which automatically set the desired position and reset the non-selected positions. This option simplifies the use of latching switches by suppressing the RESET command in switching sequence and reducing the operating current consumption.
 For example: During the AUTOMATIC RESET operation, a 28V, 4 positions switch has temporarily a consumption of 250 mA, during 40 ms maximum only (See page 56).
