User's Manual

## Renesas Synergy™ Platform

Synergy Microcontrollers

S5 Series

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (<http://www.renesas.com>).

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
  2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
  3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
  4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
  5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.

"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
  6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
  7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
  8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
  9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
  10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
  11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
  12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.
- (Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
- (Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

## General Precautions

### 1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

### 2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

### 3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

### 4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

### 5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

### 6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between  $V_{IL}$  (Max.) and  $V_{IH}$  (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between  $V_{IL}$  (Max.) and  $V_{IH}$  (Min.).

### 7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

### 8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

# Preface

## 1. About this Document

This manual describes the functions and electrical characteristics of the Renesas Synergy™ Microcontroller.

This manual is generally organized into an overview of the product, descriptions of the CPU, system control functions, peripheral functions, electrical characteristics, and usage notes. This manual describes the product specification of the microcontroller (MCU) superset. Depending on your product, some pins, registers, or functions might not exist. Address space that store unavailable registers are reserved.

## 2. Audience

This manual is written for system designers who are designing and programming applications using the Renesas Synergy Microcontroller. The user is expected to have basic knowledge of electrical circuits, logic circuits, and the MCU.

## 3. Renesas Publications

Renesas provides the following documents for the Renesas Synergy Microcontroller. Before using any of these documents, visit [renesas.com/docs](http://renesas.com/docs) for the most up-to-date version of the document.

| Component               | Document type                    | Description  |
|-------------------------|----------------------------------|--|
| Microcontrollers        | Datasheet                        | Features, overview, and electrical characteristics of the MCU  |
|                         | User's Manual: Microcontrollers  | MCU specifications such as pin assignments, memory maps, peripheral functions, electrical characteristics, timing diagrams, and operation descriptions   |
|                         | Application Notes                | Technical notes, board design guidelines, and software migration information   |
|                         | Technical Update (TU)            | Preliminary reports on product specifications such as restriction and errata   |
| Software                | Datasheet                        | Functional descriptions and specific performance data for software modules that are included in Renesas Synergy Software Package (SSP)   |
|                         | User's Manual: Software          | API reference including SSP architecture and programming information   |
|                         | Application Notes                | Project files, guidelines for software programming, and application examples to develop embedded software applications   |
| Tools & Kits, Solutions | User's Manual: Development Tools | User's manual and quick start guide for developing embedded software applications with Development Kit (DK), Starter Kit (SK), Promotion Kit (PK), Target Board Kit (TB), Product Examples (PE), and Application Examples (AE) |
|                         | User's Manual: Software          |  |
|                         | Quick Start Guide                |  |
|                         | Application Notes                | Project files, guidelines for software programming, and application examples to develop embedded software applications   |

## 4. Numbering Notation

The following numbering notation is used throughout this manual:

| Example | Description  |
|---------|--|
| 011b    | Binary number. For example, the binary equivalent of the number 3 is 011b.   |
| 1Fh     | Hexadecimal number. For example, the hexadecimal equivalent of the number 31 is described 1Fh. In some cases, a hexadecimal number is shown with the prefix 0x, based on C/C++ formatting. |
| 1234    | Decimal number. Decimal numbers are generally shown without a suffix.  |

## 5. Typographic Notation

The following typographic notation is used throughout this manual:

| Example         | Description  |
|-----------------|--|
| ICU.NMICR.NMIMD | Periods separate a function module symbol (ICU), register symbol (NMICR), and bit field symbol (NMIMD)   |
| ICU.NMICR       | A period separates a function module symbol (ICU) and register symbol (NMICR)  |
| NMICR.NMIMD     | A period separates a register symbol (NMICR) and bit field symbol (NMIMD)  |
| NFCLKSEL[1:0]   | In a register bit name, the bit range enclosed in square brackets indicates the number of bits in the field at this location. In this example, NFCLKSEL[1:0] represents a 2-bit field at the specified location in the NMI Pin Interrupt Control Register (NMICR). |

## 6. Unit Prefix

The following unit prefixes are sometimes misleading. Those unit prefixes are described throughout this manual with the following meaning:

| Prefix | Description   |
|--------|---|
| b      | Bit   |
| B      | Byte. This unit prefix is generally used for memory specification of the MCU and address space.   |
| k      | $1000 = 10^3$ . k is also used to denote 1024 ( $2^{10}$ ) but this unit prefix is used to denote 1000 ( $10^3$ ) throughout this manual. |
| K      | $1024 = 2^{10}$ . This unit prefix is used to denote 1024 ( $2^{10}$ ) not 1000 ( $10^3$ ) throughout this manual.                        |

## 7. Special Terms

The following terms have special meanings:

| Term | Description  |
|------|--|
| NC   | Not connected pin. NC means the pin is not connected to the MCU. |
| Hi-Z | High impedance   |

## 8. Register Description

Each register description includes both a register diagram that shows the bit assignments and a register bit table that describes the content of each bit. The example of symbols used in these tables are described in the sections that follow. The following is an example of a register description and associated bit field definition.

### X.X.X NMI Pin Interrupt Control Register (NMICR)

#### (1) Function module symbol, register symbol, and address assignment

Function module symbol, register symbol, and address assignment of this register are generally expressed. ICU.NMICR 4000 6100h means NMI Pin Interrupt Control Register (NMICR) of Interrupt Controller Unit (ICU) is assigned to address 4000 6100h.

#### (2) Bit number

This number indicates the bit number. These bits are shown in order from b31 to b0 for a 32-bit register, from b15 to b0 for a 16-bit register, and from b7 to b0 for an 8-bit register.

#### (3) Value after reset

This symbol or number indicates the value of each bit after a reset. The value is shown in binary unless specified otherwise.

0: Indicates that the value is 0 after a reset.

1: Indicates that the value is 1 after a reset.

x: Indicates that the value is undefined after a reset.

#### (4) Bit symbol

Bit symbol indicates the short name of the bit field. Reserved bit is expressed with a —.

#### (5) Bit name

Bit name indicates the full name of the bit field.

#### (6) R/W

The R/W column indicates access type: whether the bit field is read or write.

R/W: The bit field is read and write.

R/(W): The bit field is read and write. But writing to this bit field has some limitations. For details on the limitations, see the description or notes of respective registers.

R: The bit field is read-only. Writing to this bit field has no effect.

W: The bit field is write-only. The read value is undefined.

## 9. Abbreviations

Abbreviations used in this manual are shown in the following table:

| Abbreviation | Description                                 |
|--------------|---|
| AES          | Advanced Encryption Standard                |
| AHB          | Advanced High-Performance Bus               |
| AHB-AP       | AHB Access Port                             |
| APB          | Advanced Peripheral Bus                     |
| ARC          | Alleged RC                                  |
| ATB          | Advanced Trace Bus                          |
| BCD          | Binary Coded Decimal                        |
| BSDL         | Boundary Scan Description Language          |
| DES          | Data Encryption Standard                    |
| DSA          | Digital Signature Algorithm                 |
| ECC          | Elliptic Curve Cryptography                 |
| ETB          | Embedded Trace Buffer                       |
| ETM          | Embedded Trace Macrocell                    |
| FLL          | Frequency Locked Loop                       |
| FPU          | Floating-Point Unit                         |
| GSM          | Global System for Mobile communications     |
| HMI          | Human Machine Interface                     |
| IrDA         | Infrared Data Association                   |
| LSB          | Least Significant Bit                       |
| MSB          | Most Significant Bit                        |
| NVIC         | Nested Vector Interrupt Controller          |
| PC           | Program Counter                             |
| PFS          | Port Function Select                        |
| PLL          | Phase Locked Loop                           |
| POR          | Power-On Reset                              |
| PWM          | Pulse Width Modulation                      |
| RSA          | Rivest Shamir Adleman                       |
| SHA          | Secure Hash Algorithm                       |
| S/H          | Sample and Hold                             |
| SP           | Stack Pointer                               |
| SWD          | Serial Wire Debug                           |
| SW-DP        | Serial Wire-Debug Port                      |
| TRNG         | True Random Number Generator                |
| UART         | Universal Asynchronous Receiver/Transmitter |

## 12. Feedback on the Product

If you have any comments or suggestions about this product, go to [renesassynergy.com/support](https://renesassynergy.com/support).

## 13. Feedback on Content

If you have any comments on the document such as general suggestions for improvements, go to [renesassynergy.com/support](https://renesassynergy.com/support), and provide:

- The title of the Renesas Synergy document
- The document number
- If applicable, the page number(s) to which your comments refer
- A detailed explanation of your comments.

Leading performance 120-MHz Arm® Cortex®-M4 core, up to 1-MB code flash memory, 384-KB SRAM, Capacitive Touch Sensing Unit, Ethernet MAC Controller, USB 2.0 Full-Speed, SDHI, Quad SPI, security and safety features, and advanced analog.

## Features

### ■ Arm Cortex-M4 Core with Floating Point Unit (FPU)

- Armv7E-M architecture with DSP instruction set
- Maximum operating frequency: 120 MHz
- Support for 4-GB address space
- On-chip debugging system: JTAG, SWD, and ETM
- Boundary scan and Arm Memory Protection Unit (Arm MPU)

### ■ Memory

- Up to 1-MB code flash memory (40 MHz zero wait states)
- 32-KB data flash memory (125,000 erase/write cycles)
- Up to 384-KB SRAM
- Flash Cache (FCACHE)
- Memory Protection Units (MPU)
- Memory Mirror Function (MMF)
- 128-bit unique ID

### ■ Connectivity

- Ethernet MAC Controller (ETHERC)
- Ethernet DMA Controller (EDMAC)
- USB 2.0 Full-Speed (USBFS) module
  - On-chip transceiver
- Serial Communications Interface (SCI) with FIFO × 10
- Serial Peripheral Interface (SPI) × 2
- I<sup>2</sup>C bus interface (IIC) × 3
- Controller Area Network (CAN) × 2
- Serial Sound Interface Enhanced (SSIE)
- SD/MMC Host Interface (SDHI) × 2
- Quad Serial Peripheral Interface (QSPI)
- IrDA interface
- Sampling Rate Converter (SRC)
- External address space
  - 8-bit or 16-bit bus space is selectable per area
  - SDRAM support

### ■ Analog

- 12-bit A/D Converter (ADC12) with 3 sample-and-hold circuits each × 2
- 12-bit D/A Converter (DAC12) × 2
- High-Speed Analog Comparator (ACMPHS) × 6
- Temperature Sensor (TSN)

### ■ Timers

- General PWM Timer 32-bit Enhanced High Resolution (GPT32EH) × 4
- General PWM Timer 32-bit Enhanced (GPT32E) × 4
- General PWM Timer 32-bit (GPT32) × 6
- Asynchronous General-Purpose Timer (AGT) × 2
- Watchdog Timer (WDT)

### ■ Safety

- Error Correction Code (ECC) in SRAM
- SRAM parity error check
- Flash area protection
- ADC self-diagnosis function
- Clock Frequency Accuracy Measurement Circuit (CAC)
- Cyclic Redundancy Check (CRC) calculator
- Data Operation Circuit (DOC)
- Port Output Enable for GPT (POEG)
- Independent Watchdog Timer (IWDT)
- GPIO readback level detection
- Register write protection
- Main oscillator stop detection
- Illegal memory access

### ■ System and Power Management

- Low power modes
- Realtime Clock (RTC) with calendar and VBATT support
- Event Link Controller (ELC)
- DMA Controller (DMAC) × 8
- Data Transfer Controller (DTC)
- Key Interrupt Function (KINT)
- Power-on reset
- Low Voltage Detection (LVD) with voltage settings

### ■ Security and Encryption

- AES128/192/256
- 3DES/ARC4
- SHA1/SHA224/SHA256/MD5
- GHASH
- RSA/DSA/ECC
- True Random Number Generator (TRNG)

### ■ Human Machine Interface (HMI)

- Capacitive Touch Sensing Unit (CTSU)
- Parallel Data Capture Unit (PDC)

### ■ Multiple Clock Sources

- Main clock oscillator (MOSC) (8 to 24 MHz)
- Sub-clock oscillator (SOSC) (32.768 kHz)
- High-speed on-chip oscillator (HOCO) (16/18/20 MHz)
- Middle-speed on-chip oscillator (MOCO) (8 MHz)
- Low-speed on-chip oscillator (LOCO) (32.768 kHz)
- IWDT-dedicated on-chip oscillator (15 kHz)
- Clock trim function for HOCO/MOCO/LOCO
- Clock out support

### ■ General-Purpose I/O Ports

- Up to 110 input/output pins
  - Up to 1 CMOS input
  - Up to 109 CMOS input/output
    - Up to 21 input/output 5 V tolerant
    - Up to 18 high current (20 mA)

### ■ Operating Voltage

- VCC: 2.7 to 3.6 V

### ■ Operating Temperature and Packages

- Ta = -40°C to +85°C
  - 145-pin LGA (7 mm × 7 mm, 0.5 mm pitch)
- Ta = -40°C to +105°C
  - 144-pin LQFP (20 mm × 20 mm, 0.5 mm pitch)
  - 100-pin LQFP (14 mm × 14 mm, 0.5 mm pitch)

## 1. Overview

The MCU integrates multiple series of software- and pin-compatible Arm<sup>®</sup>-based 32-bit cores that share a common set of Renesas peripherals to facilitate design scalability and efficient platform-based product development.

The MCU in this series incorporates a high-performance Arm Cortex<sup>®</sup>-M4 core running up to 120 MHz with the following features:

- Up to 1-MB code flash memory
- 384-KB SRAM
- Capacitive Touch Sensing Unit (CTSU)
- Ethernet MAC Controller (ETHERC), USBFS, SD/MMC Host Interface
- Quad Serial Peripheral Interface (QSPI)
- Security and safety features
- 12-bit A/D Converter (ADC12)
- 12-bit D/A Converter (DAC12)
- Analog peripherals.

### 1.1 Function Outline

**Table 1.1 Arm core**

| Feature            | Functional description   |
|--------------------|--|
| Arm Cortex-M4 core | <ul style="list-style-type: none"> <li>• Maximum operating frequency: up to 120 MHz</li> <li>• Arm Cortex-M4 core:               <ul style="list-style-type: none"> <li>- Revision: r0p1-01rel0</li> <li>- ARMv7E-M architecture profile</li> <li>- Single precision floating-point unit compliant with the ANSI/IEEE Std 754-2008.</li> </ul> </li> <li>• Arm Memory Protection Unit (Arm MPU):               <ul style="list-style-type: none"> <li>- Armv7 Protected Memory System Architecture</li> <li>- 8 protect regions.</li> </ul> </li> <li>• SysTick timer:               <ul style="list-style-type: none"> <li>- Driven by SYSTICCLK (LOCO) or ICLK.</li> </ul> </li> </ul> |

**Table 1.2 Memory**

| Feature                      | Functional description   |
|------------------------------|--|
| Code flash memory            | Maximum 1-MB code flash memory. See <a href="#">section 53, Flash Memory</a> .   |
| Data flash memory            | 32-KB data flash memory. See <a href="#">section 53, Flash Memory</a> .  |
| Memory Mirror Function (MMF) | The Memory Mirror Function (MMF) can be configured to mirror the target application image load address in code flash memory to the application image link address in the 23-bit unused memory space (memory mirror space addresses). Your application code is developed and linked to run from this MMF destination address. The application code does not need to know the load location where it is stored in code flash memory. See <a href="#">section 5, Memory Mirror Function (MMF)</a> . |
| Option-setting memory        | The option-setting memory determines the state of the MCU after a reset. See <a href="#">section 7, Option-Setting Memory</a> .  |
| SRAM                         | On-chip high-speed SRAM with either parity-bit or Error Correction Code (ECC). The first 32 KB of SRAM0 error correction capability using ECC. Parity check is performed for other areas. See <a href="#">section 51, SRAM</a> .   |
| Standby SRAM                 | On-chip SRAM that can retain data in Deep Software Standby mode. See <a href="#">section 52, Standby SRAM</a> .  |

Table 1.3 System (1 of 2)

| Feature  | Functional description  |
|--|---|
| Operating modes                                    | Two operating modes: <ul style="list-style-type: none"> <li>• Single-chip mode</li> <li>• SCI or USB boot mode.</li> </ul> See <a href="#">section 3, Operating Modes</a> .   |
| Resets   | 14 resets: <ul style="list-style-type: none"> <li>• RES pin reset</li> <li>• Power-on reset</li> <li>• Voltage monitor 0 reset</li> <li>• Voltage monitor 1 reset</li> <li>• Voltage monitor 2 reset</li> <li>• Independent watchdog timer reset</li> <li>• Watchdog timer reset</li> <li>• Deep Software Standby reset</li> <li>• SRAM parity error reset</li> <li>• SRAM ECC error reset</li> <li>• Bus master MPU error reset</li> <li>• Bus slave MPU error reset</li> <li>• Stack pointer error reset</li> <li>• Software reset.</li> </ul> See <a href="#">section 6, Resets</a> .                                  |
| Low Voltage Detection (LVD)                        | The Low Voltage Detection (LVD) function monitors the voltage level input to the VCC pin, and the detection level can be selected using a software program. See <a href="#">section 8, Low Voltage Detection (LVD)</a> .  |
| Clocks   | <ul style="list-style-type: none"> <li>• Main clock oscillator (MOSC)</li> <li>• Sub-clock oscillator (SOSC)</li> <li>• High-speed on-chip oscillator (HOCO)</li> <li>• Middle-speed on-chip oscillator (MOCO)</li> <li>• Low-speed on-chip oscillator (LOCO)</li> <li>• PLL frequency synthesizer</li> <li>• IWDT-dedicated on-chip oscillator</li> <li>• Clock out support.</li> </ul> See <a href="#">section 9, Clock Generation Circuit</a> .  |
| Clock Frequency Accuracy Measurement Circuit (CAC) | The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock to be used as a measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated. See <a href="#">section 10, Clock Frequency Accuracy Measurement Circuit (CAC)</a> . |
| Interrupt Controller Unit (ICU)                    | The Interrupt Controller Unit (ICU) controls which event signals are linked to the NVIC/DTC module and DMAC module. The ICU also controls NMI interrupts. See <a href="#">section 14, Interrupt Controller Unit (ICU)</a> .   |
| Key Interrupt Function (KINT)                      | A key interrupt can be generated by setting the Key Return Mode Register (KRM) and inputting a rising or falling edge to the key interrupt input pins. See <a href="#">section 21, Key Interrupt Function (KINT)</a> .  |
| Low power modes                                    | Power consumption can be reduced in multiple ways, such as by setting clock dividers, controlling EBCLK output, controlling SDCLK output, stopping modules, selecting power control mode in normal operation, and transitioning to low power modes. See <a href="#">section 11, Low Power Modes</a> .   |
| Battery backup function                            | A battery backup function is provided for partial powering by a battery. The battery powered area includes the RTC, SOSC, backup memory, and switch between VCC and VBATT. See <a href="#">section 12, Battery Backup Function</a> .  |
| Register write protection                          | The register write protection function protects important registers from being overwritten because of software errors. See <a href="#">section 13, Register Write Protection</a> .  |
| Memory Protection Unit (MPU)                       | Four Memory Protection Units (MPUs) and a CPU stack pointer monitor function are provided for memory protection. See <a href="#">section 16, Memory Protection Unit (MPU)</a> .   |

**Table 1.3 System (2 of 2)**

| Feature                           | Functional description  |
|-----------------------------------|---|
| Watchdog Timer (WDT)              | The Watchdog Timer (WDT) is a 14-bit down-counter that can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, a non-maskable interrupt or interrupt can be generated by an underflow. A refresh-permitted period can be set to refresh the counter and be used as the condition for detecting when the system runs out of control. See <a href="#">section 27, Watchdog Timer (WDT)</a> .  |
| Independent Watchdog Timer (IWDT) | The Independent Watchdog Timer (IWDT) consists of a 14-bit down-counter that must be serviced periodically to prevent counter underflow. The IWDT provides functionality to reset the MCU or to generate a non-maskable interrupt or interrupt for a timer underflow. Because the timer operates with an independent, dedicated clock source, it is particularly useful in returning the MCU to a known state as a fail-safe mechanism when the system runs out of control. The IWDT can be triggered automatically on a reset, underflow, or refresh error, or by a refresh of the count value in the registers. See <a href="#">section 28, Independent Watchdog Timer (IWDT)</a> . |

**Table 1.4 Event link**

| Feature                     | Functional description   |
|-----------------------------|--|
| Event Link Controller (ELC) | The Event Link Controller (ELC) uses the interrupt requests generated by various peripheral modules as event signals to connect them to different modules, enabling direct interaction between the modules without CPU intervention. See <a href="#">section 19, Event Link Controller (ELC)</a> . |

**Table 1.5 Direct memory access**

| Feature                        | Functional description   |
|--------------------------------|--|
| Data Transfer Controller (DTC) | A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request. See <a href="#">section 18, Data Transfer Controller (DTC)</a> .   |
| DMA Controller (DMAC)          | An 8-channel DMAC module is provided for transferring data without the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address. See <a href="#">section 17, DMA Controller (DMAC)</a> . |

**Table 1.6 External bus interface**

| Feature        | Functional description  |
|----------------|---|
| External buses | <ul style="list-style-type: none"> <li>• CS area (EXBIU): Connected to the external devices (external memory interface)</li> <li>• SDRAM area (EXBIU): Connected to the SDRAM (external memory interface)</li> <li>• QSPI area (EXBIUT2): Connected to the QSPI (external device interface).</li> </ul> |

**Table 1.7 Timers**

| Feature                                  | Functional description  |
|--|---|
| General PWM Timer (GPT)                  | The General PWM Timer (GPT) is a 32-bit timer with 14 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or up- and down-counter. In addition, PWM waveforms can be generated for controlling brushless DC motors. The GPT can also be used as a general-purpose timer. See <a href="#">section 23, General PWM Timer (GPT)</a> .  |
| Port Output Enable for GPT (POEG)        | Use the Port Output Enable for GPT (POEG) function to place the General PWM Timer (GPT) output pins in the output disable state. See <a href="#">section 22, Port Output Enable for GPT (POEG)</a> .  |
| Asynchronous General-Purpose Timer (AGT) | The Asynchronous General Purpose Timer (AGT) is a 16-bit timer that can be used for pulse output, external pulse width or period measurement, and counting of external events. This 16-bit timer consists of a reload register and a down-counter. The reload register and the down-counter are allocated to the same address, and can be accessed with the AGT register. See <a href="#">section 25, Asynchronous General-Purpose Timer (AGT)</a> .  |
| Realtime Clock (RTC)                     | The Realtime Clock (RTC) has two counting modes, calendar count mode and binary count mode, that are controlled by the register settings.<br>For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years.<br>For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar. See <a href="#">section 26, Realtime Clock (RTC)</a> . |

**Table 1.8 Communication interfaces (1 of 2)**

| Feature                                 | Functional description   |
|---|--|
| Serial Communications Interface (SCI)   | <p>The Serial Communications Interface (SCI) is configurable to five asynchronous and synchronous serial interfaces:</p> <ul style="list-style-type: none"> <li>• Asynchronous interfaces (UART and Asynchronous Communications Interface Adapter (ACIA))</li> <li>• 8-bit clock synchronous interface</li> <li>• Simple IIC (master-only)</li> <li>• Simple SPI</li> <li>• Smart card interface.</li> </ul> <p>The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol.</p> <p>Each SCI has FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using an on-chip baud rate generator. See <a href="#">section 32, Serial Communications Interface (SCI)</a>.</p> |
| IrDA Interface (IrDA)                   | <p>The IrDA interface sends and receives IrDA data communication waveforms in cooperation with the SCI1 based on the IrDA (Infrared Data Association) standard 1.0. See <a href="#">section 33, IrDA Interface</a>.</p>  |
| I <sup>2</sup> C bus interface (IIC)    | <p>The 3-channel I<sup>2</sup>C bus interface (IIC) conforms with and provides a subset of the NXP I<sup>2</sup>C (Inter-Integrated Circuit) bus interface functions. See <a href="#">section 34, I<sup>2</sup>C Bus Interface (IIC)</a>.</p>  |
| Serial Peripheral Interface (SPI)       | <p>Two independent Serial Peripheral Interface (SPI) channels are capable of high-speed, full-duplex synchronous serial communications with multiple processors and peripheral devices. See <a href="#">section 36, Serial Peripheral Interface (SPI)</a>.</p>   |
| Serial Sound Interface Enhanced (SSIE)  | <p>The Serial Sound Interface Enhanced (SSIE) peripheral provides functionality to interface with digital audio devices for transmitting I<sup>2</sup>S (Inter-Integrated Sound) 2ch, 4ch, 6ch, 8ch, Word Select (WS) Continue/Monaural/TDM audio data over a serial bus. The SSIE supports an audio clock frequency of up to 50 MHz, and can be operated as a slave or master receiver, transmitter, or transceiver to suit various applications. The SSIE includes 32-stage FIFO buffers in the receiver and transmitter, and supports interrupts and DMA-driven data reception and transmission. See <a href="#">section 39, Serial Sound Interface Enhanced (SSIE)</a>.</p>  |
| Quad Serial Peripheral Interface (QSPI) | <p>The Quad Serial Peripheral Interface (QSPI) is a memory controller for connecting a serial ROM (nonvolatile memory such as a serial flash memory, serial EEPROM, or serial FeRAM) that has an SPI-compatible interface. See <a href="#">section 37, Quad Serial Peripheral Interface (QSPI)</a>.</p>  |
| Controller Area Network (CAN) module    | <p>The Controller Area Network (CAN) module provides functionality to receive and transmit data using a message-based protocol between multiple slaves and masters in electromagnetically-noisy applications.</p> <p>The CAN module complies with the ISO 11898-1 (CAN 2.0A/CAN 2.0B) standard and supports up to 32 mailboxes, which can be configured for transmission or reception in normal mailbox and FIFO modes. Both standard (11-bit) and extended (29-bit) messaging formats are supported. See <a href="#">section 35, Controller Area Network (CAN) Module</a>.</p>  |
| USB 2.0 Full-Speed (USBFS) module       | <p>The USB 2.0 Full-Speed (USBFS) module can operate as a host controller or device controller. The module supports full-speed and low-speed (host controller only) transfer as defined in Universal Serial Bus Specification 2.0. The module has an internal USB transceiver and supports all of the transfer types defined in Universal Serial Bus Specification 2.0. The USB has buffer memory for data transfer, providing a maximum of 10 pipes. Pipes 1 to 9 can be assigned any endpoint number based on the peripheral devices used for communication or based on your system. See <a href="#">section 31, USB 2.0 Full-Speed Module (USBFS)</a>.</p>  |
| Ethernet MAC (ETHERC)                   | <p>One-channel Ethernet MAC Controller (ETHERC) compliant with the Ethernet/IEEE802.3 Media Access Control (MAC) layer protocol. An ETHERC channel provides one channel of the MAC layer interface, connecting the MCU to the physical layer LSI (PHY-LSI) that allows transmission and reception of frames compliant with the Ethernet and IEEE802.3 standards. The ETHERC is connected to the Ethernet DMA Controller (EDMAC) so data can be transferred without using the CPU. See <a href="#">section 29, Ethernet MAC Controller (ETHERC)</a>.</p>  |

**Table 1.8 Communication interfaces (2 of 2)**

| Feature                      | Functional description   |
|------------------------------|--|
| SD/MMC Host Interface (SDHI) | The SDHI and MultiMediaCard (MMC) interface module provides the functionality required to connect a variety of external memory cards to the MCU. The SDHI supports both 1- and 4-bit buses for connecting memory cards that support SD, SDHC, and SDXC formats. When developing host devices that are compliant with the SD Specifications, you must comply with the SD Host/Ancillary Product License Agreement (SD HALA).<br>The MMC interface supports 1-bit, 4-bit, and 8-bit MMC buses that provide eMMC 4.51 (JEDEC Standard JESD 84-B451) device access. This interface also provides backward compatibility and supports high-speed SDR transfer modes. See <a href="#">section 41, SD/MMC Host Interface (SDHI)</a> . |

**Table 1.9 Analog**

| Feature                               | Functional description  |
|---------------------------------------|---|
| 12-bit A/D Converter (ADC12)          | Up to two successive approximation 12-bit A/D Converters (ADC12) are provided. In unit 0, up to 13 analog input channels are selectable. In unit 1, up to nine analog input channels, the temperature sensor output, and an internal reference voltage are selectable for conversion. The A/D conversion accuracy is selectable from 12-bit, 10-bit, and 8-bit conversion, making it possible to optimize the tradeoff between speed and resolution in generating a digital value. See <a href="#">section 45, 12-Bit A/D Converter (ADC12)</a> .                                   |
| 12-bit D/A Converter (DAC12)          | The 12-bit D/A Converter (DAC12) converts data and includes an output amplifier. See <a href="#">section 46, 12-Bit D/A Converter (DAC12)</a> .   |
| Temperature sensor (TSN)              | The on-chip temperature sensor can determine and monitor the die temperature for reliable operation of the device. The sensor outputs a voltage directly proportional to the die temperature, and the relationship between the die temperature and the output voltage is linear. The output voltage is provided to the ADC12 for conversion and can also be used by the end application. See <a href="#">section 47, Temperature Sensor (TSN)</a> .   |
| High-Speed Analog Comparator (ACMPHS) | The High-Speed Analog Comparator (ACMPHS) compares a test voltage with a reference voltage and provides a digital output based on the conversion result.<br>Both the test and reference voltages can be provided to the comparator from internal sources such as the DAC12 output and internal reference voltage, and an external source. Such flexibility is useful in applications that require go/no-go comparisons to be performed between analog signals without necessarily requiring A/D conversion. See <a href="#">section 48, High-Speed Analog Comparator (ACMPHS)</a> . |

**Table 1.10 Human machine interfaces**

| Feature                              | Functional description  |
|--------------------------------------|---|
| Capacitive Touch Sensing Unit (CTSU) | The Capacitive Touch Sensing Unit (CTSU) measures the electrostatic capacitance of the touch sensor. Changes in the electrostatic capacitance are determined by software, which enables the CTSU to detect whether a finger is in contact with the touch sensor. The electrode surface of the touch sensor is usually enclosed with an electrical insulator so that fingers do not come into direct contact with the electrodes. See <a href="#">section 49, Capacitive Touch Sensing Unit (CTSU)</a> . |

**Table 1.11 Graphics**

| Feature                          | Functional description  |
|----------------------------------|---|
| Parallel Data Capture (PDC) unit | One Parallel Data Capture (PDC) unit is provided to communicate with external I/O devices, including image sensors, and to transfer parallel data such as an image output from the external I/O device through the DTC or DMAC to the on-chip SRAM and external address spaces (the CS and SDRAM areas). See <a href="#">section 42, Parallel Data Capture Unit (PDC)</a> . |

**Table 1.12 Data processing**

| Feature                                  | Functional description  |
|--|---|
| Cyclic Redundancy Check (CRC) calculator | The CRC calculator generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication. Additionally, various CRC-generating polynomials are available. The snoop function allows monitoring reads from and writes to specific addresses. This function is useful in applications that require CRC code to be generated automatically in certain events, such as monitoring writes to the serial transmit buffer and reads from the serial receive buffer. See <a href="#">section 38, Cyclic Redundancy Check (CRC) Calculator</a> . |
| Data Operation Circuit (DOC)             | The Data Operation Circuit (DOC) compares, adds, and subtracts 16-bit data. See <a href="#">section 50, Data Operation Circuit (DOC)</a> .  |
| Sampling Rate Converter (SRC)            | The Sampling Rate Converter (SRC) converts the sampling rate of data produced by various audio decoders, such as the WMA, MP3, and AAC. Both 16-bit stereo and monaural data are supported.<br>See <a href="#">section 40, Sampling Rate Converter (SRC)</a> .  |

**Table 1.13 Security**

| Feature                       | Functional description   |
|-------------------------------|--|
| Secure Crypto Engine 7 (SCE7) | <ul style="list-style-type: none"> <li>• Security algorithms: <ul style="list-style-type: none"> <li>- Symmetric algorithms: AES, 3DES, and ARC4</li> <li>- Asymmetric algorithms: RSA, DSA, and ECC.</li> </ul> </li> <li>• Other support features: <ul style="list-style-type: none"> <li>- TRNG (True Random Number Generator)</li> <li>- Hash-value generation: SHA1, SHA224, SHA256, GHASH, and MD5</li> <li>- 128-bit unique ID.</li> </ul> </li> </ul> See <a href="#">section 44, Secure Cryptographic Engine (SCE7)</a> . |

## 1.2 Block Diagram

Figure 1.1 shows a block diagram of the MCU superset, some individual devices within the group have a subset of the features.

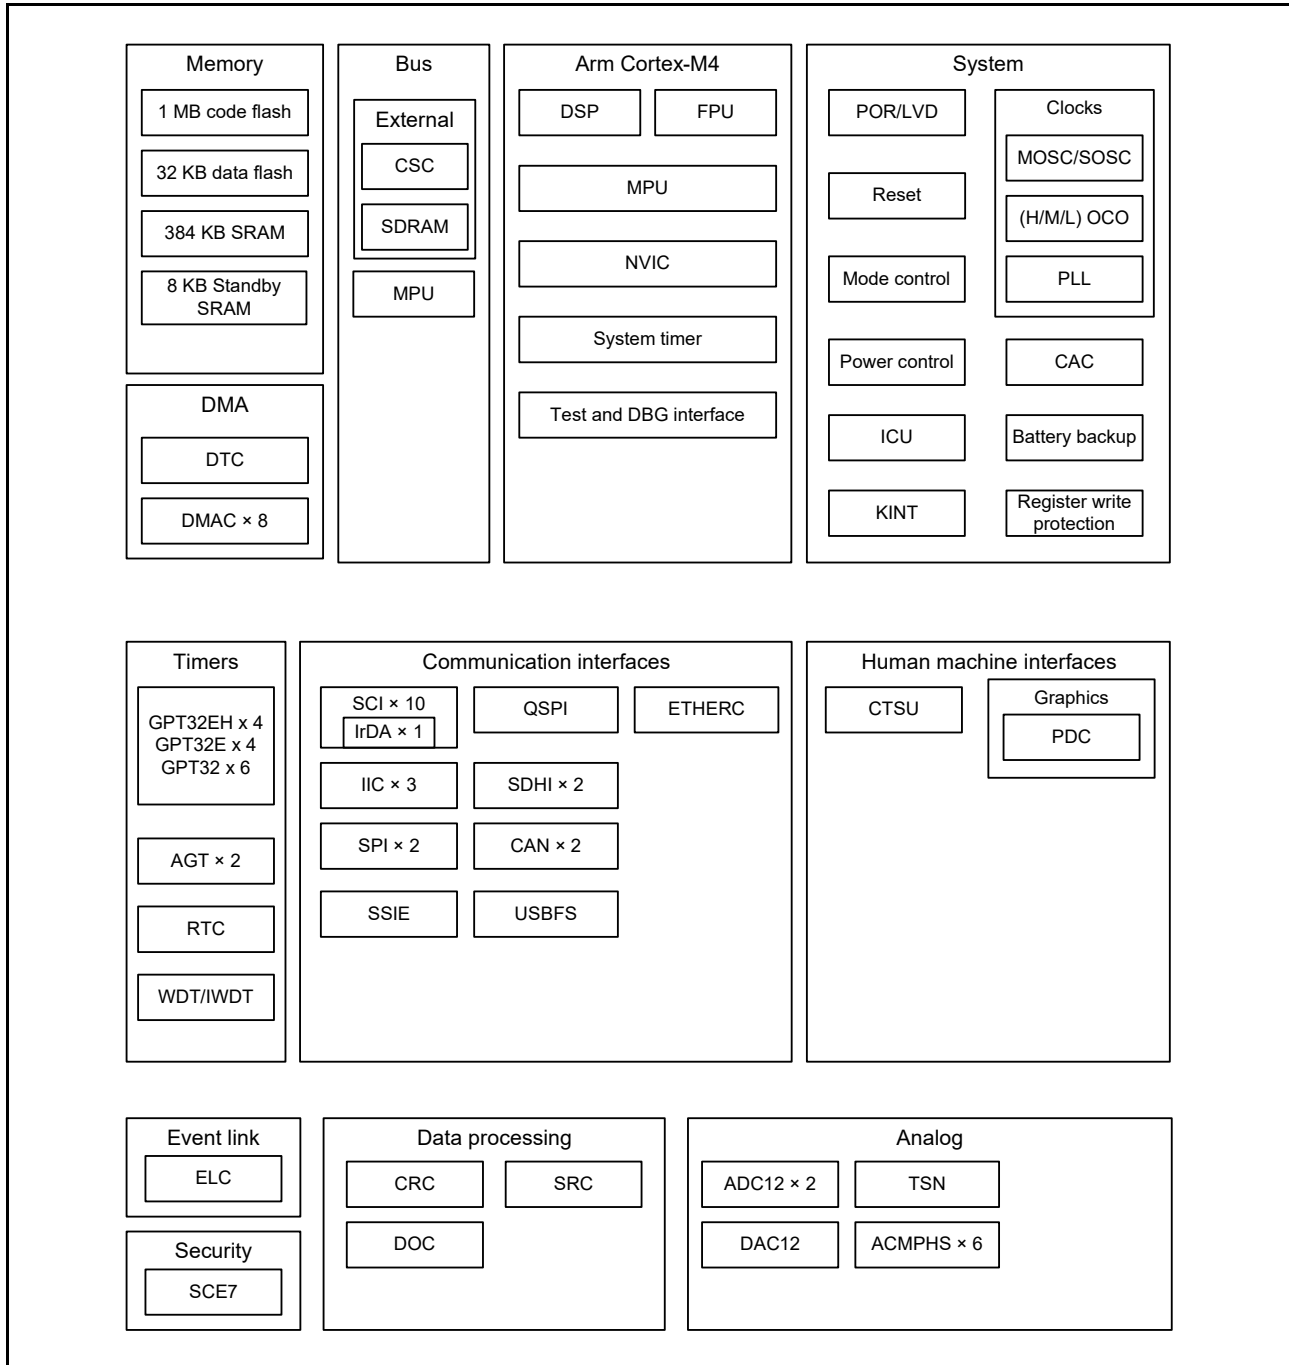

Figure 1.1 Block diagram

### 1.3 Part Numbering

Figure 1.2 shows the product part number information, including memory capacity and package type. Table 1.14 shows a list of products.

Figure 1.2 Part numbering scheme

Table 1.14 Product list

| Product part number | Orderable part number | Package      | Code flash | Data flash | SRAM   | Operating temperature |
|---------------------|-----------------------|--------------|------------|------------|--------|-----------------------|
| R7FS5D57C2A01CLK    | R7FS5D57C2A01CLK#AC1  | PTLG0145KA-A | 1 MB       | 32 KB      | 384 KB | -40 to +85°C          |

## 1.5 Pin Functions

Table 1.16 Pin functions (1 of 5)

| Function               | Signal                 | I/O    | Description   |
|------------------------|------------------------|--------|---|
| Power supply           | VCC                    | Input  | Power supply pin. This is used as the digital power supply for the respective modules and internal voltage regulator, and used to monitor the voltage of the POR/LVD. Connect it to the system power supply. Connect this pin to VSS by a 0.1- $\mu$ F capacitor. Place the capacitor close to the pin. |
|                        | VCL0                   | -      | Connect to VSS through a 0.1- $\mu$ F smoothing capacitor close to each VCL pin. Stabilize the internal power supply.   |
|                        | VCL                    | -      |   |
|                        | VSS                    | Input  | Ground pin. Connect to the system power supply (0 V).   |
|                        | VBATT                  | Input  | Backup power pin  |
| Clock                  | XTAL                   | Output | Pins for a crystal resonator. An external clock signal can be input through the EXTAL pin.  |
|                        | EXTAL                  | Input  |   |
|                        | XCIN                   | Input  | Input/output pins for the sub-clock oscillator. Connect a crystal resonator between XCOU and XCIN.  |
|                        | XCOU                   | Output |   |
|                        | EBCLK                  | Output | Outputs the external bus clock for external devices   |
|                        | SDCLK                  | Output | Outputs the SDRAM-dedicated clock   |
|                        | CLKOUT                 | Output | Clock output pin  |
| Operating mode control | MD                     | Input  | Pin for setting the operating mode. The signal level on this pin must not be changed during operation mode transition on release from the reset state.  |
| System control         | RES                    | Input  | Reset signal input pin. The MCU enters the reset state when this signal goes low.   |
| CAC                    | CACREF                 | Input  | Measurement reference clock input pin   |
| Interrupt              | NMI                    | Input  | Non-maskable interrupt request pin  |
|                        | IRQ0 to IRQ15          | Input  | Maskable interrupt request pins   |
| KINT                   | KR00 to KR07           | Input  | A key interrupt can be generated by inputting a falling edge to the key interrupt input pins  |
| On-chip emulator       | TMS                    | I/O    | On-chip emulator or boundary scan pins  |
|                        | TDI                    | Input  |   |
|                        | TCK                    | Input  |   |
|                        | TDO                    | Output |   |
|                        | TCLK                   | Output | This pin outputs the clock for synchronization with the trace data  |
|                        | TDATA0 to TDATA3       | Output | Trace data output   |
|                        | SWDIO                  | I/O    | Serial wire debug data input/output pin   |
|                        | SWCLK                  | Input  | Serial wire clock pin   |
|                        | SWO                    | Output | Serial wire trace output pin  |
|                        | External bus interface | RD     | Output  |
| WR                     |                        | Output | Strobe signal indicating that writing to the external bus interface space is in progress, in 1-write strobe mode, active-low  |
| WR0 to WR1             |                        | Output | Strobe signals indicating that either group of data bus pins (D07 to D00 or D15 to D08) is valid in writing to the external bus interface space, in byte strobe mode, active-low  |
| BC0 to BC1             |                        | Output | Strobe signals indicating that either group of data bus pins (D07 to D00 or D15 to D08) is valid in access to the external bus interface space, in 1-write strobe mode, active-low  |
| ALE                    |                        | Output | Address latch signal when address/data multiplexed bus is selected  |
| WAIT                   |                        | Input  | Input pin for wait request signals in access to the external space, active-low  |
| CS0 to CS7             |                        | Output | Select signals for CS areas, active-low   |
| A00 to A20             |                        | Output | Address bus   |
| D00 to D15             |                        | I/O    | Data bus  |
| A00/D00 to A15/D15     |                        | I/O    | Address/data multiplexed bus  |

**Table 1.16 Pin functions (2 of 5)**

| Function        | Signal                                   | I/O  | Description  |
|-----------------|--|--|--|
| SDRAM interface | CKE                                      | Output   | SDRAM clock enable signal  |
|                 | SDCS                                     | Output   | SDRAM chip select signal, active-low   |
|                 | RAS                                      | Output   | SDRAM low address strobe signal, active-low  |
|                 | CAS                                      | Output   | SDRAM column address strobe signal, active-low   |
|                 | WE                                       | Output   | SDRAM write enable signal, active-low  |
|                 | DQM0                                     | Output   | SDRAM I/O data mask enable signal for DQ07 to DQ00   |
|                 | DQM1                                     | Output   | SDRAM I/O data mask enable signal for DQ15 to DQ08   |
|                 | A00 to A15                               | Output   | Address bus  |
| DQ00 to DQ15    | I/O                                      | Data bus   |  |
| GPT             | GTETRGA, GTETRGB, GTETRGC, GTETRGD       | Input  | External trigger input pins  |
|                 | GTIOC0A to GTIOC13A, GTIOC0B to GTIOC13B | I/O  | Input capture, output compare, or PWM output pins  |
|                 | GTIU                                     | Input  | Hall sensor input pin U  |
|                 | GTIV                                     | Input  | Hall sensor input pin V  |
|                 | GTIW                                     | Input  | Hall sensor input pin W  |
|                 | GTOUUP                                   | Output   | 3-phase PWM output for BLDC motor control (positive U phase)   |
|                 | GTOULO                                   | Output   | 3-phase PWM output for BLDC motor control (negative U phase)   |
|                 | GTOVUP                                   | Output   | 3-phase PWM output for BLDC motor control (positive V phase)   |
|                 | GTOVLO                                   | Output   | 3-phase PWM output for BLDC motor control (negative V phase)   |
|                 | GTOWUP                                   | Output   | 3-phase PWM output for BLDC motor control (positive W phase)   |
|                 | GTOWLO                                   | Output   | 3-phase PWM output for BLDC motor control (negative W phase)   |
|                 | AGT                                      | AGTEE0, AGTEE1                                       | Input  |
| AGTIO0, AGTIO1  |  | I/O  | External event input and pulse output pins   |
| AGTO0, AGTO1    |  | Output   | Pulse output pins  |
| AGTOA0, AGTOA1  |  | Output   | Output compare match A output pins   |
| AGTOB0, AGTOB1  |  | Output   | Output compare match B output pins   |
| RTC             | RTCOUT                                   | Output   | Output pin for 1-Hz or 64-Hz clock   |
|                 | RTCIC0 to RTCIC2                         | Input  | Time capture event input pins  |
| SCI             | SCK0 to SCK9                             | I/O  | Input/output pins for the clock (clock synchronous mode)   |
|                 | RXD0 to RXD9                             | Input  | Input pins for received data (asynchronous mode/clock synchronous mode)  |
|                 | TXD0 to TXD9                             | Output   | Output pins for transmitted data (asynchronous mode/clock synchronous mode)  |
|                 | CTS0_RTS0 to CTS9_RTS9                   | I/O  | Input/output pins for controlling the start of transmission and reception (asynchronous mode/clock synchronous mode), active-low |
|                 | SCL0 to SCL9                             | I/O  | Input/output pins for the IIC clock (simple IIC mode)  |
|                 | SDA0 to SDA9                             | I/O  | Input/output pins for the IIC data (simple IIC mode)   |
|                 | SCK0 to SCK9                             | I/O  | Input/output pins for the clock (simple SPI mode)  |
|                 | MISO0 to MISO9                           | I/O  | Input/output pins for slave transmission of data (simple SPI mode)   |
|                 | MOSI0 to MOSI9                           | I/O  | Input/output pins for master transmission of data (simple SPI mode)  |
| SS0 to SS9      | Input                                    | Chip-select input pins (simple SPI mode), active-low |  |
| IIC             | SCL0 to SCL2                             | I/O  | Input/output pins for the clock  |
|                 | SDA0 to SDA2                             | I/O  | Input/output pins for data   |
| SSIE            | SSIBCK0                                  | I/O  | SSIE serial bit clock pins   |
|                 | SSILRCK0/SSIFS0                          | I/O  | LR clock/frame synchronization pins  |
|                 | SSITXD0                                  | Output   | Serial data output pins  |
|                 | SSIRXD0                                  | Input  | Serial data input pins   |
|                 | SSIDATA0                                 | I/O  | Serial data input/output pins  |
|                 | AUDIO_CLK                                | Input  | External clock pin for audio (input oversampling clock)  |

**Table 1.16 Pin functions (3 of 5)**

| Function | Signal                         | I/O  | Description   |
|----------|--------------------------------|--|---|
| SPI      | RSPCKA, RSPCKB                 | I/O  | Clock input/output pin  |
|          | MOSIA, MOSIB                   | I/O  | Input or output pins for data output from the master  |
|          | MISOA, MISOB                   | I/O  | Input or output pins for data output from the slave   |
|          | SSLA0, SSLB0                   | I/O  | Input or output pin for slave selection   |
|          | SSLA1 to SSLA3, SSLB1 to SSLB3 | Output   | Output pins for slave selection   |
| QSPI     | QSPCLK                         | Output   | QSPI clock output pin   |
|          | QSSL                           | Output   | QSPI slave output pin   |
|          | QIO0 to QIO3                   | I/O  | Data0 to Data3  |
| CAN      | CRX0, CRX1                     | Input  | Receive data  |
|          | CTX0, CTX1                     | Output   | Transmit data   |
| USBFS    | VCC_USB                        | Input  | Power supply pins   |
|          | VSS_USB                        | Input  | Ground pins   |
|          | USB_DP                         | I/O  | D+ I/O pin of the USB on-chip transceiver. Connect this pin to the D+ pin of the USB bus  |
|          | USB_DM                         | I/O  | D- I/O pin of the USB on-chip transceiver. Connect this pin to the D- pin of the USB bus  |
|          | USB_VBUS                       | Input  | USB cable connection monitor pin. Connect this pin to VBUS of the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USB module is operating as a device controller. |
|          | USB_EXICEN                     | Output   | Low-power control signal for external power supply (OTG) chip   |
|          | USB_VBUSEN                     | Output   | VBUS (5 V) supply enable signal for external power supply chip  |
|          | USB_OVRCURA, USB_OVRCURB       | Input  | Connect the external overcurrent detection signals to these pins. Connect the VBUS comparator signals to these pins when the OTG power supply chip is connected.                                    |
| USB_ID   | Input                          | Connect the MicroAB connector ID input signal to this pin during operation in OTG mode |   |

**Table 1.16 Pin functions (4 of 5)**

| Function            | Signal                                 | I/O   | Description   |
|---------------------|--|---|---|
| ETHERC              | REF50CK0                               | Input   | 50-MHz reference clock. This pin inputs reference signal for transmission/reception timing in RMII mode.  |
|                     | RMII0_CRS_DV                           | Input   | Indicates carrier detection signals and valid receive data on RMII0_RXD1 and RMII0_RXD0 in RMII mode  |
|                     | RMII0_TXD0, RMII0_TXD1                 | Output  | 2-bit transmit data in RMII mode  |
|                     | RMII0_RXD0, RMII0_RXD1                 | Input   | 2-bit receive data in RMII mode   |
|                     | RMII0_TXD_EN                           | Output  | Output pin for data transmit enable signal in RMII mode   |
|                     | RMII0_RX_ER                            | Input   | Indicates an error occurred during reception of data in RMII mode   |
|                     | ET0_CRS                                | Input   | Carrier detection/data reception enable signal  |
|                     | ET0_RX_DV                              | Input   | Indicates valid receive data on ET0_ERXD3 to ET0_ERXD0  |
|                     | ET0_EXOUT                              | Output  | General-purpose external output pin   |
|                     | ET0_LINKSTA                            | Input   | Input link status from the PHY-LSI  |
|                     | ET0_ETXD0 to ET0_ETXD3                 | Output  | 4 bits of MII transmit data   |
|                     | ET0_ERXD0 to ET0_ERXD3                 | Input   | 4 bits of MII receive data  |
|                     | ET0_TX_EN                              | Output  | Transmit enable signal. Functions as signal indicating that transmit data is ready on ET0_ETXD3 to ET0_ETXD0  |
|                     | ET0_TX_ER                              | Output  | Transmit error pin. Functions as signal notifying the PHY_LSI of an error during transmission   |
|                     | ET0_RX_ER                              | Input   | Receive error pin. Functions as signal to recognize an error during reception   |
|                     | ET0_TX_CLK                             | Input   | Transmit clock pin. This pin inputs reference signal for output timing from ET0_TX_EN, ET0_ETXD3 to ET0_ETXD0, and ET0_TX_ER  |
|                     | ET0_RX_CLK                             | Input   | Receive clock pin. This pin inputs reference signal for input timing to ET0_RX_DV, ET0_ERXD3 to ET0_ERXD0, and ET0_RX_ER  |
|                     | ET0_COL                                | Input   | Input collision detection signal  |
|                     | ET0_WOL                                | Output  | Receive Magic packets   |
|                     | ET0_MDC                                | Output  | Output reference clock signal for information transfer through ET0_MDIO   |
| ET0_MDIO            | I/O                                    | Input or output bidirectional signal for exchange of management data with PHY-LSI |   |
| SDHI                | SD0CLK, SD1CLK                         | Output  | SD clock output pins  |
|                     | SD0CMD, SD1CMD                         | I/O   | Command output pin and response input signal pins   |
|                     | SD0DAT0 to SD0DAT7, SD1DAT0 to SD1DAT7 | I/O   | SD and MMC data bus pins  |
|                     | SD0CD, SD1CD                           | Input   | SD card detection pins  |
|                     | SD0WP                                  | Input   | SD write-protect signals  |
| Analog power supply | AVCC0                                  | Input   | Analog voltage supply pin. This is used as the analog power supply for the respective modules. Supply this pin with the same voltage as the VCC pin.  |
|                     | AVSS0                                  | Input   | Analog ground pin. This is used as the analog ground for the respective modules. Supply this pin with the same voltage as the VSS pin.  |
|                     | VREFH0                                 | Input   | Analog reference voltage supply pin for the ADC12 (unit 0). Connect this pin to VCC when not using the ADC12 (unit 0) and sample-and-hold circuit for AN000 to AN002.                                   |
|                     | VREFL0                                 | Input   | Analog reference ground pin for the ADC12. Connect this pin to VSS when not using the ADC12 (unit 0) and sample-and-hold circuit for AN000 to AN002   |
|                     | VREFH                                  | Input   | Analog reference voltage supply pin for the ADC12 (unit 1) and D/A Converter. Connect this pin to VCC when not using the ADC12 (unit 1), sample-and-hold circuit for AN100 to AN102, and D/A Converter. |
|                     | VREFL                                  | Input   | Analog reference ground pin for the ADC12 and D/A Converter. Connect this pin to VSS when not using the ADC12 (unit 1), sample-and-hold circuit for AN100 to AN102, and D/A Converter.                  |

**Table 1.16 Pin functions (5 of 5)**

| Function   | Signal   | I/O                               | Description   |
|------------|--|-----------------------------------|---|
| ADC12      | AN000 to AN007,<br>AN016 to AN020                    | Input                             | Input pins for the analog signals to be processed by the ADC12            |
|            | AN100 to AN102,<br>AN105 to AN107,<br>AN116 to AN118 | Input                             |   |
|            | ADTRG0   | Input                             | Input pins for the external trigger signals that start the A/D conversion |

| M11        | 143                              | -       | -       | IRQ14     | P512     | -            | -     | -      | -   | -   | -   | -          | -                        | -                    | -   | -         | -    | -                    | -                      | -     | -      | -             | -    | VSYN |
| M12        | 144                              | -       | -       | IRQ15     | P511     | -            | -     | -      | -   | -   | -   | -          | -                        | -                    | -   | -         | -    | -                    | -                      | -     | -      | -             | -    | PCKO |

Note: Some pin names have the added suffix of \_A, \_B, and \_C. When assigning the GPT, IIC, SPI, SSIE, ETHERC (RMII), and SDHI functionality, select the functional pins with the same suffix.

## 2. CPU

The MCU is based on the Arm® Cortex®-M4 core.

### 2.1 Overview

#### 2.1.1 CPU

- Arm Cortex-M4
  - Revision: r0p1-01rel0
  - ARMv7E-M architecture profile
  - Single Precision Floating Point Unit compliant with the ANSI/IEEE Std 754-2008.
- Memory Protection Unit (MPU)
  - ARMv7 Protected Memory System Architecture
  - 8 protected regions.
- SysTick timer
  - Driven by SYSTICCLK (LOCO) or ICLK.

See [reference 1.](#) and [reference 2.](#) for details.

#### 2.1.2 Debug

- Arm CoreSight™ ETM-M4
  - Revision: r0p1-00rel0
  - Arm ETM architecture version 3.5.
- CoreSight Instrumentation Trace Macrocell (ITM)
- Data Watchpoint and Trace Unit (DWT)
  - 4 comparators for watchpoints and triggers.
- Flash Patch and Breakpoint Unit (FPB)
  - Flash Patch (remap) function is not available, only Breakpoint function is available
  - 6 instruction comparators
  - 2 literal comparators.
- CoreSight Time Stamp Generator (TSG)
  - Time stamp for ETM and ITM
  - Driven by CPU clock.
- Debug Register Module (DBGREG)
  - Reset control
  - Halt control.
- CoreSight Debug Access Port (DAP)
  - JTAG Debug Port (JTAG-DP)
  - Serial Wire Debug Port (SW-DP).
- Cortex-M4 Trace Port Interface Unit (TPIU)
  - 4-bit TPIU formatter output
  - Serial Wire Output.

- CoreSight Embedded Trace Buffer (ETB)
  - CoreSight Trace Memory Controller with ETB configuration
  - Buffer size: 2 KB.

See [reference 1.](#) and [reference 2.](#) for details.

### 2.1.3 Operating Frequency

The operating frequencies for the MCU are as follows:

- CPU: maximum 120 MHz
- 4-bit TPIU trace interface: maximum 60 MHz
- Serial Write Output (SWO) trace interface: maximum 60 MHz
- Joint Test Action Group (JTAG) interface: maximum 25 MHz
- SWD interface: maximum 25 MHz.

[Figure 2.1](#) shows a block diagram of the Cortex-M4 CPU.

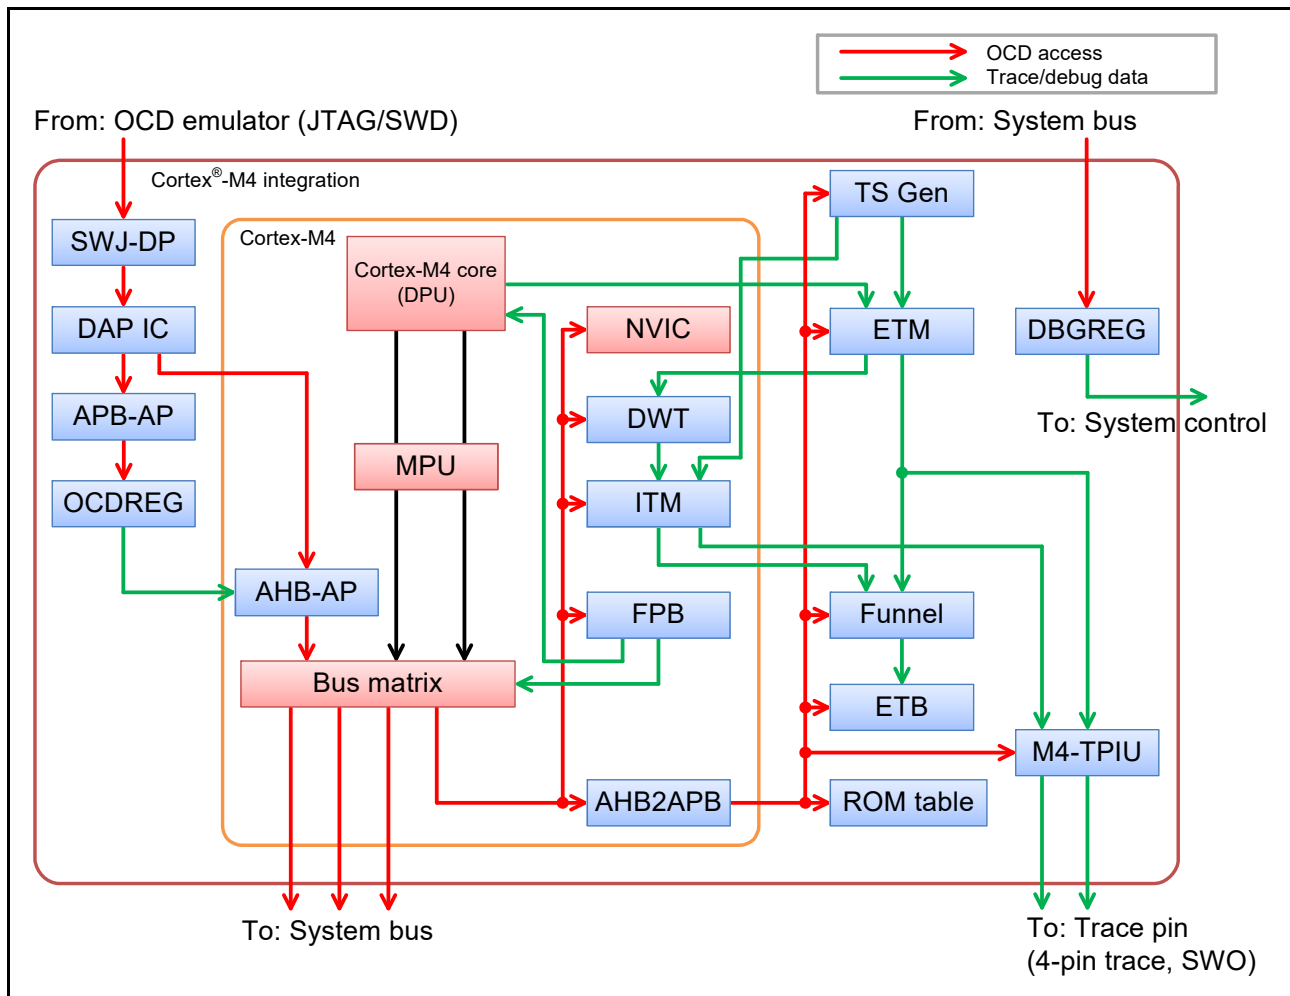

Figure 2.1 Cortex-M4 CPU block diagram

## 2.2 MCU Implementation Options

Table 2.1 shows the implementation options of the MCU and is based on the configurable options in [reference 2](#).

**Table 2.1 Implementation options**

| Option   | Implementation   |
|--|--|
| MPU  | Included, 8 protect regions  |
| FPB  | Flash Patch (remap) function is not available, only Breakpoint function is available   |
| FPU  | Included   |
| Number of interrupts                           | 96   |
| Number of priority bits                        | 4  |
| Number of Wakeup Interrupt Controllers (WIC*1) | Not included   |
| Sleep mode power saving                        | Sleep mode and other low power modes are supported. For more details, see <a href="#">section 11, Low Power Modes</a> .<br>Note: SCB.SCR.SLEEPDEEP is ignored.   |
| Endianness                                     | Little-endian  |
| SysTick SYST_CALIB register                    | SYST_CALIB = 4000 0147h<br>Bit [31] = 0 Reference clock provided<br>Bit [30] = 1 TERMS value is inexact<br>Bits [29:24] = 00h Reserved<br>Bits [23:0] = 000147h TERM: (32768 × 10 ms) - 1 / 32.768 kHz<br>= 326.66 decimal<br>= 327 with skew<br>= 000147h |
| Event input/output                             | Not implemented  |
| System reset request output                    | The SYSRESETREQ bit in the Application Interrupt and Reset Control Register causes a CPU reset   |
| Auxiliary fault inputs (AUXFAULT)              | Not implemented  |

Note 1. The ICU can wake up the CPU instead of the Wakeup Interrupt Controller (WIC). For details, see [section 14, Interrupt Controller Unit \(ICU\)](#).

## 2.3 Trace Interface

A Trace Port Interface Unit (TPIU) and Serial Wire Output (SWO) provide trace output. [Table 2.2](#) shows the MCU pins for the function. These pins are multiplexed with other functions.

**Table 2.2 Trace function pins**

| Name    | I/O    | Width | Function  |
|---------|--------|-------|---|
| TCLK    | Output | 1 bit | Trace clock   |
| TDATA0  | Output | 1 bit | Trace data output 0                                 |
| TDATA1  | Output | 1 bit | Trace data output 1                                 |
| TDATA2  | Output | 1 bit | Trace data output 2                                 |
| TDATA3  | Output | 1 bit | Trace data output 3                                 |
| TDO/SWO | Output | 1 bit | Serial wire output<br>Multiplexed with JTAG TDO pin |

## 2.4 JTAG/SWD Interface

[Table 2.3](#) shows the JTAG/SWD pins.

**Table 2.3 JTAG/SWD pins**

| Name      | I/O    | P/N  | Width | Function  | When not in use |
|-----------|--------|------|-------|---|-----------------|
| TCK/SWCLK | Input  | Pos. | 1 bit | JTAG clock pin                                      | Pull-up         |
| TMS/SWDIO | I/O    | Neg. | 1 bit | JTAG TMS pin<br>SWD I/O pin                         | Pull-up         |
| TDI       | Input  | Pos. | 1 bit | JTAG TDI pin  | Pull-up         |
| TDO/SWO   | Output | Neg. | 1 bit | JTAG TDO pin<br>Multiplexed with serial wire output | Open            |

## 2.5 Debug Mode

### 2.5.1 Debug Mode Definition

In single chip mode, the debugger state of connection is defined as OCD mode, the debugger state of disconnection is defined as User mode. [Table 2.4](#) shows the two CPU debug modes and usage conditions.

**Table 2.4 CPU debug mode and conditions**

| Conditions    |                         | Mode       |                      |
|---------------|-------------------------|------------|----------------------|
| OCD connect   | JTAG/SWD authentication | Debug mode | Debug authentication |
| Not connected | —                       | User mode  | Disabled             |
| Connected     | Failed                  | User mode  | Disabled             |
| Connected     | Passed                  | OCD mode   | Enabled              |

Note 1. OCD connect is determined by the CDBGPWRUPREQ bit output in the SWJ-DP register. The bit can only be written by the OCD. However, the level of the bit can be confirmed by reading the DBGSTR.CDBGPWRUPREQ bit.

Note 2. Debug Authentication is defined by the ARMv7-M architecture. Enabled means that both invasive and non-invasive CPU debugging are permitted. Disabled means that both are not permitted.

### 2.5.2 Debug Mode Effects

This section describes the effects of debug mode, which occur both internally and externally to the CPU.

#### 2.5.2.1 Low power mode

All CoreSight debug components can store the register settings even when the CPU enters Software Standby, Snooze, or Deep Software Standby mode. However, AHB-AP cannot respond to On-Chip Debug (OCD) access in these low power modes. The OCD must wait for cancellation of the low power mode to access the CoreSight debug components. To request low power mode cancellation, the OCD can set the DBIRQ bit in the MCUCTRL register. For details, see [section 2.6.5.3, MCU Control Register \(MCUCTRL\)](#).

#### 2.5.2.2 Reset

In OCD mode, some resets depend on the CPU status and the DBGSTOPCR setting.

**Table 2.5 Reset or interrupt and mode setting (1 of 2)**

| Reset or interrupt name                    | Control in On-Chip Debug (OCD) mode |                                |
|--|-------------------------------------|--------------------------------|
|  | OCD break mode                      | OCD run mode                   |
| RES pin reset                              | Same as user mode                   |                                |
| Power-on reset                             | Same as user mode                   |                                |
| Independent watchdog timer reset/interrupt | Does not occur*1                    | Depends on DBGSTOPCR setting*2 |
| Watchdog timer reset/interrupt             | Does not occur*1                    | Depends on DBGSTOPCR setting*2 |
| Voltage monitor 0 reset                    | Depends on DBGSTOPCR setting*3      |                                |
| Voltage monitor 1 reset/interrupt          | Depends on DBGSTOPCR setting*3      |                                |

**Table 2.5 Reset or interrupt and mode setting (2 of 2)**

| Reset or interrupt name             | Control in On-Chip Debug (OCD) mode |              |
|-------------------------------------|-------------------------------------|--------------|
|                                     | OCD break mode                      | OCD run mode |
| Voltage monitor 2 reset/interrupt   | Depends on DBGSTOPPCR setting*3     |              |
| SRAM parity error reset/interrupt   | Depends on DBGSTOPPCR setting*3     |              |
| SRAM ECC error reset/interrupt      | Depends on DBGSTOPPCR setting*3     |              |
| MPU bus master reset/interrupt      | Same as user mode                   |              |
| MPU bus slave reset/interrupt       | Same as user mode                   |              |
| Stack pointer error reset/interrupt | Same as user mode                   |              |
| Deep software standby reset         | Same as user mode                   |              |
| Software reset                      | Same as user mode                   |              |

Note: In OCD break mode, the CPU is halted. In OCD run mode, the CPU is in OCD mode and the CPU is not halted.

Note 1. The IWDG and WDG always stop in this mode.

Note 2. The IWDG and WDG operation depends on the DBGSTOPPCR setting.

Note 3. Reset or interrupt masking depends on the DBGSTOPPCR setting.

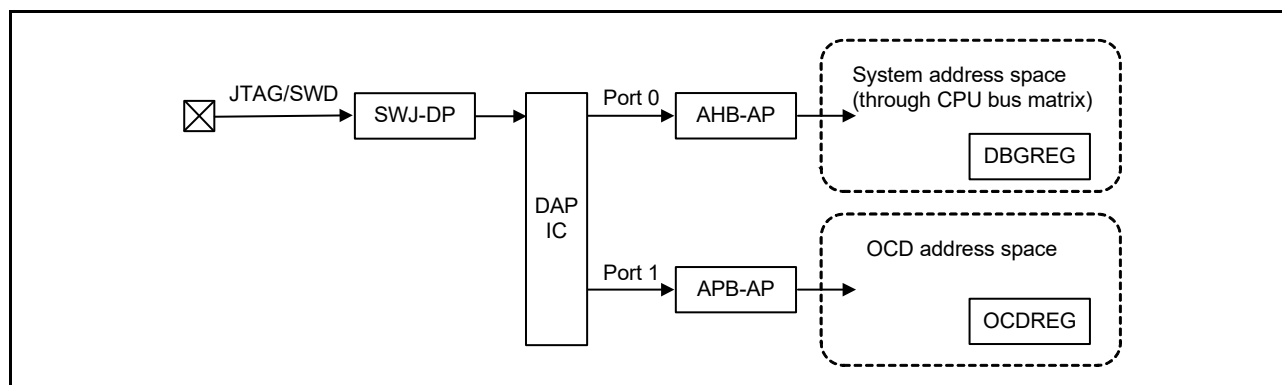

## 2.6 Programmers Model

### 2.6.1 Address Spaces

The MCU debug system includes two CoreSight Access Ports (AP):

- AHB-AP, which is connected to the CPU bus matrix and has the same access to the system address space as the CPU
- APB-AP, which has a dedicated address space (OCD address space) and is connected to the OCD register.

Figure 2.2 shows a block diagram of the AP connection and address spaces.

**Figure 2.2 JTAG/SWD authentication block diagram**

For debugging purposes, there are two register modules, DBGREG and OCDREG. DBGREG is located in the system address space and can be accessed from the OCD emulator, the CPU, and other bus masters in the MCU. OCDREG is located in the OCD address space and can only be accessed from the OCD tool. The CPU and other bus masters cannot access the OCD registers.

### 2.6.2 Cortex-M4 Peripheral Address Map

In the system address space, the Cortex-M4 core has a Private Peripheral Bus (PPB) that can only be accessed from the CPU and OCD emulator. The PPB is expanded from the Cortex-M4 original implementation for the MCU. Table 2.6 shows the address map of the MCU.

**Table 2.6** Cortex-M4 peripheral address map

| Component name       | Start address | End address | Note  |
|----------------------|---------------|-------------|---|
| ITM                  | E000 0000h    | E000 0FFFh  | See <a href="#">reference 2</a> .                                   |
| DWT                  | E000 1000h    | E000 1FFFh  | See <a href="#">reference 2</a> .                                   |
| FPB                  | E000 2000h    | E000 2FFFh  | See <a href="#">reference 2</a> .                                   |
| SCS                  | E000 E000h    | E000 EFFFh  | See <a href="#">reference 2</a> .                                   |
| TPIU                 | E004 0000h    | E004 0FFFh  | See <a href="#">reference 2</a> .                                   |
| ETM                  | E004 1000h    | E004 1FFFh  | See <a href="#">reference 5</a> .                                   |
| ATB funnel           | E004 2000h    | E004 2FFFh  | See <a href="#">section 2.7</a> and <a href="#">reference 4</a> .   |
| ETB                  | E004 3000h    | E004 3FFFh  | See <a href="#">reference 6</a> .                                   |
| Time Stamp Generator | E004 4000h    | E004 4FFFh  | See <a href="#">section 2.10</a> and <a href="#">reference 4</a> .  |
| ROM Table            | E00F F000h    | E00F FFFFh  | See <a href="#">section 2.6.3</a> and <a href="#">reference 7</a> . |

### 2.6.3 CoreSight ROM Table

The MCU contains one CoreSight ROM Table, which lists the Arm components.

#### 2.6.3.1 ROM entries

[Table 2.7](#) shows the ROM entries in the CoreSight ROM Table. The OCD emulator can use the ROM entries to determine which components are implemented in a system. See [reference 7](#) for details.

**Table 2.7** CoreSight ROM Table

| # | Address    | Access size | R/W | Value    | Component        |
|---|------------|-------------|-----|----------|------------------|
| 0 | E00F F000h | 32 bits     | R   | FFF0F003 | NVIC             |
| 1 | E00F F004h | 32 bits     | R   | FFF02003 | SWT              |
| 2 | E00F F008h | 32 bits     | R   | FFF03003 | FPB              |
| 3 | E00F F00Ch | 32 bits     | R   | FFF01003 | ITM              |
| 4 | E00F F010h | 32 bits     | R   | FFF41003 | TPIU             |
| 5 | E00F F014h | 32 bits     | R   | FFF42003 | ETM              |
| 6 | E00F F018h | 32 bits     | R   | FFF43003 | Funnel           |
| 7 | E00F F01Ch | 32 bits     | R   | FFF44003 | ETB              |
| 8 | E00F F020h | 32 bits     | R   | FFF45003 | TSG              |
| 9 | E00F F024h | 32 bits     | R   | 00000000 | (End of entries) |

#### 2.6.3.2 CoreSight component registers

The CoreSight ROM Table lists the CoreSight component registers defined in the Arm CoreSight architecture.

[Table 2.8](#) shows the registers. See [reference 7](#) for details of each register.

**Table 2.8** CoreSight component registers in the CoreSight ROM Table (1 of 2)

| Name    | Address    | Access size | R/W | Initial value |
|---------|------------|-------------|-----|---------------|
| DEVTYPE | E00F FFCCh | 32 bits     | R   | 00000001h     |
| PID4    | E00F FFD0h | 32 bits     | R   | 00000004h     |
| PID5    | E00F FFD4h | 32 bits     | R   | 00000000h     |
| PID6    | E00F FFD8h | 32 bits     | R   | 00000000h     |

**Table 2.8 CoreSight component registers in the CoreSight ROM Table (2 of 2)**

| Name | Address     | Access size | R/W | Initial value |
|------|-------------|-------------|-----|---------------|
| PID7 | E00F FFDCh  | 32 bits     | R   | 00000000h     |
| PID0 | E00F FFE0h  | 32 bits     | R   | 00000015h     |
| PID1 | E00F FFE4h  | 32 bits     | R   | 00000030h     |
| PID2 | E00F FFE8h  | 32 bits     | R   | 0000000Ah     |
| PID3 | E00F FFECCh | 32 bits     | R   | 00000000h     |
| CID0 | E00F FFF0h  | 32 bits     | R   | 0000000Dh     |
| CID1 | E00F FFF4h  | 32 bits     | R   | 00000010h     |
| CID2 | E00F FFF8h  | 32 bits     | R   | 00000005h     |
| CID3 | E00F FFFCh  | 32 bits     | R   | 000000B1h     |

## 2.6.4 DBGREG Module

The DBGREG register module controls the debug functionalities and is implemented as a CoreSight-compliant component.

Table 2.9 shows the DBGREG registers other than the CoreSight component registers.

**Table 2.9 Non-CoreSight DBGREG registers**

| Name                        | DAP port  | Address    | Access size | R/W |
|-----------------------------|-----------|------------|-------------|-----|
| Debug Status Register       | DBGSTR    | 4001 B000h | 32 bits     | R   |
| Debug Stop Control Register | DBGSTOPCR | 4001 B010h | 32 bits     | R/W |
| Trace Control Register      | TRACECTR  | 4001 B020h | 32 bits     | R/W |

### 2.6.4.1 Debug Status Register (DBGSTR)

Address(es): [DBG.DBGSTR 4001 B000h](#)

|                    | b31 | b30 | b29                  | b28                  | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |

#### 2.6.4.4 DBGREG CoreSight component registers

The DBGREG module provides the CoreSight component registers defined in the Arm CoreSight architecture.

Table 2.10 shows these registers. See [reference 7](#) for details of each register.

**Table 2.10** DBGREG CoreSight component registers

| Name | Address     | Access size | R/W | Initial value |
|------|-------------|-------------|-----|---------------|
| PID4 | 4001 BFD0h  | 32 bits     | R   | 00000004h     |
| PID5 | 4001 BFD4h  | 32 bits     | R   | 00000000h     |
| PID6 | 4001 BFD8h  | 32 bits     | R   | 00000000h     |
| PID7 | 4001 BFDCh  | 32 bits     | R   | 00000000h     |
| PID0 | 4001 BFE0h  | 32 bits     | R   | 00000005h     |
| PID1 | 4001 BFE4h  | 32 bits     | R   | 00000030h     |
| PID2 | 4001 BFE8h  | 32 bits     | R   | 0000001Ah     |
| PID3 | 4001 BFECCh | 32 bits     | R   | 00000000h     |
| CID0 | 4001 BFF0h  | 32 bits     | R   | 0000000Dh     |
| CID1 | 4001 BFF4h  | 32 bits     | R   | 000000F0h     |
| CID2 | 4001 BFF8h  | 32 bits     | R   | 00000005h     |
| CID3 | 4001 BFFCh  | 32 bits     | R   | 000000B1h     |

#### 2.6.5 OCDREG Module

The OCDREG register module controls the On-Chip Debug (OCD) emulator functionalities and is implemented as a CoreSight-compliant component.

Table 2.11 shows the OCDREG registers other than the CoreSight component registers.

**Table 2.11** Non-CoreSight OCDREG registers

| Name                              |         | DAP port | Address    | Access size | R/W |
|-----------------------------------|---------|----------|------------|-------------|-----|
| ID Authentication Code Register 0 | IAUTH0  | Port 1   | 8000_0000  | 32 bits     | W   |
| ID Authentication Code Register 1 | IAUTH1  | Port 1   | 8000_0100  | 32 bits     | W   |
| ID Authentication Code Register 2 | IAUTH2  | Port 1   | 8000_0200  | 32 bits     | W   |
| ID Authentication Code Register 3 | IAUTH3  | Port 1   | 8000_0300  | 32 bits     | W   |
| MCU Status Register               | MCUSTAT | Port 1   | 8000 0400h | 32 bits     | R   |
| MCU Control Register              | MCUCTRL | Port 1   | 8000 0410h | 32 bits     | R/W |

Note: OCDREG is located in the dedicated OCD address space. This address map is independent from the system address map. See [section 2.6.2, Cortex-M4 Peripheral Address Map](#).

##### 2.6.5.1 ID Authentication Code Register (IAUTH0 to 3)

Four authentication registers are provided for writing the 128-bit key. These registers must be written in sequential order from IAUTH0 to IAUTH3. If the set of register writes is not compliant with this order, the result is unpredictable.

Only 32-bit writes are permitted. The initial value of the registers is all 1s. This means that JTAG/SWD access is initially permitted when the ID code in the OSIS register has the initial value. See [section 2.11.2, Unlock ID Code](#).

Address(es): IAUTH0 8000 0000h

Value after reset:

Address(es): IAUTH1 8000 0100h

Value after reset:

Address(es): IAUTH2 8000 0200h

Value after reset:

Address(es): IAUTH3 8000 0300h

Value after reset:

### 2.6.5.2 MCU Status Register (MCUSTAT)

Address(es): MCUSTAT 8000 0400h

Value after reset:

Value after reset:

| Bit       | Symbol     | Bit name              | Description  | R/W |
|-----------|------------|-----------------------|--|-----|
| b0        | AUTH       | Authentication status | 0: Authentication failed<br>1: Authentication succeeded.   | R   |
| b1        | CPUSLEEP   |                       | 0: CPU is not in Sleep mode<br>1: CPU is in Sleep mode.  | R   |
| b2        | CPUSTOPCLK |                       | 0: CPU clock is not stopped. This indicates that the MCU is in Normal or Sleep mode<br>1: CPU clock is stopped. This indicates that the MCU is in Snooze or Software Standby mode. | R   |
| b31 to b3 | —          | Reserved              | These bits are read as 0.  | R   |

Note 1. Depends on the MCU status.

### 2.6.5.3 MCU Control Register (MCUCTRL)

Address(es): [MCUCTRL 8000 0410h](#)

|                    |     |     |     |     |     |     |     |       |     |     |     |     |     |     |     |        |
|--------------------|-----|-----|-----|-----|-----|-----|-----|-------|-----|-----|-----|-----|-----|-----|-----|--------|

|                    | —   | —   | —   | —   | —   | —   | —   | —     | —   | —   | —   | —   | —   | —   | —   | —      |
| Value after reset: | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0     | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0      |
|                    | b15 | b14 | b13 | b12 | b11 | b10 | b9  | b8    | b7  | b6  | b5  | b4  | b3  | b2  | b1  | b0     |
|                    | —   | —   | —   | —   | —   | —   | —   | DBIRQ | —   | —   | —   | —   | —   | —   | —   | EDBGRQ |
| Value after reset: | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0     | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0      |

| Bit       | Symbol                 | Bit name                | Description   | R/W |
|-----------|------------------------|-------------------------|---|-----|
| b0        | <a href="#">EDBGRQ</a> | External Debug Request  | Writing 1 to the bit causes a CPU halt or debug monitor exception:<br>0: Debug event not requested<br>1: Debug event requested.<br>When the EDBGRQ bit is set to 0 or the CPU is halted, the EDBGRQ bit is cleared. | R/W |
| b7 to b1  | —                      | Reserved                | These bits are read as 0. The write value should be 0.  | R/W |
| b8        | <a href="#">DBIRQ</a>  | Debug Interrupt Request | Writing 1 to the bit wakes up the MCU from low power mode:<br>0: Debug interrupt not requested<br>1: Debug interrupt requested.<br>The condition can be cleared by writing 0 to the DBIRQ bit.                      | R/W |
| b31 to b9 | —                      | Reserved                | These bits are read as 0. The write value should be 0.  | R/W |

Note: Set DBIRQ and EDBGRQ to the same value.

### 2.6.5.4 OCDREG CoreSight component registers

The OCDREG module provides the CoreSight component registers defined in the Arm CoreSight architecture.

[Table 2.12](#) shows these registers. See [reference 7](#) for details of each register.

**Table 2.12** OCDREG CoreSight component registers

| Name | Address    | Access size | R/W       | Initial value |
|------|------------|-------------|-----------|---------------|
| PID4 | 8000 0FD0h | 32 bits     | Read-only | 00000004h     |
| PID5 | 8000 0FD4h | 32 bits     | Read-only | 00000000h     |
| PID6 | 8000 0FD8h | 32 bits     | Read-only | 00000000h     |
| PID7 | 8000 0FDCh | 32 bits     | Read-only | 00000000h     |
| PID0 | 8000 0FE0h | 32 bits     | Read-only | 00000004h     |
| PID1 | 8000 0FE4h | 32 bits     | Read-only | 00000030h     |
| PID2 | 8000 0FE8h | 32 bits     | Read-only | 0000000Ah     |
| PID3 | 8000 0FECh | 32 bits     | Read-only | 00000000h     |
| CID0 | 8000 0FF0h | 32 bits     | Read-only | 0000000Dh     |
| CID1 | 8000 0FF4h | 32 bits     | Read-only | 000000F0h     |
| CID2 | 8000 0FF8h | 32 bits     | Read-only | 00000005h     |
| CID3 | 8000 0FFCh | 32 bits     | Read-only | 000000B1h     |

## 2.7 CoreSight ATB Funnel

There is one CoreSight ATB funnel in the MCU. The funnel has two ATB slaves and one ATB master, and it selects the debug trace source from ETM and ITM to ETB. [Figure 2.3](#) shows the CoreSight ATB connection in the MCU.

**Figure 2.3** CoreSight ATB connection

Table 2.13 shows the ATB slave connection for the funnel.

**Table 2.13** ATB slave connection

| ATB slave number | Connected trace source |
|------------------|------------------------|
| #0               | ITM                    |
| #1               | ETM                    |

For details of the ATB and funnel, see [reference 4](#).

## 2.8 Flash Patch and Break Unit

The MCU has a flash patch and break unit. Breakpoint function is available, but flash patch (remap) function is not available. Therefore, do not set the REPLACE bits [31:30] in the FP\_COMPn register to 0. Bit [28] of FP\_REMAP register is always set to 1. When writing to this register, write 1 to bit [28]. When reading this register, bit [28] is always read as 1. See [reference 1](#).<sup>\*1</sup> for details.

Note 1. In the reference, SYSTICCLK (LOCO) is the IMPLEMENTATION DEFINED external reference clock and ICLK is the processor clock.

## 2.9 SysTick System Timer

The SysTick system timer provides a simple 24-bit down counter. The reference clock for the timer can be selected as the CPU clock (ICLK) or SysTick Timer clock (SYSTICCLK). See [reference 1](#) for details.

## 2.10 CoreSight Time Stamp Generator

A CoreSight Time Stamp Generator provides a CPU clock-based timestamp to ITM and ETM. The 48 LSB bits of the 64-bit counter are used for the two components. See [reference 4](#) for details.

## 2.11 OCD Emulator Connection

A JTAG/SWD authentication mechanism checks access permission for debug and MCU resources. To obtain full debug functionality, a pass result of the authentication mechanism is required.

[Figure 2.4](#) shows a block diagram of the authentication mechanism.

**Figure 2.4 Authentication mechanism block diagram**

An ID comparator is available in the MCU for authentication. The comparator compares the 128-bit IAUTH output from OCDREG and the 128-bit unlock ID code from the option-setting memory. When the two outputs are identical, the CPU debug functions and system bus access from the OCD emulator are permitted.

### 2.11.1 DBGEN

After the OCD emulator gets access permission, the OCD emulator must set the DBGEN bit in the System Control OCD Control Register (SYOCD CR). In addition, the OCD emulator must clear the DBGEN bit before disconnecting it. See [section 11, Low Power Modes](#) for details.

### 2.11.2 Unlock ID Code

The unlock ID code is used for checking permissions for debug and access to on-chip resources. If the unlock ID code matches the 128-bit data written in ID Authentication Registers 0 to 3, the JTAG/SWD debugger obtains access permission. Unlock ID code is written in the OCD/Serial Programmer ID Setting Register (OSIS) in the option-setting memory. The initial value of the unlock ID code is all 1s (FFFFFFFF\_FFFFFFFF\_FFFFFFFFh). See [section 7, Option-Setting Memory](#) for details.

### 2.11.3 Restrictions on Connecting an OCD Emulator

This section describes the restrictions on emulator access.

#### 2.11.3.1 Starting connection while in low power mode

When starting a JTAG/SWD connection from an OCD emulator, the MCU must be in Normal or Sleep mode. If the MCU is in Software Standby, Snooze, or Deep Software Standby mode, the OCD emulator can cause the MCU to hang.

#### 2.11.3.2 Changing low power mode while in OCD mode

When the MCU is in OCD mode, the low power mode can be changed. However, system bus access from AHB-AP is prohibited in Software Standby, Snooze, or Deep Software Standby mode. Only SWJ-DP, APB-AP, and OCDREG can be accessed from the OCD emulator in these modes. [Table 2.14](#) shows the restrictions.

**Table 2.14 Restrictions by mode**

| Active mode           | Start OCD emulator connection | Change low power mode | Access AHB-AP and system bus | Access APB-AP and OCDREG |
|-----------------------|-------------------------------|-----------------------|------------------------------|--------------------------|
| Normal                | Yes                           | Yes                   | Yes                          | Yes                      |
| Sleep                 | Yes                           | Yes                   | Yes                          | Yes                      |
| Software Standby      | No                            | Yes                   | No                           | Yes                      |
| Snooze                | No                            | Yes                   | No                           | Yes                      |
| Deep Software Standby | No                            | Yes                   | No                           | Yes                      |

If system bus access is required in Software Standby, Snooze, or Deep Software Standby mode, set the OCUCTRL.DBIRG bit in OCDREG to wake up the MCU from the low power modes. Simultaneously, using the OCUCTRL.EDBGRQ bit in OCDREG, the OCD emulator can wake up the MCU without starting CPU execution by using a CPU break.

### 2.11.3.3 Modifying the unlock ID code in OSIS

After modifying the unlock ID code in the OSIS, the OCD emulator must reset the MCU by asserting the RES pin or setting the SYSRESETREQ bit of the Application Interrupt and Reset Control Register in the system control block to 1. The modified unlock ID code is reflected after reset.

### 2.11.3.4 Connecting sequence and JTAG/SWD authentication

Because the OCD emulator is protected by the JTAG/SWD authentication mechanism, the OCD might be required to input the ID code to the authentication registers. The OSIS value in the option-setting memory determines whether the code is required.

After the negation of the reset, a 5  $\mu$ s wait time is required before comparing the OSIS value at cold start.

#### (1) When MSB of OSIS is 0 (bit [127] = 0)

The ID code is always mismatching and connection to the OCD is prohibited.

#### (2) When OSIS is all 1s (default)

OCD authentication is not required and the OCD can use the AHB-AP without the authentication.

1. Connect the OCD emulator to the MCU through the JTAG or SWD interface.
2. Set up SWJ-DP to access the DAP bus. In the setup, the OCD emulator must assert CDBGPWRUPREQ in the SWJ-DP Control Status Register, then wait until CSDBGPWRUPACK in the same register is asserted.
3. Set up the AHB-AP to access the system address space. The AHB-AP is connected to the DAP bus port 0.
4. Start accessing the CPU debug resources using the AHB-AP.

#### (3) When OSIS[127:126] = 2'b10

OCD authentication is required and the OCD must write the unlock ID code to the IAUTH registers 0 to 3 in the OCDREG before using the AHB-AP.

1. Connect the OCD debugger to the MCU through the JTAG or SWD interface.
2. Set up SWJ-DP to access the DAP bus. In the setup, the OCD emulator must assert CDBGPWRUPREQ in the SWJ-DP Control Status Register, and wait until CSDBGPWRUPACK in the same register is asserted.
3. Set up the APB-AP to access OCDREG. The APB-AP is connected to the DAP bus port 1.
4. Write the 128-bit ID code to IAUTH registers 0 to 3 in the OCDREG register using the APB-AP.
5. If the 128-bit ID code matches the OSIS value, the AHB-AP is authorized to issue an AHB transaction. The authorization result can be confirmed in the AUTH bit in the MCUSTAT Register or the DbgStatus bit in the AHB-AP Control Status Word Register.
  - When the DbgStatus bit is 1, the 128-bit ID code is a match with the OSIS value. AHB transfers are permitted.

- When the DbgStatus bit is 0, the 128-bit ID code is not a match with the OSIS value. AHB transfers are not permitted.
6. Set up the AHB-AP to access the system address space. The AHB-AP is connected to the DAP bus port 0.
  7. Start accessing the CPU debug resources using the AHB-AP.

#### (4) When OSIS[127:126] is 2'b11

OCD authentication is required and the OCD must write the unlock ID code to IAUTH registers 0 to 3 in the OCDREG register. The connection sequence is the same when OSIS[127:126] is 2'b10 except for ALeRASE capability.

When IATUH0-3 are ALeRASE in ASCII code, the contents of the code flash, data flash, and configuration area are erased at once. See [section 53, Flash Memory](#) for details.

ALeRASE sequence:

1. Connect the OCD debugger to the MCU through the JTAG or SWD interface.
2. Set up SWJ-DP to access DAP bus. In the setup, the OCD emulator must assert CDBGPWRUPREQ in the SWJDP Control Status Register, and then wait until CSDBGPWRUPACK in the same register is asserted.
3. Set the APB-AP to access OCDREG. This APB-AP is connected to the DAP bus port 1.
4. Write the 128-bit ID code to IAUTH registers 0 to 3 in the OCDREG register using the APB-AP.
5. If the 128-bit ID code is ALeRASE in ASCII code (414C\_6552\_4153\_45FF\_FFFF\_FFFF\_FFFF\_FFFFh), the contents of the code flash, data flash, and configuration area are erased. After that, the MCU transitions to Sleep mode.

### 3. Operating Modes

#### 3.1 Overview

Table 3.1 shows the selection of operating modes by the mode-setting pin. For details, see section 3.2, Details of Operating Modes. Operation starts with the on-chip flash memory enabled, regardless of the mode in which operation started.

**Table 3.1 Selection of operating modes by the mode-setting pin**

| Mode-setting pin |                   |                      |              |
|------------------|-------------------|----------------------|--------------|
| MD               | Operating mode    | On-chip flash memory | External bus |
| 1                | Single-chip mode  | Enable               | Disable      |
| 0                | SCI/USB boot mode | Enable               | Disable      |

#### 3.2 Details of Operating Modes

##### 3.2.1 Single-Chip Mode

In single-chip mode, all I/O pins are available for use as input or output port, inputs or outputs for peripheral functions, or as interrupt inputs. When a reset is released while the MD pin is high, the MCU starts in single-chip mode and the on-chip flash is enabled.

##### 3.2.2 SCI Boot Mode

In this mode, the on-chip flash memory programming routine (SCI boot program), stored in a dedicated area within the MCU, is used. The on-chip flash, including the code flash memory and data flash memory, can be modified from outside the MCU by using a universal asynchronous receiver/transmitter (UART) SCI. For details, see section 53, Flash Memory. The MCU starts in SCI boot mode if the MD pin is held low on release from the reset state.

##### 3.2.3 USB Boot Mode

In this mode, the on-chip flash memory programming routine (USB boot program), stored in the boot area within the MCU, is used. The on-chip flash, including the code flash memory and data flash memory, can be modified from outside the MCU by using the USB. For details, see section 53, Flash Memory. The MCU starts in USB boot mode if the MD pin is held low on release from the reset state.

#### 3.3 Operating Mode Transitions

##### 3.3.1 Operating Mode Transitions as Determined by the Mode-Setting Pin

Figure 3.1 shows operating mode transitions determined by the settings of the MD pin.

**Figure 3.1 Mode-setting pin level and operating mode**

## 4. Address Space

### 4.1 Overview

The MCU supports a 4-GB linear address space ranging from 0000 0000h to FFFF FFFFh that can contain both program and data. [Figure 4.1](#) shows the memory map.

|            |  |
|------------|--|
| FFFF FFFFh | System for Cortex <sup>®</sup> -M4                         |
| E000 0000h | Reserved area*2  |
| 9800 0000h | External address space (SDRAM area)                        |
| 9000 0000h | Reserved area*2  |
| 8720 0000h | External address space (CS area)                           |
| 8000 0000h | Reserved area*2  |
| 6800 0000h | External address space (SPI area)                          |
| 6000 0000h | Reserved area*2  |
| 4080 0000h | Flash I/O registers  |
| 407F C000h | Reserved area*2  |
| 407F B1A0h | On-chip flash (option-setting memory) <sup>1,4</sup>       |
| 407F B17Ch | Reserved area*2  |
| 407F 0000h | Flash I/O registers  |
| 407E 0000h | Reserved area*2  |
| 4010 8000h | On-chip flash (data flash)                                 |
| 4010 0000h | Peripheral I/O registers                                   |
| 4000 0000h | Reserved area*2  |
| 2010 0000h | Standby SRAM   |
| 200F E000h | Reserved area*2  |
| 2004 0000h | SRAM0  |
| 2000 0000h | SRAMHS   |
| 1FFE 0000h | Reserved area*2  |
| 0280 0000h | Memory mapping area  |
| 0200 0000h | Reserved area*2  |
| 0100 A168h | On-chip flash (option-setting memory)                      |
| 0100 A150h | Reserved area*2  |
| 0100 8000h | On-chip flash (option-setting memory)                      |
| 0100 7000h | Reserved area*2  |
| 0010 0000h | On-chip flash (program flash) (read only) <sup>1,*,3</sup> |
| 0000 0000h |  |

Note 1. The capacity of the flash differs depending on the product.

| Code flash memory capacity | Address                 | Data flash memory capacity | Address                 | RAM capacity | Address                 |
|----------------------------|-------------------------|----------------------------|-------------------------|--------------|-------------------------|
| 1 Mbytes                   | 0000 0000h - 000F FFFFh | 32 Kbytes                  | 4010 0000h - 4010 7FFFh | 384 Kbyte    | 1FFE 0000h - 2003 FFFFh |
| 512 Kbytes                 | 0000 0000h - 0007 FFFFh |                            |                         |              |                         |

Note 2. Do not access reserved areas.

Note 3. Some regions are reserved for the option-setting memory. For details, see [section 7, Option-Setting Memory](#).

Note 4. Do not access from 407F B180h to 407F B19Bh.

**Figure 4.1** Memory map

## 4.2 External Address Space

The external address space is divided into CS areas (CS0 to CS7), SDRAM area (SDCS), and SPI area. The eight CS areas (CS0 to CS7) each correspond to the CSn signal output from a CSn (n = 0 to 7) pin. The SPI area is divided into two areas, QSPI I/O registers and external SPI device space.

Figure 4.2 shows the address ranges associated with the individual CS areas (CS0 to CS7), SDRAM area (SDCS), and SPI area.

Figure 4.2 Association between external address spaces and CS areas

## 5. Memory Mirror Function (MMF)

### 5.1 Overview

The MCU provides a Memory Mirror Function (MMF). You can configure the MMF to map an application image load address in the code flash memory to the application image link address in the unused 23-bit memory mirror space addresses. Your application code must be developed and linked to run from this MMF destination address. The application code is not required to know the load location where it is stored in the code flash memory.

Table 5.1 lists the MMF specifications.

**Table 5.1 MMF specifications**

| Parameter              | Description                     |
|------------------------|---------------------------------|
| Memory mirror space    | 8 MB (0200 0000h to 027F FFFFh) |
| Memory mirror boundary | 128 bytes                       |

### 5.2 Register Descriptions

#### 5.2.1 MemMirror Special Function Register (MMSFR)

Address(es): MMF.MMSFR 4000 1000h

| Bits       | Symbol           | Bit name              | Description   | R/W |
|------------|------------------|-----------------------|---|-----|
| b6 to b0   | —                | Reserved              | These bits are read as 0. The write value should be 0.        | R/W |
| b22 to b7  | MEMMIRADDR[15:0] | Memory Mirror Address | 0000h to FFFFh (8 MB)   | R/W |
| b23        | —                | Reserved              | This bit is read as 0. The write value should be 0.           | R/W |
| b31 to b24 | KEY[7:0]         | MMSFR Key Code        | These bits enable or disable rewriting of the MEMMIRADDR bits | R/W |

#### MEMMIRADDR[15:0] bits (Memory Mirror Address)

The MEMMIRADDR bits specify bits [22:7] of the memory mirror address. They define where the start address of the memory mirror space addresses (0200 0000h) is linked to. Writing to these bits is enabled only when this register is accessed in 32-bit words and the value DBh is written to the KEY[7:0] bits.

#### KEY[7:0] bits (MMSFR Key Code)

The KEY[7:0] bits enable or disable rewriting of the MEMMIRADDR bits. Data written to the KEY bits is not saved. These bits are read as 0. The KEY code and MEMMIRADDR must be written to in the same cycle.

## 5.2.2 MemMirror Enable Register (MMEN)

Address(es): MMF.MMEN 4000 1004h

| Bits       | Symbol   | Bit name                      | Description  | R/W |
|------------|----------|-------------------------------|--|-----|
| b0         | EN       | Memory Mirror Function Enable | 0: Disable MMF<br>1: Enable MMF.                       | R/W |
| b23 to b1  | —        | Reserved                      | These bits are read as 0. The write value should be 0. | R/W |
| b31 to b24 | KEY[7:0] | MMEN Key Code                 | These bits enable or disable rewriting of the EN bit.  | R/W |

### EN bit (Memory Mirror Function Enable)

Writing to the EN bit is enabled only when the MemMirror Enable Register is accessed in 32-bit words and the value DBh is written to the KEY[7:0] bits.

### KEY[7:0] bits (MMEN Key Code)

The KEY[7:0] bits enable or disable rewriting of the EN bit. Data written to the KEY[7:0] bits is not saved. These bits are read as 0. The KEY code and the EN bit must be written to in the same cycle.

## 5.3 Operation

### 5.3.1 MMF Operation

The MMF links the memory mirror space (0200 0000h to 027F FFFFh) to the code flash area. If MMEN.EN = 1, the CPU can access code flash using both normal addresses (starting at 0000 0000h) and memory mirror space addresses (starting at 0200 0000h). [Figure 5.1](#) shows an overview of the MMF. The MMSFR.MEMMIRADDR bits specify where the start address of the memory mirror space addresses (0200 0000h) is linked to. [Figure 5.2](#), [Figure 5.3](#), and [Figure 5.4](#) show the MMF operation. [Figure 5.5](#) shows the setting procedure of the MMF.

Figure 5.1 MMF operation

Note 1. For details, see Figure 5.4.

Figure 5.2 MMF block diagram

Figure 5.3 shows the addresses handled by each module. The Arm® MPU uses the original address of the CPU. The security MPU and code flash memory each uses an address after conversion through the Memory Mirror Function.

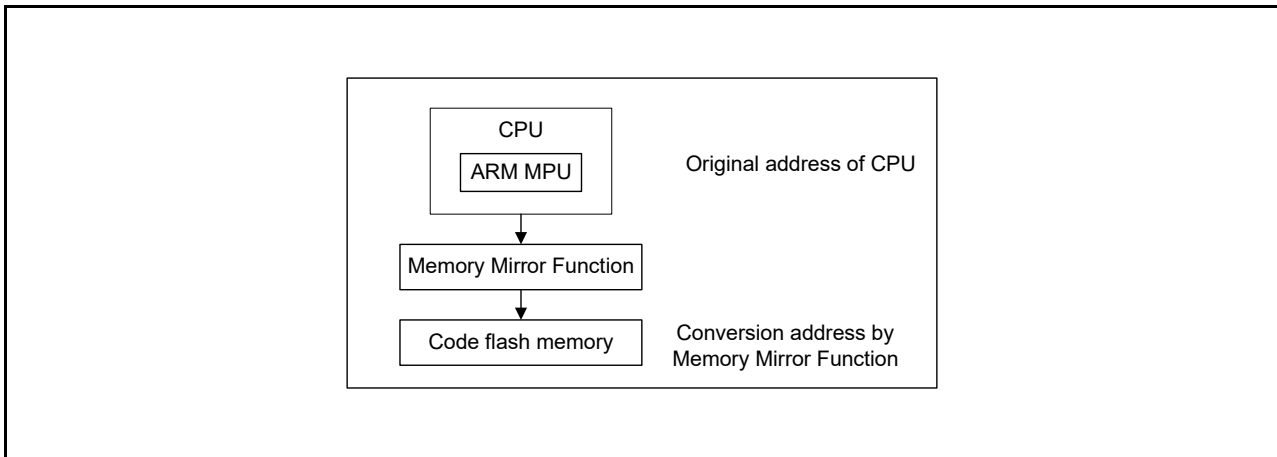

Figure 5.3 MMF address handling

Figure 5.4 MMF operation flow

**Figure 5.5** MMF setup flow

### 5.3.2 Setting Example

The target application code on the code flash can be accessed from the address 0200 0000h on the memory mirror space by setting up the code flash start address in MMSFR.MEMMIRADDR and setting MMEN.EN = 1.

[Figure 5.6](#) shows an example of how to use the MMF.

**Figure 5.6 MMF setting example**

Setting the MMSFR register to DB10 0000h to use the application code ver1.

Setting the MMSFR register to DB11 0000h to use the application code ver2.

Setting the MMSFR register to DB12 0000h to use the application code ver3.

## 6. Resets

### 6.1 Overview

The MCU provides 14 resets:

- RES pin reset
- Power-on reset
- Independent watchdog timer reset
- Watchdog timer reset
- Voltage monitor 0 reset
- Voltage monitor 1 reset
- Voltage monitor 2 reset
- SRAM parity error reset
- SRAM ECC error reset
- Bus master MPU error reset
- Bus slave MPU error reset
- Stack pointer error reset
- Deep Software Standby reset
- Software reset.

[Table 6.1](#) lists the reset names and sources.

**Table 6.1 Reset names and sources**

| Reset name                       | Source   |
|----------------------------------|--|
| RES pin reset                    | Voltage input to the RES pin is driven low                           |
| Power-on reset                   | VCC rise (voltage detection $V_{POR}$ ) <sup>*1</sup>                |
| Independent watchdog timer reset | IWDT underflow or refresh error                                      |
| Watchdog timer reset             | WDT underflow or refresh error                                       |
| Voltage monitor 0 reset          | VCC fall (voltage detection $V_{det0}$ ) <sup>*1</sup>               |
| Voltage monitor 1 reset          | VCC fall (voltage detection $V_{det1}$ ) <sup>*1</sup>               |
| Voltage monitor 2 reset          | VCC fall (voltage detection $V_{det2}$ ) <sup>*1</sup>               |
| SRAM parity error reset          | SRAM parity error detection  |
| SRAM ECC error reset             | SRAM ECC error detection   |
| Bus master MPU error reset       | Bus master MPU error detection                                       |
| Bus slave MPU error reset        | Bus slave MPU error detection  |
| Stack pointer error reset        | Stack pointer error detection  |
| Deep software standby reset      | Canceling of Deep Software Standby mode by an interrupt              |
| Software reset                   | Register setting (use the Arm® software reset bit AIRCR.SYSRESETREQ) |

Note 1. For details on the voltages to be monitored ( $V_{POR}$ ,  $V_{det0}$ ,  $V_{det1}$ , and  $V_{det2}$ ), see [section 8, Low Voltage Detection \(LVD\)](#) and [section 55, Electrical Characteristics](#).

The internal state and pins are initialized by a reset. [Table 6.2](#) and [Table 6.3](#) list the targets initialized by resets.

Table 6.2 Reset detect flags initialized by each reset source

| Flag to be initialized                                       | Reset source  |                |                         |                                  |                      |                         |                         |                |
|--|---------------|----------------|-------------------------|----------------------------------|----------------------|-------------------------|-------------------------|----------------|
|  | RES pin reset | Power-on reset | Voltage monitor 0 reset | Independent watchdog timer reset | Watchdog timer reset | Voltage monitor 1 reset | Voltage monitor 2 reset | Software reset |
| Power-On Reset Detect Flag (RSTSR0.PORF)                     | ✓             | x              | x                       | x                                | x                    | x                       | x                       | x              |

✓: Initialized  
 x: Not initialized

Note 1. For the initial value of each register, see [section 9, Clock Generation Circuit](#).

Note 2. The RTC has a software reset. RCR1.RTCOS, RCR1.CIE, RCR2.RTCOE, RCR2.ADJ30, and RCR2.RESET are initialized by all types of resets. For details on the target bits, see [section 26, Realtime Clock \(RTC\)](#).

Note 3. Depends on the setting of DPSBYCR.IOKEEP.

The RTC is not initialized by any reset source. SOSC and LOCO can be selected as the clock sources of RTC. [Table 6.4](#) and [Table 6.5](#) show the states of SOSC and LOCO when a reset occurs.

**Table 6.4 States of SOSC when a reset occurs**

|      |                   | Reset source  |   |
|------|-------------------|---|---|
|      |                   | POR   | Other   |
| SOSC | Enable or disable | Initialized to enable   | Continue with the state that was selected before the reset occurred |
|      | Drive capability  | Continue with the state that was selected before the reset occurred |   |

**Table 6.5 States of LOCO when a reset occurs**

|      |                        | Reset source  |   |
|------|------------------------|---|---|
|      |                        | POR, LVD0, LVD1, LVD2/<br>Deep Software Standby<br>(DEEPCUT[0] = 1)         | Other   |
| LOCO | Enable or disable      | Initialized to enable   |   |
|      | Oscillation accuracy*1 | Initialized to accuracy before trimming by LOCOUTCR (accuracy: $\pm 15\%$ ) | Continue with the accuracy that was trimmed by LOCOUTCR |

Note 1. The LOCO User Trimming Control Register (LOCOUTCR) is reset by POR, LVD0, LVD1, LVD2, and Deep Software Standby (DEEPCUT[0] = 1) resets, returning the LOCO to the default oscillation accuracy. This can affect RTC accuracy if the RTC uses the LOCO (with a user trimming value in LOCOUTCR) as the RTC source clock. To restore the pre-reset LOCO oscillation accuracy, reload the required trimming value into LOCOUTCR after any of these resets.

[Table 6.6](#) lists the pin related to the reset function.

**Table 6.6 Reset I/O pin**

| Pin name | I/O   | Function  |
|----------|-------|-----------|
| RES      | Input | Reset pin |

## 6.2 Register Descriptions

Note 1. The value after reset depends on the reset source.

Note 2. Only 0 can be written to clear the flag. The flag must be cleared by writing 0 after 1 is read.

#### PORF flag (Power-On Reset Detect Flag)

The PORF flag indicates that a power-on reset occurred.

[Setting condition]

- When a power-on reset occurs.

[Clearing conditions]

- When a reset listed in [Table 6.2](#) occurs
- When 1 is read from and then 0 is written to PORF.

#### LVD0RF flag (Voltage Monitor 0 Reset Detect Flag)

The LVD0RF flag indicates that the VCC voltage fell below  $V_{det0}$ .

[Setting condition]

- When a voltage monitor 0 reset occurs.

[Clearing conditions]

- When a reset listed in [Table 6.2](#) occurs
- When 1 is read from and then 0 is written to LVD0RF.

#### LVD1RF flag (Voltage Monitor 1 Reset Detect Flag)

The LVD1RF flag indicates that the VCC voltage fell below  $V_{det1}$ .

[Setting condition]

- When a voltage monitor 1 reset occurs.

[Clearing conditions]

- When a reset listed in [Table 6.2](#) occurs
- When 1 is read from and then 0 is written to LVD1RF.

### LVD2RF flag (Voltage Monitor 2 Reset Detect Flag)

The LVD2RF flag indicates that the VCC voltage fell below  $V_{det2}$ .

[Setting condition]

- When a voltage monitor 2 reset occurs.

[Clearing conditions]

- When a reset listed in [Table 6.2](#) occurs
- When 1 is read from and then 0 is written to LVD2RF.

### DPSRSTF flag (Deep Software Standby Reset Flag)

The DPSRSTF flag indicates that Deep Software Standby mode is canceled by an external or internal interrupt, and that an internal reset (Deep Software Standby reset) occurs when an exception from Deep Software Standby mode occurs.

[Setting condition]

- When Deep Software Standby mode is canceled by an external or internal interrupt. For details, see [section 11, Low Power Modes](#).

[Clearing conditions]

- When a reset listed in [Table 6.2](#) occurs
- When 1 is read from and then 0 is written to DPSRSTF.

## 6.2.2 Reset Status Register 1 (RSTSR1)

| Bit        | Symbol | Bit name | Description  | R/W |
|------------|--------|----------|--|-----|
| b15 to b13 | —      | Reserved | These bits are read as 0. The write value should be 0. | R/W |

Note 1. The value after reset depends on the reset source.

Note 2. Only 0 can be written to clear the flag. The flag must be cleared by writing 0 after 1 is read.

### IWDTRF flag (Independent Watchdog Timer Reset Detect Flag)

The IWDTRF flag indicates that an independent watchdog timer reset occurred.

[Setting condition]

- When an independent watchdog timer reset occurs.

[Clearing conditions]

- When a reset listed in [Table 6.2](#) occurs
- When 1 is read from and then 0 is written to IWDTRF.

### WDTRF flag (Watchdog Timer Reset Detect Flag)

The WDTRF flag indicates that a watchdog timer reset occurred.

[Setting condition]

- When a watchdog timer reset occurs.

[Clearing conditions]

- When a reset listed in [Table 6.2](#) occurs
- When 1 is read from and then 0 is written to WDTRF.

### SWRF flag (Software Reset Detect Flag)

The SWRF flag indicates that a software reset occurred.

[Setting condition]

- When a software reset occurs.

[Clearing conditions]

- When a reset listed in [Table 6.2](#) occurs
- When 1 is read from and then 0 is written to SWRF.

### RPERF flag (SRAM Parity Error Reset Detect Flag)

The RPERF flag indicates that a SRAM parity error reset occurred.

[Setting condition]

- When a SRAM parity error reset occurs.

[Clearing conditions]

- When a reset listed in [Table 6.2](#) occurs
- When 1 is read from and then 0 is written to RPERF.

### REERF flag (SRAM ECC Error Reset Detect Flag)

The REERF flag indicates that a SRAM ECC error reset occurred.

[Setting condition]

- When a SRAM ECC error reset occurs.

[Clearing conditions]

- When a reset listed in [Table 6.2](#) occurs

- When 1 is read from and then 0 is written to REERF.

#### **BUSSRF flag (Bus Slave MPU Error Reset Detect Flag)**

The BUSSRF flag indicates that a bus slave MPU error reset occurred.

[Setting condition]

- When a bus slave MPU error reset occurs.

[Clearing conditions]

- When a reset listed in [Table 6.2](#) occurs
- When 1 is read from and then 0 is written to BUSSRF.

#### **BUSMRF flag (Bus Master MPU Error Reset Detect Flag)**

The BUSMRF flag indicates that a bus master MPU error reset occurred.

[Setting condition]

- When a bus master MPU error reset occurs.

[Clearing conditions]

- When a reset listed in [Table 6.2](#) occurs
- When 1 is read from and then 0 is written to BUSMRF.

#### **SPERF flag (SP Error Reset Detect Flag)**

The SPERF flag indicates that a stack pointer error reset occurred.

[Setting condition]

- When a stack pointer error reset occurs.

[Clearing conditions]

- When a reset listed in [Table 6.2](#) occurs
- When 1 is read from and then 0 is written to SPERF.

### 6.2.3 Reset Status Register 2 (RSTSR2)

Address(es): [SYSTEM.RSTSR2 4001 E411h](#)

|                    |    |    |    |    |    |    |    |      |
|--------------------|----|----|----|----|----|----|----|------|
|                    | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0   |
|                    | —  | —  | —  | —  | —  | —  | —  | CWSF |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0  | x*1  |

x: Undefined

| Bit      | Symbol | Bit name                           | Description  | R/W         |
|----------|--------|------------------------------------|--|-------------|
| b0       | CWSF   | Cold/Warm Start Determination Flag | 0: Cold start<br>1: Warm start.                        | R/(W)<br>*2 |
| b7 to b1 | —      | Reserved                           | These bits are read as 0. The write value should be 0. | R/W         |

Note 1. The value after reset depends on the reset source.

Note 2. Only 1 can be written to set the flag.

RSTSR2 determines whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

#### **CWSF flag (Cold/Warm Start Determination Flag)**

The CWSF flag indicates the type of reset processing, either cold start or warm start. The CWSF flag is initialized by a

power-on reset. It is not initialized by a reset signal generated by the RES pin.

[Setting condition]

- When 1 is written by software. Writing 0 to CWSF does not set it to 0.

[Clearing condition]

- When a reset listed in [Table 6.2](#) occurs.

## 6.3 Operation

### 6.3.1 RES Pin Reset

The RES pin generates this reset. When the RES pin is driven low, all the processing in progress is aborted and the MCU enters a reset state. To successfully reset the MCU, the RES pin must be held low for the power supply stabilization time specified at power-on.

When the RES pin is driven high from low, the internal reset is canceled after the post-RES cancellation wait time ( $t_{RESWT}$ ) elapses. The CPU then starts the reset exception handling.

For details, see [section 55, Electrical Characteristics](#).

### 6.3.2 Power-On Reset

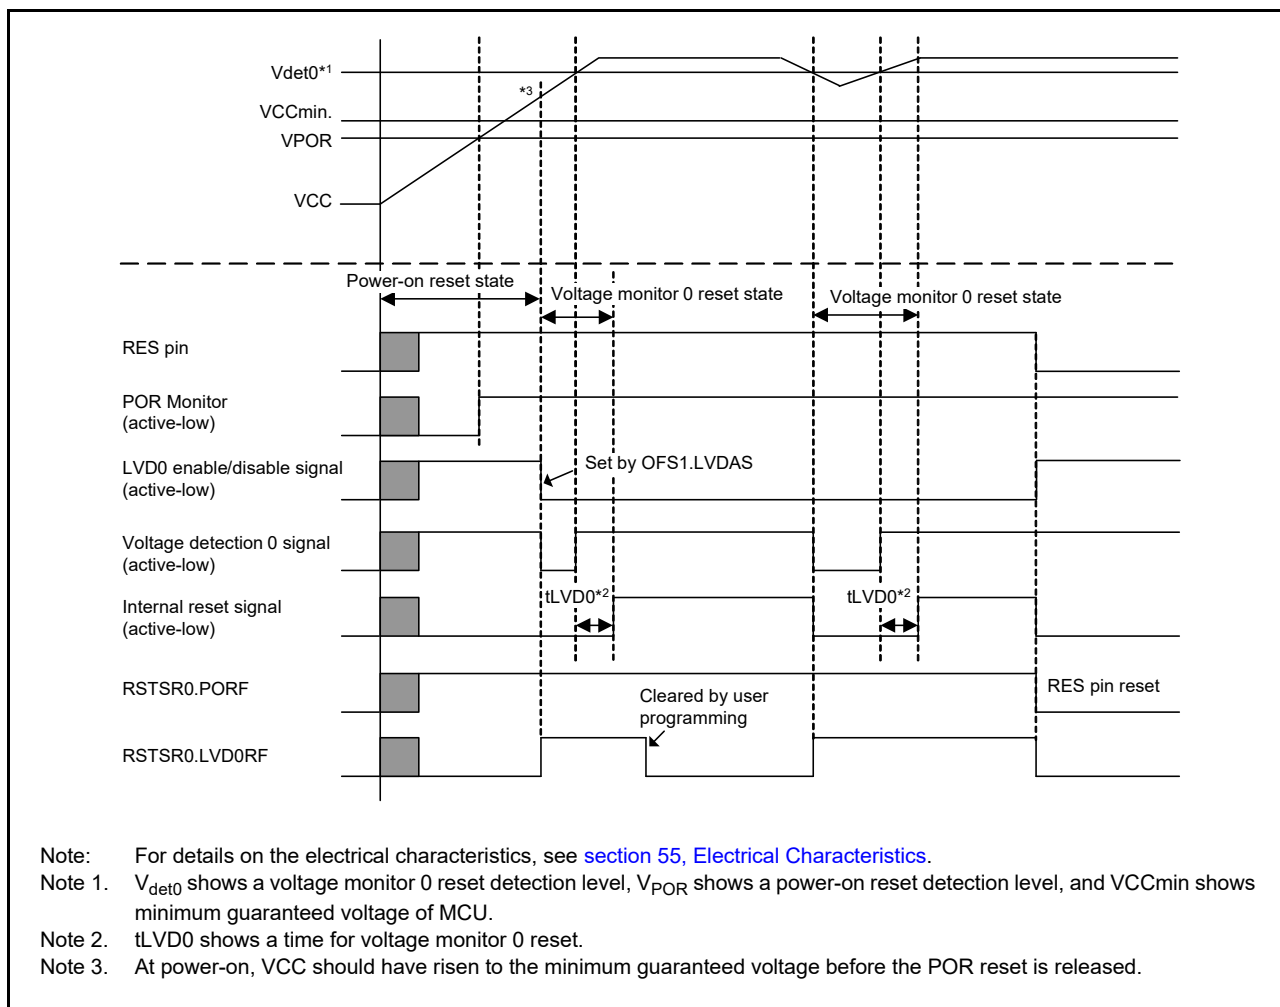

The power-on reset (POR) is an internal reset generated by the power-on reset circuit. If the RES pin is in a high-level state when power is supplied, a power-on reset is generated. After VCC exceeds  $V_{POR}$  and the specified power-on reset time elapses, the internal reset is canceled and the CPU starts the reset exception handling. The power-on reset time is the stabilization period for the external power supply and the MCU circuit. After a power-on reset is generated, the PORF flag in the RSTSR0 is set to 1. The PORF flag is initialized by the RES pin reset.

The voltage monitor 0 reset is an internal reset generated by the voltage monitor circuit. If the Voltage Detection 0 Circuit Start bit (LVDAS) in Option Function Select Register 1 (OFS1) is 0 (voltage monitor 0 reset is enabled after a reset) and VCC falls below  $V_{det0}$ , the RSTSR0.LVD0RF flag is set to 1 and the voltage detection circuit generates voltage monitor 0 reset. Clear the OFS1.LVDAS bit to 0 if the voltage monitor 0 reset is to be used.

After VCC exceeds  $V_{det0}$  and the voltage monitor 0 reset time ( $t_{LVD0}$ ) elapses, the internal reset is canceled and the CPU starts the reset exception handling. The  $V_{det0}$  voltage detection level can be changed by the setting in the VDSEL[1:0] bits in Option Function Select Register 1 (OFS1).

[Figure 6.1](#) shows example of operations during a power-on reset and voltage monitor 0 reset.

**Figure 6.1** Example of operations during power-on and voltage monitor 0 resets

### 6.3.3 Voltage Monitor Reset

The voltage monitor 0 reset is an internal reset generated by the voltage monitor circuit. If the Voltage Detection 0 Circuit Start (LVDAS) bit in Option Function Select Register 1 (OFS1) is 0 (voltage monitor 0 reset is enabled after a reset) and VCC falls below  $V_{det0}$ , the RSTR0.LVD0RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 0 reset. Clear the OFS1.LVDAS bit to 0 if the voltage monitor 0 reset is to be used. After VCC exceeds  $V_{det0}$  and the voltage monitor 0 reset time ( $t_{LVD0}$ ) elapses, the internal reset is canceled and the CPU starts the reset exception handling.

When the Voltage Monitor 1 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 1 Circuit Mode Select bit (LVD1CR0.RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in the Voltage Monitor 1 Circuit Control Register 0 (LVD1CR0), the RSTR0.LVD1RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 1 reset if VCC falls to or below  $V_{det1}$ .

Likewise, when the Voltage Monitor 2 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 2 Circuit Mode Select bit (LVD2CR0.RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 2 Circuit Control Register 0 (LVD2CR0), the RSTR0.LVD2RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 2 reset if VCC falls to or below  $V_{det2}$ .

Similarly, timing for release from the voltage monitor 1 reset state is selectable in the Voltage Monitor 1 Reset Negate Select bit (RN) in the LVD1CR0. When the LVD1CR0.RN bit is 0 and VCC falls to or below  $V_{det1}$ , the CPU is released from the internal reset state and starts reset exception handling when the LVD1 reset time ( $t_{LVD1}$ ) elapses after VCC rises above  $V_{det1}$ . When the LVD1CR0.RN bit is 1 and VCC falls to or below  $V_{det1}$ , the CPU is released from the

internal reset state and starts reset exception handling when the LVD1 reset time ( $t_{LVD1}$ ) elapses.

Likewise, timing for release from the voltage monitor 2 reset state is selectable in the Voltage Monitor 2 Reset Negate Select bit (RN) in the LDV2CR0 register.

Detection levels  $V_{det1}$  and  $V_{det2}$  can be changed in the Voltage Detection Level Select Register (LDV1VLR).

Figure 6.2 shows example of operations during voltage monitor 1 and 2 resets. For details on the voltage monitor 1 reset and voltage monitor 2 reset, see [section 8, Low Voltage Detection \(LVD\)](#).

**Figure 6.2** Example of operations during voltage monitor 1 and voltage monitor 2 resets

### 6.3.4 Deep Software Standby Reset

The deep software standby reset is an internal reset generated when Deep Software Standby mode is canceled by an associated interrupt. The deep software standby reset is canceled after  $t_{DSBY}$  (return time after Deep Software Standby mode cancellation) elapses.

When  $t_{DSBYWT}$  (wait time after Deep Software Standby mode cancellation) elapses after Deep Software Standby mode is canceled, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the deep software standby reset, see [section 11, Low Power Modes](#).

### 6.3.5 Independent Watchdog Timer Reset

The independent watchdog timer reset is an internal reset generated from the Independent Watchdog Timer (IWDT). Output of the reset from the IWDT can be selected in the Option Function Select Register 0 (OFS0).

When output of the independent watchdog timer reset is selected, the reset is generated if the IWDT underflows, or if data is written when refresh operation is disabled. When the internal reset time ( $t_{RESW2}$ ) elapses after the independent watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the independent watchdog timer reset, see [section 28, Independent Watchdog Timer \(IWDT\)](#).

### 6.3.6 Watchdog Timer Reset

The watchdog timer reset is an internal reset generated from the Watchdog Timer (WDT). Output of the reset from the WDT can be selected in the WDT Reset Control Register (WDTRCR) or Option Function Select Register 0 (OFS0).

When output of the watchdog timer reset is selected, the reset is generated if the WDT underflows, or if data is written when refresh operation is disabled. When the internal reset time ( $t_{RESW2}$ ) elapses after the watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the watchdog timer reset, see [section 27, Watchdog Timer \(WDT\)](#).

### 6.3.7 Software Reset

Software reset is an internal reset generated by a software setting of the SYSRESETREQ bit in the AIRCR register in the Arm core. When the SYSRESETREQ bit is set to 1, a software reset is generated. When the internal reset time ( $t_{RESW2}$ ) elapses after a software reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the SYSRESETREQ bit, see the *ARM® Cortex®-M4 Technical Reference Manual*.

### 6.3.8 Determination of Cold/Warm Start

Read the CWSF flag in RSTSR2 to determine the cause of reset processing. The flag indicates whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

The CWSF flag is set to 0 when a power-on reset occurs (cold start). Otherwise, the flag is not set to 0. The flag is set to 1 when 1 is written to it through software. It is not set to 0 even on writing 0 to it.

[Figure 6.3](#) shows an example of a cold/warm start determination operation.

**Figure 6.3** Example of a cold/warm start determination operation

### 6.3.9 Determination of Reset Generation Source

Read RSTSR0 and RSTSR1 to determine which reset executes the reset exception handling. [Figure 6.4](#) shows an example of the flow to identify a reset generation source. The reset flag must be written with 0 after it is read as 1.

**Figure 6.4** Example of reset generation source determination flow

## 7. Option-Setting Memory

### 7.1 Overview

The option-setting memory determines the state of the MCU after a reset. The option-setting memory is allocated to the configuration setting area and the program flash area of the flash memory, and the available methods of setting are different for the two areas.

Figure 7.1 shows the option-setting memory area.

Figure 7.1 Option-setting memory area

| b31        | —            | Reserved   | When read, this bit returns the written value. The write value should be 1.   | R   |

Note 1. The value in a blank product is FFFF FFFFh. It is set to the value written by your application.

#### **IWDTSTRT bit (IWDT Start Mode Select)**

The IWDTSTRT bit selects the mode in which the IWDT is activated after a reset (stopped state or activated state).

#### **IWDTTOPS[1:0] bits (IWDT Timeout Period Select)**

The IWDTTOPS[1:0] bits select the timeout period, the time it takes for the down counter to underflow, as 128, 512, 1024, or 2048 cycles of the frequency-divided clock set in the IWDTCKS[3:0] bits. The number of clock cycles that the counter takes to underflow after a refresh operation is determined by the combination of the IWDTCKS[3:0] and IWDTTOPS[1:0] bits.

For details, see [section 28, Independent Watchdog Timer \(IWDT\)](#).

#### **IWDTCKS[3:0] bits (IWDT-Dedicated Clock Frequency Division Ratio Select)**

The IWDTCKS[3:0] bits select the division ratio of the prescaler for dividing the frequency of the clock for the IWDT as 1/1, 1/16, 1/32, 1/64, 1/128, or 1/256. Using this setting combined with the IWDTTOPS[1:0] bit setting, the IWDT counting period can be set from 128 to 524,288 IWDT clock cycles.

For details, see [section 28, Independent Watchdog Timer \(IWDT\)](#).

#### **IWDRPES[1:0] bits (IWDT Window End Position Select)**

The IWDRPES[1:0] bits select the position where the window for the down counter ends as 0%, 25%, 50%, or 75% of the count value. The value of the window end position must be smaller than the value of the window start position. Otherwise, only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window, in the IWDRPSS[1:0] and IWDRPES[1:0] bits vary with the setting in the IWDTTOPS[1:0] bits.

For details, see [section 28, Independent Watchdog Timer \(IWDT\)](#).

#### **IWDRPSS[1:0] bits (IWDT Window Start Position Select)**

The IWDRPSS[1:0] bits select the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the positions where the window starts and ends becomes the period in which a refresh is possible. However, refresh is not possible outside this period.

For details, see [section 28, Independent Watchdog Timer \(IWDT\)](#).

#### **IWDRSTIRQS bit (IWDT Reset Interrupt Request Select)**

The IWDRSTIRQS bit selects the operation on an underflow of the down counter or generation of a refresh error. The selected operation can be an independent watchdog timer reset, non-maskable interrupt request, or interrupt request.

For details, see [section 28, Independent Watchdog Timer \(IWDT\)](#).

#### **IWDTSTPCTL bit (IWDT Stop Control)**

The IWDTSTPCTL bit specifies whether to stop counting when entering Sleep, Snooze, or Software Standby mode.

For details, see [section 28, Independent Watchdog Timer \(IWDT\)](#).

#### **WDTSTRT bit (WDT Start Mode Select)**

The WDTSTRT bit selects the mode in which the WDT is activated after a reset (stopped state or activated state). When the WDT is activated in auto start mode, the OFS0 register setting for the WDT is valid.

#### **WDTTOPS[1:0] bits (WDT Timeout Period Select)**

The WDTTOPS[1:0] bits select the timeout period, the time it takes for the down counter to underflow, as 1024, 4096, 8192, or 16384 cycles of the frequency-divided clock set in the WDTCKS[3:0] bits. The number of PCLKB cycles that the counter takes to underflow after a refresh operation is determined by the combination of the WDTCKS[3:0] and WDTTOPS[1:0] bits.

For details, see [section 27, Watchdog Timer \(WDT\)](#).

**WDTCK[3:0] bits (WDT Clock Frequency Division Ratio Select)**

The WDTCK[3:0] bits select the division ratio of the prescaler to divide the PCLKB frequency as 1/4, 1/64, 1/128, 1/512, 1/2048, or 1/8192. Using this setting combined with the WDTTOPS[1:0] bit setting, the WDT counting period can be set from 4,096 to 134,217,728 PCLKB cycles.

For details, see [section 27, Watchdog Timer \(WDT\)](#).

**WDRPES[1:0] bits (WDT Window End Position Select)**

The WDRPES[1:0] bits select the position where the window for the down counter ends as 0%, 25%, 50%, or 75% of the counted value. The value of the window end position must be smaller than the value of the window start position. Otherwise, only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window, in the WDTRPSS[1:0] and WDRPES[1:0] bits, vary with the setting of the WDTTOPS[1:0] bits.

For details, see [section 27, Watchdog Timer \(WDT\)](#).

**WDTRPSS[1:0] bits (WDT Window Start Position Select)**

The WDTRPSS[1:0] bits select the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the positions where the window starts and ends becomes the period in which a refresh is possible. However, refresh is not possible outside this period.

For details, see [section 27, Watchdog Timer \(WDT\)](#).

**WDRSTIRQS bit (WDT Reset Interrupt Request Select)**

The WDRSTIRQS bit selects the operation on an underflow of the down counter or generation of a refresh error. The selected operation can be a watchdog timer reset, non-maskable interrupt request, or interrupt request.

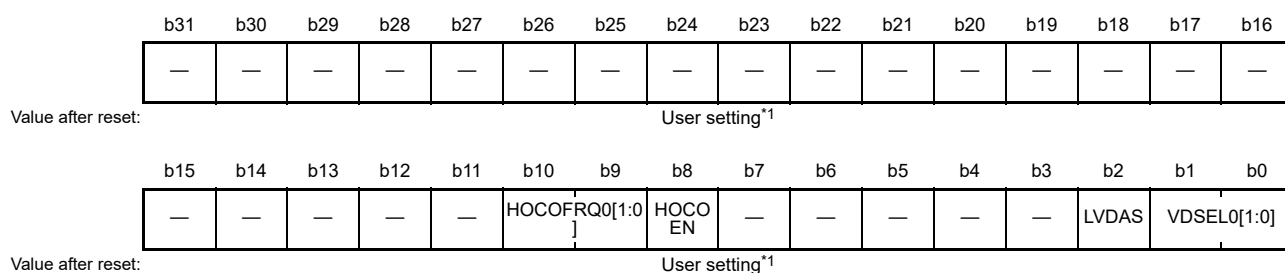

For details, see [section 27, Watchdog Timer \(WDT\)](#).

**WDTSTPCTL bit (WDT Stop Control)**

The WDTSTPCTL bit specifies whether to stop counting when entering Sleep mode. For details, see [section 27, Watchdog Timer \(WDT\)](#).

**7.2.2 Option Function Select Register 1 (OFS1)**

Address(es): **OFS1 0000 0404h**

| Bit      | Symbol             | Bit name                          | Description  | R/W |

| b31 to b11 | —                             | Reserved                 | When read, these bits return the written value. The write value should be 1.           | R   |

Note 1. The value in a blank product is FFFF FFFFh. It is set to the value written by your application.

### [VDSEL0\[1:0\] bits \(Voltage Detection 0 Level Select\)](#)

The VDSEL0[1:0] bits select the voltage detection level of the voltage detection 0 circuit.

### [LVDAS bit \(Voltage Detection 0 Circuit Start\)](#)

The LVDAS bit selects whether the voltage monitor 0 reset is enabled or disabled after a reset.

### [HOCOEN bit \(HOCO Oscillation Enable\)](#)

The HOCOEN bit selects whether the HOCO oscillation is enabled or disabled after a reset. Setting this bit to 0 allows the HOCO oscillation to start before the CPU starts operation, which reduces the wait time for oscillation stabilization.

Note: When the HOCOEN bit is set to 0, the system clock source is not switched to HOCO. The system clock source is only switched to HOCO by setting the Clock Source Select bits (SCKSCR.CKSEL[2:0]). To use the HOCO clock, you must set the OFS1.HOCOFRQ0 bit to an optimum value.

### [HOCOFRQ0\[1:0\] bits \(HOCO Frequency Setting 0\)](#)

The HOCOFRQ0[1:0] bits specify the HOCO frequency after a reset as 16, 18, or 20 MHz.

## 7.2.3 Access Window Setting Register (AWS)

Address(es): [AWS 0100 A164h](#)

| Bit        | Symbol                     | Bit name                          | Description  | R/W |
|------------|----------------------------|-----------------------------------|--|-----|
| b10 to b0  | <a href="#">FAWS[10:0]</a> | Access Window Start Block Address | These bits specify the start block address for the access window. They do not represent the block number of the access window. The access window is only valid in the program flash area. The block address specifies the first address of the block and consists of address bits [23:13]. | R   |
| b14 to b11 | —                          | Reserved                          | When read, these bits return the written value. The write value should be 1.   | R   |

| Bit        | Symbol     | Bit name   | Description  | R/W |
|------------|------------|--|--|-----|
| b15        | FSPR       | Protection of Access Window and Startup Area Select Function | This bit controls the programming of the write/erase protection for the access window, the Startup Area Select flag (AWS.BTFLG), and the temporary boot swap control. When this bit is set to 0, it cannot be changed to 1.<br>0: Executing the configuration setting command for programming the access window (FAWE[10:0], FAWS[10:0]) and the Startup Area Select flag (AWS.BTFLG) is invalid<br>1: Executing the configuration setting command for programming the access window (FAWE[10:0], FAWS[10:0]) and the Startup Area Select flag (AWS.BTFLG) is valid. | R   |
| b26 to b16 | FAWE[10:0] | Access Window End Block Address                              | These bits specify the end block address for the access window. They do not represent the block number of the access window. The access window is only valid in the program flash area. The end block address for the access window is the next block to the region acceptable for programming and erasure defined by the access window. The block address specifies the first address of the block and consists of the address bits [23:13].  | R   |
| b30 to b27 | —          | Reserved   | When read, these bits return the written value. The write value should be 1.   | R   |
| b31        | BTFLG      | Startup Area Select Flag                                     | This bit specifies whether the address of the startup area is exchanged for the boot swap function or not:<br>0: First 8-KB area (0000 0000h to 0000 1FFFh) and second 8-KB area (0000 2000h to 0000 3FFFh) are exchanged<br>1: First 8-KB area (0000 0000h to 0000 1FFFh) and second 8-KB area (0000 2000h to 0000 3FFFh) are not exchanged.  | R   |

Issuing the program or erase (P/E) command to an area outside the access window causes a command-locked state. The access window is only valid in the program flash area. The access window provides protection in self-programming mode, serial programming mode, and on-chip debug mode. The access window can be locked by the FSPR bit.

The access window is specified in both the FAWS[10:0] and FAWE[10:0] bits: The following describes how to set the FAWS[10:0] and FAWE[10:0] bits:

- FAWE[10:0] = FAWS[10:0]: The P/E command is allowed to execute in the full program flash area
- FAWE[10:0] > FAWS[10:0]: The P/E command is only allowed to execute in the window from the block pointed to by the FAWS[10:0] bits to the block one lower than the block pointed to by the FAWE[10:0] bits
- FAWE[10:0] < FAWS[10:0]: The P/E command is not allowed to execute in the program flash area.

Figure 7.2 Access window overview

### 7.2.4 OCD/Serial Programmer ID Setting Register (OSIS)

The OSIS register stores the ID for ID code protection of the OCD/serial programmer. When connecting the OCD/serial programmer, write values so that the MCU can determine whether to permit the connection. Use this register to check whether a code transmitted from the OCD/serial programmer matches the ID code in the option-setting memory.

When the ID codes match, connection of the OCD/serial programmer is permitted, if not, connection with the OCD/serial programmer is not possible. The OSIS register must be set in 32-bit words.

Address(es): OSIS 0100 A150h, OSIS 0100 A154h, OSIS 0100 A158h, OSIS 0100 A15Ch

These fields hold the ID for use in ID authentication for the OCD/serial programmer.

ID code bits [127] and [126] determine whether ID code protection is enabled and the method of authentication to use with the host. Table 7.1 shows how the ID code determines the method of authentication.

Setting bit [127] to 0 prevents Renesas from accessing the test mode. Therefore, Renesas cannot perform failure analysis unless provided with bits [126:0]. To process any warranty claim, Renesas must be able to perform failure analysis.

**Table 7.1 Specifications for ID code protection**

| Operating mode on boot up                   | ID code   | State of protection | Operations on connection to programmer or on-chip debugger   |
|---|---|---------------------|--|
| Serial programming mode (SCI/USB boot mode) | FFh, ..., FFh (all bytes are FFh)   | Protection disabled | The ID code is not checked, the ID code always matches, and the connection to programmer or on-chip debugger is permitted  |
| On-chip debug mode (JTAG/SWD boot mode)     | Bit [127] = 1 and bit [126] = 1, and at least one of the 16 bytes is not FFh. | Protection enabled  | Matching ID code = authentication is complete and connection to the programmer or the on-chip debugger is permitted.<br>Mismatching ID code = transition to the ID code protection wait state.<br>When the ID code sent from the programmer or the on-chip debugger is ALeRASE in ASCII code (414C_6552_4153_45FF_FFFF_FFFF_FFFF_FF FFh), the contents of the user flash (code and data) area and the configuration area are erased. However, forced erasure is not executed when the FSPR bit is 0. |
|   | Bit [127] = 1 and bit [126] = 0   | Protection enabled  | Matching ID code = authentication is complete and connection to the programmer or the on-chip debugger is permitted.<br>Mismatching ID code = transition to the ID code protection wait state.   |
|   | Bit [127] = 0   | Protection enabled  | The ID code is not checked, the ID code is always mismatching, and the connection to the programmer or the on-chip debugger is prohibited  |

## 7.3 Setting the Option-Setting Memory

### 7.3.1 Allocation of Data in the Option-Setting Memory

Programming data is allocated to the addresses in the option-setting memory shown in [Figure 7.1](#). The allocated data is used by tools such as a flash programming software or an on-chip debugger.

Note: Programming formats vary depending on the compiler. See the compiler manual for details.

### 7.3.2 Setting Data for Programming the Option-Setting Memory

Allocating data as described in [section 7.3.1, Allocation of Data in the Option-Setting Memory](#), alone does not actually write the data to the option-setting memory. You must also follow one of the actions described in this section.

#### (1) Changing the option-setting memory by self-programming

To write data to the program flash area, use the programming command. To write data to the option-setting memory in the configuration setting area, use the configuration setting command. In addition, use the startup area select function to safely update the boot program that includes the option-setting memory.

For details on the programming command, the configuration setting command, and the startup area select function, see [section 53, Flash Memory](#).

Note: While programming the configuration setting area, the following restrictions apply:

- The code must not access addresses that satisfy the ranges described by the expression defined in [Expression 1](#) from all bus masters
- The code must not execute on addresses that satisfy the ranges described by the expression defined in [Expression 1](#).

#### Expression 1

If  $((\text{address} \ \& \ 0x0101F800) == 0x01010000) \ || \ ((\text{address} \ \& \ 0x0101FC00) == 0x01012000)$

For example, the ranges of addresses 0x1FFF0000 to 0x1FFF07FF or 0x1FFF2000 to 0x1FFF23FF are associated with the SRAMHS area that is tagged as restricted. Also, interrupts are allowed, however, the ISR has these specified restrictions. Therefore, it is highly recommended that you disable all interrupts, and bus masters except the CPU while programming the configuration setting area because the interrupts and these modules might access prohibited area in [Expression 1](#).

#### (2) Debugging through an OCD or programming by a flash writer

This procedure depends on the tool in use, see the tool manual for details.

The MCU provides two setting procedures:

- Read the data allocated as described in [section 7.3.1, Allocation of Data in the Option-Setting Memory](#), from an object file or Motorola S-format file generated by the compiler, and write the data to the MCU
- Use the GUI interface of the tool to program the same data allocated as described in [section 7.3.1, Allocation of Data in the Option-Setting Memory](#).

Note: While programming the OSIS or AWS registers, the following restrictions apply:

- The code must not access addresses that satisfy the ranges described by the expression defined in [Expression 1](#) from all bus masters
- The code must not execute on addresses that satisfy the ranges described by the expression defined in [Expression 1](#).

## 7.4 Usage Notes

### 7.4.1 Data for Programming Reserved Areas and Reserved Bits in the Option-Setting Memory

When reserved areas and reserved bits in the option-setting memory are within the scope of programming, write 1 to all bits in reserved areas and all reserved bits. Operation is not guaranteed if 0 is written to these bits.

## 8. Low Voltage Detection (LVD)

### 8.1 Overview

The Low Voltage Detection (LVD) module monitors the voltage level input to the VCC pin, and the detection level can be selected using a software program. The LVD module consists of three separate voltage level detectors, 0, 1, and 2, which measure the voltage level input to the VCC pin. LVD voltage detection registers allow your application to configure detection of VCC changes at various voltage thresholds.

Each voltage level detector has a voltage monitor associated with it, for example voltage monitors 0, 1, and 2. Voltage monitor registers are used to configure the LVD to trigger an interrupt, event link output, or reset when the thresholds are crossed.

Table 8.1 lists the LVD specifications. Figure 8.1 shows a block diagram of voltage detectors 0, 1, and 2, Figure 8.2 shows a block diagram of the voltage monitor 1 interrupt and reset circuit, and Figure 8.3 shows a block diagram of the voltage monitor 2 interrupt and reset circuit.

**Table 8.1 LVD specifications**

| Parameter                    |                          | Voltage monitor 0 specifications   | Voltage monitor 1 specifications   | Voltage monitor 2 specifications   |

## 8.2 Register Descriptions

### 8.2.1 Voltage Monitor 1 Circuit Control Register 1 (LVD1CR1)

Address(es): SYSTEM.LVD1CR1 4001 E0E0h

Value after reset: 0 0 0 0 0 0 0 1

| Bit      | Symbol      | Bit name  | Description   | R/W |
|----------|-------------|---|---|-----|
| b1, b0   | IDTSEL[1:0] | Voltage Monitor 1 Interrupt Generation Condition Select | b1 b0<br>0 0: When $VCC \geq V_{det1}$ (rise) is detected<br>0 1: When $VCC < V_{det1}$ (fall) is detected<br>1 0: When fall and rise are detected<br>1 1: Settings prohibited. | R/W |
| b2       | IRQSEL      | Voltage Monitor 1 Interrupt Type Select                 | 0: Non-maskable interrupt<br>1: Maskable interrupt.*1   | R/W |
| b7 to b3 | —           | Reserved  | These bits are read as 0. The write value should be 0.  | R/W |

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

Note 1. When enabling maskable interrupts, do not change the value of the NMIER.LVD1EN bit in the ICU from the reset state.

## 8.2.2 Voltage Monitor 1 Circuit Status Register (LVD1SR)

Address(es): SYSTEM.LVD1SR 4001 E0E1h

|    |    |    |    |    |    |     |     |
|----|----|----|----|----|----|-----|-----|
| b7 | b6 | b5 | b4 | b3 | b2 | b1  | b0  |
| —  | —  | —  | —  | —  | —  | MON | DET |
| 0  | 0  | 0  | 0  | 0  | 0  | 1   | 0   |

Value after reset:

| Bit      | Symbol | Bit name  | Description   | R/W         |
|----------|--------|---|---|-------------|
| b0       | DET    | Voltage Monitor 1 Voltage Change Detection Flag | 0: Not detected<br>1: $V_{det1}$ passage detected.                | R/(W)<br>*1 |
| b1       | MON    | Voltage Monitor 1 Signal Monitor Flag           | 0: $VCC < V_{det1}$<br>1: $VCC \geq V_{det1}$ or MON is disabled. | R           |
| b7 to b2 | —      | Reserved  | These bits are read as 0. The write value should be 0.            | R/W         |

Note 1. Only 0 can be written to this bit. After writing 0 to this bit, 2 system clock cycles are required for the bit to be read as 0.

### DET flag (Voltage Monitor 1 Voltage Change Detection Flag)

The DET flag is enabled when the LVCMPCR.LVD1E bit is 1 (voltage detection 1 circuit enabled) and the LVD1CR0.CMPE bit is 1 (voltage monitor 1 circuit comparison result output enabled).

Set the DET flag to 0 after LVD1CR0.RIE is set to 0 (disabled). LVD1CR0.RIE can be set to 1 (enabled) after 2 or more PCLKB cycles have elapsed.

### MON flag (Voltage Monitor 1 Signal Monitor Flag)

The MON flag is enabled when the LVCMPCR.LVD1E bit is 1 (voltage detection 1 circuit enabled) and the LVD1CR0.CMPE bit is 1 (voltage monitor 1 circuit comparison result output enabled).

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

## 8.2.3 Voltage Monitor 2 Circuit Control Register 1 (LVD2CR1)

Address(es): SYSTEM.LVD2CR1 4001 E0E2h

|    |    |    |    |    |        |             |    |
|----|----|----|----|----|--------|-------------|----|
| b7 | b6 | b5 | b4 | b3 | b2     | b1          | b0 |
| —  | —  | —  | —  | —  | IRQSEL | IDTSEL[1:0] |    |
| 0  | 0  | 0  | 0  | 0  | 0      | 0           | 1  |

Value after reset:

| Bit      | Symbol      | Bit name  | Description   | R/W |
|----------|-------------|---|---|-----|
| b1, b0   | IDTSEL[1:0] | Voltage Monitor 2 Interrupt Generation Condition Select | b1 b0<br>0 0: When $VCC \geq V_{det2}$ (rise) is detected<br>0 1: When $VCC < V_{det2}$ (fall) is detected<br>1 0: When fall and rise are detected<br>1 1: Settings prohibited. | R/W |
| b2       | IRQSEL      | Voltage Monitor 2 Interrupt Type Select                 | 0: Non-maskable interrupt<br>1: Maskable interrupt.*1   | R/W |
| b7 to b3 | —           | Reserved  | These bits are read as 0. The write value should be 0.  | R/W |

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

Note 1. When enabling maskable interrupts, do not change the value of the NMIER.LVD1EN bit in the ICU from the reset state.

### 8.2.4 Voltage Monitor 2 Circuit Status Register (LVD2SR)

Address(es): SYSTEM.LVD2SR 4001 E0E3h

|    |    |    |    |    |    |     |     |
|----|----|----|----|----|----|-----|-----|
| b7 | b6 | b5 | b4 | b3 | b2 | b1  | b0  |
| —  | —  | —  | —  | —  | —  | MON | DET |
| 0  | 0  | 0  | 0  | 0  | 0  | 1   | 0   |

Value after reset:

| Bit      | Symbol | Bit name  | Description   | R/W         |
|----------|--------|---|---|-------------|
| b0       | DET    | Voltage Monitor 2 Voltage Change Detection Flag | 0: Not detected<br>1: $V_{det2}$ passage detected.                | R/(W)<br>*1 |
| b1       | MON    | Voltage Monitor 2 Signal Monitor Flag           | 0: $VCC < V_{det2}$<br>1: $VCC \geq V_{det2}$ or MON is disabled. | R           |
| b7 to b2 | —      | Reserved  | These bits are read as 0. The write value should be 0.            | R/W         |

Note 1. Only 0 can be written to this bit. After writing 0 to this bit, it takes two system clock cycles for the bit to be read as 0.

#### DET flag (Voltage Monitor 2 Voltage Change Detection Flag)

The DET flag is enabled when the LVCMPER.LVD2E bit is 1 (voltage detection 2 circuit enabled) and the LVD2CR0.CMPE bit is 1 (voltage monitor 2 circuit comparison result output enabled).

Set the DET flag to 0 after LVD2CR0.RIE is set to 0 (disabled). LVD2CR0.RIE can be set to 1 (enabled) after 2 or more PCLKB cycles have elapsed.

#### MON flag (Voltage Monitor 2 Signal Monitor Flag)

The MON flag is enabled when the LVCMPER.LVD2E bit is 1 (voltage detection 2 circuit enabled) and the LVD2CR0.CMPE bit is 1 (voltage monitor 2 circuit comparison result output enabled).

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

### 8.2.5 Voltage Monitor Circuit Control Register (LVCMPER)

Address(es): SYSTEM.LVCMPER 4001 E417h

|    |       |       |    |    |    |    |    |
|----|-------|-------|----|----|----|----|----|
| b7 | b6    | b5    | b4 | b3 | b2 | b1 | b0 |
| —  | LVD2E | LVD1E | —  | —  | —  | —  | —  |
| 0  | 0     | 0     | 0  | 0  | 0  | 0  | 0  |

Value after reset:

| Bit      | Symbol | Bit name                   | Description  | R/W |
|----------|--------|----------------------------|--|-----|
| b4 to b0 | —      | Reserved                   | These bits are read as 0. The write value should be 0.                             | R/W |
| b5       | LVD1E  | Voltage Detection 1 Enable | 0: Voltage detection 1 circuit disabled<br>1: Voltage detection 1 circuit enabled. | R/W |
| b6       | LVD2E  | Voltage Detection 2 Enable | 0: Voltage detection 2 circuit disabled<br>1: Voltage detection 2 circuit enabled. | R/W |
| b7       | —      | Reserved                   | This bit is read as 0. The write value should be 0.                                | R/W |

#### LVD1E bit (Voltage Detection 1 Enable)

When using voltage detection 1 interrupt/reset or the LVD1SR.MON bit, set the LVD1E bit to 1. The voltage detection 1 circuit starts when  $t_d(E-A)$  elapses after the LVD1E bit value is changed from 0 to 1. When using the voltage detection 1 circuit in Deep Software Standby mode, do not set the DPSBYCR.DEEPCUT[1:0] bits to 11b.

**LVD2E bit (Voltage Detection 2 Enable)**

When using voltage detection 2 interrupt/reset or the LVD2SR.MON bit, set the LVD2E bit to 1. The voltage detection 2 circuit starts when  $t_d(E-A)$  elapses after the LVD2E bit value is changed from 0 to 1. When using the voltage detection 2 circuit in Deep Software Standby mode, do not set the DPSBYCR.DEEPCUT[1:0] bits to 11b.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

**8.2.6 Voltage Detection Level Select Register (LVDLVLR)**

Address(es): [SYSTEM.LVDLVLR 4001 E418h](#)

| Bit      | Symbol                       | Bit name  | Description   | R/W |    |  |         |   |                  |         |   |                  |         |   |                   |     |
|----------|------------------------------|---|---|-----|----|--|---------|---|------------------|---------|---|------------------|---------|---|-------------------|-----|
| b4 to b0 | <a href="#">LVD1LVL[4:0]</a> | Voltage Detection 1 Level Select<br>(standard voltage during fall in voltage) | <table border="0"> <tr> <td>b4</td><td>b0</td><td></td> </tr> <tr> <td>1 0 0 0</td><td>1</td><td>2.99 V (Vdet1_1)</td> </tr> <tr> <td>1 0 0 1</td><td>0</td><td>2.92 V (Vdet1_2)</td> </tr> <tr> <td>1 0 0 1</td><td>1</td><td>2.85 V (Vdet1_3).</td> </tr> </table> Other settings are prohibited. | b4  | b0 |  | 1 0 0 0 | 1 | 2.99 V (Vdet1_1) | 1 0 0 1 | 0 | 2.92 V (Vdet1_2) | 1 0 0 1 | 1 | 2.85 V (Vdet1_3). | R/W |
| b4       | b0                           |   |   |     |    |  |         |   |                  |         |   |                  |         |   |                   |     |
| 1 0 0 0  | 1                            | 2.99 V (Vdet1_1)  |   |     |    |  |         |   |                  |         |   |                  |         |   |                   |     |
| 1 0 0 1  | 0                            | 2.92 V (Vdet1_2)  |   |     |    |  |         |   |                  |         |   |                  |         |   |                   |     |
| 1 0 0 1  | 1                            | 2.85 V (Vdet1_3).   |   |     |    |  |         |   |                  |         |   |                  |         |   |                   |     |
| b7 to b5 | <a href="#">LVD2LVL[2:0]</a> | Voltage Detection 2 Level Select<br>(standard voltage during fall in voltage) | <table border="0"> <tr> <td>b7</td><td>b5</td><td></td> </tr> <tr> <td>1 0 1</td><td></td><td>2.99 V (Vdet2_1)</td> </tr> <tr> <td>1 1 0</td><td></td><td>2.92 V (Vdet2_2)</td> </tr> <tr> <td>1 1 1</td><td></td><td>2.85 V (Vdet2_3).</td> </tr> </table> Other settings are prohibited.          | b7  | b5 |  | 1 0 1   |   | 2.99 V (Vdet2_1) | 1 1 0   |   | 2.92 V (Vdet2_2) | 1 1 1   |   | 2.85 V (Vdet2_3). | R/W |
| b7       | b5                           |   |   |     |    |  |         |   |                  |         |   |                  |         |   |                   |     |
| 1 0 1    |                              | 2.99 V (Vdet2_1)  |   |     |    |  |         |   |                  |         |   |                  |         |   |                   |     |
| 1 1 0    |                              | 2.92 V (Vdet2_2)  |   |     |    |  |         |   |                  |         |   |                  |         |   |                   |     |
| 1 1 1    |                              | 2.85 V (Vdet2_3).   |   |     |    |  |         |   |                  |         |   |                  |         |   |                   |     |

The contents of the LVDLVLR register can only be changed if the LVCMPCR.LVD1E and LVCMPCR.LVD2E bits (voltage detection n circuit disable, n = 1, 2) are both 0. Do not set LVD detectors 1 and 2 to the same voltage detection level.

Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

**8.2.7 Voltage Monitor 1 Circuit Control Register 0 (LVD1CR0)**

Address(es): [SYSTEM.LVD1CR0 4001 E41Ah](#)

x: Undefined

| Bit | Symbol                | Bit name  | Description  | R/W |
|-----|-----------------------|---|--|-----|
| b0  | <a href="#">RIE</a>   | Voltage Monitor 1<br>Interrupt/Reset Enable                     | 0: Disable<br>1: Enable.   | R/W |
| b1  | <a href="#">DFDIS</a> | Voltage Monitor 1 Digital<br>Filter Disable Mode Select         | 0: Enable digital filter<br>1: Disable digital filter.   | R/W |
| b2  | <a href="#">CMPE</a>  | Voltage Monitor 1 Circuit<br>Comparison Result Output<br>Enable | 0: Disable voltage monitor 1 circuit comparison result output<br>1: Enable voltage monitor 1 circuit comparison result output. | R/W |
| b3  | —                     | Reserved  | The read value is undefined. The write value should be 1.  | R/W |

| Bit    | Symbol     | Bit name                              | Description  | R/W |
|--------|------------|---------------------------------------|--|-----|
| b5, b4 | FSAMP[1:0] | Sampling Clock Select                 | b5 b4<br>0 0: 1/2 LOCO frequency<br>0 1: 1/4 LOCO frequency<br>1 0: 1/8 LOCO frequency<br>1 1: 1/16 LOCO frequency.  | R/W |
| b6     | RI         | Voltage Monitor 1 Circuit Mode Select | 0: Generate voltage monitor 1 interrupt on $V_{det1}$ passage<br>1: Enable voltage monitor 1 reset when the voltage falls to and below $V_{det1}$ .            | R/W |
| b7     | RN         | Voltage Monitor 1 Reset Negate Select | 0: Negate after a stabilization time (tLVD1) when $VCC > V_{det1}$ is detected<br>1: Negate after a stabilization time (tLVD1) on assertion of the LVD1 reset. | R/W |

### RIE bit (Voltage Monitor 1 Interrupt/Reset Enable)

The RIE bit enables or disables the voltage monitor 1 interrupt/reset. Set this bit to ensure that neither a voltage monitor 1 interrupt nor a voltage monitor 1 reset is generated during programming or erasure of the flash memory.

### DFDIS bit (Voltage Monitor 1 Digital Filter Disable Mode Select)

The DFDIS bit enables the digital filter circuit. Set the LOCOCR.LCSTP bit to 0 (the LOCO operates) if this bit is 0 (enabled). Set the bit to 1 (disabled) when using the voltage monitor 1 circuit in Software Standby or Deep Software Standby mode.

### FSAMP[1:0] bits (Sampling Clock Select)

Only change the FSAMP[1:0] bits when the LVD1CR0.DFDIS bit is 1 (digital filter circuit disabled) but not when LVD1CR0.DFDIS is 0 (digital filter circuit enabled).

### RI bit (Voltage Monitor 1 Circuit Mode Select)

When the RI bit is 1 (voltage monitor 1 reset selected) or when the LVD2CR0.RI bit is 1 (voltage monitor 2 reset selected), transition to Software Standby mode can be made but not to Deep Software Standby mode. To enter Deep Software Standby mode, set the RI bit to 0 (voltage monitor 1 interrupt selected) and the LVD2CR0.RI bit to 0 (voltage monitor 2 interrupt selected).

### RN bit (Voltage Monitor 1 Reset Negate Select)

If the RN bit is to be set to 1 (negation follows a stabilization time on assertion of the LVD1 reset signal), set the LOCOCR.LCSTP bit to 0 (the LOCO operates). In addition, for a transition to Software Standby or Deep Software Standby, the only possible value for the RN bit is 0 (negation follows a stabilization time when  $VCC > V_{det1}$  is detected). Do not set the RN bit to 1 when this is the case.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

## 8.2.8 Voltage Monitor 2 Circuit Control Register 0 (LVD2CR0)

Address(es): SYSTEM.LVD2CR0 4001 E41Bh

|                    | b7 | b6 | b5         | b4 | b3   | b2    | b1  | b0 |
|--------------------|----|----|------------|----|------|-------|-----|----|
|                    | RN | RI | FSAMP[1:0] | —  | CMPE | DFDIS | RIE |    |
| Value after reset: | 1  | 0  | 0          | 0  | x    | 0     | 1   | 0  |

x: Undefined

| Bit | Symbol | Bit name   | Description  | R/W |
|-----|--------|--|--|-----|
| b0  | RIE    | Voltage Monitor 2 Interrupt/Reset Enable             | 0: Disable<br>1: Enable.                               | R/W |
| b1  | DFDIS  | Voltage Monitor 2 Digital Filter Disable Mode Select | 0: Enable digital filter<br>1: Disable digital filter. | R/W |

| Bit    | Symbol     | Bit name  | Description  | R/W |
|--------|------------|---|--|-----|
| b2     | CMPE       | Voltage Monitor 2 Circuit Comparison Result Output Enable | 0: Disable voltage monitor 2 circuit comparison result output<br>1: Enable voltage monitor 2 circuit comparison result output.                                 | R/W |
| b3     | —          | Reserved  | The read value is undefined. The write value should be 1.  | R/W |
| b5, b4 | FSAMP[1:0] | Sampling Clock Select                                     | b5 b4<br>0 0: 1/2 LOCO frequency<br>0 1: 1/4 LOCO frequency<br>1 0: 1/8 LOCO frequency<br>1 1: 1/16 LOCO frequency.  | R/W |
| b6     | RI         | Voltage Monitor 2 Circuit Mode Select                     | 0: Generate voltage monitor 2 interrupt on $V_{det2}$ passage<br>1: Enable voltage monitor 2 reset when the voltage falls to and below $V_{det2}$ .            | R/W |
| b7     | RN         | Voltage Monitor 2 Reset Negate Select                     | 0: Negate after a stabilization time (tLVD2) when $VCC > V_{det2}$ is detected<br>1: Negate after a stabilization time (tLVD2) on assertion of the LVD2 reset. | R/W |

### RIE bit (Voltage Monitor 2 Interrupt/Reset Enable)

The RIE bit enables or disables voltage monitor 2 interrupt/reset. Set this bit to ensure that neither a voltage monitor 2 interrupt nor a voltage monitor 2 reset is generated during programming or erasure of the flash memory.

### DFDIS bit (Voltage Monitor 2 Digital Filter Disable Mode Select)

The DFDIS bit enables the digital filter circuit. Set the LOCOCR.LCSTP bit to 0 (the LOCO operates) if this bit is 0 (enabled). Set the bit to 1 (disabled) when using the voltage monitor 2 circuit in Software Standby or Deep Software Standby mode.

### FSAMP[1:0] bits (Sampling Clock Select)

Only change the FSAMP[1:0] bits when the LVD2CR0.DFDIS bit is 1 (digital filter circuit disabled), but not when LVD2CR0.DFDIS is 0 (digital filter circuit enabled).

### RI bit (Voltage Monitor 2 Circuit Mode Select)

When the RI bit is 1 (voltage monitor 2 reset selected) or when the LVD1CR0.RI bit is 1 (voltage monitor 1 reset selected), transition to Software Standby mode can be made but not to Deep Software Standby mode. To enter Deep Software Standby mode, set the RI bit to 0 (voltage monitor 2 interrupt selected) and the LVD1CR0.RI bit to 0 (voltage monitor 1 interrupt selected).

### RN bit (Voltage Monitor 2 Reset Negate Select)

If the RN bit is set to 1 (negation follows a stabilization time on assertion of the LVD2 reset signal), set the LOCOCR.LCSTP bit to 0 (the LOCO operates). Additionally, for a transition to Software Standby or Deep Software Standby mode, the only possible value for the RN bit is 0 (negation follows a stabilization time when  $VCC > V_{det2}$  is detected). Do not set the RN bit to 1 (negation follows a stabilization time after assertion of the LVD2 reset signal) when this is the case.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

## 8.3 VCC Input Voltage Monitor

### 8.3.1 Monitoring $V_{det0}$

The comparison results from voltage monitor 0 are not available for reading.

### 8.3.2 Monitoring $V_{det1}$

Table 8.2 shows the procedure to set up monitoring against  $V_{det1}$ . After the settings are complete, the comparison results from voltage monitor 1 can be monitored with the LVD1SR.MON flag.

**Table 8.2 Procedure to set up monitoring against  $V_{det1}$** 

| Step                                    | Monitoring the comparison results from voltage monitor 1 |   |
|---|--|---|
| Setting the voltage detection 1 circuit | 1  | Set LVCMPCR.LVD1E = 0 to disable voltage detection 1 before writing to LVDLVL register.   |
|   | 2  | Select the detection voltage in the LVDLVL.LVD1LVL[4:0] bits.   |
|   | 3  | Set LVCMPCR.LVD1E = 1 to enable voltage detection 1.  |
|   | 4  | Wait for at least $t_d(E-A)$ for the LVD operation stabilization time after LVD is enabled.*1   |
| Setting the digital filter*2            | 5  | Select the sampling clock for the digital filter in the LVD1CR0.FSAMP[1:0] bits.  |
|   | 6  | Set LVD1CR0.DFDIS = 0 to enable the digital filter.   |
|   | 7  | Wait for at least $2n + 3$ cycles of the LOCO, where $n = 2, 4, 8, 16$ and the sampling clock for the digital filter is the LOCO frequency-divided by $n$ . |
| Enabling output                         | 8  | Set LVD1CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 1.   |

Note 1. Steps 5 to 7 can be performed during the wait time in step 4. For details on  $t_d(E-A)$ , see [section 55, Electrical Characteristics](#).

Note 2. Steps 5 to 7 are not required if the digital filter is not in use.

### 8.3.3 Monitoring $V_{det2}$

[Table 8.3](#) shows the procedure to set up monitoring against  $V_{det2}$ . After the settings are complete, the comparison results from voltage monitor 2 can be monitored with the LVD2SR.MON flag.

**Table 8.3 Procedure to set up monitoring against  $V_{det2}$** 

| Step                                       | Monitoring the comparison results by voltage monitor 2 |  |
|--|--|--|
| Setting up the voltage detection 2 circuit | 1  | Set LVCMPCR.LVD2E = 0 to disable voltage detection 2 before writing to the LVDLVL register.  |
|  | 2  | Select the detection voltage in the LVDLVL.LVD2LVL[2:0] bits.  |
|  | 3  | Set LVCMPCR.LVD2E = 1 to enable the voltage detection 2 circuit.   |
|  | 4  | Wait for at least $t_d(E-A)$ for the LVD operation stabilization time after LVD is enabled.*1  |
| Setting up the digital filter*2            | 5  | Select the sampling clock for the digital filter in the LVD2CR0.FSAMP[1:0] bits.   |
|  | 6  | Set LVD2CR0.DFDIS = 0 to enable the digital filter.  |
|  | 7  | Wait for at least $2n + 3$ LOCO cycles, where $n = 2, 4, 8, 16$ and the sampling clock for the digital filter is the LOCO frequency-divided by $n$ . |
| Enabling output                            | 8  | Set LVD2CR0.CMPE = 1 to enable output of the comparison results by voltage monitor 2.  |

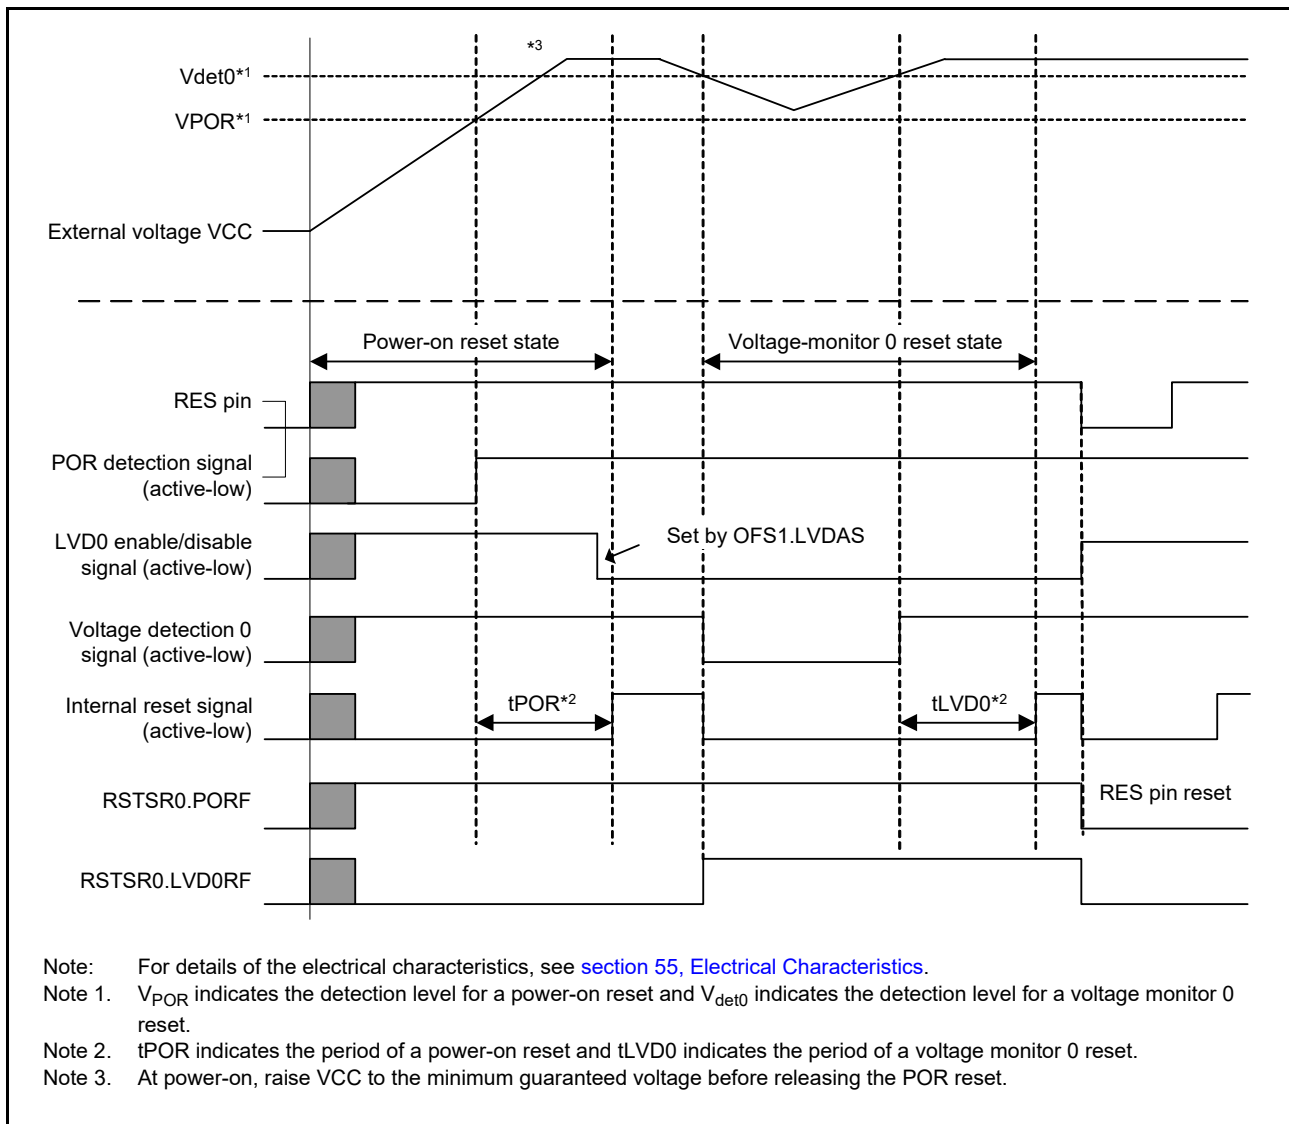

Note 1. Steps 5 to 7 can be performed during the wait time in step 4. For details on  $t_d(E-A)$ , see [section 55, Electrical Characteristics](#).

Note 2. Steps 5 to 7 are not required if the digital filter is not in use.

## 8.4 Reset from Voltage Monitor 0

When using the reset from voltage monitor 0, clear the OFS1.LVDAS bit to 0 to enable the voltage monitor 0 reset after a reset. However, at boot mode, the reset from voltage monitor 0 is disabled regardless of the value of OFS1.LVDAS bit.

[Figure 8.4](#) shows an example of operations for a voltage monitor 0 reset.

**Figure 8.4 Example of voltage monitor 0 reset operation**

## 8.5 Interrupt and Reset from Voltage Monitor 1

An interrupt or reset can be generated in response to the comparison results from the voltage monitor 1 circuit.

[Table 8.4](#) shows the procedure for setting bits related to the voltage monitor 1 interrupt and reset so that voltage monitoring operates. [Table 8.5](#) shows the procedure for setting bits related to the voltage monitor 1 interrupt and reset so that voltage monitoring stops. [Figure 8.5](#) shows an example of operations for a voltage monitor 1 interrupt. For the operation of the voltage monitor 1 reset, see [Figure 6.2](#) in [section 6, Resets](#).

When using the voltage monitor 1 circuit in Software Standby or Deep Software Standby, set the circuit with the following procedures.

### (1) Settings in Software Standby mode

- Disable the digital filter ( $LVD1CR0.DFDIS = 1$ )
- When  $VCC > V_{det1}$  is detected, negate the voltage monitor 1 reset signal ( $LVD1CR0.RN = 0$ ) following a stabilization time.

### (2) Settings in Deep Software Standby mode

- Disable the digital filter ( $LVD1CR0.DFDIS = 1$ )

- Enable voltage monitor 1 interrupts (LVD1CR0.RI = 0). If the voltage monitor 1 reset is enabled (LVD1CR0.RI = 1), a transition to Deep Software Standby mode is not possible, and the operation transitions to Software Standby mode instead
- When the DPSBYCR.DEEPCUT[1:0] bits are 11b, the voltage monitor 1 circuit stops. To use the voltage monitor 1 circuit in Deep Software Standby mode, set the DPSBYCR.DEEPCUT[1:0] bits to a value other than 11b.

**Table 8.4 Procedure to set bits related to the voltage monitor 1 interrupt and voltage monitor 1 reset so that voltage monitoring operates**

| Step  | Voltage monitor 1 interrupt (voltage monitor 1 ELC event output) | Voltage monitor 1 reset  |
|---|--|--|
| Setting up the voltage detection 1 circuit          | 1  | Set LVCMPCR.LVD1E = 0 to disable voltage detection 1 before writing to the LVDLVLRL register.  |
|   | 2  | Select the detection voltage in the LVDLVLRL.LVD1LVL[3:0] bits.  |
|   | 3  | Set LVCMPCR.LVD1E = 1 to enable the voltage detection 1 circuit.   |
|   | 4  | Wait for at least $t_d(E-A)$ for the LVD operation stabilization time after LVD is enabled.*1  |
| Setting up the digital filter *2                    | 5  | Select the sampling clock for the digital filter in the LVD1CR0.FSAMP[1:0] bits.   |
|   | 6  | Set LVD1CR0.DFDIS = 0 to enable the digital filter.  |
|   | 7  | Wait for at least $2n + 3$ LOCO cycles, where $n = 2, 4, 8, 16$ and the sampling clock for the digital filter is the LOCO frequency-divided by $n$ .*4   |
| Setting up the voltage monitor 1 interrupt or reset | 8  | Set LVD1CR0.RI = 0 to select the voltage monitor 1 interrupt. <ul style="list-style-type: none"> <li>• Set LVD1CR0.RI = 1 to select the voltage monitor 1 reset</li> <li>• Select the type of reset negation in the LVD1CR0.RN bit.</li> </ul> |
|   | 9  | <ul style="list-style-type: none"> <li>• Select the interrupt request timing in the LVD1CR1.IDTSEL[1:0] bits</li> <li>• Select the interrupt type in the LVD1CR1.IRQSEL bit.</li> </ul>  |
| Enabling output                                     | 10   | Set LVD1SR.DET = 0.  |
|   | 11   | Set LVD1CR0.RIE = 1 to enable the voltage monitor 1 interrupt or reset.*3  |
|   | 12   | Set LVD1CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 1.  |

Note 1. Steps 5 to 11 can be performed during the wait time in step 4. For details on  $t_d(E-A)$ , see [section 55, Electrical Characteristics](#).

Note 2. Steps 5 to 7 are not required if the digital filter is not in use.

Note 3. Step 11 is not required if only the ELC event signal is to be output.

Note 4. Steps 8 to 11 can be performed during the wait time in step 7.

**Table 8.5 Procedure to set bits related to the voltage monitor 1 interrupt and voltage monitor 1 reset so that voltage monitoring stops**

| Step                                     | Voltage monitor 1 interrupt (voltage monitor 1 ELC event output), voltage monitor 1 reset |  |
|--|---|--|
| Settings to stop enabling output         | 1   | Set LVD1CR0.CMPE = 0 to disable output of the comparison results by voltage monitor 1.   |
|  | 2   | Wait for at least $2n + 3$ LOCO cycles, where $n = 2, 4, 8, 16$ and the sampling clock for the digital filter is the LOCO frequency-divided by $n$ .*1 |
|  | 3   | Set LVD1CR0.RIE = 0 to disable the voltage monitor 1 interrupt or reset.*2   |
| Stopping the digital filter              | 4   | Set LVD1CR0.DFDIS = 1 to disable the digital filter.*1, *3   |
| Stopping the voltage detection 1 circuit | 5   | Set LVCMPCR.LVD1E = 0 to disable the voltage detection 1 circuit.  |

Note 1. Steps 2 and 4 are not required if the digital filter is not in use.

Note 2. Step 3 is not required if only the ELC event signal is to be output.

Note 3. To disable the digital filter from its enabled state and then re-enable it, disable it and wait for at least 2 LOCO clock cycles before re-enabling it.

If the voltage monitor 1 interrupt or reset setting is to be made again after it is used and stopped once, omit the following steps in the procedures for stopping and setting, depending on the conditions:

- Setting or stopping the voltage detection 1 circuit is not required if the settings for the circuit do not change
- Setting or stopping the digital filter is not required if the settings for the digital filter do not change
- Setting the voltage monitor 1 interrupt or reset is not required if the settings for the voltage monitor 1 interrupt or reset do not change.

Figure 8.5 Voltage monitor 1 interrupt operation example

## 8.6 Interrupt and Reset from Voltage Monitor 2

An interrupt or reset can be generated in response to the comparison results from the voltage monitor 2 circuit.

Table 8.6 shows the procedure for setting bits related to the voltage monitor 2 interrupt and reset so that voltage monitoring operates. Table 8.7 shows the procedure for setting bits related to the voltage monitor 2 interrupt and reset so that voltage monitoring stops. Figure 8.6 shows an example of operations for a voltage monitor 2 interrupt. For the operation of the voltage monitor 2 reset, see Figure 6.2 in section 6, Resets.

When using the voltage monitor 2 circuit in Software Standby or Deep Software Standby, set the circuit with the following procedures.

### (1) Settings in Software Standby mode

- Disable the digital filter (LVD2CR0.DFDIS = 1)
- When  $V_{CC} > V_{det2}$  is detected, negate the voltage monitor 2 reset signal (LVD2CR0.RN = 0) following the stabilization time.

### (2) Settings in Deep Software Standby mode

- Disable the digital filter (LVD2CR0.DFDIS = 1)
- Enable voltage monitor 2 interrupts (LVD2CR0.RI = 0). If the voltage monitor 2 reset is enabled (LVD2CR0.RI = 1), a transition to Deep Software Standby mode is not possible, and the operation transitions to Software Standby mode instead.
- When the DPSBYCR.DEEPCUT[1:0] bits are 11b, the voltage monitor 2 circuit stops. To use the voltage monitor 2 circuit in Deep Software Standby mode, set the DPSBYCR.DEEPCUT[1:0] bits to a value other than 11b.

**Table 8.6 Procedures to set bits related to voltage monitor 2 interrupt and voltage monitor 2 reset so that voltage monitoring operates**

| Step  | Voltage monitor 2 interrupt<br>(voltage monitor 2 ELC event output) | Voltage monitor 2 reset  |
|---|---|--|
| Setting up the voltage detection 2 circuit          | 1   | Set LVCMPCR.LVD2E = 0 to disable voltage detection 2 before writing to the LVDLVL register.  |
|   | 2   | Select the detection voltage in the LVDLVL.LVD2LVL[2:0] bits.  |
|   | 3   | Set LVCMPCR.LVD2E = 1 to enable the voltage detection 2 circuit.   |
|   | 4   | Wait for at least $t_d(E-A)$ for the LVD operation stabilization time after LVD is enabled.*1  |
| Setting up the digital filter *2                    | 5   | Select the sampling clock for the digital filter in the LVD2CR0.FSAMP[1:0] bits.   |
|   | 6   | Set LVD2CR0.DFDIS = 0 to enable the digital filter.  |
|   | 7   | Wait for at least $2n + 3$ LOCO cycles, where $n = 2, 4, 8, 16$ , and the sampling clock for the digital filter is the LOCO frequency-divided by $n$ .*4   |
| Setting up the voltage monitor 2 interrupt or reset | 8   | Set LVD2CR0.RI = 0 to select the voltage monitor 2 interrupt. <ul style="list-style-type: none"> <li>• Set LVD2CR0.RI = 1 to select the voltage monitor 2 reset</li> <li>• Select the type of reset negation in the LVD2CR0.RN bit.</li> </ul> |
|   | 9   | <ul style="list-style-type: none"> <li>• Select the interrupt request timing in the LVD2CR1.IDTSEL[1:0] bits</li> <li>• Select the interrupt type in the LVD2CR1.IRQSEL bit.</li> </ul>  |
| Enabling output                                     | 10  | Set LVD2SR.DET = 0.  |
|   | 11  | Set LVD2CR0.RIE = 1 to enable the voltage monitor 2 interrupt or reset.*3  |
|   | 12  | Set LVD2CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 2.  |

Note 1. Steps 5 to 11 can be performed during the wait time in step 4. For details on  $t_d(E-A)$ , see section 55, Electrical Characteristics.

Note 2. Steps 5 to 7 are not required if the digital filter is not in use.

Note 3. Step 11 is not required if only the ELC event signal is to be output.

Note 4. Steps 8 to 10 can be performed during the wait time in step 7.

**Table 8.7 Procedure to set bits related to voltage monitor 2 interrupt and voltage monitor 2 reset so that voltage monitoring stops**

| Step                                     | Voltage monitor 2 interrupt (voltage monitor 2 ELC event output), voltage monitor 2 reset |  |
|--|---|--|
| Settings to stop enabling output         | 1   | Set LVD2CR0.CMPE = 0 to disable output of the comparison results by voltage monitor 2.   |
|  | 2   | Wait for at least $2n + 3$ LOCO cycles, where $n = 2, 4, 8, 16$ , and the sampling clock for the digital filter is the LOCO frequency-divided by $n$ . <sup>*1</sup> |
|  | 3   | Set LVD2CR0.RIE = 0 to disable the voltage monitor 2 interrupt or reset. <sup>*2</sup>   |
| Stopping the digital filter              | 4   | Set LVD2CR0.DFDIS = 1 to disable the digital filter. <sup>*1, *3</sup>   |
| Stopping the voltage detection 1 circuit | 5   | Set LVCMPCR.LVD2E = 0 to disable the voltage detection 2 circuit.  |

Note 1. Steps 2 and 4 are not required if the digital filter is not in use.

Note 2. Step 3 is not required if only the ELC event signal is to be output.

Note 3. To disable the digital filter from its enabled state and then re-enable it, disable it and wait for at least 2 LOCO cycles before re-enabling it.

If the voltage monitor 2 interrupt or reset setting is to be made again after it is used and stopped once, omit the following steps in the procedures for stopping and setting, depending on the conditions:

- Setting or stopping the voltage detection 2 circuit is not required if the settings for the circuit do not change
- Setting or stopping the digital filter is not required if the settings for the digital filter do not change
- Setting the voltage monitor 2 interrupt or reset is not required if the settings for the voltage monitor 2 interrupt or voltage monitor 2 reset do not change.

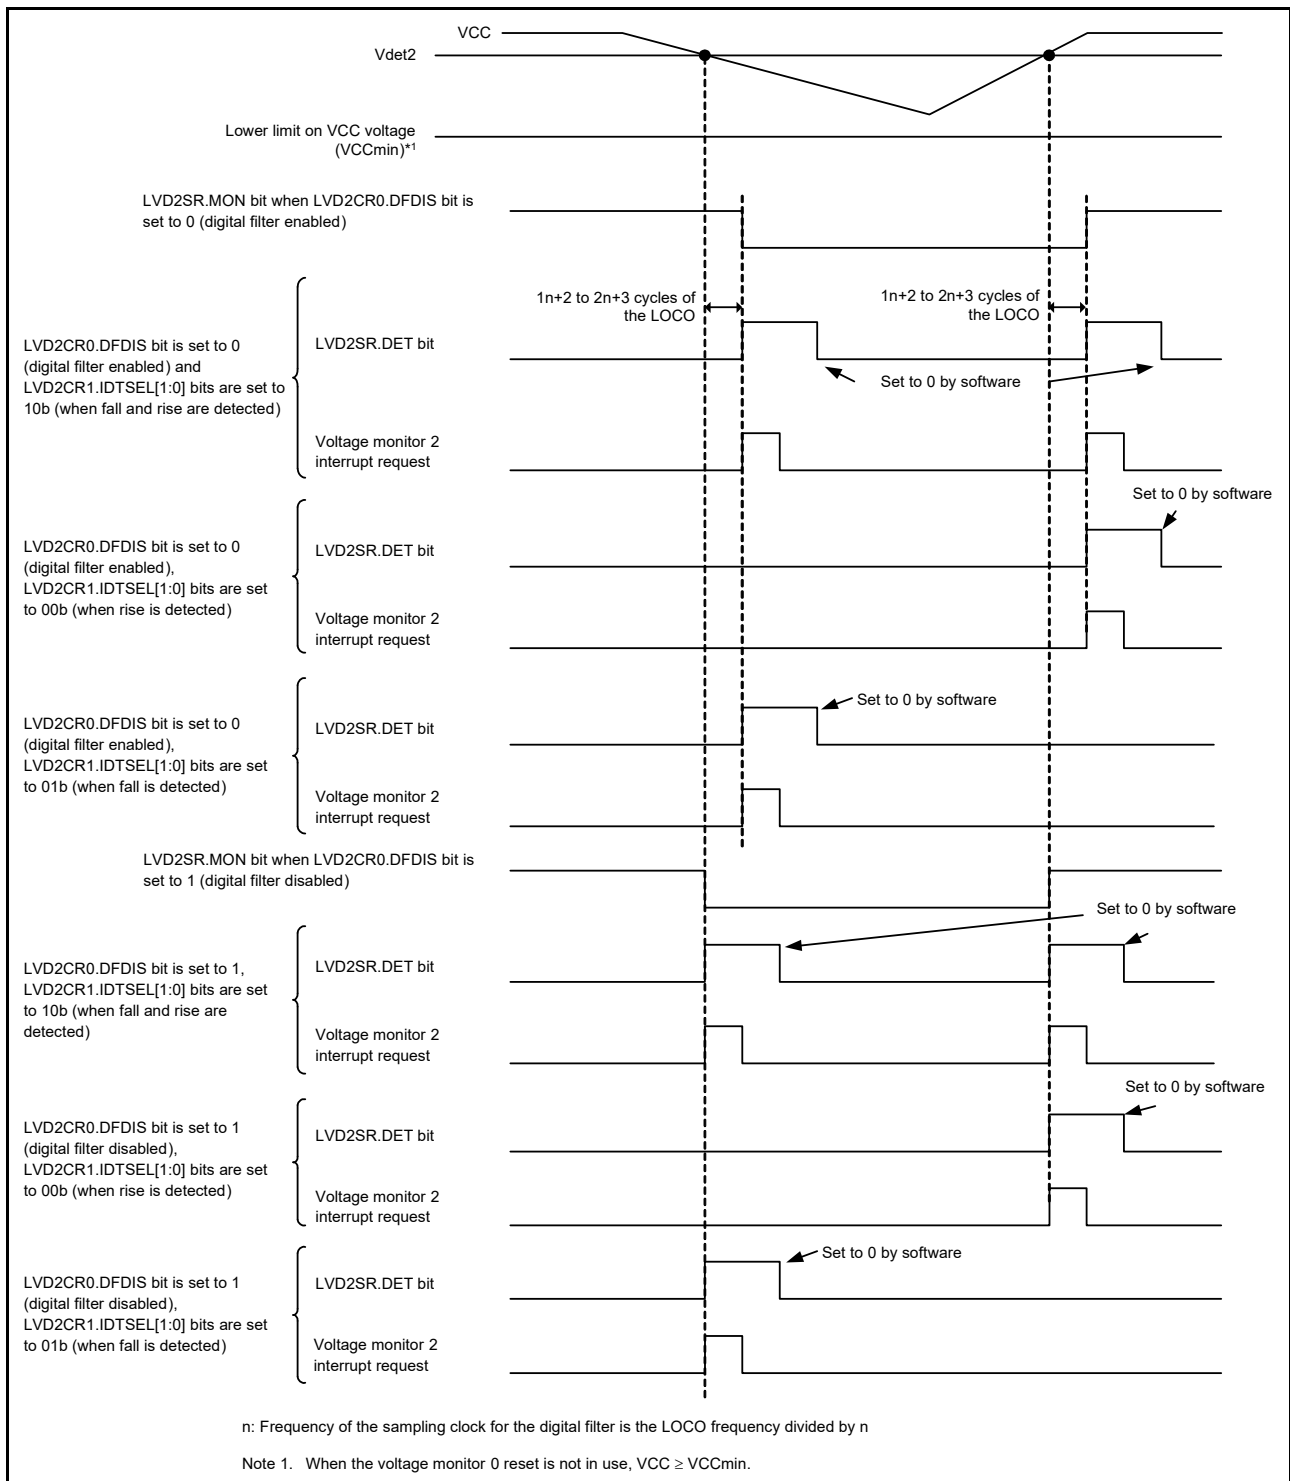

Figure 8.6 Example of voltage monitor 2 interrupt operation

## 8.7 Event Link Output

The LVD can output the event signals to the Event Link Controller (ELC).

### (1) $V_{det1}$ Crossing Detection Event

The LVD outputs the event signal when it detects that the voltage has passed the  $V_{det1}$  voltage while both the voltage detection 1 circuit and the voltage monitor 1 circuit comparison result output are enabled.

## (2) $V_{\text{det}2}$ Crossing Detection Event

The LVD outputs the event signal when it detects that the voltage has passed the  $V_{\text{det}2}$  voltage while both the voltage detection 2 circuit and the voltage monitor 2 circuit comparison result output are enabled.

When enabling the event link output function of the LVD, you must enable the LVD before enabling the LVD event link function of the ELC. To stop the event link output function of the LVD, you must stop the LVD before disabling the LVD event link function of the ELC.

### 8.7.1 Interrupt Handling and Event Linking

The LVD provides bits to separately enable or disable the voltage monitor 1 and 2 interrupts. When an interrupt source is generated and the interrupt is enabled by the interrupt enable bit, the interrupt signal (LVD1CR0.RIE or LVD2CR0.RIE) is output to the CPU.

On the other hand, as soon as an interrupt source is generated, an event link signal is output as the event signal to the other module through the ELC, regardless of the state of the interrupt enable bit.

It is possible to output voltage monitor 1 and 2 interrupts in Software Standby and Deep Software Standby modes. The event signals for the ELC in Software Standby and Deep Software Standby modes are output as follows:

- When a  $V_{\text{det}1}$  or  $V_{\text{det}2}$  passage event is detected in Software Standby mode, event signals are not generated for the ELC because the clock is not supplied in Software Standby mode. Because the  $V_{\text{det}1}$  and  $V_{\text{det}2}$  passage detection flags are saved, when the clock supply resumes after returning from Software Standby mode, the event signals for the ELC are output based on the state of the  $V_{\text{det}1}$  and  $V_{\text{det}2}$  detection flags.
- When a  $V_{\text{det}1}$  or  $V_{\text{det}2}$  passage events is detected in Deep Software Standby mode, event signals are not generated for the ELC.

## 9. Clock Generation Circuit

### 9.1 Overview

The MCU provides a clock generation circuit. [Table 9.1](#) and [Table 9.2](#) list the clock generation circuit specifications, [Figure 9.1](#) shows a block diagram, and [Table 9.3](#) lists the I/O pins.

**Table 9.1 Clock generation circuit specifications for the clock sources**

| Clock source                                 | Parameter  | Specifications  |
|--|--|---|
| Main clock oscillator (MOSC)                 | Resonator frequency  | 8 to 24 MHz<br>USB boot mode: 8, 10, 12, 15, 16, 20, 24 MHz |
|  | External clock input frequency                                       | Up to 24 MHz  |
|  | External resonator or additional circuit: ceramic resonator, crystal | Available   |
|  | Connection pins EXTAL, XTAL  |   |
|  | Drive capability switching   |   |
|  | Oscillation stop detection function                                  |   |
| Sub-clock oscillator (SOSC)                  | Resonator frequency  | 32.768 kHz  |
|  | External resonator or additional circuit: crystal resonator          | Available   |
|  | Connection pins: XCIN, XCOUT   |   |
|  | Drive capability switching   |   |
| PLL circuit                                  | Input clock source   | MOSC, HOCO  |
|  | Input pulse frequency division ratio                                 | Selectable from 1, 2, and 3                                 |
|  | Input frequency  | 8 to 24 MHz   |
|  | Frequency multiplication ratio                                       | Selectable from 10 to 30 (0.5 steps)                        |
|  | PLL output frequency   | 120 to 240 MHz  |
| High-speed on-chip oscillator (HOCO)         | Oscillation frequency  | 16, 18, 20 MHz  |
|  | User trimming  | Available   |
| Middle-speed on-chip oscillator (MOCO)       | Oscillation frequency  | 8 MHz   |
|  | User trimming  | Available   |
| Low-speed on-chip oscillator (LOCO)          | Oscillation frequency  | 32.768 kHz  |
|  | User trimming  | Available   |
| IWDT-dedicated on-chip oscillator (IWDTLOCO) | Oscillation frequency  | 15 kHz  |
| External clock input for JTAG (TCK)          | Input clock frequency  | Up to 25 MHz  |
| External clock input for SWD (SWCLK)         | Input clock frequency  | Up to 25 MHz  |

**Table 9.2 Clock generation circuit specifications for the internal clocks (1 of 2)**

| Parameter                         | Clock sources                     | Clock supply   | Specifications   |
|-----------------------------------|-----------------------------------|--|--|
| System clock (ICLK)               | MOSC, SOSC, HOCO, MOCO, LOCO, PLL | CPU, DTC, DMAC, Flash, SRAM  | Up to 120 MHz<br>Division ratios: 1, 2, 4, 8, 16, 32, 64   |
| Peripheral module clock A (PCLKA) | MOSC, SOSC, HOCO, MOCO, LOCO, PLL | Peripheral modules (ETHERC, EDMAC, QSPI, SPI, SCI, SCE7, SDHI, CRC, IrDA, GPT bus-clock) | Up to 120 MHz*2<br>Division ratios: 1, 2, 4, 8, 16, 32, 64 |

**Table 9.2 Clock generation circuit specifications for the internal clocks (2 of 2)**

| Parameter                         | Clock sources                     | Clock supply   | Specifications   |
|-----------------------------------|-----------------------------------|--|--|
| Peripheral module clock B (PCLKB) | MOSC, SOSC, HOCO, MOCO, LOCO, PLL | Peripheral modules (IIC, SSIE, SRC, DOC, CAC, CAN, DAC12, POEG, CTSU, AGT, Standby SRAM, ELC, I/O ports, RTC, WDT, IWDT, ADC12, KINT, USBFS, ACMPHS, TSN, PDC) | Up to 60 MHz<br>Division ratios: 1, 2, 4, 8, 16, 32, 64                                |
| Peripheral module clock C (PCLKC) | MOSC, SOSC, HOCO, MOCO, LOCO, PLL | Peripheral module (ADC12 conversion clock)   | Up to 60 MHz<br>Division ratios: 1, 2, 4, 8, 16, 32, 64                                |

| CAC HOCO clock (CACHCLK)          | HOCO                              | CAC  | 16, 18, 20 MHz   |
| CAC IWDTLOCO clock (CACILCLK)     | IWDTLOCO                          | CAC  | 15 kHz   |
| RTC clock (RTCSCLK, RTCLCLK)      | SOSC, LOCO                        | RTC  | 32.768 kHz   |
| IWDT clock (IWDTCLK)              | IWDTLOCO                          | IWDT   | 15 kHz   |
| SysTick timer clock (SYSTICCLK)   | LOCO                              | SysTick timer  | 32.768 kHz   |
| JTAG clock (JTAGTCK)              | TCK pin                           | JTAG   | Up to 25 MHz   |
| Clock and buzzer output (CLKOUT)  | MOSC, SOSC, LOCO, MOCO, HOCO      | CLKOUT pin   | Up to 24 MHz<br>Division ratios: 1, 2, 4, 8, 16, 32, 64, 128                           |
| Serial wire clock (SWCLK)         | SWCLK pin                         | OCD  | Up to 25 MHz   |
| Trace clock (TRCLK)               | MOSC, SOSC, HOCO, MOCO, LOCO, PLL | CPU-OCD  | Up to 60 MHz<br>Division ratios: 1, 2, 4   |
| TCLK pin output (TCLK)            | 1/2 TRCLK                         | TCLK pin   | Up to 30 MHz   |

Note: Restrictions on the clock frequency settings:  $ICLK \geq PCLKA \geq PCLKB$ ,  $PCLKD \geq PCLKA \geq PCLKB$

Restrictions on the clock frequency ratio (N: integer, and up to 64):

$ICLK:FCLK = N:1$ ,  $ICLK:BCLK = N:1$ ,  $ICLK:PCLKA = N:1$ ,  $ICLK:PCLKB = N:1$

$ICLK:PCLKC = N:1$  or  $1:N$ ,  $ICLK:PCLKD = N:1$  or  $1:N$

If the A/D converter is enabled, the clock frequency ratio is constrained as follows:

$PCLKB:PCLKC = 1:1$  or  $1:2$  or  $1:4$  or  $2:1$  or  $4:1$  or  $8:1$ .

- Note: Clocks have a permissible frequency range. See [Table 9.2](#).  
Flash memory and SRAM also have a permissible operating frequency range in each wait cycle setting. See [section 51, SRAM](#), and [section 53, Flash Memory](#).  
Those clock frequency ranges must be satisfied even when the HOCO has its maximum or minimum frequency. See [section 55, Electrical Characteristics](#).
- Note: If the PLL reference clock source is HOCO, the PLL multiplication setting must be set to 120 - 240 MHz in consideration of HOCO frequency (minimum/maximum).
- Note 1. The minimum FCLK frequency is 4 MHz in Programming/Erase (P/E) mode.
- Note 2. When using ETHERC, the PCLKA frequency is in the range  $12.5 \text{ MHz} \leq \text{PCLKA} \leq 120 \text{ MHz}$ .  
When using ETHERC and PCLKA = ICLK.

Figure 9.1 Clock generation circuit block diagram

**Table 9.3** Clock Generation Circuit I/O pins

| Pin name  | I/O    | Description   |
|-----------|--------|---|
| XTAL      | Output | Crystal resonator connections   |
| EXTAL     | Input  | The EXTAL pin can also be used to input an external clock. For details, see <a href="#">section 9.3.2, External Clock Input</a> . |
| XCIN      | Input  | 32.768-kHz crystal resonator connection   |
| XCOU      | Output |   |
| TCK/SWCLK | Input  | JTAG clock input  |
| EBCLK     | Output | External bus clock (EBCLK) supply for external devices  |
| SDCLK     | Output | SDRAM clock (SDCLK) supply for external devices   |
| CLKOUT    | Output | CLKOUT and BUZZER clock output  |

## 9.2 Register Descriptions

| b26 to b24 | ICK[2:0]  | System Clock (ICK) Select*1*2*3*4*5        | b26 b24<br>0 0 0: ×1/1<br>0 0 1: ×1/2<br>0 1 0: ×1/4<br>0 1 1: ×1/8<br>1 0 0: ×1/16<br>1 0 1: ×1/32<br>1 1 0: ×1/64.<br>Other settings are prohibited. | R/W |
| b27        | —         | Reserved                                   | This bit is read as 0. The write value should be 0.  | R/W |
| b30 to b28 | FCK[2:0]  | Flash Interface Clock (FCLK) Select*1      | b30 b28<br>0 0 0: ×1/1<br>0 0 1: ×1/2<br>0 1 0: ×1/4<br>0 1 1: ×1/8<br>1 0 0: ×1/16<br>1 0 1: ×1/32<br>1 1 0: ×1/64.<br>Other settings are prohibited. | R/W |
| b31        | —         | Reserved                                   | This bit is read as 0. The write value should be 0.  | R/W |

- Note 1. The following association is required between the frequencies of the system clock (ICK) and the flash interface clock (FCLK):  
 ICLK:FCLK = N:1 (N: integer)  
 If a setting is made where ICLK < FCLK, then that setting is ignored.
- Note 2. The following association is required between the frequencies of the system clock (ICK) and the external bus clock (BCLK):  
 ICLK:BCLK = N:1 (N: integer)  
 If a setting is made where ICLK < BCLK, then that setting is ignored.
- Note 3. The following association is required between the frequencies of the system clock (ICK) and the peripheral module clocks (PCLKA, PCLKB): ICLK:PCLKA = N:1, ICLK:PCLKB = N:1 (N: integer)  
 If a setting is made where ICLK < PCLKA or ICLK < PCLKB, then that setting is ignored.
- Note 4. The following association is required between the frequencies of the system clock (ICK) and the peripheral module clocks (PCLKC, PCLKD): ICLK:PCLKC, PCLKD = N:1 or 1:N (N: integer).
- Note 5. The frequency of the system clock (ICK) is limited to the flash wait cycle register (FLWT). See [section 53, Flash Memory](#).

The SCKDIVCR register selects the frequencies of the system clock (ICLK), the peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD), flash interface clock (FCLK), external bus clock (BCLK), and SDRAM clock (SDCLK).

When the PLL is selected as the clock source, set the following modules to the module-stop state before changing the value of SCKDIVCR:

- ETHERC
- EDMAC
- SCE7
- GPT32EH
- GPT32E.

In addition, when changing any value in SCKDIVCR from a lower division ratio to a higher division ratio, wait at least 750 ns before changing the value. When changing any value from a higher division ratio to a lower division ratio, wait at least 250 ns after changing the value, before starting subsequent processing.

The recommended method to measure the wait time is through software. Be sure to consider the worst-case conditions to ensure that the required wait time elapses.

Figure 9.2 shows an example flow for changing the value of SCKDIVCR.

#### **PCKD[2:0] bits (Peripheral Module Clock D (PCLKD) Select\*4)**

The PCKD[2:0] bits select the frequency for peripheral module clock D (PCLKD).

#### **PCKC[2:0] bits (Peripheral Module Clock C (PCLKC) Select\*4)**

The PCKC[2:0] bits select the frequency for peripheral module clock C (PCLKC).

#### **PCKB[2:0] bits (Peripheral Module Clock B (PCLKB) Select\*3)**

The PCKB[2:0] bits select the frequency for peripheral module clock B (PCLKB).

#### **PCKA[2:0] bits (Peripheral Module Clock A (PCLKA) Select\*3)**

The PCKA[2:0] bits select the frequency for peripheral module clock A (PCLKA).

#### **BCK[2:0] bits (External Bus Clock (BCLK) Select\*2)**

The BCK[2:0] bits select the frequency for the external bus clock (BCLK) and the SDRAM clock (SDCLK).

#### **ICK[2:0] bits (System Clock (ICLK) Select\*1\*2\*3\*4\*5)**

The ICK[2:0] bits select the frequency for the system clock for the CPU, DMAC, and DTC.

#### **FCK[2:0] bits (Flash Interface Clock (FCLK) Select\*1)**

The FCK[2:0] bits select the frequency for the flash interface clock (FCLK).

Figure 9.2 Example flow for changing the value of SCKDIVCR

## 9.2.2 System Clock Division Control Register 2 (SCKDIVCR2)

Address(es): [SYSTEM.SCKDIVCR2 4001 E024h](#)

| Bit      | Symbol                   | Bit name                | Description   | R/W |
|----------|--------------------------|-------------------------|---|-----|
| b3 to b0 | —                        | Reserved                | These bits are read as 0. The write value should be 0.                                | R/W |
| b6 to b4 | <a href="#">UCK[2:0]</a> | USB Clock (UCLK) Select | b6 b4<br>0 1 0: ×1/3<br>0 1 1: ×1/4<br>1 0 0: ×1/5.<br>Other settings are prohibited. | R/W |
| b7       | —                        | Reserved                | This bit is read as 0. The write value should be 0.                                   | R/W |

Note: Do not write to SCKDIVCR2 and SCKSCR at the same time by 32-bit access.

The SCKDIVCR2 register selects the frequency of the USB clock (UCLK).

### [UCK\[2:0\] bits \(USB Clock \(UCLK\) Select\)](#)

The UCK[2:0] bits select the frequency of the USB clock (UCLK). The duty ratio is 2:1 when ×1/3 is selected or 3:2 when ×1/5 is selected.

## 9.2.3 System Clock Source Control Register (SCKSCR)

Address(es): [SYSTEM.SCKSCR 4001 E026h](#)

| Bit      | Symbol                     | Bit name            | Description  | R/W |
|----------|----------------------------|---------------------|--|-----|
| b2 to b0 | <a href="#">CKSEL[2:0]</a> | Clock Source Select | b2 b0<br>0 0 0: HOCO<br>0 0 1: MOCO<br>0 1 0: LOCO<br>0 1 1: Main clock oscillator<br>1 0 0: Sub-clock oscillator<br>1 0 1: PLL.<br>Other settings are prohibited. | R/W |
| b7 to b3 | —                          | Reserved            | These bits are read as 0. The write value should be 0.   | R/W |

Note: Do not write to SCKDIVCR2 and SCKSCR at the same time by 32-bit access.

The SCKSCR register selects the clock source for the system clock.

When changing the value of SCKSCR to either select or deselect the PLL, set the following modules to the module-stop state before changing the SCKSCR value:

- ETHERC
- EDMAC
- SCE7
- GPT32EH

- GPT32E.

In addition, when changing the value of SCKSCR from the PLL to a different clock source, wait at least 750 ns before changing the value. When changing the value from a non-PLL clock source to the PLL, wait at least 250 ns after changing the value, before starting subsequent processing.

The recommended method to measure the wait time is through software. Be sure to consider the worst-case conditions to ensure that the required wait time elapses.

Figure 9.3 shows an example flow for changing the value of SCKSCR.

#### **CKSEL[2:0] bits (Clock Source Select)**

The CKSEL[2:0] bits select the clock source for the following modules:

- System clock (ICLK)
- Peripheral module clocks (PCLKA, PCLKB, PCLKC, and PCLKD)
- Flash interface clock (FCLK)
- External bus clock (BCLK)
- SDRAM clock (SDCLK)
- USBFS clock (UCLK).

The bits select from one of the following sources:

- Low-speed on-chip oscillator (LOCO)
- Middle-speed on-chip oscillator (MOCO)
- High-speed on-chip oscillator (HOCO)
- Main clock oscillator
- Sub-clock oscillator
- PLL circuit.

The clock sources should be switched when there are no occurring internal asynchronous interrupt.

Transitions to clock sources that are not in operation are prohibited.

Figure 9.3 Example flow for changing the value of SCKSCR

### 9.2.4 PLL Clock Control Register (PLLCCR)

Address(es): [SYSTEM.PLLCCR 4001 E028h](#)

| Bit       | Symbol                      | Bit name                                     | Description   | R/W |
|-----------|-----------------------------|--|---|-----|
| b1, b0    | <a href="#">PLIDIV[1:0]</a> | PLL Input Frequency Division Ratio Select*1  | b1 b0<br>0 0: × 1<br>0 1: × 1/2<br>1 0: × 1/3<br>1 1: Setting prohibited.   | R/W |
| b3, b2    | —                           | Reserved                                     | These bits are read as 0. The write value should be 0.  | R/W |
| b4        | <a href="#">PLSRCSEL</a>    | PLL Clock Source Select                      | 0: Main clock oscillator*3<br>1: HOCO.  | R/W |
| b7 to b5  | —                           | Reserved                                     | These bits are read as 0. The write value should be 0.  | R/W |
| b13 to b8 | <a href="#">PLLMUL[5:0]</a> | PLL Frequency Multiplication Factor Select*2 | b13 b8<br>0 1 0 0 1 1: × 10.0<br>0 1 0 1 0 0: × 10.5<br>0 1 0 1 0 1: × 11.0<br>...<br>0 1 1 1 0 0: × 14.5<br>0 1 1 1 0 1: × 15.0<br>0 1 1 1 1 0: × 15.5<br>...<br>1 1 1 0 1 0: × 29.5<br>1 1 1 0 1 1: × 30.0.<br>Other settings are prohibited. | R/W |
| b15, b14  | —                           | Reserved                                     | These bits are read as 0. The write value should be 0.  | R/W |

Note 1. PLIDIV[1:0] must be set so that the frequency of the PLL input signal is within the range listed in [Table 9.1](#).

Note 2. PLLMUL[5:0] must be set so that the frequency of the PLL output signal is within the range listed in [Table 9.1](#).

Note 3. PLSRCSEL must be set to 0 when using UCLK.

The PLLCCR register sets up the operation of the PLL circuit. Writing to the PLLCCR is prohibited when the PLL is operating (when the PLLCR.PLLSTP bit is 0).

#### [PLIDIV\[1:0\] bits \(PLL Input Frequency Division Ratio Select\\*1\)](#)

The PLIDIV[1:0] bits select the frequency division ratio for the PLL clock source.

#### [PLSRCSEL bit \(PLL Clock Source Select\)](#)

The PLSRCSEL bit selects the clock source for the PLL.

#### [PLLMUL\[5:0\] bits \(PLL Frequency Multiplication Factor Select\\*2\)](#)

The PLLMUL[5:0] bits select the frequency multiplication factor for the PLL circuit.

### 9.2.5 PLL Control Register (PLLCR)

Address(es): [SYSTEM.PLLCR 4001 E02Ah](#)

| Bit      | Symbol                 | Bit name         | Description  | R/W |
|----------|------------------------|------------------|--|-----|
| b0       | <a href="#">PLLSTP</a> | PLL Stop Control | 0: Operate the PLL<br>1: Stop the PLL.                 | R/W |
| b7 to b1 | —                      | Reserved         | These bits are read as 0. The write value should be 0. | R/W |

The PLLCR register controls the operation of the PLL circuit.

#### PLLSTP bit (PLL Stop Control)

The PLLSTP bit starts or stops the PLL circuit. When selecting the main clock oscillator as the clock source for the PLL in the PLLCCR.PLSRCSEL bit, you must also set the Main Clock Oscillator Wait Control Register (MOSCWTCR).

After setting the PLLSTP bit to 0, confirm that the OSCSF.PLLSF bit is set to 1 before using the PLL clock. A fixed stabilization wait is required after setting the PLL to start operation. A fixed wait for the oscillation to stop is also required.

The following restrictions apply when starting and stopping the PLL operation:

- After stopping the PLL, confirm that the OSCSF.PLLSF bit is 0 before restarting the PLL
- Confirm that the PLL operates and that the OSCSF.PLLSF bit is 1 before stopping the PLL
- Regardless of whether the PLL clock is selected as the system clock, after setting the PLL to start operation, confirm that the OSCSF.PLLSF is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the PLL, confirm that the OSCSF.PLLSF bit is set to 0 before executing the WFI instruction.

Writing 1 to PLLSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL).

Make sure the following conditions apply before writing 0 to PLLSTP:

- When PLL source clock = MOSC, OSCSF.MOSCSF bit = 1
- When PLL source clock = HOCO, OSCSF.HOCOSF bit = 1.

### 9.2.6 External Bus Clock Control Register (BCKCR)

Address(es): [SYSTEM.BCKCR 4001 E030h](#)

| Bit      | Symbol                  | Bit name                | Description  | R/W |
|----------|-------------------------|-------------------------|--|-----|
| b0       | <a href="#">BCLKDIV</a> | EBCLK Pin Output Select | 0: BCLK<br>1: BCLK/2.                                  | R/W |
| b7 to b1 | —                       | Reserved                | These bits are read as 0. The write value should be 0. | R/W |

The BCKCR register controls the external bus clock pin.

### BCLKDIV bit (EBCLK Pin Output Select)

The BCLKDIV bit selects the clock signal for output from the EBCLK pin. The signal can be selected from either the BCLK clock with the frequency selected in the BCK[2:0] bits in SCKDIVCR or the BCLK clock divided by 2.

## 9.2.7 Main Clock Oscillator Control Register (MOSCCR)

Address(es): SYSTEM.MOSCCR 4001 E032h

| Bit      | Symbol       | Bit name                   | Description  | R/W |
|----------|--------------|----------------------------|--|-----|
| b0       | <b>MOSTP</b> | Main Clock Oscillator Stop | 0: Operate the main clock oscillator*1<br>1: Stop the main clock oscillator. | R/W |
| b7 to b1 | —            | Reserved                   | These bits are read as 0. The write value should be 0.                       | R/W |

Note 1. The MOMCR register must be set before setting MOSTP to 0.

The MOSCCR register controls the main clock oscillator.

### MOSTP bit (Main Clock Oscillator Stop)

The MOSTP bit starts or stops the main clock oscillator. To start the main clock oscillator, set this bit to 0. When changing the value of the bit, only execute subsequent instructions after reading the bit to check that the value was updated. When using the main clock oscillator, you must set the Main Clock Oscillator Mode Oscillation Control Register (MOMCR) and the Main Clock Oscillator Wait Control Register (MOSCWTCR) before setting MOSTP to 0.

After setting the MOSTP bit to 0, confirm that the OSCSF.MOSCSF bit is set to 1 before using the main clock oscillator. A fixed stabilization wait is required after setting the main clock oscillator to start operation. A fixed wait for the oscillation to stop is also required.

The following restrictions apply when starting and stopping the main clock oscillator operation:

- After stopping the main clock oscillator, ensure that the OSCSF.MOSCSF bit is 0 before restarting the main clock oscillator
- Confirm that the main clock oscillator operates and that the OSCSF.MOSCSF bit is 1 before stopping the main clock oscillator
- Regardless of whether the main clock oscillator is selected as the system clock, confirm that the OSCSF.MOSCSF bit is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the main clock oscillator, confirm that the OSCSF.MOSCSF bit is set to 0 before executing the WFI instruction.

Writing 1 to MOSTP is prohibited under the following conditions:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC)
- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL)
- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and PLLCR.PLLSTP = 0 (PLL is operating).

### 9.2.8 Subclock Oscillator Control Register (SOSCCR)

Address(es): SYSTEM.SOSCCR 4001 E480h

| Bit      | Symbol | Bit name                  | Description  | R/W |
|----------|--------|---------------------------|--|-----|
| b0       | SOSTP  | Sub-Clock Oscillator Stop | 0: Operate the sub-clock oscillator* <sup>1</sup><br>1: Stop the sub-clock oscillator. | R/W |
| b7 to b1 | —      | Reserved                  | These bits are read as 0. The write value should be 0.                                 | R/W |

Note 1. The SOMCR register must be set before setting SOSTP to 0.

The SOSCCR register controls the sub-clock oscillator.

#### SOSTP bit (Sub-Clock Oscillator Stop)

The SOSTP bit starts or stops the sub-clock oscillator.

When changing the value of the SOSTP bit, only execute subsequent instructions after reading the bit and checking that its value is updated. Use the SOSTP bit when using the sub-clock oscillator as the source for a peripheral module, for example the RTC. When using the sub-clock oscillator, you must set the Sub-Clock Oscillator Mode Control Register (SOMCR) before setting SOSTP to 0.

After setting SOSTP to 0, only use the sub-clock oscillator after the sub-clock oscillation stabilization wait time (tSUBOSCOWT) elapses. A fixed stabilization wait is required after setting the sub-clock oscillator to start operation. A fixed wait for the oscillation to stop is also required.

The following restrictions apply when starting and stopping operation:

- After stopping the sub-clock oscillator, allow a stop interval of at least 5 SOSC clock cycles before restarting it
- Confirm that sub-clock oscillation is stable before stopping the sub-clock oscillator
- Regardless of whether the sub-clock oscillator is selected as the system clock, confirm that sub-clock oscillation is stable before executing a WFI instruction to place the MCU in Software Standby mode
- When a transition to Software Standby mode is to follow the setting to stop the sub-clock oscillator, wait for at least 3 SOSC clock cycles before executing the WFI instruction.

Writing 1 to SOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 100b (system clock source = SOSC).

### 9.2.9 Low-Speed On-Chip Oscillator Control Register (LOCOCR)

Address(es): SYSTEM.LOCOCR 4001 E490h

| Bit      | Symbol | Bit name  | Description  | R/W |
|----------|--------|-----------|--|-----|
| b0       | LCSTP  | LOCO Stop | 0: Operate the LOCO clock<br>1: Stop the LOCO clock.   | R/W |
| b7 to b1 | —      | Reserved  | These bits are read as 0. The write value should be 0. | R/W |

The LOCOCR register controls the LOCO clock.

### LCSTP bit (LOCO Stop)

The LCSTP bit starts or stops the LOCO clock.

After setting the LCSTP bit to 0 to start the LOCO clock, only use the clock after the LOCO clock oscillation stabilization wait time (tLOCOWT) elapses. A fixed stabilization wait is required after setting the LOCO clock to start operation. A fixed wait for the oscillation to stop is also required.

The following restrictions apply when starting and stopping operation:

- After stopping the LOCO clock, allow a stop interval of at least 5 LOCO clock cycles before restarting it
- Confirm that LOCO oscillation is stable before stopping the LOCO clock
- Regardless of whether the LOCO clock is selected as the system clock, confirm that LOCO oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the LOCO clock, wait for at least 3 LOCO clock cycles before executing the WFI instruction.

Writing 1 to LOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 010b (system clock source = LOCO).

Because the LOCO clock measures the wait time for other oscillators, it continues to oscillate while measuring this time, regardless of the setting in LOCOCR.LCSTP. As a result, the LOCO clock might be unintentionally supplied even when the LCSTP is set to stop.

### 9.2.10 High-Speed On-Chip Oscillator Control Register (HOCOOCR)

Address(es): SYSTEM.HOCOOCR 4001 E036h

| Bit      | Symbol | Bit name  | Description  | R/W |
|----------|--------|-----------|--|-----|
| b0       | HCSTP  | HOCO Stop | 0: Operate the HOCO clock*2<br>1: Stop the HOCO clock. | R/W |
| b7 to b1 | —      | Reserved  | These bits are read as 0. The write value should be 0. | R/W |

Note 1. The HCSTP bit value after a reset is 0 when the OFS1.HOCOEN bit is 0. It is 1 when the OFS1.HOCOEN bit is 1.

Note 2. If you use the HOCO (HCSTP = 0), you must set the OFS1.HOCOFRQ1 bit to an optimum value.

The HOCOOCR register controls the HOCO clock.

### HCSTP bit (HOCO Stop)

The HCSTP bit starts or stops the HOCO clock.

After setting the HCSTP bit to 0 to start the HOCO clock, confirm that the OSCSF.HOSCSF bit is set to 1 before using the clock. When OFS1.HOCOEN is set to 1, confirm that the OSCSF.HOCOSF is also set to 1 before using the HOCO clock. A fixed stabilization wait is required after setting the HOCO clock to start operation. A fixed wait for oscillation to stop is also required. For the HOCO to operate, the HOCO Wait Control Register (HOCOWTCR) must also be set.

The following restrictions apply when starting and stopping operation:

- After stopping the HOCO, confirm that the OSCSF.HOCOSF bit is 0 before restarting the HOCO clock
- Confirm that the HOCO clock operates and that the OSCSF.HOCOSF bit is 1 before stopping the HOCO clock
- Regardless of whether the HOCO clock is selected as the system clock, confirm that the OSCSF.HOSCSF bit is set

to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode

- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the HOCO clock, confirm that the OSCSF.MOSCSF bit is set to 0, before executing the WFI instruction.

Writing 1 to HCSTP is prohibited under the following conditions:

- SCKSCR.CKSEL[2:0] = 000b (system clock source = HOCO)
- PLLCCR.PLSRCSEL = 1 (PLL source clock = HOCO) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL)
- PLLCCR.PLSRCSEL = 1 (PLL source clock = HOCO) and PLLCR.PLLSTP = 0 (PLL is operating).

### 9.2.11 High-Speed On-Chip Oscillator Wait Control Register (HOCOWTCR)

Address(es): SYSTEM.HOCOWTCR 4001 E0A5h

| Bit      | Symbol    | Bit name               | Description  | R/W |
|----------|-----------|------------------------|--|-----|
| b2 to b0 | HSTS[2:0] | HOCO Wait Time Setting | Wait time (s) = (HSTS[2:0] setting +3) / f <sub>LOCO</sub> | R/W |
| b7 to b3 | —         | Reserved               | These bits are read as 0. The write value should be 0.     | R   |

#### HSTS[2:0] bits (HOCO Wait Time Setting)

The HOCOWTCR.HSTS[2:0] bits must be set to 110b, except when using SC10 in Snooze mode. When using SC10 in Snooze mode, the HOCOWTCR.HSTS[2:0] bits must be set to 010b.

### 9.2.12 Middle-Speed On-Chip Oscillator Control Register (MOCOOCR)

Address(es): SYSTEM.MOCOOCR 4001 E038h

| Bit      | Symbol | Bit name  | Description  | R/W |
|----------|--------|-----------|--|-----|
| b0       | MCSTP  | MOCO Stop | 0: Operate the MOCO clock<br>1: Stop the MOCO clock.   | R/W |
| b7 to b1 | —      | Reserved  | These bits are read as 0. The write value should be 0. | R/W |

The MOCOOCR register controls the MOCO clock.

#### MCSTP bit (MOCO Stop)

The MCSTP bit starts or stops the MOCO clock.

After setting the MCSTP bit to 0 to start the MOCO clock, only use the clock after the MOCO clock oscillation stabilization time (t<sub>MOCOWT</sub>) elapses. A fixed stabilization wait is required after setting the MOCO clock to start operation. A fixed wait for oscillation to stop is also required.

The following restrictions apply when starting and stopping operation:

- After stopping the MOCO clock, allow a stop interval of at least 5 MOCO clock cycles before restarting it
- Confirm that MOCO oscillation is stable before stopping the MOCO clock

- Regardless of whether the MOCO clock is selected as the system clock, confirm that MOCO oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the MOCO clock, wait for at least 3 MOCO clock cycles before executing the WFI instruction.

Writing 1 to MCSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 001b (system clock source = MOCO).

Writing 1 to the MCSTP bit (stopping the MOCO) is prohibited if oscillation stop detection is enabled in the Oscillation Stop Detection Control Register (OSTDCR.OSTDE).

### 9.2.13 FLL Control Register 1 (FLLCR1)

Address(es): SYSTEM.FLLCR1 4001 E039h

| Bit      | Symbol | Bit name   | Description  | R/W |
|----------|--------|------------|--|-----|
| b0       | FLEEN  | FLL Enable | 0: FLL function is disabled<br>1: FLL function is enabled. | R/W |
| b7 to b1 | —      | Reserved   | These bits are read as 0. The write value should be 0.     | R/W |

Note: HOCO must be stopped (HOCOCCR.HCSTP = 1) before FLLCR1.FLEEN is changed.  
SOSC must operate with stabilization while FLL is enabled (FLLCR1.FLEEN = 1).

The FLLCR1 register controls the FLL function of the HOCO. The FLL function uses SOSC when available for better accuracy in HOCO.

#### FLEEN bit (FLL Enable)

The FLEEN bit enables or disables the FLL function of the HOCO.

If the FLL function is enabled, the frequency accuracy is guaranteed after the FLL is stabilized. The FLL stabilization can be checked by the frequency measurement of the Clock Frequency Accuracy Measurement Circuit (CAC) after the HOCO is stabilized.

The FLL function must be disabled before the transition to Software Standby mode. Therefore, this bit must be set to 0 before the transition to Software Standby mode.

Figure 9.4 and Figure 9.5 show an example flow of the FLL setting in each case.

**Figure 9.4 FLL setting flow after reset release/Deep Software Standby cancellation**

**Figure 9.5 Software Standby transition/cancellation flow**

### 9.2.14 FLL Control Register 2 (FLLCR2)

Address(es): SYSTEM.FLLCR2.4001 E03Ah

| Bit        | Symbol        | Bit name                   | Description   | R/W |
|------------|---------------|----------------------------|---|-----|
| b10 to b0  | FLLCNTL[10:0] | FLL Multiplication Control | <ul style="list-style-type: none"> <li>• When OFS1.HOCOFRQ0[1:0] is 00b (16 MHz), these bits must be set to 1E9h</li> <li>• When OFS1.HOCOFRQ0[1:0] is 01b (18 MHz), these bits must be set to 226h</li> <li>• When OFS1.HOCOFRQ0[1:0] is 10b (20 MHz), these bits must be set to 263h.</li> </ul> Other settings are prohibited. | R/W |
| b15 to b11 | —             | Reserved                   | These bits are read as 0. The write value should be 0.  | R/W |

The FLLCR2 register controls the FLL function of the HOCO.

#### FLLCNTL[10:0] bits (FLL Multiplication Control)

The FLLCNTL[10:0] bits select the multiplication ratio of the FLL reference clock.

These bits must be set before FLL is enabled (FLLCR1.FLLEN = 1).

### 9.2.15 Oscillation Stabilization Flag Register (OSCSF)

Address(es): SYSTEM.OSCSF 4001 E03Ch

| Bit    | Symbol | Bit name                                  | Description   | R/W |
|--------|--------|---|---|-----|
| b0     | HOCOSF | HOCO Clock Oscillation Stabilization Flag | 0: The HOCO clock is stopped or is not yet stable<br>1: The HOCO clock is stable, and is available for use as the system clock.                                     | R   |
| b2, b1 | —      | Reserved                                  | These bits are read as 0.   | R   |
| b3     | MOSCSF | Main Clock Oscillation Stabilization Flag | 0: The main clock oscillator is stopped (MOSTP = 1) or is not yet stable*2<br>1: The main clock oscillator is stable, and is available for use as the system clock. | R   |
| b4     | —      | Reserved                                  | This bit is read as 0.  | R   |
| b5     | PLLSF  | PLL Clock Oscillation Stabilization Flag  | 0: The PLL clock is stopped or is not yet stable<br>1: The PLL clock is stable, and is available for use as the system clock.                                       | R   |
| b7, b6 | —      | Reserved                                  | These bits are read as 0  | R   |

Note 1. The value after reset depends on the OFS1.HOCOEN setting.  
 When OFS1.HOCOEN = 1, the value after reset of HOCOSF is 0.  
 When OFS1.HOCOEN = 0, the HOCOSF value becomes 0 after reset is released, and HOCOSF is set to 1 after the HOCO oscillation stabilization wait time elapses.

Note 2. An appropriate value is set in the Wait Control Register for the given oscillator. If the wait time value is not sufficient, the oscillation stabilization flag is set to 1 and supply of the clock signal to the internal circuits starts before oscillation is stable.

The OSCSF register contains flags to indicate the operating status of the counters in the oscillation stabilization wait circuits for the individual oscillators. After oscillation starts, these counters measure the wait time until each oscillator output clock is supplied to the internal circuits. An overflow of a counter indicates that the clock supply is stable and available for the associated circuit.

### HOCOSF flag (HOCO Clock Oscillation Stabilization Flag)

The HOCOSF flag indicates the operating status of the counter that measures the wait time for the high-speed clock oscillator (HOCO). When OFS1.HOCOEN is set to 1, confirm that the OSCSF.HOCOSF is also set to 1 before using the HOCO clock.

[Setting condition]

- After the HOCO clock stops and the HOCOCR.HCSTP bit is set to 0, supply of the MCU clock starts after the number of LOCO cycles associated with the setting of the HOCOWTCR register elapses.

[Clearing condition]

- When the HOCO clock is operating and then is deactivated because the HOCOCR.HCSTP bit is set to 1.

### MOSCSF flag (Main Clock Oscillation Stabilization Flag)

The MOSCSF flag indicates the operating status of the counter that measures the wait time for the main clock oscillator.

[Setting condition]

- After the main clock oscillator stops and the MOSCCR.MOSTP bit is set to 0, supply of the MCU clock starts after the number of LOCO cycles associated with the setting of the MOSCWTCR register elapses.

[Clearing condition]

- When the main clock oscillator is operating and then is deactivated because the MOSCCR.MOSTP bit is set to 1.

### PLLSF flag (PLL Clock Oscillation Stabilization Flag)

The PLLSF flag indicates the operating status of the counter that measures the wait time for the PLL.

[Setting condition]

- After the PLL stops and the PLLCR.PLLSTP bit is set to 0, supply of the MCU clock starts after 31 LOCO cycles. If oscillation by the PLL clock source selected in the PLLCCR.PLSRCSEL bit is not stable when the PLLSTP bit is set to 0, counting of the LOCO cycles continues after the PLL clock source oscillation is stabilized. Wait time is calculated as:

$$1 \text{ cycle} = \text{LOCO} (32.768 \text{ kHz}) \times 8 (3.81 \mu\text{s typical}).$$

[Clearing condition]

- When the PLL is operating and then is deactivated because the PLLCCR.PLLSTP bit is set to 1.

## 9.2.16 Oscillation Stop Detection Control Register (OSTDCR)

Address(es): SYSTEM.OSTDCR 4001 E040h

| Bit      | Symbol | Bit name                                    | Description   | R/W |
|----------|--------|---|---|-----|
| b0       | OSTDIE | Oscillation Stop Detection Interrupt Enable | 0: Disable oscillation stop detection interrupt (do not notify the POEG)<br>1: Enable oscillation stop detection interrupt (notify the POEG). | R/W |
| b6 to b1 | —      | Reserved                                    | These bits are read as 0. The write value should be 0.  | R/W |

| Bit | Symbol | Bit name                                   | Description  | R/W |
|-----|--------|--|--|-----|
| b7  | OSTDE  | Oscillation Stop Detection Function Enable | 0: Disable oscillation stop detection function<br>1: Enable oscillation stop detection function. | R/W |

The OSTDCR register controls the oscillation stop detection function.

#### OSTDIE bit (Oscillation Stop Detection Interrupt Enable)

The OSTDIE bit enables the oscillation stop detection function interrupt. It also controls whether oscillation stop detection is reported to the POEG.

If the Oscillation Stop Detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) requires clearing, set the OSTDIE bit to 0 before clearing OSTDF. Wait for at least 2 PCLKB cycles before setting the OSTDIE bit to 1. A longer PCLKB wait time might be required, depending on the number of cycles required to read a given I/O register.

#### OSTDE bit (Oscillation Stop Detection Function Enable)

The OSTDE bit enables the oscillation stop detection function.

When OSTDE is 1 (enabled), the MOCO stop bit (MOCO.CMSTP) is set to 0 and MOCO operation starts. The MOCO clock cannot be stopped while the oscillation stop detection function is enabled. Writing 1 to the MOCO.CMSTP bit (MOCO stopped) is invalid.

When the Oscillation Stop Detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) is 1 (main clock oscillation stop detected), writing 0 to the OSTDE bit is invalid.

The OSTDE bit must be set to 0 before transitioning to Software Standby or Deep Software Standby mode. To transition to either of these modes, first set the OSTDE bit to 0, then execute the WFI instruction.

The following restrictions apply when using the oscillation stop detection function:

- In low-speed mode, selecting division by 1, 2, 4, 8 for ICLK, FCLK, BCLK, PCLKA, PCLKB, PCLKC, PCLKD is prohibited.

### 9.2.17 Oscillation Stop Detection Status Register (OSTDSR)

Address(es): SYSTEM.OSTDSR 4001 E041h

|                    | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0    |
|--------------------|----|----|----|----|----|----|----|-------|
|                    | —  | —  | —  | —  | —  | —  | —  | OSTDF |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0     |

| Bit      | Symbol | Bit name                        | Description   | R/W                 |
|----------|--------|---------------------------------|---|---------------------|
| b0       | OSTDF  | Oscillation Stop Detection Flag | 0: Main clock oscillation stop not detected<br>1: Main clock oscillation stop detected. | R/(W) <sup>*1</sup> |
| b7 to b1 | —      | Reserved                        | These bits are read as 0. The write value should be 0.                                  | R                   |

Note 1. This bit can only be set to 0.

The OSTDSR register indicates the stop detection status of the main clock oscillator.

#### OSTDF flag (Oscillation Stop Detection Flag)

The OSTDF flag indicates the main clock oscillator status. When OSTDF is 1, it indicates that the main clock oscillation stop was detected. After this stop is detected, the OSTDF flag is not set to 0 even when oscillation is restarted. The OSTDF flag is set to 0 by writing 0 after reading it as 1.

At least 3 ICLK cycles of wait time are required between writing 0 to OSTDF and reading OSTDF as 0. If the OSTDF flag is set to 0 when the main clock oscillation is stopped, the OSTDF flag becomes 0 then returns to 1.

OSTDSR.OSTDF cannot be set to 0 under the following conditions:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC)
- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL).

The OSTDF flag must be set to 0 after switching the clock source to sources other than the main clock oscillator and PLL.

[Setting condition]

- The main clock oscillator is stopped when OSTDCR.OSTDE = 1 (oscillation stop detection function enabled).

[Clearing condition]

- 1 is read and then 0 is written when the SCKSCR.CKSEL[2:0] bits are neither 011b (system clock = MOSC) nor 101b (system clock = PLL), and the PLLCCR.PLSRCSEL bit is not 0 (PLL source clock = MOSC).

### 9.2.18 Main Clock Oscillator Wait Control Register (MOSCWTCR)

Address(es): SYSTEM.MOSCWTCR 4001 E0A2h

#### MSTS[3:0] bits (Main Clock Oscillator Wait Time Setting)

Set the MSTS[3:0] bits to select the oscillation stabilization wait time for the main clock oscillator.

Specify a time period longer than or equal to the stabilization time recommended by the oscillator manufacturer. When the main clock is input externally, set these bits to 0001b, because the oscillation stabilization time is not required.

The wait time set in the MSTS[3:0] bits is counted using:

$$1 \text{ cycle } (\mu\text{s}) = 1 / (f\_LOCO [\text{MHz}] \times 8) = 1 / (0.032768 \times 8) = 3.81 (\mu\text{s}).$$

The LOCO clock automatically oscillates when necessary, regardless of the value of the LOCOCR.LOSTP bit. After the specified wait time elapses, supply of the main clock oscillator starts internally in the MCU, and the OSCSF.MOSCSF flag is set to 1. If the specified wait time is short, supply of the main clock oscillator starts before oscillation of the clock becomes stable.

Only rewrite the MOSCWTCR register when the MOSCCR.MOSTP bit is 1 and the OSCSF.MOSCSF flag is 0. Do not rewrite this register under any other conditions.

### 9.2.19 Main Clock Oscillator Mode Oscillation Control Register (MOMCR)

Address(es): SYSTEM.MOMCR 4001 E413h

| b3 to b0 | —           | Reserved   | These bits are read as 0. The write value should be 0.                             | R/W |
| b5, b4   | MODRV0[1:0] | Main Clock Oscillator Drive Capability 0 Switching           | b5 b4<br>0 0: 20 to 24 MHz<br>0 1: 16 to 20 MHz<br>1 0: 8 to 16 MHz<br>1 1: 8 MHz. | R/W |
| b6       | MOSEL       | Main Clock Oscillator Switching                              | 0: Resonator<br>1: External clock input.   | R/W |
| b7       | AUTODRVEN   | Main Clock Oscillator Drive Capability Auto Switching Enable | 0: Disable<br>1: Enable.   | R/W |

Note: The EXTAL/XTAL pin is also used as a port. In the initial state, the port function is selected.

Note: The MOSTP bit must be 1 (MOSC = stopped) before changing this register.

#### MODRV0[1:0] bits (Main Clock Oscillator Drive Capability 0 Switching)

The MODRV0[1:0] bits switch the drive capability of the main clock oscillator.

#### MOSEL bit (Main Clock Oscillator Switching)

The MOSEL bit switches the source for the main clock oscillator.

#### AUTODRVEN bit (Main Clock Oscillator Drive Capability Auto Switching Enable)

The AUTODRVEN bit controls the drive capability auto switching of the main clock oscillator.

When AUTODRVEN = 1, after the time set in the MSTS bits in the Main Clock Oscillator Wait Control Register elapses, the effective main clock oscillator drive capability is automatically set to the lowest, regardless of the MOMCR.MODRV0[1:0] setting. The main clock oscillator restarts oscillation with MOMCR.MODRV0 specified drive capability after the oscillation stops by the MOSCCR.MOSTP setting or by entering Software Standby mode.

### 9.2.20 Subclock Oscillator Mode Control Register (SOMCR)

Address(es): SYSTEM.SOMCR 4001 E481h

x: Undefined

| Bit      | Symbol | Bit name  | Description  | R/W |
|----------|--------|---|--|-----|
| b0       | —      | Reserved  | This bit is read as 0. The write value should be 0.    | R/W |
| b1       | SODRV1 | Sub-Clock Oscillator Drive Capability Switching | 0: Standard<br>1: Low.                                 | R/W |
| b7 to b2 | —      | Reserved  | These bits are read as 0. The write value should be 0. | R/W |

Note: The SOSCCR.SOSTP bit must be 1 (SOSC = stopped) before changing this register.

#### SODRV1 bit (Sub-Clock Oscillator Drive Capability Switching)

The SODRV1 bit switches the drive capability of the sub-clock oscillator. This bit is undefined at the first power on, but the value after reset of SOSCCR.SOSTP is 0 (SOSC = operating). Set up the SOSC as follows at the first power on:

1. Set the SOSCCR.SOSTP bit to 1 (SOSC = stopped).
2. Set the SODRV1 bit to the correct value for the current capacitor.
3. Set the SOSCCR.SOSTP bit to 0 (SOSC = operating).

### 9.2.21 Clock Out Control Register (CKOCR)

Address(es): SYSTEM.CKOCR 4001 E03Eh

| b7       | CKOEN       | Clock Out Enable                          | 0: Disable clock out<br>1: Enable clock out.  | R/W |    |  |   |   |         |   |   |         |   |   |         |   |   |         |   |   |          |     |   |        |   |   |        |   |   |          |     |

**CKOSEL[2:0] bits (Clock Out Source Select)**

The CKOSEL[2:0] bits specify the HOCO, MOCO, LOCO, MOSC, or SOSC clock as the source of the clock to be output from the CLKOUT pin. When changing the CLKOUT source clock, set the CKOEN bit to 0.

**CKODIV[2:0] bits (Clock Out Input Frequency Division Select)**

The CKODIV[2:0] bits specify the clock division ratio. Set the CKOEN bit to 0 when changing the division ratio. The division ratio of the output clock frequency must be set to a value no higher than the characteristics of the CLKOUT pin output frequency. For details on the characteristics of the CLKOUT pin, see [section 55, Electrical Characteristics](#).

**CKOEN bit (Clock Out Enable)**

The CKOEN bit enables output from the CLKOUT pin. When CKOEN is set to 1, the selected clock is output. When CKOEN is set to 0, low is output. When changing this bit, confirm that the clock out source clock selected in the CKOSEL[2:0] bits is stable. Otherwise, a glitch might be generated in the output.

The CKOEN bit must be cleared before entering Software Standby or Deep Software Standby mode if the selected clock out source clock is stopped in that mode.

**9.2.22 External Bus Clock Output Control Register (EBCKOCR)**

Address(es): [SYSTEM.EBCKOCR 4001 E052h](#)

### 9.2.24 LOCO User Trimming Control Register (LOCOUTCR)

Address(es): [SYSTEM.LOCOUTCR 4001 E492h](#)

| Bit      | Symbol                        | Bit name           | Description  | R/W |
|----------|-------------------------------|--------------------|--|-----|
| b7 to b0 | <a href="#">LOCOUTRM[7:0]</a> | LOCO User Trimming | b7 b0<br>1 0 0 0 0 0 0 0: -128<br>1 0 0 0 0 0 0 1: -127<br>1 0 0 0 0 0 1 0: -126<br>...<br>1 1 1 1 1 1 1 1: -1<br>0 0 0 0 0 0 0 0: Center Code<br>0 0 0 0 0 0 0 1: +1<br>...<br>0 1 1 1 1 1 0 1: +125<br>0 1 1 1 1 1 1 0: +126<br>0 1 1 1 1 1 1 1: +127. | R/W |

These bits are added to the original LOCO trimming bits.

Note: MCU operation is not guaranteed when LOCOUTCR is set to a value that causes the LOCO frequency to be outside of the specification range.

Note: When LOCOUTCR is changed, the time that the frequency is stabilized corresponds to the frequency stabilization time at the start of the MCU operation.

### 9.2.25 MOCO User Trimming Control Register (MOCOUTCR)

Address(es): [SYSTEM.MOCOUTCR 4001 E061h](#)

| Bit      | Symbol                        | Bit name           | Description  | R/W |
|----------|-------------------------------|--------------------|--|-----|
| b7 to b0 | <a href="#">MOCOUTRM[7:0]</a> | MOCO User Trimming | b7 b0<br>1 0 0 0 0 0 0 0: -128<br>1 0 0 0 0 0 0 1: -127<br>1 0 0 0 0 0 1 0: -126<br>...<br>1 1 1 1 1 1 1 1: -1<br>0 0 0 0 0 0 0 0: Center Code<br>0 0 0 0 0 0 0 1: +1<br>...<br>0 1 1 1 1 1 0 1: +125<br>0 1 1 1 1 1 1 0: +126<br>0 1 1 1 1 1 1 1: +127. | R/W |

These bits are added to the original MOCO trimming bits.

Note: MCU operation is not guaranteed when MOCOUTCR is set to a value that causes the MOCO frequency to be outside of the specification range.

Note: When MOCOUTCR is changed, the time that the frequency is stabilized corresponds to the frequency stabilization time at the start of the MCU operation.

### 9.2.26 HOCO User Trimming Control Register (HOCOUTCR)

Address(es): [SYSTEM.HOCOUTCR 4001 E062h](#)

| Bit      | Symbol                        | Bit name           | Description   | R/W |
|----------|-------------------------------|--------------------|---|-----|
| b7 to b0 | <a href="#">HOCOUTRM[7:0]</a> | HOCO User Trimming | b7                      b0<br>1 0 0 0 0 0 0 0: -128<br>1 0 0 0 0 0 0 1: -127<br>1 0 0 0 0 0 1 0: -126<br>...<br>1 1 1 1 1 1 1 1: -1<br>0 0 0 0 0 0 0 0: Center Code<br>0 0 0 0 0 0 0 1: +1<br>...<br>0 1 1 1 1 1 0 1: +125<br>0 1 1 1 1 1 1 0: +126<br>0 1 1 1 1 1 1 1: +127. | R/W |

These bits are added to the original HOCO trimming bits.

Note: MCU operation is not guaranteed when HOCOUTCR is set to a value that causes the HOCO frequency to be outside of the specification range.

Note: When HOCOUTCR is changed, the time that the frequency is stabilized corresponds to the frequency stabilization time at the start of the MCU operation.

Note: These bits must be 00000000b when FLL is enabled (FLLCR1.FLLEN = 1).

### 9.2.27 Trace Clock Control Register (TRCKCR)

Address(es): [SYSTEM.TRCKCR 4001 E03Fh](#)

| Bit      | Symbol                    | Bit name                               | Description  | R/W |

| b3 to b0 | <a href="#">TRCK[3:0]</a> | Trace Clock Operating Frequency Select | b3                      b0<br>0 0 0 0: /1<br>0 0 0 1: /2 (value after reset)<br>0 0 1 0: /4.<br>Other settings are prohibited. | R/W |
| b6 to b4 | —                         | Reserved                               | These bits are read as 0. The write value should be 0.   | R/W |
| b7       | <a href="#">TRCKEN</a>    | Trace Clock Operation Enable           | 0: Disable operation<br>1: Enable operation.   | R/W |

The Trace Clock Control Register controls the switching of the trace clock. Before changing the TRCLK frequency, set the TRCKEN bit to 0. The TRCKCR register is initialized by all reset sources.

## 9.3 Main Clock Oscillator

Use one of the following ways to supply the clock signal to the main clock oscillator:

- Connect an oscillator
- Connect the input of an external clock signal.

### 9.3.1 Connecting the Crystal Resonator

Figure 9.6 shows an example connection to a crystal resonator. A damping resistor ( $R_d$ ) can be added, if required. Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the manufacturer recommends using an external feedback resistor ( $R_f$ ), insert an  $R_f$  between EXTAL and XTAL by following the instructions.

When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the main clock oscillator as described in Table 9.1.

Figure 9.6 Example of crystal resonator connection

Figure 9.7 shows an equivalent circuit of the crystal resonator.

Figure 9.7 Equivalent circuit of the crystal resonator

### 9.3.2 External Clock Input

Figure 9.8 shows an example connection to an external clock input. To operate the oscillator with an external clock signal, set the MOMCR.MOSEL bit to 1. The XTAL pin is the function that is set in PFS.P213PFS.

Figure 9.8 Equivalent circuit for external clock

### 9.3.3 Notes on External Clock Input

The frequency of the external clock input can only be changed when the main clock oscillator is stopped. Do not change the frequency of the external clock input when the Main Clock Oscillator Stop bit (MOSCCR.MOSTP) is 0.

### 9.4 Sub-Clock Oscillator

The only way of supplying a clock signal to the sub-clock oscillator is by connecting a crystal oscillator.

#### 9.4.1 Connecting a 32.768-kHz Crystal Resonator

To supply a clock to the sub-clock oscillator, connect a 32.768-kHz crystal resonator as shown in Figure 9.9. A damping resistor ( $R_d$ ) can be added, if required. Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the manufacturer recommends using an external feedback resistor ( $R_f$ ), insert an  $R_f$  between XCIN and XCOU**T** by following the instructions.

When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the sub-clock oscillator as described in Table 9.1.

**Figure 9.9** Connection example of 32.768-kHz crystal resonator

Figure 9.10 shows an equivalent circuit for the 32.768-kHz crystal resonator.

**Figure 9.10** Equivalent circuit for the 32.768-kHz crystal resonator

#### 9.4.2 Handling of Pins When the Sub-Clock Oscillator Is Not Used

When the sub-clock oscillator is not in use, connect the XCIN pin to VSS through a resistor (to pull VSS down) and leave the XCOU**T** pin open as shown in Figure 9.11. In addition, if an oscillator is not connected, set the Sub-clock Oscillator Stop bit (SOSCCR.SOSTP) to 1 to stop the oscillator.

**Figure 9.11** Pin handling when the sub-clock oscillator is not used

## 9.5 Oscillation Stop Detection Function

### 9.5.1 Oscillation Stop Detection and Operation after Detection

The oscillation stop detection function detects the main clock oscillator stop. When an oscillation stop is detected, the system clock switches as follows:

- If an oscillation stop is detected with `SCKSCR.CKSEL[2:0] = 011b` (system clock source = MOSC), the system clock source switches to the MOCO clock.
- If an oscillation stop is detected with `PLLCCR.PLSRCSEL = 0` (PLL source clock = MOSC) and `SCKSCR.CKSEL[2:0] = 101b` (system clock source = PLL), the PLL clock remains as the system clock source. The frequency becomes a free-running oscillation frequency, and the setting of `SCKSCR.CKSEL[2:0]` bits does not change.

An oscillation stop detection interrupt request can be generated when an oscillation stop is detected. In addition, the General PWM Timer (GPT) output can be forced to a high-impedance state on detection.

The main clock oscillation stop is detected when the input clock remains at 0 or 1 for a certain period, for example, when a malfunction occurs in the main clock oscillator. See [section 55, Electrical Characteristics](#).

Switching between the main clock oscillator and the MOCO clock or between the PLL clock and the PLL free-running clock is controlled by the Oscillation Stop Detection flag (`OSTDSR.OSTDF`).

The `OSTDF` flag controls the switched clock as follows:

- When `SCKSCR.CKSEL[2:0] = 011b` (system clock source = MOSC):
  - When `OSTDF` changes from 0 to 1, the clock source switches to the MOCO clock.
  - When `OSTDF` changes from 1 to 0, the clock source switches to MOSC again.
- When `PLLCCR.PLSRCSEL = 0` (PLL source clock = MOSC) and `SCKSCR.CKSEL[2:0] = 101b` (system clock source = PLL)
  - When `OSTDF` changes from 0 to 1, the clock source switches to the PLL free-running oscillation clock.
  - When `OSTDF` changes from 1 to 0, the clock source switches to PLL again.

To switch the clock source to the main clock oscillator or PLL clock again after oscillation stop detection, set the `CKSEL[2:0]` bits to a clock source other than the main clock oscillator or PLL clock, and clear the `OSTDF` flag to 0. Also, check that the `OSTDF` flag is not 1, and then set the `CKSEL[2:0]` bits to the main clock oscillator or PLL clock after the specified oscillation stabilization time elapses.

After a reset release, the main clock oscillator is stopped and the oscillation stop detection function is disabled. To enable the oscillation stop detection function, activate the main clock oscillator and write 1 to the Oscillation Stop Detection Function Enable bit (`OSTDCR.OSTDE`) after the specified oscillation stabilization time elapses.

The oscillation stop detection function detects when the main clock oscillator is stopped by an external cause. This means that the oscillation stop detection function must be disabled before the main clock oscillator is stopped by software or before entering Software Standby or Deep Software Standby mode.

The oscillation stop detection function switches the following clocks to the MOCO clock (when the system clock is MOSC) or the PLL free-running clock (when the system clock is PLL):

- All clocks that can be selected as the MOSC clock or PLL except `CLKOUT`
- The system clock (`ICLK`) frequency during MOCO operation (when the system clock is MOSC) or PLL free-running operation (when the system clock is PLL) is specified in the MOCO oscillation frequency and the division ratio set in the System Clock Select bits (`SCKDIVCR.ICK[2:0]`).

**Figure 9.12** Flow of recovery on detection of oscillator stop

### 9.5.2 Oscillation Stop Detection Interrupts

An oscillation stop detection interrupt (MOSC\_STOP) is generated when the Oscillation Stop Detection flag (OSTDSR.OSTDF) is 1 and the Oscillation Stop Detection Interrupt Enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE) is 1 (enabled). The Port Output Enable for GPT (POEG) is notified of the main clock oscillator stop. On receiving the notification, the POEG sets the Oscillation Stop Detection Flag in the POEG Group n Setting Register (POEGGn.OSTPF) to 1 (n = A, B).

After the oscillation stop is detected, wait at least 10 PCLKB cycles before writing to the POEGGn.OSTPF flag. When the OSTDSR.OSTDF flag requires clearing, do so after clearing the Oscillation Stop Detection Interrupt Enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE). Wait for at least 2 PCLKB clock cycles before setting the OSTDCR.OSTDIE bit to 1 again. Depending on the number of cycles required to read a given I/O register, a longer PCLKB wait time might be required.

The oscillation stop detection interrupt is a non-maskable interrupt. Because non-maskable interrupts are disabled in the initial state after a reset release, enable non-maskable interrupts through software before using oscillation stop detection interrupts. For details, see [section 14, Interrupt Controller Unit \(ICU\)](#).

## 9.6 PLL Circuit

The PLL circuit provides a function for multiplying the frequency from the oscillator.

## 9.7 Internal Clock

Clock sources for the internal clock signals include:

- Main clock oscillator
- Sub-clock oscillator
- HOCO clock
- MOCO clock
- LOCO clock
- PLL clock
- Dedicated clock for the IWDT
- External clock for JTAG.

The following internal clocks are produced from these sources:

- Operating clock for the CPU, DMAC, DTC, flash memory, and SRAM — system clock (ICLK)
- Operating clocks for peripheral modules — PCLKA, PCLKB, PCLKC, and PCLKD
- Operating clock for the flash interface — FCLK
- Clock for the external bus controller and external pin output — EBCLK
- Clock for the external bus controller and external pin output for the SDRAM — SDCLK
- Operating clock for the USBFS — UCLK
- Operating clock for the CAN — CANMCLK
- Operating clock for the CAC — CACCLK
- Operating clock for the RTC LOCO clock — RTCLCLK
- Operating clock for the RTC sub-clock — RTCSCCLK
- Operating clock for the IWDT — IWDTCLK
- Operating clock for the AGT LOCO clock — AGTLCLK
- Operating clock for the AGT sub-clock — AGTSCLK
- Operating clock for the SysTick timer — SYSTICCLK
- Clock for external pin output — CLKOUT
- Operating clock for the JTAG — JTAGTCK.

For details on the registers used to set the frequencies of the internal clocks, see [section 9.7.1, System Clock \(ICLK\)](#) to [section 9.7.14, JTAG Clock \(JTAGTCK\)](#). If the value of any of these bits is changed, subsequent operation is at the frequency determined by the new value.

### 9.7.1 System Clock (ICLK)

The system clock, ICLK, is the operating clock for the CPU, DMAC, DTC, flash memory, and SRAM. Specify the frequency in the following bits:

- ICK[2:0] bits in SCKDIVCR

- CKSEL[2:0] bits in SCKSCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ[1:0] bits in OFS1.

When the ICLK clock source is switched, the duration of the ICLK clock cycle becomes longer during the clock source transition period. See Figure 9.13 and Figure 9.14.

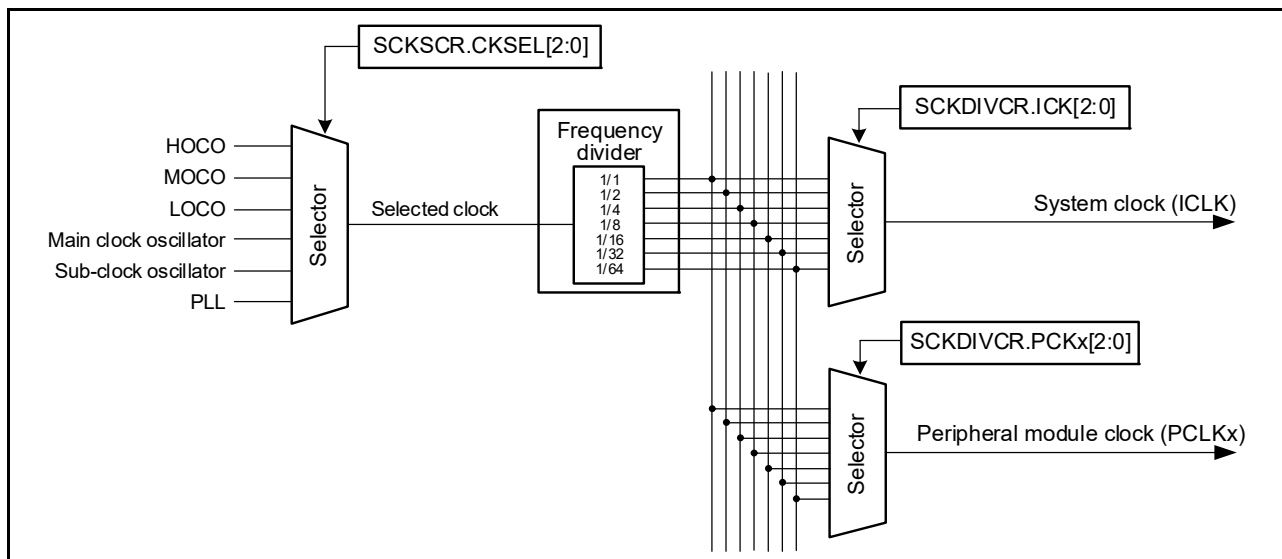

Figure 9.13 Clock source selector block diagram

Figure 9.14 Clock source switching timing diagram

### 9.7.2 Peripheral Module Clock (PCLKA, PCLKB, PCLKC, PCLKD)

The peripheral module clocks, PCLKA, PCLKB, PCLKC, and PCLKD, are the operating clocks for the peripheral modules. Specify the frequency in the following bits:

- PCKA[2:0], PCKB[2:0], PCKC[2:0], and PCKD[2:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ[1:0] bits in OFS1.

When the clock source of the peripheral module clock is switched, the duration of the peripheral module clock cycle becomes longer during the clock source transition period. See [Figure 9.13](#) and [Figure 9.14](#).

### 9.7.3 Flash Interface Clock (FCLK)

The flash interface clock, FCLK, is the operating clock for the flash memory interface. In addition to reading from the data flash, it is used for the programming and erasure of the code flash and data flash. Specify the frequency in the following bits:

- FCK[2:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ[1:0] bits in OFS1.

### 9.7.4 External Bus Clock (BCLK)

The external bus clock, BCLK, is an operating clock for the external bus controller. It is also output externally from the EBCLK pin for the external connection bus. To output BCLK from the EBCLK pin, set the EBCKOCR.EBCKOEN bit to 1 and set the PmnPFS.PSEL[4:0] bits to 01011b. Only change the PmnPFS.PSEL[4:0] bits to 01011b when the EBCKOCR.EBCKOEN bit is 0. When the BCKCR.BCLKDIV bit is 1, the BCLK clock divided by 2 is output from the EBCLK pin. Specify the frequency in the following bits:

- BCK[2:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ[1:0] bits in OFS1.

Do not set BCLK to a frequency higher than that of the system clock (ICLK).

### 9.7.5 SDRAM Clock (SDCLK)

The SDRAM clock, SDCLK, is an operating clock for the external bus controller. It is output externally from the SDCLK pin for the SDRAM that is connected to the external bus. To output SDCLK on the SDCLK pin, set the SDCKOCR.SDCKOEN bit to 1 and set the PmnPFS.PSEL[4:0] bits to 01011b (enabling SDCLK output). Only change the value in the PmnPFS.PSEL[4:0] bits when the SDCKOCR.SDCKOEN bit is 0. Specify the frequency in the following bits:

- SCKDIVCR.BCK[2:0], SCKSCR.CKSEL[2:0], PLLMUL[5:0], and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ[1:0] bits in OFS1.

Do not set SDCLK to a frequency higher than that of the system clock (ICLK).

### 9.7.6 USB Clock (UCLK)

The USB clock, UCLK, is the operating clock for the USBFS module. A 48-MHz clock must be supplied to the USBFS module. When the module is used, the UCLK clock must be specified as 48 MHz. Specify the frequency in the following bits:

- UCK[2:0] bits in SCKDIVCR2
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR.

### 9.7.7 CAN Clock (CANMCLK)

The CAN clock, CANMCLK, is the operating clock for the CAN module. CANMCLK is generated by the main clock oscillator.

### 9.7.8 CAC Clock (CACCLK)

The CAC clock, CACCLK, is the operating clock for the CAC. CACCLK is generated by the following oscillators:

- Main clock oscillator
- Sub-clock oscillator
- High-speed clock oscillator (HOCO)
- Middle-speed clock oscillator (MOCO)
- Low-speed on-chip oscillator (LOCO)
- IWDT-dedicated on-chip oscillator.

### 9.7.9 RTC-Dedicated Clock (RTCSCLK, RTCLCLK)

The RTC-dedicated clocks, RTCSCLK and RTCLCLK, are the operating clocks for the RTC. RTCSCLK is generated by the sub-clock oscillator and RTCLCLK by the LOCO clock.

### 9.7.10 IWDT-Dedicated Clock (IWDTCLK)

The IWDT-dedicated clock, IWDTCLK, is the operating clock for the IWDT. IWDTCLK is internally generated by the IWDT-dedicated on-chip oscillator.

### 9.7.11 AGT-Dedicated Clock (AGTSCLK, AGTLCLK)

The AGT-dedicated clocks, AGTSCLK and AGTLCLK, are the operating clocks for the AGT. AGTSCLK is generated by the sub-clock oscillator and AGTLCLK is generated by the LOCO clock.

### 9.7.12 SysTick Timer-Dedicated Clock (SYSTICCLK)

The SysTick timer-dedicated clock, SYSTICCLK, is the operating clock for the SYSTICCLK. SYSTICCLK is generated by the LOCO clock.

### 9.7.13 Clock/Buzzer Output Clock (CLKOUT)

The CLKOUT is output externally from the CLKOUT pin for the clock or buzzer output. CLKOUT is output to the CLKOUT pin when CKOCR.CKOEN is set to 1. Only change the value in the CKODIV[2:0] or CKOSEL[2:0] bits in CKOCR when the CKOCR.CKOEN bit is 0. Specify the frequency in the following bits:

- CKODIV[2:0] or CKOSEL[2:0] bits in CKOCR
- HOCOFREQ[1:0] bits in OFS1.

### 9.7.14 JTAG Clock (JTAGTCK)

The JTAG-dedicated clock, JTAGTCK, is the operating clock for the JTAG. JTAGTCK is generated by the external clock for JTAG (TCK).

## 9.8 Usage Notes

### 9.8.1 Notes on Clock Generation Circuit

The frequencies of the system clock (ICLK), peripheral module clock (PCLKA to PCLKD), flash interface clock (FCLK), external bus clock (BCLK), and SDRAM clock (SDCLK) supplied to each module change according to the settings in SCKDIVCR. Each frequency must meet the following conditions:

- Each frequency must be selected within the operation-guaranteed range of the clock cycle time (tcyc) specified in the AC electrical characteristics, see [section 55, Electrical Characteristics](#)

- The frequencies must not exceed the ranges listed in [Table 9.2](#)
- The peripheral modules operate on PCLKB and PCLKA. As a result, the operating speed of modules such as the timer and SCI is different before and after the frequency is changed.
- The system clock (ICLK), peripheral module clock (PCLKA to PCLKD), flash interface clock (FCLK), and external bus clock (BCLK) must be set as shown in [Table 9.2](#).

Do not change the clock frequency during external bus access. Additionally, when access by the external bus starts after a change to the clock frequency, only access by the bus after confirming that the change to the frequencies is complete. To ensure correct processing after the clock frequency changes, first write to the relevant Clock Control Register to change the frequency, then read the value from the register, and finally perform the subsequent processing.

### 9.8.2 Notes on the Resonator

Because the resonator characteristics relate closely to your board design, adequate evaluation is required before use. See the resonator connection example in [Figure 9.9](#). The circuit constants for the resonator depend on the resonator to be used and the stray capacitance of the mounting circuit. Always consult the resonator manufacturer when determining the circuit constants. The voltage to be applied between the resonator pins must be within the absolute maximum rating.

### 9.8.3 Notes on Board Design

When using a crystal resonator, place the resonator and its load capacitors as close to the XTAL and EXTAL pins as possible. Route other signal lines away from the oscillation circuit, as shown in [Figure 9.15](#), to prevent electromagnetic induction from interfering with correct oscillation.

**Figure 9.15** Notes on board design for oscillation circuit (applies to the sub-clock oscillator for the main clock oscillator)

### 9.8.4 Notes on the Resonator Connect Pin

When the main clock oscillator is not used, the EXTAL and XTAL pins can be used as general ports P212 and P213. When these pins are used as general ports, the main clock oscillator must be stopped (MOSCCR.MOSTP must be set to 1).

### 9.8.5 Notes on Using Sub-Clock Oscillator for LGA Packages

The output of the P212 (EXTAL), P213 (XTAL), and P704 pins may affect the oscillation by the sub-clock oscillator.

If the sub-clock oscillator is used, implement the board design so as not to affect the oscillation. Renesas strongly recommends setting the DSCR[1:0] bits to 00b or 01b when using P212 (EXTAL), P213 (XTAL), and P704 as output pins and using the sub-clock oscillator.

In addition, when using the sub-clock oscillator in middle drive capability (SOMCR.SODRV1 = 1), Renesas recommends not to use two or more ports of P212 (EXTAL), P213 (XTAL), and P704 simultaneously as output pins to avoid affecting the oscillation.

### 9.8.6 Notes on the Main Clock Oscillator Drive Capability Auto Switching Function

The drive capability auto switching function lowers the main clock oscillator drive capability automatically after the main clock oscillator starts and suppresses the EMI associated with the main clock oscillator.

To enable drive capability auto switching, set MOMCR.AUTODRVEN to 1 when the main clock oscillator is stopped (MOSCCR.MOSTP = 1). Regardless of the MOMCR.AUTODRVEN setting, the Drive Capability Switching register (MOMCR.MODRV0[1:0]) must be set properly according to the selected oscillator. Next, enable the main clock oscillator (MOSCCR.MOSTP = 0). After the Oscillation Stabilization flag (OSCSF.MOSCSF) becomes 1, the main clock can be used.

EMI suppression is gained in return for an extension in the oscillation stabilization wait time. For more information, see [section 9.2.18, Main Clock Oscillator Wait Control Register \(MOSCWTCR\)](#).

## 10. Clock Frequency Accuracy Measurement Circuit (CAC)

### 10.1 Overview

The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock selected as a measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range.

The reference clock can be provided externally through an I/O port pin or internally from various on-chip oscillators. Interrupt signals can be generated when the clock does not match or measurement ends. This feature is useful in implementing a fail-safe mechanism for home and industrial automation applications.

[Table 10.1](#) lists the CAC specifications, [Figure 10.1](#) shows a block diagram, and [Table 10.2](#) describes the I/O pin.

**Table 10.1 CAC specifications**

| Parameter                    | Specifications   |
|------------------------------|--|
| Measurement target clocks    | Frequency can be measured for: <ul style="list-style-type: none"> <li>• Main clock oscillator</li> <li>• Sub-clock oscillator</li> <li>• HOCO clock</li> <li>• MOCO clock</li> <li>• LOCO clock</li> <li>• IWDTCLK clock</li> <li>• Peripheral module clock B (PCLKB).</li> </ul>  |
| Measurement reference clocks | Frequency can be referenced to: <ul style="list-style-type: none"> <li>• External clock input to the CACREF pin</li> <li>• Main clock oscillator</li> <li>• Sub-clock oscillator</li> <li>• HOCO clock</li> <li>• MOCO clock</li> <li>• LOCO clock</li> <li>• IWDTCLK clock</li> <li>• Peripheral module clock B (PCLKB).</li> </ul> |

| CACREF   | Input | Measurement reference clock input pin |

## 10.2 Register Descriptions

### 10.2.1 CAC Control Register 0 (CACR0)

Address(es): [CAC.CACR0 4004 4600h](#)

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol | Bit name                           | Description  | R/W |
|----------|--------|------------------------------------|--|-----|
| b0       | CFME   | Clock Frequency Measurement Enable | 0: Disable<br>1: Enable.                               | R/W |
| b7 to b1 | —      | Reserved                           | These bits are read as 0. The write value should be 0. | R/W |

#### CFME bit (Clock Frequency Measurement Enable)

The CFME bit enables the clock frequency measurement. Read the CFME bit to confirm that the bit value has changed. Additional write accesses are ignored before the change is complete.

## 10.2.2 CAC Control Register 1 (CACR1)

Address(es): CAC.CACR1 4004 4601h

| Bit      | Symbol     | Bit name   | Description  | R/W |
|----------|------------|--|--|-----|
| b0       | CACREFE    | CACREF Pin Input Enable                                  | 0: Disable<br>1: Enable.   | R/W |
| b3 to b1 | FMCS[2:0]  | Measurement Target Clock Select                          | b3 b1<br>0 0 0: Main clock oscillator<br>0 0 1: Sub-clock oscillator<br>0 1 0: HOCO clock<br>0 1 1: MOCO clock<br>1 0 0: LOCO clock<br>1 0 1: Peripheral module clock (PCLKB)<br>1 1 0: IWDCLK clock<br>1 1 1: Setting prohibited. | R/W |
| b5, b4   | TCSS[1:0]  | Measurement Target Clock Frequency Division Ratio Select | b5 b4<br>0 0: No division<br>0 1: ×1/4 clock<br>1 0: ×1/8 clock<br>1 1: ×1/32 clock.   | R/W |
| b7, b6   | EDGES[1:0] | Valid Edge Select  | b7 b6<br>0 0: Rising edge<br>0 1: Falling edge<br>1 0: Both rising and falling edges<br>1 1: Setting prohibited.   | R/W |

Note: Set the CACR1 register when the CACR0.CFME bit is 0.

### CACREFE bit (CACREF Pin Input Enable)

The CACREFE bit enables the CACREF pin input.

### FMCS[2:0] bits (Measurement Target Clock Select)

The FMCS[2:0] bits select the clock for which the frequency is to be measured.

### TCSS[1:0] bits (Measurement Target Clock Frequency Division Ratio Select)

The TCSS[1:0] bits select the division ratio of the measurement target clock.

### EDGES[1:0] bits (Valid Edge Select)

The EDGES[1:0] bits select the valid edge for the reference signal.

### 10.2.3 CAC Control Register 2 (CACR2)

Address(es): CAC.CACR2 4004 4602h

| Bit      | Symbol    | Bit name  | Description  | R/W |    |  |   |   |                           |   |   |  |   |   |   |   |   |   |     |   |               |   |   |                                    |   |   |                   |   |   |                        |     |

| 1        | 1         | Use sampling clock for the digital filter as the frequency measuring clock divided by 16. |  |     |    |  |   |   |                           |   |   |  |   |   |   |   |   |   |     |   |               |   |   |                                    |   |   |                   |   |   |                        |     |

Note: Set the CACR2 register when the CACR0.CFME bit is 0.

#### RPS bit (Reference Signal Select)

The RPS bit selects whether to use the CACREF pin input or an internal clock (internally generated signal) as the reference signal.

#### RSCS[2:0] bits (Measurement Reference Clock Select)

The RSCS[2:0] bits select the clock source for generating the measurement reference clock.

#### RCDS[1:0] bits (Measurement Reference Clock Frequency Division Ratio Select)

The RCDS[1:0] bits select the frequency division ratio of the measurement reference clock when an internal reference clock is selected (RPS = 1). When RPS = 0 (CACREF pin is used as the reference clock source), the reference clock is not divided.

#### DFS[1:0] bits (Digital Filter Select)

The setting of the DFS[1:0] bits enables or disables the digital filter and selects its sampling clock.

### 10.2.4 CAC Interrupt Control Register (CAICR)

Address(es): CAC.CAICR 4004 4603h

|    |            |             |             |    |       |            |            |
|----|------------|-------------|-------------|----|-------|------------|------------|

| —  | OVFFC<br>L | MENDF<br>CL | FERRF<br>CL | —  | OVFIE | MENDI<br>E | FERRI<br>E |
| 0  | 0          | 0           | 0           | 0  | 0     | 0          | 0          |

Value after reset:

| Bit | Symbol  | Bit name                                 | Description  | R/W |
|-----|---------|--|--|-----|
| b0  | FERRIE  | Frequency Error Interrupt Request Enable | 0: Disable<br>1: Enable.   | R/W |
| b1  | MENDIE  | Measurement End Interrupt Request Enable | 0: Disable<br>1: Enable.   | R/W |
| b2  | OVFIE   | Overflow Interrupt Request Enable        | 0: Disable<br>1: Enable.   | R/W |
| b3  | —       | Reserved                                 | This bit is read as 0. The write value should be 0.                                    | R/W |
| b4  | FERRFCL | FERRF Clear                              | When 1 is written to this bit, the CASTR.FERRF flag is cleared. This bit is read as 0. | R/W |
| b5  | MENDFCL | MENDF Clear                              | When 1 is written to this bit, the CASTR.MENDF flag is cleared. This bit is read as 0. | R/W |
| b6  | OVFFCL  | OVFF Clear                               | When 1 is written to this bit, the CASTR.OVFF flag is cleared. This bit is read as 0.  | R/W |
| b7  | —       | Reserved                                 | This bit is read as 0. The write value should be 0.                                    | R/W |

#### FERRIE bit (Frequency Error Interrupt Request Enable)

The FERRIE bit enables the frequency error interrupt request.

#### MENDIE bit (Measurement End Interrupt Request Enable)

The MENDIE bit enables the measurement end interrupt request.

#### OVFIE bit (Overflow Interrupt Request Enable)

The OVFIE bit enables the overflow interrupt request.

#### FERRFCL bit (FERRF Clear)

Setting the FERRFCL bit to 1 clears the CASTR.FERRF flag.

#### MENDFCL bit (MENDF Clear)

Setting the MENDFCL bit to 1 clears the CASTR.MENDF flag.

#### OVFFCL bit (OVFF Clear)

Setting the OVFFCL bit to 1 clears the CASTR.OVFF flag.

### 10.2.5 CAC Status Register (CASTR)

Address(es): CAC.CASTR 4004 4604h

| Bit      | Symbol | Bit name             | Description   | R/W |
|----------|--------|----------------------|---|-----|
| b0       | FERRF  | Frequency Error Flag | 0: Clock frequency is within the allowable range<br>1: Clock frequency has deviated beyond the allowable range (frequency error). | R   |
| b1       | MENDF  | Measurement End Flag | 0: Measurement is in progress<br>1: Measurement ended.  | R   |
| b2       | OVFF   | Overflow Flag        | 0: Counter has not overflowed<br>1: Counter overflowed.   | R   |
| b7 to b3 | —      | Reserved             | These bits are read as 0  | R   |

#### FERRF flag (Frequency Error Flag)

The FERRF flag indicates a deviation of the clock frequency from the set value (frequency error).

[Setting condition]

- The clock frequency is outside the allowable range defined in the CAULVR and CALLVR registers.

[Clearing condition]

- 1 is written to the FERRFCL bit.

#### MENDF flag (Measurement End Flag)

The MENDF flag indicates the end of measurement.

[Setting condition]

- Measurement completes.

[Clearing condition]

- 1 is written to the MENDFCL bit.

#### OVFF flag (Overflow Flag)

The OVFF flag indicates that the counter overflowed.

[Setting condition]

- The counter overflows.

[Clearing condition]

- 1 is written to the OVFFCL bit.

### 10.2.6 CAC Upper-Limit Value Setting Register (CAULVR)

Address(es): CAC.CAULVR 4004 4606h

CAULVR is a 16-bit read/write register that specifies the upper value of the allowable range. When the counter value exceeds the value specified in this register, a frequency error is detected. Write to this register when the CACR0.CFME bit is 0.

The counter value stored in CACNTBR can vary depending on the difference between the phases of the digital filter and edge-detection circuit, and the signal on the CACREF pin. Ensure that this setting allows an adequate margin.

### 10.2.7 CAC Lower-Limit Value Setting Register (CALLVR)

Address(es): CAC.CALLVR 4004 4608h

CALLVR is a 16-bit read/write register that specifies the lower value of the allowable range. When the counter value falls below the value specified in this register, a frequency error is detected. Write to this register when the CACR0.CFME bit is 0.

The counter value stored in CACNTBR can vary depending on the difference between the phases of the digital filter and edge-detection circuit, and the signal on the CACREF pin. Ensure that this setting allows an adequate margin.

### 10.2.8 CAC Counter Buffer Register (CACNTBR)

Address(es): CAC.CACNTBR 4004 460Ah

CACNTBR is a 16-bit read-only register that stores the measurement result.

## 10.3 Operation

### 10.3.1 Measuring Clock Frequency

The CAC measures the clock frequency using the CACREF pin input or the internal clock as a reference. [Figure 10.2](#) shows an operating example of the CAC.

**Figure 10.2 CAC operating example**

The events in [Figure 10.2](#) are:

1. Before writing 1 to CACR0.CFME, set CACR1 and CACR2 to define the measurement target clock and measurement reference clock. Writing 1 to the CACR0.CFME bit enables clock frequency measurement.
2. The timer starts counting up if the valid edge selected in the CACR1.EDGES[1:0] bits is input from the measurement reference clock. In [Figure 10.2](#), the valid edge is a rising edge (CACR1.EDGES[1:0] = 00b).
3. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If both  $CACNTBR \leq CAULVR$  and  $CACNTBR \geq CALLVR$  are true, only the MENDF flag in CASTER is set to 1, because the clock frequency is correct. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
4. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If  $CACNTBR > CAULVR$ , the FERRF flag in CASTER is set to 1, because the clock frequency is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CASTER is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
5. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If  $CACNTBR < CALLVR$ , the FERRF flag in CASTER is set to 1, because the clock frequency is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CASTER is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
6. When the CFME bit in CACR0 is 1, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR every time a valid edge is input. Writing 0 to the CFME bit in CACR0 clears the counter and stops up-counting.

### 10.3.2 Digital Filtering of Signals on CACREF Pin

The CACREF pin has a digital filter, and levels on the CACREF pin are transmitted to the internal circuitry after three consecutive matches in the selected sampling interval. The same level continues to be transmitted internally until the level on the pin has three consecutive matches again. Enabling or disabling of the digital filter and its sampling clock are selectable.

The counter value transferred to CACNTBR might be in error by up to 1 cycle of the sampling clock because of the difference between the phases of the digital filter and the signal input to the CACREF pin. When a frequency dividing clock is selected as a count source clock, the counter value error is obtained using the following formula:

$$\text{Counter value error} = (1 \text{ cycle of the count source clock}) / (1 \text{ cycle of the sampling clock})$$

## 10.4 Interrupt Requests

The CAC generates three types of interrupt requests:

- Frequency error interrupt
- Measurement end interrupt
- Overflow interrupt.

When an interrupt source is generated, the associated status flag becomes 1. [Table 10.3](#) provides information on the CAC interrupt requests.

**Table 10.3 CAC interrupt requests**

| Interrupt request         | Interrupt enable bit | Status flag | Interrupt sources  |
|---------------------------|----------------------|-------------|--|
| Frequency error interrupt | CAICR.FERRIE         | CASTR.FERRF | The result of comparing CACNTBR with CAULVR and CALLVR is either CACNTBR > CAULVR or CACNTBR < CALLVR  |
| Measurement end interrupt | CAICR.MENDIE         | CASTR.MENDF | <ul style="list-style-type: none"> <li>• Valid edge is input from the CACREF pin or internal clock</li> <li>• Measurement end interrupt does not occur at the first valid edge after writing 1 to the CACR0.CFME bit.</li> </ul> |
| Overflow interrupt        | CAICR.OVFIE          | CASTR.OVFF  | The counter overflows  |

## 10.5 Usage Notes

### 10.5.1 Settings for the Module-Stop Function

The Module Stop Control Register C (MSTPCRC) can enable or disable CAC operation. The CAC module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 11, Low Power Modes](#).

## 11. Low Power Modes

### 11.1 Overview

The MCU provides several functions for reducing power consumption, such as setting clock dividers, controlling EBCLK output, controlling SDCLK output, stopping modules, selecting power control mode in normal mode, and transitioning to low power modes.

[Table 11.1](#) lists the specifications of the low power mode functions. [Table 11.2](#) lists the conditions to transition to low power modes, the states of the CPU and peripheral modules, and the method for canceling each mode. After a reset, the MCU enters the program execution state, but only the DMAC, DTC, and SRAM operate.

**Table 11.1 Specifications of the low power mode functions**

| Parameter   | Specifications   |
|---|--|
| Reducing power consumption by switching clock signals | Frequency division ratio independently selectable for the system clock (ICLK), peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD), external bus clock (BCLK), and flash interface clock (FCLK)*1  |
| EBCLK output control                                  | Selectable to BCLK output or high-level output   |
| SDCLK output control                                  | Selectable to SDCLK output or high-level output  |
| Module-stop state                                     | Peripheral module functions can be stopped independently   |
| Low power modes                                       | <ul style="list-style-type: none"> <li>• Sleep mode</li> <li>• Software Standby mode</li> <li>• Snooze mode</li> <li>• Deep Software Standby mode.</li> </ul>  |
| Power control modes                                   | Power consumption can be reduced in Normal, Sleep, and Snooze modes by selecting an appropriate operating power control mode according to the operating frequency and voltage.<br>Available operating power control modes: <ul style="list-style-type: none"> <li>• High-speed mode</li> <li>• Low-speed mode</li> <li>• Subosc-speed mode.</li> </ul> |

Note 1. For details, see [section 9, Clock Generation Circuit](#).

**Table 11.2 Operating conditions of each low power mode (1 of 3)**

| Event Link Controller (ELC)                         | Selectable      | Stop (Retained)   | Selectable*10   | Stop (Undefined)  |
| High-Speed Analog Comparator (ACMPHS0)              | Selectable      | Selectable*12   | Selectable. VCOUT function only.*12   | Stop (Undefined)  |
| High-Speed Analog Comparator (ACMPHSn, n = 1 to 5)  | Selectable      | Selectable*11   | Selectable. VCOUT function only.*11   | Stop (Undefined)  |

**Table 11.2 Operating conditions of each low power mode (3 of 3)**

| Parameter                                | Sleep mode | Software Standby mode | Snooze mode*1        | Deep Software Standby mode |
|--|------------|-----------------------|----------------------|----------------------------|
| IRQn (n = 0 to 15) pin interrupt         | Selectable | Selectable            | Selectable           | Stop (Undefined)           |
| NMI, IRQn-DS (n = 0 to 13) pin interrupt | Selectable | Selectable            | Selectable           | Selectable                 |
| Key Interrupt Function (KINT)            | Selectable | Selectable            | Selectable           | Stop (Undefined)           |
| Low voltage detection (LVD)              | Selectable | Selectable            | Selectable           | Selectable*15              |
| Power-on reset circuit                   | Operating  | Operating             | Operating            | Operating*16               |
| Other peripheral modules                 | Selectable | Stop (Retained)       | Operation prohibited | Stop (Undefined)           |
| I/O ports                                | Operating  | Retained*17           | Operating            | Retained*17                |

Note: Selectable means that operating or not operating can be selected in the control registers.

Stop (Retained) means that the contents of the internal registers are retained but the operations are suspended.

Operation prohibited means that the function must be stopped before entering Software Standby mode.

Stop (Undefined) means that the contents of the internal registers are undefined and power to the internal circuit is cut off.

- Note 1. All modules whose module-stop bits are 0 start as soon as PCLKs are supplied after entering Snooze mode. To avoid an increase in power consumption in Snooze mode, set the module-stop bit of modules that are not required in Snooze mode to 1 before entering Software Standby mode.
- Note 2. When using SCIO in Snooze mode, the MOSCCR.MOSTP and PLLCR.PLLSTP bits must be 1.
- Note 3. If the DPSBYCR.DEEPCUT[1:0] bits are 00b, the oscillator status is the same as before entering Deep Software Standby mode. When the DPSBYCR.DEEPCUT[1:0] bits are not 00b, the oscillator stops when the MCU enters Deep Software Standby mode.
- Note 4. Stopped when the clock output source select bits (CKOCR.CKOSEL[2:0]) are set to a value other than 010b (LOCO) and 100b (SOSC).
- Note 5. If the DPSBYCR.DEEPCUT[1:0] bits are 00b, data in the Standby SRAM is retained in Deep Software Standby mode. When the DPSBYCR.DEEPCUT[1:0] bits are not 00b, data in the Standby SRAM is undefined in Deep Software Standby mode.
- Note 6. If the DPSBYCR.DEEPCUT[1:0] bits are 00b, the values of the USB resume detection circuit registers are retained and detection of USB resumption is enabled, and the values of other registers are undefined in Deep Software Standby mode. When the DPSBYCR.DEEPCUT[1:0] bits are not 00b, the values of all registers are undefined in Deep Software Standby mode.
- Note 7. In IWDT-dedicated on-chip oscillator and IWDT, operating or stopping is selected by setting the IWDT Stop Control bit (IWDTSTPCTL) in Option Function Select register 0 (OFS0) in IWDT auto start mode. In WDT, operating or stopping is selected by setting the WDT Stop Control bit (WDTSTPCTL) in Option Function Select Register 0 (OFS0) in WDT auto start mode.
- Note 8. When the RCR4.RCKSEL bit set to 1 (LOCO), the DPSBYCR.DEEPCUT[1:0] bits must set to 00b before entering Deep Software Standby mode.
- Note 9. AGT0 operation is possible when 100b (AGTLCLK) or 110b (AGTSCLK) is selected in the AGT0.AGTMR1.TCK[2:0] bits. AGT1 operation is possible when 100b (AGTLCLK), 110b (AGTSCLK) or 101 (underflow event signal from AGT0) is selected in the AGT1.AGTMR1.TCK[2:0] bits. When 100b (AGTLCLK) is selected in AGTn.AGTMR1.TCK[2:0] bits (n = 0, 1), the DPSBYCR.DEEPCUT[1:0] bits must set to 00b before entering Deep Software Standby mode.
- Note 10. Event lists the restrictions described in [section 11.10.13, ELC Events in Snooze Mode](#).
- Note 11. Only VCOOUT function is permitted. The VCOOUT pin operates when ACMPHS uses no digital filter. For details on digital filter, see [section 48, High-Speed Analog Comparator \(ACMPHS\)](#).
- Note 12. When CMPCTL0.CSTEN bit is 1, canceling Software Standby Mode or entering Snooze mode by the comparator detection is available.
- Note 13. IIC0 wakeup interrupt is available.
- Note 14. Serial communication mode of SCIO is asynchronous mode.
- Note 15. When using LVD in Deep Software Standby mode, DPSBYCR.DEEPCUT[1:0] bits must be 00b or 01b before entering Deep Software Standby mode.
- Note 16. When the MCU enters Deep Software Standby mode with the DPSBYCR.DEEPCUT[1:0] bits set to 11b, the LVD circuit stops and the low power function of the power-on reset circuit is enabled.
- Note 17. For the address bus and bus control signals (For SRAM: [CS0 to CS7, RD, WR0 to WR1, WR, BC0 to BC1, and ALE], and for SDRAM: [SDCS, RAS, CAS and WE]), keeping the output state or changing to the high-impedance state can be selected in the SBYCR.OPE bit.
- Note 18. When using the 12-bit A/D Converter in Snooze mode, the ADCMPCR.CMPAE and ADCMPCR.CMPBE bits must be 1.

**Table 11.3 Interrupt sources for canceling Snooze, Software Standby, and Deep Software Standby modes**

| Interrupt source     | Name                       | Software Standby mode | Snooze mode          | Deep Software Standby mode |
|----------------------|----------------------------|-----------------------|----------------------|----------------------------|
| NMI                  |                            | Yes                   | Yes                  | Yes                        |
| Port                 | PORT_IRQn (n = 0 to 15)    | Yes                   | Yes                  | No                         |
|                      | PORT_IRQn-DS (n = 0 to 13) | Yes                   | Yes                  | Yes                        |
| LVD                  | LVD_LVD1                   | Yes                   | Yes                  | Yes                        |
|                      | LVD_LVD2                   | Yes                   | Yes                  | Yes                        |
| IWDT                 | IWDT_NMIUNDF               | Yes                   | Yes                  | No                         |
| USBFS                | USBFS_USBR                 | Yes                   | Yes                  | Yes                        |
| RTC                  | RTC_ALM                    | Yes                   | Yes                  | Yes                        |
|                      | RTC_PRD                    | Yes                   | Yes                  | Yes                        |
| KINT                 | KEY_INTKR                  | Yes                   | Yes                  | No                         |
| AGT1                 | AGT1_AGTI                  | Yes                   | Yes*3                | Yes                        |
|                      | AGT1_AGTCMAI               | Yes                   | Yes                  | No                         |
|                      | AGT1_AGTCMBI               | Yes                   | Yes                  | No                         |
| ACMPHS               | ACMP_HS0                   | Yes                   | Yes                  | No                         |
| IIC0                 | IIC0_WUI                   | Yes                   | Yes                  | No                         |
| ADC12n<br>(n = 0, 1) | ADC12n_WCMPPM              | No                    | Yes with SELSR0*1,*3 | No                         |
|                      | ADC12n_WCMPUM              | No                    | Yes with SELSR0*1,*3 | No                         |

| CTSU                 | CTSU_CTSUFN                | No                    | Yes with SELSR0*1    | No                         |

Note 1. To use the interrupt request as a trigger for exiting Snooze mode, the request must be selected in SELSR0. See [section 14, Interrupt Controller Unit \(ICU\)](#). When a trigger selected in SELSR0 occurs after executing a WFI instruction and during the transition from Normal to Software Standby mode, whether the request can be accepted depends on the timing of the occurrence.

Note 2. Only one of either SCI0\_AM or SCI0\_RXI\_OR\_ERI can be set.

Note 3. The event that is enabled by the SNZEDCR register must not be used.

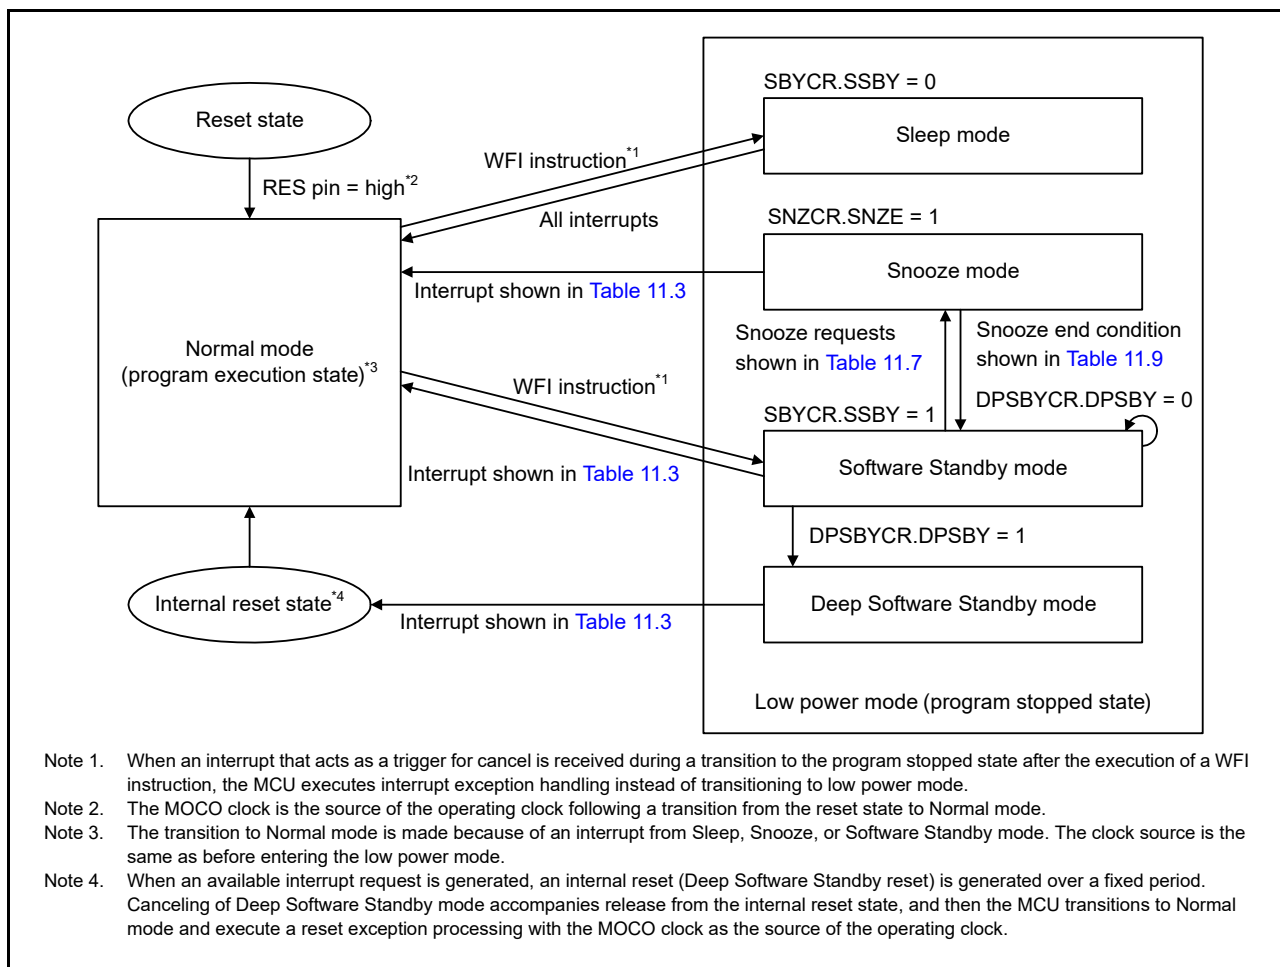

Figure 11.1 Mode transitions

## 11.2 Register Descriptions

### 11.2.1 Standby Control Register (SBYCR)

Address(es): SYSTEM.SBYCR 4001 E00Ch

|                    |      |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |
|--------------------|------|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
|                    | b15  | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|                    | SSBY | OPE | —   | —   | —   | —   | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  |
| Value after reset: | 0    | 1   | 0   | 0   | 0   | 0   | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit       | Symbol | Bit name           | Description  | R/W |
|-----------|--------|--------------------|--|-----|
| b13 to b0 | —      | Reserved           | These bits are read as 0. The write value should be 0.   | R/W |
| b14       | OPE    | Output Port Enable | 0: In Software Standby or Deep Software Standby mode, set the address bus and bus control signals to the high-impedance state. In Snooze mode, the status of the address bus and bus control signals are the same as before entering Software Standby mode.<br>1: In Software Standby or Deep Software Standby mode, retain the output state of the address bus and bus control signals. | R/W |
| b15       | SSBY   | Software Standby   | 0: Sleep mode<br>1: Software Standby mode when DPSBYCR.DPSBY = 0 and Deep Software Standby mode when DPSBYCR.DPSBY = 1.  | R/W |

### OPE bit (Output Port Enable)

The OPE bit specifies whether to set to the high-impedance state or to retain the output of the address bus and bus control signals (for SRAM: CS0 to CS7, RD, WR0 to WR1, WR, BC0 to BC1, and ALE, and for SDRAM: SDCS, RAS, CAS, and WE) in Software Standby mode or Deep Software Standby mode.

### SSBY bit (Software Standby)

The SSBY bit specifies the target transition after a WFI instruction is executed. When the SSBY bit is set to 1, the MCU enters Software Standby mode after executing the WFI instruction. When the MCU cancels Software Standby mode by an interrupt, the SSBY bit remains 1. The SSBY bit can be cleared by writing 0 to it.

When the OSTDCR.OSTDE bit is 1, the SSBY bit is ignored. Even if the SSBY bit is 1, the MCU enters Sleep mode on execution of a WFI instruction.

When the FENTRYR.FENTRYi bit (i = 0 to 3) is 1 or the FENTRYR.FENTRYD bit is 1, the setting of SSBY is ignored. Even if the SSBY bit is 1, the MCU enters Sleep mode on execution of a WFI instruction. See Table 11.6 for details.

When using the HOCO clock to enter Software Standby mode, STCONR.STCON[1:0] must be set to 00b and HOCOWTCR.HSTS[2:0] must be set to 110b. However, when using SCI0 in Snooze mode, HOCOWTCR.HSTS[2:0] must be set to 010b.

## 11.2.2 Module Stop Control Register A (MSTPCRA)

Address(es): SYSTEM.MSTPCRA 4001 E01Ch

|                    |     |     |     |     |     |     |     |     |                    |                     |                    |     |     |     |     |                    |

|                    | —   | —   | —   | —   | —   | —   | —   | —   | MSTPA <sub>7</sub> | MSTPA <sub>6</sub>  | MSTPA <sub>5</sub> | —   | —   | —   | —   | MSTPA <sub>0</sub> |
| Value after reset: | 1   | 1   | 1   | 1   | 1   | 1   | 1   | 1   | 0                  | 0                   | 0                  | 1   | 1   | 1   | 1   | 0                  |

| Bit        | Symbol  | Bit name  | Description  | R/W |
|------------|---------|---|--|-----|
| b0         | MSTPA0  | SRAM0 Module Stop*1                                   | Target module: SRAM0<br>0: Cancel the module-stop state<br>1: Enter the module-stop state.           | R/W |
| b4 to b1   | —       | Reserved  | These bits are read as 1. The write value should be 1.   | R/W |
| b5         | MSTPA5  | High-Speed SRAM Module Stop                           | Target module: high-speed SRAM<br>0: Cancel the module-stop state<br>1: Enter the module-stop state. | R/W |
| b6         | MSTPA6  | ECC SRAM Module Stop*1                                | Target module: ECC SRAM<br>0: Cancel the module-stop state<br>1: Enter the module-stop state.        | R/W |
| b7         | MSTPA7  | Standby SRAM Module Stop                              | Target module: Standby SRAM<br>0: Cancel the module-stop state<br>1: Enter the module-stop state.    | R/W |
| b21 to b8  | —       | Reserved  | These bits are read as 1. The write value should be 1.   | R/W |
| b22        | MSTPA22 | DMA Controller/Data Transfer Controller Module Stop*2 | Target modules: DMAC, DTC<br>0: Cancel the module-stop state<br>1: Enter the module-stop state.      | R/W |
| b31 to b23 | —       | Reserved  | These bits are read as 1. The write value should be 1.   | R/W |

Note 1. The MSTPA0 and MSTPA6 bit settings must be the same.

Note 2. When rewriting the MSTPA22 bit from 0 to 1, disable the DMAC and DTC before setting the MSTPA22 bit.

### 11.2.3 Module Stop Control Register B (MSTPCRB)

Address(es): **MSTP.MSTPCRB 4004 7000h**

|                    |             |             |             |             |             |             |             |             |             |             |            |     |             |             |            |     |

Note 1. The MSTPBi bit must be written to while the oscillation of the clock controlled by this bit is stable. To enter Software Standby mode after writing to this bit, wait for 2 CAN clock (CANMCLK) cycles after writing, then execute a WFI instruction (i = 1, 2).

Note 2. To enter Software Standby mode after writing to the MSTPB11 bit, wait for 2 USB clock (UCLK) cycles after writing, then execute a WFI instruction.

| b4         | —       | Reserved   | This bit is read as 1. The write value should be 1.   | R/W |
| b5         | MSTPD5  | General PWM Timer 32EH0 to 32EH3 and 32E4 to 32E7 and PWM Delay Generation Circuit Module Stop | Target modules: GPT32EHx (x = 0 to 3), GPT32Ey (y = 4 to 7), and PWM Delay Generation Circuit<br>0: Cancel the module-stop state<br>1: Enter the module-stop state. | R/W |
| b6         | MSTPD6  | General PWM Timer 328 to 3213 Module Stop  | Target modules: GPT32x (x = 8 to 13)<br>0: Cancel the module-stop state<br>1: Enter the module-stop state.  | R/W |
| b13 to b7  | —       | Reserved   | These bits are read as 1. The write value should be 1.  | R/W |
| b14        | MSTPD14 | Port Output Enable for GPT Module Stop   | Target module: POEG<br>0: Cancel the module-stop state<br>1: Enter the module-stop state.   | R/W |
| b15        | MSTPD15 | 12-Bit A/D Converter 1 Module Stop   | Target module: ADC121<br>0: Cancel the module-stop state<br>1: Enter the module-stop state.   | R/W |
| b16        | MSTPD16 | 12-Bit A/D Converter 0 Module Stop   | Target module: ADC120<br>0: Cancel the module-stop state<br>1: Enter the module-stop state.   | R/W |
| b19 to b17 | —       | Reserved   | These bits are read as 1. The write value should be 1.  | R/W |
| b20        | MSTPD20 | 12-Bit D/A Converter Module Stop   | Target module: DAC12<br>0: Cancel the module-stop state<br>1: Enter the module-stop state.  | R/W |
| b21        | —       | Reserved   | This bit is read as 1. The write value should be 1.   | R/W |
| b22        | MSTPD22 | Temperature Sensor Module Stop   | Target module: TSN<br>0: Cancel the module-stop state<br>1: Enter the module-stop state.  | R/W |
| b23        | MSTPD23 | High-Speed Analog Comparator 5 Module Stop   | Target module: ACMPHS5<br>0: Cancel the module-stop state<br>1: Enter the module-stop state.  | R/W |
| b24        | MSTPD24 | High-Speed Analog Comparator 4 Module Stop   | Target module: ACMPHS4<br>0: Cancel the module-stop state<br>1: Enter the module-stop state.  | R/W |
| b25        | MSTPD25 | High-Speed Analog Comparator 3 Module Stop   | Target module: ACMPHS3<br>0: Cancel the module-stop state<br>1: Enter the module-stop state.  | R/W |
| b26        | MSTPD26 | High-Speed Analog Comparator 2 Module Stop   | Target module: ACMPHS2<br>0: Cancel the module-stop state<br>1: Enter the module-stop state.  | R/W |
| b27        | MSTPD27 | High-Speed Analog Comparator 1 Module Stop   | Target module: ACMPHS1<br>0: Cancel the module-stop state<br>1: Enter the module-stop state.  | R/W |
| b28        | MSTPD28 | High-Speed Analog Comparator 0 Module Stop   | Target module: ACMPHS0<br>0: Cancel the module-stop state<br>1: Enter the module-stop state.  | R/W |
| b31 to b29 | —       | Reserved   | These bits are read as 1. The write value should be 1.  | R/W |

Note 1. When the count source is sub-clock oscillator or LOCO, AGT1 counting does not stop even if MSTPD2 is set to 1. If the count source is the sub-clock oscillator or LOCO, this bit must be set to 1 except when accessing the AGT1 registers.

Note 2. When the count source is sub-clock oscillator or LOCO, AGT0 counting does not stop even if MSTPD3 is set to 1. If the count source is the sub-clock oscillator or LOCO, this bit must be set to 1 except when accessing the AGT0 registers.

## 11.2.6 Operating Power Control Register (OPCCR)

Address(es): SYSTEM.OPCCR 4001 E0A0h

| Bit      | Symbol    | Bit name  | Description  | R/W |
|----------|-----------|---|--|-----|
| b1, b0   | OPCM[1:0] | Operating Power Control Mode Select                 | b1 b0<br>0 0: High-speed mode<br>1 1: Low-speed mode.<br>Other settings are prohibited.  | R/W |
| b3, b2   | —         | Reserved  | These bits are read as 0. The write value should be 0.   | R/W |
| b4       | OPCMTSF   | Operating Power Control Mode Transition Status Flag | <ul style="list-style-type: none"> <li>• Read</li> <li>0: Transition completed</li> <li>1: Transition in progress.</li> </ul><br><ul style="list-style-type: none"> <li>• Write</li> <li>The write value should be 0.</li> </ul> | R   |
| b7 to b5 | —         | Reserved  | These bits are read as 0. The write value should be 0.   | R/W |

The OPCCR register is used to reduce power consumption in Normal and Sleep modes by specifying a lower operating frequency and operating voltage. For the procedure to change the operating power control modes, see [section 11.5, Function for Lower Operating Power Consumption](#).

When transitioning from Software Standby mode to Normal or Snooze mode, the settings in the OPCCR.OPCM[1:0] and SOPCCR.SOPCM bits are as follows, regardless of their settings before entering Software Standby mode:

- OPCCR.OPCM[1:0] = 00b (High-speed mode)
- SOPCCR.SOPCM = 0b (not Subosc-speed mode).

If Software Standby mode is canceled before the transition to Software Standby completes, the OPCCR.OPCM[1:0] and SOPCCR.SOPCM bits retain their settings from before the WFI instruction is executed. If this causes any problem, set the MCU to High-speed mode during the exception handling procedure when canceling Software Standby mode.

### OPCM[1:0] bits (Operating Power Control Mode Select)

The OPCM[1:0] bits select the operating power control mode in Normal and Sleep modes. [Table 11.4](#) shows the relationship between the operating power control modes and the OPCM[1:0] and SOPCM settings.

### OPCMTSF flag (Operating Power Control Mode Transition Status Flag)

The OPCMTSF flag indicates the switching control state when the operating power control mode is switched. This flag becomes 1 when the OPCM[1:0] bits are written, and 0 when the mode transition completed. Read this flag and confirm that it is 0 before proceeding.

## 11.2.7 Sub Operating Power Control Register (SOPCCR)

Address(es): `SYSTEM.SOPCCR 4001 E0AAh`

| Bit      | Symbol          | Bit name  | Description  | R/W |
|----------|-----------------|---|--|-----|
| b0       | <b>SOPCM</b>    | Sub Operating Power Control Mode Select                 | 0: Not Subosc-speed mode<br>1: Subosc-speed mode.      | R/W |
| b3 to b1 | —               | Reserved  | These bits are read as 0. The write value should be 0. | R/W |
| b4       | <b>SOPCMTSF</b> | Sub Operating Power Control Mode Transition Status Flag | 0: Transition completed<br>1: Transition in progress.  | R   |
| b7 to b5 | —               | Reserved  | These bits are read as 0. The write value should be 0. | R/W |

The SOPCCR register is used to reduce power consumption in Normal and Sleep modes by initiating entry to and exit from Subosc-speed mode. Subosc-speed mode is only available when using the sub-clock oscillator or LOCO without dividing the frequency.

The flash cache function should be set to disabled by setting `FCACHEE.FCACHEEN` to 0 before switching the operating power control mode. For details, see [section 53, Flash Memory](#).

For the procedure to change operating power control modes, see [section 11.5, Function for Lower Operating Power Consumption](#).

### SOPCM bit (Sub Operating Power Control Mode Select)

The SOPCM bit selects the operating power control mode in Normal and Sleep modes. Setting this bit to 1 allows transition to Subosc-speed mode. Setting this bit to 0 allows a return to the operating mode (operating mode set by `OPCCR.OPCM[1:0]`) that was active before the transition to Subosc-speed mode.

When transitioning from Software Standby mode to Normal mode or Snooze mode, the `OPCCR.OPCM[1:0]` and `SOPCCR.SOPCM` settings are as follows, regardless of their settings before entering Software Standby mode:

- `OPCCR.OPCM[1:0] = 00b` (High-speed mode)
- `SOPCCR.SOPCM = 0b` (not Subosc-speed mode).

If Software Standby mode is canceled before the transition to Software Standby completes, the `OPCCR.OPCM[1:0]` and `SOPCCR.SOPCM` bits retain their settings from before the WFI instruction is executed. If this causes any problem, set the MCU to High-speed mode during the exception handling procedure when canceling Software Standby mode.

[Table 11.4](#) shows the relationship between the operating power control modes and the `OPCM[1:0]` and `SOPCM` settings.

### SOPCMTSF flag (Sub Operating Power Control Mode Transition Status Flag)

The SOPCMTSF flag indicates the switching control state when the operating power control mode is switched to Subosc-speed mode or from Subosc-speed mode. The flag is set to 1 on a write access to the SOPCM bit, and to 0 when the mode transition completes. Confirm that the flag is 0 before next proceeding.

**Table 11.4 Relationship between the operating power control modes and the `OPCM[1:0]` and `SOPCM` settings**

| Operating power control mode | OPCM[1:0] bits | SOPCM bit | Power consumption |
|------------------------------|----------------|-----------|-------------------|
| High-speed mode              | 00b            | 0         | High<br>↓<br>Low  |
| Low-speed mode               | 11b            | 0         |                   |
| Subosc-speed mode            | 00b, 11b       | 1         |                   |

Note: See [section 55, Electrical Characteristics](#), for the operating frequency range and voltage range.

### High-speed operating mode

After a reset cancellation, the MCU is activated in this mode.

### Low-speed mode

The following constraints apply in low-speed mode:

- Programming and erasure operations for the flash memory are prohibited
- Using the PLL is prohibited. See [section 11.10.1, Register Access](#).

In this mode, lower power consumption is possible than in High-speed mode when the same operation is performed under the same conditions, such as operating frequency and operating voltage.

### Subosc-speed mode

The following constraints apply in Subosc-speed mode:

- Programming and erasure operations for the flash memory are prohibited
- Reading of the data flash is prohibited
- Using MOSC, PLL, MOCO, or HOCO is prohibited. See [section 11.10.1, Register Access](#)
- Using the divided clock for ICK or FCK is prohibited. See [section 11.10.1, Register Access](#)
- Using the oscillation stop detection function of the main clock oscillator is prohibited.

## 11.2.8 Snooze Control Register (SNZCR)

Address(es): [SYSTEM.SNZCR 4001 E092h](#)

|                    | b7   | b6 | b5 | b4 | b3 | b2 | b1       | b0       |
|--------------------|------|----|----|----|----|----|----------|----------|
|                    | SNZE | —  | —  | —  | —  | —  | SNZDTCEN | RXDREQEN |
| Value after reset: | 0    | 0  | 0  | 0  | 0  | 0  | 0        | 0        |

| Bit      | Symbol                   | Bit name                   | Description   | R/W |
|----------|--------------------------|----------------------------|---|-----|
| b0       | <a href="#">RXDREQEN</a> | RXD0 Snooze Request Enable | 0: Ignore the RXD0 falling edge in Software Standby mode<br>1: Detect the RXD0 falling edge in Software Standby mode. | R/W |
| b1       | <a href="#">SNZDTCEN</a> | DTC Enable in Snooze mode  | 0: Disable DTC operation in Snooze mode<br>1: Enable DTC operation in Snooze mode.                                    | R/W |
| b6 to b2 | —                        | Reserved                   | These bits are read as 0. The write value should be 0.  | R/W |
| b7       | <a href="#">SNZE</a>     | Snooze Mode Enable         | 0: Disable Snooze mode<br>1: Enable Snooze mode.  | R/W |

#### [RXDREQEN bit \(RXD0 Snooze Request Enable\)](#)

The RXDREQEN bit specifies whether to detect a falling edge of the RXD0 pin in Software Standby mode. This bit is only available when SCIO operates in asynchronous mode. To detect a falling edge of the RXD0 pin, set this bit before entering Software Standby mode. When this bit is set to 1, a falling edge of the RXD0 pin in Software Standby mode causes the MCU to enter Snooze mode.

#### [SNZDTCEN bit \(DTC Enable in Snooze mode\)](#)

The SNZDTCEN bit specifies whether to use the DTC and SRAM in Snooze mode. To use the DTC and SRAM in Snooze mode, set this bit to 1 before entering Software Standby mode. When this bit is set to 1, the DTC can be activated by setting IELSRn (ICU Event Link Setting Register n).

#### [SNZE bit \(Snooze Mode Enable\)](#)

The SNZE bit enables or disables a transition from Software Standby to Snooze mode. To use Snooze mode, set this bit to 1 before entering Software Standby mode. When this bit is set to 1, one of the event triggers shown in [Table 11.7](#) occurring in Software Standby mode causes the MCU to enter Snooze mode. After the MCU transitions from Software

Standby or Snooze mode to Normal mode, clear the SNZE bit once and then set it before re-entering Software Standby mode. For details, see [section 11.8, Snooze Mode](#).

### 11.2.9 Snooze End Control Register (SNZEDCR)

Address(es): SYSTEM.SNZEDCR 4001 E094h

|                    |          |        |          |        |          |         |          |
|--------------------|----------|--------|----------|--------|----------|---------|----------|
| b7                 | b6       | b5     | b4       | b3     | b2       | b1      | b0       |
| SCI0UMTED          | AD1UMTED | AD1MAT | AD0UMTED | AD0MAT | DTCNZRED | DTCZRED | AGTUNFED |
| Value after reset: | 0        | 0      | 0        | 0      | 0        | 0       | 0        |

| Bit | Symbol                    | Bit name   | Description  | R/W |
|-----|---------------------------|--|--|-----|
| b0  | <a href="#">AGTUNFED</a>  | AGT1 Underflow Snooze End Enable                       | 0: Disable the Snooze end request<br>1: Enable the Snooze end request. | R/W |
| b1  | <a href="#">DTCZRED</a>   | Last DTC Transmission Completion Snooze End Enable     | 0: Disable the Snooze end request<br>1: Enable the Snooze end request. | R/W |
| b2  | <a href="#">DTCNZRED</a>  | Not Last DTC Transmission Completion Snooze End Enable | 0: Disable the Snooze end request<br>1: Enable the Snooze end request. | R/W |
| b3  | <a href="#">AD0MATED</a>  | AD Compare Match 0 Snooze End Enable                   | 0: Disable the Snooze end request<br>1: Enable the Snooze end request. | R/W |
| b4  | <a href="#">AD0UMTED</a>  | AD Compare Mismatch 0 Snooze End Enable                | 0: Disable the Snooze end request<br>1: Enable the Snooze end request. | R/W |
| b5  | <a href="#">AD1MATED</a>  | AD Compare Match 1 Snooze End Enable                   | 0: Disable the Snooze end request<br>1: Enable the Snooze end request. | R/W |
| b6  | <a href="#">AD1UMTED</a>  | AD Compare Mismatch 1 Snooze End Enable                | 0: Disable the Snooze end request<br>1: Enable the Snooze end request. | R/W |
| b7  | <a href="#">SCI0UMTED</a> | SCI0 Address Mismatch Snooze End Enable                | 0: Disable the Snooze end request<br>1: Enable the Snooze end request. | R/W |

To use one of the triggers shown in [Table 11.8](#) as a condition to switch from Snooze to Software Standby mode, set the associated bit in the SNZEDCR register to 1.

The event that is used for returning to Normal mode from Snooze mode as listed in [Table 11.3](#) must not be enabled in the SNZEDCR register.

#### **AGTUNFED bit (AGT1 Underflow Snooze End Enable)**

The AGTUNFED bit enables or disables a transition from Snooze to Software Standby mode on an AGT1 underflow. For details on the trigger conditions, see [section 25, Asynchronous General-Purpose Timer \(AGT\)](#).

#### **DTCZRED bit (Last DTC Transmission Completion Snooze End Enable)**

The DTCZRED bit enables or disables a transition from Snooze to Software Standby mode on completion of the last DTC transmission, signaled when the CRA or CRB register in the DTC is 0. For details on the trigger conditions, see [section 18, Data Transfer Controller \(DTC\)](#).

#### **DTCNZRED bit (Not Last DTC Transmission Completion Snooze End Enable)**

The DTCNZRED bit enables or disables a transition from Snooze to Software Standby mode on completion of each DTC transmission, signaled when the CRA or CRB register in the DTC is not 0. For details on the trigger conditions, see [section 18, Data Transfer Controller \(DTC\)](#).

#### **AD0MATED bit (AD Compare Match 0 Snooze End Enable)**

The AD0MATED bit enables or disables a transition from Snooze to Software Standby mode on an AD0 event when a conversion result matches the expected data. For details on the trigger conditions, see [section 45, 12-Bit A/D Converter \(ADC12\)](#).

**AD0UMTED bit (AD Compare Mismatch 0 Snooze End Enable)**

The AD0UMTED bit enables or disables a transition from Snooze to Software Standby mode on an AD0 event when the conversion result does not match the expected data. For details on the trigger conditions, see [section 45, 12-Bit A/D Converter \(ADC12\)](#).

**AD1MATED bit (AD Compare Match 1 Snooze End Enable)**

The AD1MATED bit enables or disables a transition from Snooze to Software Standby mode on an AD1 event when the conversion result matches the expected data. For details on the trigger conditions, see [section 45, 12-Bit A/D Converter \(ADC12\)](#).

**AD1UMTED bit (AD Compare Mismatch 1 Snooze End Enable)**

The AD1UMTED bit enables or disables a transition from Snooze to Software Standby mode on an AD1 event when the conversion result does not match the expected data. For details on the trigger conditions, see [section 45, 12-Bit A/D Converter \(ADC12\)](#).

**SCIOUMTED bit (SCIO Address Mismatch Snooze End Enable)**

The SCIOUMTED bit enables or disables a transition from Snooze to Software Standby mode on an SCIO event when an address received in Software Standby mode does not match the expected data. For details on the trigger conditions, see [section 32, Serial Communications Interface \(SCI\)](#). Only set this bit to 1 when SCIO is operating in asynchronous mode.

**11.2.10 Snooze Request Control Register (SNZREQCR)**

The SNZREQCR register controls which trigger causes the MCU to switch from Software Standby to Snooze mode. If a trigger is selected as a request to cancel Software Standby mode in the WUPEN register (see [section 14, Interrupt Controller Unit \(ICU\)](#)), the MCU enters Normal mode when the trigger is generated even when the associated bit of the

SNZREQCR is 1. The setting of the WUPEN register always has a higher priority than the SNZREQCR register settings. For details, see [section 11.8, Snooze Mode](#), and [section 14, Interrupt Controller Unit \(ICU\)](#).

### 11.2.11 Deep Software Standby Control Register (DPSBYCR)

Address(es): SYSTEM.DPSBYCR 4001 E400h

| Bit      | Symbol                        | Bit name              | Description   | R/W |
|----------|-------------------------------|-----------------------|---|-----|
| b1, b0   | <a href="#">DEEPCUT [1:0]</a> | Power-Supply Control  | b1 b0<br>0 0: Supply power to the Standby SRAM, low-speed on-chip oscillator, AGTn, and USBFS resume detecting unit in Deep Software Standby mode<br>0 1: Do not supply power to the Standby SRAM, low-speed on-chip oscillator, AGTn, and USBFS resume detecting unit in Deep Software Standby mode<br>1 0: Setting prohibited<br>1 1: Do not supply power to the Standby SRAM, low-speed on-chip oscillator, AGTn, and USBFS resume detecting unit in Deep Software Standby mode. In addition, disable the LVD and enable the low power function of the power-on reset circuit. | R/W |
| b5 to b2 | —                             | Reserved              | These bits are read as 0. The write value should be 0.  | R/W |
| b6       | <a href="#">IOKEEP</a>        | I/O Port Retention    | 0: When Deep Software Standby mode is canceled, clear the I/O ports to the reset state<br>1: When Deep Software Standby mode is canceled, keep the I/O ports in the same state as in Deep Software Standby mode.  | R/W |
| b7       | <a href="#">DPSBY</a>         | Deep Software Standby | 0: Sleep mode (SBYCR.SSBY = 0) or Software Standby mode (SBYCR.SSBY = 1)<br>1: Sleep mode (SBYCR.SSBY = 0) or Deep Software Standby mode (SBYCR.SSBY = 1).  | R/W |

The DPSBYCR register is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see [Table 6.2, Reset detect flags initialized by each reset source](#).

#### [DEEPCUT\[1:0\] bits \(Power-Supply Control\)](#)

The DEEPCUT[1:0] bits control the internal power supply to the Standby SRAM, low-speed on-chip oscillator, AGTn, and USBFS resume detecting unit in Deep Software Standby mode. In addition, these bits control the state of the LVD and power-on reset circuit in Deep Software Standby mode. When a USBFS suspend/resume interrupt is used as a canceling source for Deep Software Standby mode, the DEEPCUT[1:0] bits must be set to 00b. When an LVD interrupt is used in Deep Software Standby mode, the DEEPCUT[1:0] bits must be set to 00b or 01b.

For lower power consumption, set the DEEPCUT[1:0] bits to 11b so that the LVD is stopped and the low power mode function of the power-on reset circuit is enabled. The internal power supply of the SRAM stops in Deep Software Standby mode regardless of the DEEPCUT[1:0] bit settings.

#### [IOKEEP bit \(I/O Port Retention\)](#)

In Deep Software Standby mode, the I/O ports keep the same states as in Software Standby mode. The IOKEEP bit specifies whether to reset the state of the I/O ports when Deep Software Standby mode is canceled.

#### [DPSBY bit \(Deep Software Standby\)](#)

The DPSBY bit controls transitions to Deep Software Standby mode. See [Table 11.6](#) for details.

When the WFI instruction is executed while the SBYCR.SSBY and DPSBYCR.DPSBY bits are both 1, the MCU enters Deep Software Standby mode through Software Standby mode.

The DPSBY bit remains 1 when Deep Software Standby mode is canceled by certain pins that are the sources of external pin interrupts (NMI and IRQ0-DS to IRQ13-DS) or by a peripheral interrupt (RTC alarm, RTC interval, USB suspend/resume, voltage monitor 1, or voltage monitor 2). Write 0 to this bit to clear it.

The DPSBY setting is invalid when the OFS0.IWDTSTPCTL bit is 0 (counting continues), regardless of the setting in the OFS0.IWDTSTRT bit. When the SBYCR.SSBY and DPSBY bits are 1, the MCU transitions to Software Standby mode on execution of a WFI instruction.

The DPSBY setting is invalid when the voltage monitor 1 reset is enabled (LVD1CR0.RI = 1) or when the voltage monitor 2 reset is enabled (LVD2CR0.RI = 1). When the SBYCR.SSBY and the DPSBY bits are 1, the MCU transitions to Software Standby mode on execution of a WFI instruction.

## 11.2.12 Deep Software Standby Interrupt Enable Register 0 (DPSIER0)

Address(es): [SYSTEM.DPSIER0 4001 E402h](#)

|                    | b7         | b6         | b5         | b4         | b3         | b2         | b1         | b0         |

| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0           | 0  | 0            |

| Bit      | Symbol                   | Bit name  | Description  | R/W |
|----------|--------------------------|---|--|-----|
| b0       | <a href="#">DUSBFSIE</a> | USBFS Suspend/Resume Deep Software Standby Cancel Signal Enable | Enables canceling of Deep Software Standby mode by a USBFS suspend/resume:<br>0: Disable<br>1: Enable. | R/W |
| b1       | —                        | Reserved  | This bit is read as 0. The write value should be 0.  | R/W |
| b2       | <a href="#">DAGT1IE</a>  | AGT1 Underflow Deep Software Standby Cancel Signal Enable       | Enables canceling of Deep Software Standby mode by an AGT1 underflow:<br>0: Disable<br>1: Enable.      | R/W |
| b7 to b3 | —                        | Reserved  | These bits are read as 0. The write value should be 0.   | R/W |

The DPSIER3 register is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see [Table 6.2, Reset detect flags initialized by each reset source](#). After a setting in DPSIER3 is changed, an edge can be internally generated depending on the associated pin state, resulting in the associated DPSIFR3 bit setting to 1. Clear DPSIFR3 to 0 before entering Deep Software Standby mode.

## 11.2.16 Deep Software Standby Interrupt Flag Register 0 (DPSIFR0)

Address(es): SYSTEM.DPSIFR0 4001 E406h

| b7                   | b6         | b5         | b4         | b3         | b2         | b1         | b0         |

| b6  | DIRQ6F | IRQ6-DS Deep Software Standby Cancel Flag | Indicates Deep Software Standby cancel request by the IRQ6-DS pin:<br>0: No request generated<br>1: Request generated. | R/(W)<br>*1 |
| b7  | DIRQ7F | IRQ7-DS Deep Software Standby Cancel Flag | Indicates Deep Software Standby cancel request by the IRQ7-DS pin:<br>0: No request generated<br>1: Request generated. | R/(W)<br>*1 |

Note 1. Only 0 can be written to clear the flag.

The flags in the DPSIFR0 register is set to 1 when the associated cancel request specified in DPSIEGR0 is generated. Each flag can be set to 1 when a cancel request is generated in any mode, not only in Deep Software Standby mode, or when the setting in DPSIER0 is changed. Clear DPSIFR0 to 00h before entering Deep Software Standby mode.

To clear DPSIFR0 to 00h after modifying DPSIER0, wait for at least 6 PCLKB cycles, read DPSIFR0, and then write 0 to DPSIFR0. Six or more PCLKB cycles can be secured, for example, by reading DPSIER0. DPSIFR0 is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see [Table 6.2, Reset detect flags initialized by each reset source](#).

### DIRQnF flags (IRQn-DS Deep Software Standby Cancel Flag) (n = 0 to 7)

The DIRQnF flag indicates that a cancel request is generated by the IRQn-DS pin.

[Setting condition]

- A cancel request generated by an IRQn-DS pin specified in DPSIEGR0.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

## 11.2.17 Deep Software Standby Interrupt Flag Register 1 (DPSIFR1)

Address(es): SYSTEM.DPSIFR1 4001 E407h

|                    | b7 | b6 | b5          | b4          | b3          | b2          | b1         | b0         |
|--------------------|----|----|-------------|-------------|-------------|-------------|------------|------------|

| Value after reset: | 0  | 0  | 0           | 0           | 0           | 0           | 0          | 0          |

| Bit    | Symbol  | Bit name                                   | Description   | R/W     |
|--------|---------|--|---|---------|
| b0     | DIRQ8F  | IRQ8-DS Deep Software Standby Cancel Flag  | Indicates Deep Software Standby cancel request by the IRQ8-DS pin:<br>0: No request generated<br>1: Request generated.  | R/(W)*1 |
| b1     | DIRQ9F  | IRQ9-DS Deep Software Standby Cancel Flag  | Indicates Deep Software Standby cancel request by the IRQ9-DS pin:<br>0: No request generated<br>1: Request generated.  | R/(W)*1 |
| b2     | DIRQ10F | IRQ10-DS Deep Software Standby Cancel Flag | Indicates Deep Software Standby cancel request by the IRQ10-DS pin:<br>0: No request generated<br>1: Request generated. | R/(W)*1 |
| b3     | DIRQ11F | IRQ11-DS Deep Software Standby Cancel Flag | Indicates Deep Software Standby cancel request by the IRQ11-DS pin:<br>0: No request generated<br>1: Request generated. | R/(W)*1 |
| b4     | DIRQ12F | IRQ12-DS Deep Software Standby Cancel Flag | Indicates Deep Software Standby cancel request by the IRQ12-DS pin:<br>0: No request generated<br>1: Request generated. | R/(W)*1 |
| b5     | DIRQ13F | IRQ13-DS Deep Software Standby Cancel Flag | Indicates Deep Software Standby cancel request by the IRQ13-DS pin:<br>0: No request generated<br>1: Request generated. | R/(W)*1 |
| b7, b6 | —       | Reserved                                   | These bits are read as 0. The write value should be 0.  | R/(W)*1 |

Note 1. Only 0 can be written to clear the flag.

The flags in the DPSIFR1 register are set to 1 when the associated cancel request specified in DPSIEGR1 is generated. Each flag can be set to 1 when a cancel request is generated in any mode, not only in Deep Software Standby mode, or when the setting in DPSIER1 is changed. Clear DPSIFR1 to 00h before entering Deep Software Standby mode.

To clear DPSIFR1 to 00h after modifying DPSIER1, wait for at least 6 PCLKB cycles, read DPSIFR1, and then write 0 to DPSIFR1. Six or more PCLKB cycles can be secured, for example, by reading DPSIER1. DPSIFR1 is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see [Table 6.2, Reset detect flags initialized by each reset source](#).

### DIRQnF flags (IRQn-DS Deep Software Standby Cancel Flag) (n = 8 to 13)

The DIRQnF flag indicates that a cancel request is generated by the IRQn-DS pin.

[Setting condition]

- A cancel request generated by the IRQn-DS pin specified in DPSIEGR1.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

## 11.2.18 Deep Software Standby Interrupt Flag Register 2 (DPSIFR2)

Address(es): SYSTEM.DPSIFR2 4001 E408h

| b7 | b6 | b5 | b4    | b3      | b2       | b1      | b0      |
|----|----|----|-------|---------|----------|---------|---------|
| —  | —  | —  | DNMIF | DRTCAIF | DRTCIIIF | DLVD2IF | DLVD1IF |
| 0  | 0  | 0  | 0     | 0       | 0        | 0       | 0       |

Value after reset:

| Bit      | Symbol   | Bit name   | Description  | R/W     |
|----------|----------|--|--|---------|
| b0       | DLVD1IF  | LVD1 Deep Software Standby Cancel Flag                   | Indicates Deep Software Standby cancel request by the voltage monitor 1 signal:<br>0: No request generated<br>1: Request generated.      | R/(W)*1 |
| b1       | DLVD2IF  | LVD2 Deep Software Standby Cancel Flag                   | Indicates Deep Software Standby cancel request by the voltage monitor 2 signal:<br>0: No request generated<br>1: Request generated.      | R/(W)*1 |
| b2       | DRTCIIIF | RTC Interval Interrupt Deep Software Standby Cancel Flag | Indicates Deep Software Standby cancel request by the RTC interval interrupt signal:<br>0: No request generated<br>1: Request generated. | R/(W)*1 |
| b3       | DRTCAIF  | RTC Alarm Interrupt Deep Software Standby Cancel Flag    | Indicates Deep Software Standby cancel request by the RTC alarm interrupt signal:<br>0: No request generated<br>1: Request generated.    | R/(W)*1 |
| b4       | DNMIF    | NMI Deep Software Standby Cancel Flag                    | Indicates Deep Software Standby cancel request by the NMI pin:<br>0: No request generated<br>1: Request generated.                       | R/(W)*1 |
| b7 to b5 | —        | Reserved   | These bits are read as 0. The write value should be 0.   | R/W     |

Note 1. Only 0 can be written to clear the flag.

The flags in the DPSIFR2 register are set to 1 when the associated cancel request specified in DPSIEGR2 is generated. Each flag can be set to 1 when a cancel request is generated in any mode, not only in Deep Software Standby mode, or when the setting in DPSIER2 is changed. Clear DPSIFR2 to 00h before entering Deep Software Standby mode.

To clear DPSIFR2 to 00h after modifying DPSIER2, wait for at least 6 PCLKB cycles, read DPSIFR2, and then write 0 to DPSIFR2. Six or more PCLKB cycles can be secured, for example, by reading DPSIER2. DPSIFR2 is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see [Table 6.2, Reset detect flags initialized by each reset source](#).

### DLVDmIF flag (LVDm Deep Software Standby Cancel Flag) (m = 1 or 2)

The DLVDmIF flag indicates that a cancel request is generated by the voltage monitor m signal.

[Setting condition]

- A cancel request generated by the voltage monitor m signal specified in DPSIEGR2.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

### DRTCIIIF flag (RTC Interval Interrupt Deep Software Standby Cancel Flag)

The DRTCIIIF flag indicates that a cancel request is generated by the RTC interval interrupt signal.

[Setting condition]

- A cancel request generated by the RTC interval interrupt signal.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

### DRTCAIF flag (RTC Alarm Interrupt Deep Software Standby Cancel Flag)

The DRTCAIF flag indicates that a cancel request is generated by the RTC alarm interrupt signal.

[Setting condition]

- A cancel request generated by the RTC alarm interrupt signal.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

### DNMIF flag (NMI Deep Software Standby Cancel Flag)

The DNMIF flag indicates that a cancel request is generated by the NMI pin.

[Setting condition]

- A cancel request generated by the NMI pin specified in DPSIEGR2.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

## 11.2.19 Deep Software Standby Interrupt Flag Register 3 (DPSIFR3)

Address(es): SYSTEM.DPSIFR3 4001 E409h

|                    |    |    |    |    |             |    |              |
|--------------------|----|----|----|----|-------------|----|--------------|
| b7                 | b6 | b5 | b4 | b3 | b2          | b1 | b0           |
| —                  | —  | —  | —  | —  | DAGT1<br>IF | —  | DUSBF<br>SIF |
| Value after reset: | 0  | 0  | 0  | 0  | 0           | 0  | 0            |

| Bit      | Symbol   | Bit name   | Description   | R/W     |
|----------|----------|--|---|---------|
| b0       | DUSBFSIF | USBFS Suspend/Resume Deep Software Standby Cancel Flag | Indicates Deep Software Standby cancel request by a USBFS suspend/resume:<br>0: No request generated<br>1: Request generated. | R/(W)*1 |
| b1       | —        | Reserved   | This bit is read as 0. The write value should be 0.   | R/W     |
| b2       | DAGT1IF  | AGT1 Underflow Deep Software Standby Cancel Flag       | Indicates Deep Software Standby cancel request by an AGT1 underflow:<br>0: No request generated<br>1: Request generated.      | R/(W)*1 |
| b7 to b3 | —        | Reserved   | These bits are read as 0. The write value should be 0.  | R/W     |

Note 1. Only 0 can be written to clear the flag.

The flags in the DPSIFR3 register are set to 1 when the associated cancel request is generated. Each flag can be set to 1 when a cancel request is generated in any mode, not only in Deep Software Standby mode, or when the setting in DPSIER3 is changed. Clear DPSIFR3 to 00h before entering Deep Software Standby mode.

To clear DPSIFR3 to 00h after modifying DPSIER3, wait for at least 6 PCLKB cycles, read DPSIFR3, and then write 0 to DPSIFR3. Six or more PCLKB cycles can be secured, for example, by reading DPSIER3. DPSIFR3 is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see [section 6, Resets](#).

### DUSBFSIF flag (USBFS Suspend/Resume Deep Software Standby Cancel Flag)

The DUSBFSIF flag indicates that a cancel request is generated by a USBFS suspend/resume.

[Setting condition]

- A cancel request generated by the USBFS suspend/resume.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

### DAGT1IF flag (AGT1 Underflow Deep Software Standby Cancel Flag)

The DAGT1IF flag indicates that a cancel request is generated by an AGT1 underflow.

[Setting condition]

- A cancel request generated by the AGT1 underflow.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

## 11.2.20 Deep Software Standby Interrupt Edge Register 0 (DPSIEGR0)

Address(es): [SYSTEM.DPSIEGR0 4001 E40Ah](#)

|                    |             |             |             |             |             |             |             |             |
|--------------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|

|----------|-----------------------|--------------------------------|---|---------|
| b0       | <a href="#">DOCDF</a> | Deep Software Standby OCD Flag | Indicates cancel request by the DBIRQ:<br>0: DBIRQ is not generated<br>1: DBIRQ is generated.             | R/(W)*1 |
| b6 to b1 | —                     | Reserved                       | These bits are read as 0. The write value must be 0.  | R/W     |
| b7       | <a href="#">DBGEN</a> | Debugger Enable Bit            | 0: Disable on-chip debugger<br>1: Enable on-chip debugger.<br>Set to 1 first in On-Chip Debug (OCD) mode. | R/W     |

Note 1. Writing 0 clears the flag. Writing 1 is ignored.

SYOCDRCR is not initialized by the internal reset signal that cancels Deep Software Standby mode.

#### DOCDF flag (Deep Software Standby OCD Flag)

The DOCDF flag indicates that a Deep Software Standby cancel request is generated by the MCUCTRL.DBIRQ bit. The flag is set to 1 when the cancel request is generated. The flag can be set to 1 when a cancel request is generated in any mode, not only in Deep Software Standby mode. Clear the DOCDF flag to 0 before entering Deep Software Standby mode.

[Setting condition]

- A cancel request generated by the MCUCTRL.DBIRQ bit.

[Clearing condition]

- Writing 0 to the flag after reading it as 1
- When the DBGEN bit is 0.

#### DBGEN bit (Debugger Enable Bit)

The DBGEN bit enables the OCD mode. This bit must be set to 1 first in the OCD mode.

[Setting condition]

- Writing 1 to the bit when the debugger is connected.

[Clearing condition]

- Power-on reset is generated
- Writing 0 to the bit.

### 11.2.24 Standby Condition Register (STCONR)

Address(es): SYSTEM.STCONR 4001 E40Fh

| Bit      | Symbol     | Bit name            | Description  | R/W |
|----------|------------|---------------------|--|-----|
| b1 to b0 | STCON[1:0] | SSTBY Condition Bit | b1 b0<br>0 0: Set this value to transition to Software Standby mode when using HOCO<br>1 1: Set this value to transition to Software Standby mode when not using HOCO. | R/W |
| b5 to b2 | —          | Reserved            | These bits are read as 0. The write value should be 0.   | R/W |
| b7 to b6 | —          | Reserved            | These bits are read as 1. The write value should be 1.   | R/W |

#### STCON[1:0] bits (SSTBY Condition Bit)

The STCON[1:0] bits must always be set to 00b when using HOCO to enter Software Standby mode.

### 11.3 Reducing Power Consumption by Switching Clock Signals

When the SCKDIVCR.FCK[2:0], ICK[2:0], BCK[2:0], PCKA[2:0], PCKB[2:0], PCKC[2:0], and PCKD[2:0] bits are set, the clock frequency changes. The module and clock associations are as follows:

- The CPU, DMAC, DTC, flash, and SRAM use the operating clock specified in the ICK[2:0] bits
- Peripheral modules use the operating clocks specified in the PCKA[2:0], PCKB[2:0], PCKC[2:0], and PCKD[2:0] bits
- The flash memory interface uses the operating clock specified in the FCK[2:0] bits

- The external bus uses the operating clock specified in the BCK[2:0] bits.

For details, see [section 9, Clock Generation Circuit](#).

## 11.4 Module-Stop Function

The module-stop function can be set for each on-chip peripheral module. When the MSTPmi bit (m = A to D, i = 31 to 0) in MSTPCRA to MSTPCRD is set to 1, the specified module stops operating and enters the module-stop state, but the CPU continues to operate independently. Clearing the MSTPmi bit to 0 cancels the module-stop state, allowing the module to resume operation at the end of the bus cycle. The internal states of the modules are retained in the module-stop state.

After a reset is canceled, all modules other than the DMAC, DTC, and SRAM modules are placed in the module-stop state. Do not access the module while the associated MSTPmi bit is 1. Otherwise, the read/write data and the operation of the module is not guaranteed. Do not set the MSTPmi bit to 1 while the associated module is being accessed.

When the PLL is selected as the clock source, MSTPmi bits must be changed only one bit at a time. In this case, wait at least 250 ns after changing each MSTPmi bit before starting subsequent processing if you change any of the following bits:

- MSTPA22 (DMAC, DTC)
- MSTPB15 (ETHERC0, EDMAC0)
- MSTPC31 (SCE7)
- MSTPD5 (GPT32EH, GPT32E).

The recommended method to measure the wait time is through software. Be sure to consider the worst-case conditions to ensure that the required wait time elapses.

## 11.5 Function for Lower Operating Power Consumption

Power consumption can be reduced in Normal, Sleep, and Snooze modes by selecting an appropriate operating power mode for the given operating frequency and operating voltage.

### 11.5.1 Setting the Operating Power Control Mode

Make sure that the operating conditions, such as the voltage and frequency ranges, are always within the specified ranges before and after switching the operating power control modes. This section provides example procedures for switching operating power control modes.

**Table 11.5 Available oscillators in each mode**

| Mode         | Oscillator |                               |                                 |                              |                       |                      |                                   |
|--------------|------------|-------------------------------|---------------------------------|------------------------------|-----------------------|----------------------|-----------------------------------|
|              | PLL        | High-speed on-chip oscillator | Middle-speed on-chip oscillator | Low-speed on-chip oscillator | Main clock oscillator | Sub-clock oscillator | IWDT-dedicated on-chip oscillator |
| High-speed   | Available  | Available                     | Available                       | Available                    | Available             | Available            | Available                         |
| Low-speed    | N/A        | Available                     | Available                       | Available                    | Available             | Available            | Available                         |
| Subosc-speed | N/A        | N/A                           | N/A                             | Available                    | N/A                   | Available            | Available                         |

#### (1) Switching from a higher to a lower power mode

Example 1: From High-speed mode to Low-speed mode

Operation begins in High-speed mode.

1. Change the oscillator to that used in Low-speed mode. Set the frequency of each clock lower than the maximum operating frequency in Low-speed mode.
2. Turn off the oscillator that is not required in Low-speed mode.
3. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
4. Set the OPCCR.OPCM[1:0] bits to 11b (Low-speed mode).

5. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).

Operation is now in Low-speed mode.

Example 2: From High-speed mode to Subosc-speed mode

Operation begins in High-speed mode.

1. Change the clock source to the sub-clock oscillator.
2. Turn off HOCO, MOCO, LOCO, main oscillator, and PLL.
3. Confirm that all clock sources except the sub-clock oscillator are stopped.
4. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicates transition completed).
5. Set the SOPCCR.SOPCM bit to 1 (Subosc-speed mode).
6. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicates transition completed).

Operation is now in Subosc-speed mode.

## (2) Switching from a lower to a higher power mode

Example 1: From Subosc-speed mode to High-speed mode

Operation begins in Subosc-speed mode.

1. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicates transition completed).
2. Set the SOPCCR.SOPCM bit to 0 (High-speed mode).
3. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicates transition completed).
4. Turn on the desired oscillator in High-speed mode.
5. Set the frequency of each clock lower than the maximum operating frequency for High-speed mode.

Operation is now in High-speed mode.

Example 2: From Low-speed mode to High-speed mode

Operation begins in Low-speed mode.

1. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
2. Set the OPCCR.OPCM[1:0] bits to 00b (High-speed mode).
3. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
4. Turn on any desired oscillator in High-speed mode.
5. Set the frequency of each clock lower than the maximum operating frequency for High-speed mode.

Operation is now in High-speed mode.

## 11.6 Sleep Mode

### 11.6.1 Transition to Sleep Mode

When a WFI instruction is executed while the SBYCR.SSBY bit is 0, the MCU enters Sleep mode. In Sleep mode, the CPU stops operating, but the contents of its internal registers are retained. Other peripheral functions do not stop. Available resets or interrupts in Sleep mode cause the MCU to cancel Sleep mode. All interrupt sources are available. If using an interrupt to cancel Sleep mode, you must set the associated IELSRn register before executing a WFI instruction. For details, see [section 14, Interrupt Controller Unit \(ICU\)](#).

Counting by the IWDT stops when the MCU enters Sleep mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 1 (IWDT stops in Sleep, Software Standby, or Snooze mode).

Counting by the IWDT continues when the MCU enters Sleep mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 0 (IWDT does not stop in Sleep, Software Standby, or Snooze mode).

Counting by the WDT stops when the MCU enters Sleep mode while the WDT is in auto start mode and the

OFS0.WDTSTPCTL bit is 1 (WDT stops in Sleep mode). In the same way, counting by the WDT stops when the MCU enters Sleep mode while the WDT is in register start mode and the WDTCSSTPR.SLCSTP bit is 1 (WDT stops in Sleep mode).

Counting by the WDT continues when the MCU enters Sleep mode while the WDT is in auto start mode and the OFS0.WDTSTPCTL bit is 0 (WDT does not stop in Sleep mode). In the same way, counting by the WDT continues when the MCU enters Sleep mode while the WDT is in register start mode and the WDTCSSTPR.SLCSTP bit is 0 (WDT does not stop in Sleep mode).

### 11.6.2 Canceling Sleep Mode

Sleep mode is canceled by:

- An interrupt
- RES pin reset
- A power-on reset
- A voltage monitor reset
- An SRAM parity error reset
- An SRAM ECC error reset
- Bus master MPU error reset
- Bus slave MPU error reset
- A reset caused by an IWDT
- A WDT underflow.

The operations are as follows:

- Canceling by an interrupt  
When an available interrupt request (see [Table 11.3](#)) is generated, Sleep mode is canceled and the MCU starts the interrupt handling.
- Canceling by RES pin reset  
When the RES pin is driven low, the MCU enters the reset state. You must keep the RES pin low for the time period specified in [section 55, Electrical Characteristics](#). When the RES pin is driven high after the specified time period, the CPU starts the reset exception handling.
- Canceling by IWDT reset  
Sleep mode is canceled by an internal reset generated by an IWDT underflow, and the MCU starts the reset exception handling. However, IWDT stops in Sleep mode and an internal reset for canceling Sleep mode is not generated in the following conditions:
  - OFS0.IWDTSTRT = 0 and OFS0.IWDTSTPCTL = 1.
- Canceling by WDT reset  
Sleep mode is canceled by an internal reset generated by an WDT underflow and the MCU starts the reset exception handling. However, WDT stops in Sleep mode even when counting in Normal mode and an internal reset for canceling Sleep mode is not generated in the following conditions:
  - OFS0.WDTSTRT = 0 (auto start mode) and OFS0.WDTSTPCTL = 1
  - OFS0.WDTSTRT = 1 (register start mode) and WDTCSSTPR.SLCSTP = 1.
- Canceling by other resets available in Sleep mode  
Sleep mode is canceled by the associated resets, and the MCU starts the reset exception handling.

Note: For details on proper setting of the interrupts, see [section 14, Interrupt Controller Unit \(ICU\)](#).

## 11.7 Software Standby Mode

### 11.7.1 Transition to Software Standby Mode

When a WFI instruction is executed while the SBYCR.SSBY bit is 1 and the DPSBYCR.DPSBY bit is 0, the MCU enters Software Standby mode. In this mode, the CPU, most of the on-chip peripheral functions, and the oscillators stop. However, the contents of the CPU internal registers and the SRAM data, the states of the on-chip peripheral functions, and the I/O port states are retained. Software Standby mode allows a significant reduction in power consumption because most of the oscillators stop in this mode. [Table 11.2](#) shows the status of the on-chip peripheral functions and oscillators. Available resets or interrupts in Software Standby mode cause the MCU to cancel Software Standby mode. See [Table 11.3](#) for available interrupt sources and [section 14.2.9, Wake Up Interrupt Enable Register \(WUPEN\)](#) for information on waking up the MCU from Software Standby mode. If using an interrupt to cancel Software Standby mode, you must set the associated IELSRn register before executing a WFI instruction. For details, see [section 14, Interrupt Controller Unit \(ICU\)](#).

The status of the address bus and bus control signals in Software Standby mode can be selected with the SBYCR.OPE bit.

Clear the DMAST.DMST and DTCST.DTCST bits to 0 before executing a WFI instruction, except when using the DTC in Snooze mode. If the DTC is required in Snooze mode, set the DTCST.DTCST bit to 1 before executing a WFI instruction.

Counting by the IWDG stops when the MCU enters Software Standby mode while the IWDG is in auto start mode and the OFS0.IWDGSTOPCTL bit is 1 (IWDG stops in Sleep, Software Standby, or Snooze mode).

Counting by the IWDG continues when the MCU enters Software Standby mode while the IWDG is in auto start mode and the OFS0.IWDGSTOPCTL bit is 0 (IWDG does not stop in Sleep mode, Software Standby, or Snooze mode). The WDT stops counting when the MCU enters Software Standby mode.

Do not enter Software Standby mode while OSTDCR.OSTDE is 1 (oscillation stop detection function enabled). To enter Software Standby mode, execute a WFI instruction after disabling the oscillation stop detection function (OSTDCR.OSTDE is 0). If software executes a WFI instruction while OSTDCR.OSTDE is 1, the MCU enters Sleep mode even when SBYCR.SSBY is 1. Do not enter Software Standby mode while the flash memory is performing a programming or erasing procedure. To enter Software Standby mode, execute a WFI instruction after the programming or erasing procedure completes.

When the PLL is selected as the clock source, set the following modules to the module-stop state before executing a WFI instruction:

- ETHERC
- EDMAC
- SCE7
- GPT32EH
- GPT32E.

In this case, you must also insert a wait time of at least 750 ns before executing the WFI instruction. The recommended method to measure the wait time is through software. Be sure to consider the worst-case conditions to ensure that the required wait time elapses.

[Table 11.6](#) shows the setting of the related control bits and the modes entered on execution of a WFI instruction.

[Figure 11.2](#) shows an example flow for transitioning to Software Standby or Deep Software Standby mode.

**Table 11.6 Bit settings that affect modes on WFI instruction execution (1 of 2)**

| Other bit settings |   | SBYCR.SSBY and DPSBYCR.DPSBY bit settings |                     |                       |                            |
|--------------------|---|---|---------------------|-----------------------|----------------------------|
|                    |   | SSBY = 0, DPSBY = 0                       | SSBY = 0, DPSBY = 1 | SSBY = 1, DPSBY = 0   | SSBY = 1, DPSBY = 1        |
| OSTDCR.OSTDE       | 0 | Sleep mode                                | Sleep mode          | Software Standby mode | Deep Software Standby mode |
|                    | 1 |   |                     | Sleep mode            | Sleep mode                 |

**Table 11.6 Bit settings that affect modes on WFI instruction execution (2 of 2)**

| Other bit settings |   | SBYCR.SSBY and DPSBYCR.DPSBY bit settings |                     |                       |                            |
|--------------------|---|---|---------------------|-----------------------|----------------------------|
|                    |   | SSBY = 0, DPSBY = 0                       | SSBY = 0, DPSBY = 1 | SSBY = 1, DPSBY = 0   | SSBY = 1, DPSBY = 1        |
| FENTRYR.FENTRYI    | 0 | Sleep mode                                | Sleep mode          | Software Standby mode | Deep Software Standby mode |
|                    | 1 |   |                     | Sleep mode            | Sleep mode                 |
| OFS0.IWDTSTPCTL    | 0 | Sleep mode                                | Sleep mode          | Software Standby mode | Software Standby mode      |
|                    | 1 |   |                     |                       | Deep Software Standby mode |
| LVD1CR0.RI         | 0 | Sleep mode                                | Sleep mode          | Software Standby mode | Deep Software Standby mode |
|                    | 1 |   |                     |                       | Software Standby mode      |
| LVD2CR0.RI         | 0 | Sleep mode                                | Sleep mode          | Software Standby mode | Deep Software Standby mode |
|                    | 1 |   |                     |                       | Software Standby mode      |

**Figure 11.2 Example flow for transition to Software Standby or Deep Software Standby mode**

### 11.7.2 Canceling Software Standby Mode

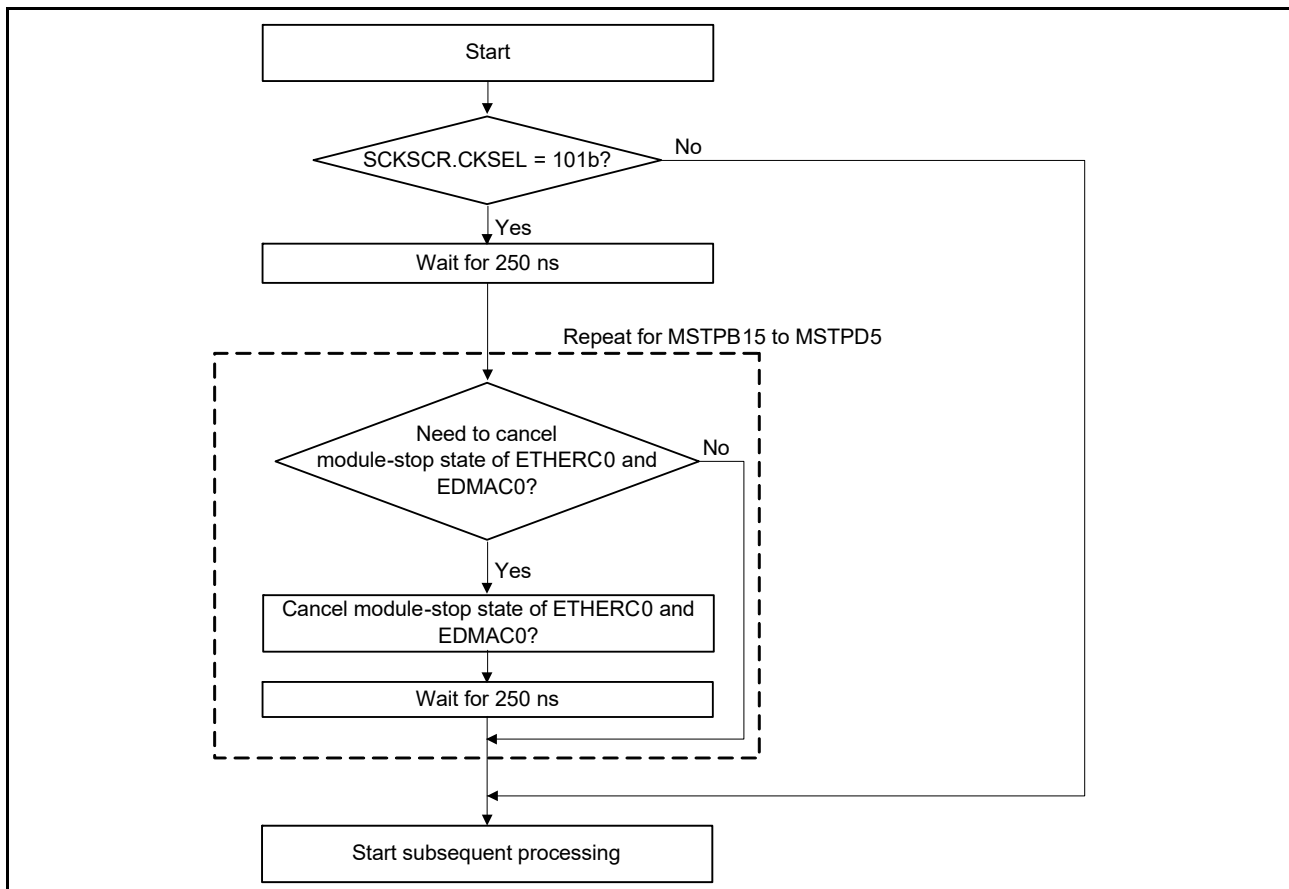

Software Standby mode is canceled by:

- An available interrupt shown in [Table 11.3](#)
- RES pin reset
- A power-on reset
- A voltage monitor reset
- A reset caused by an IWDT underflow.

On exiting Software Standby mode, the oscillators that operate before transitioning to the mode restart. After all the oscillators are stabilized, the MCU returns to Normal mode from Software Standby mode. See [section 14.2.9, Wake Up Interrupt Enable Register \(WUPEN\)](#), for information on waking up the MCU from Software Standby mode.

You can cancel Software Standby mode in any of the following ways:

- **Canceling by an interrupt**  
When an available interrupt request (see [Table 11.3](#)) is generated, all oscillators that operate before the transition to Software Standby mode restart. After all the oscillators are stabilized, the MCU cancels Software Standby mode and starts the interrupt handling. When the PLL is selected as the clock source, you must insert a wait time of at least 250 ns at the beginning of the interrupt handling. The recommended method to measure the wait time is through software. Be sure to consider the worst-case conditions to ensure that the required wait time elapses. [Figure 11.3](#) shows an example flow for canceling Software Standby by an interrupt.
- **Canceling by RES pin reset**  
When the RES pin is driven low, the MCU enters the reset state and the oscillators start to operate in their default status. Make sure to keep the RES pin low for the time period specified in [section 55, Electrical Characteristics](#). When the RES pin is driven high after the specified time period, the CPU starts the reset exception handling.
- **Canceling by a power-on reset**  
Software Standby mode is canceled by a power-on reset and the MCU starts the reset exception handling.
- **Canceling by a voltage monitor reset**  
Software Standby mode is canceled by a voltage monitor reset from the voltage detection circuit and the MCU starts the reset exception handling.
- **Canceling by IWDT reset**  
Software Standby mode is canceled by an internal reset generated by an IWDT underflow, and the MCU starts reset exception handling. However, IWDT stops in Software Standby mode and an internal reset for canceling Software Standby mode is not generated in the following conditions:
  - $OFS0.IWDTSTRT = 0$  and  $OFS0.IWDTSTPCTL = 1$ .
- **Canceling by other resets available in Software Standby mode**  
Software Standby mode is canceled by the associated resets, and the MCU starts the reset exception handling.

**Figure 11.3** Example flow for canceling Software Standby mode

### 11.7.3 Example of Software Standby Mode Application

Figure 11.4 shows an example of entry to Software Standby mode on detection of a falling edge of the IRQn pin, and exit from Software Standby mode on a rising edge of the IRQn pin. In this example, an IRQn pin interrupt is accepted when the IRQCRi.IRQMD[1:0] bits of the ICU are set to 01b (falling edge) in Normal mode, and then set to 10b (rising edge). Next, the SBYCR.SSBY bit is set to 1 and a WFI instruction is executed. As a result, entry to Software Standby mode completes, and exit from Software Standby mode is initiated by a rising edge of the IRQn pin.

Setting the ICU is also required to exit Software Standby mode. For details, see [section 14, Interrupt Controller Unit \(ICU\)](#). The oscillation stabilization time in [Figure 11.4](#) is specified in [section 55, Electrical Characteristics](#).

Figure 11.4 Example of Software Standby mode application

## 11.8 Snooze Mode

### 11.8.1 Transition to Snooze Mode

Figure 11.5 shows snooze mode entry configuration. When the snooze control circuit receives a snooze request in Software Standby mode, the MCU transitions to Snooze mode. In this mode, some peripheral modules operate without waking up the CPU. Table 11.2 shows the peripheral modules that can operate in Snooze mode. Also, DTC operation can be selected in Snooze mode by setting the SNZCR.SNZDTCEN bit.

Figure 11.5 Snooze entry configuration

Table 11.7 shows the snooze requests to switch the MCU from Software Standby mode to Snooze mode. To use a listed snooze requests as a trigger to switch to Snooze mode, you must set the associated SNZREQENn bit of the SNZREQCR register or RXDREQEN bit of the SNZCR register before entering Software Standby mode.

**Table 11.7 Available snooze requests to switch to Snooze mode**

| Snooze request          | Control Register |                         |
|-------------------------|------------------|-------------------------|
|                         | Register         | Bit*1                   |
| PORT_IRQn (n = 0 to 15) | SNZREQCR         | SNZREQENn (n = 0 to 15) |
| KEY_INTKR               | SNZREQCR         | SNZREQEN17              |
| ACMP_HS0                | SNZREQCR         | SNZREQEN22              |
| RTC_ALM                 | SNZREQCR         | SNZREQEN24              |
| RTC_PRD                 | SNZREQCR         | SNZREQEN25              |
| AGT1_AGTI               | SNZREQCR         | SNZREQEN28              |
| AGT1_AGTCMAI            | SNZREQCR         | SNZREQEN29              |
| AGT1_AGTCMBI            | SNZREQCR         | SNZREQEN30              |
| RXD0 falling edge       | SNZCR            | RXDREQEN*2              |

Note 1. Do not enable multiple snooze requests at the same time.  
 Note 2. Do not set the RXDREQEN bit to 1 except in asynchronous mode.

### 11.8.2 Canceling Snooze Mode

Snooze mode is canceled by an interrupt request that is available in Software Standby mode or a reset. Table 11.3 shows the requests that can be used to exit each mode. After canceling the Snooze mode, the MCU enters Normal mode and proceeds with exception processing for the given interrupt or reset. The action triggered by the interrupt requests that is selected in SELSR0, cancels Snooze mode. Interrupt canceling Snooze mode must be selected in IELSRn (n = 0 to 96) to link to the NVIC for the corresponding interrupt handling. See section 14, Interrupt Controller Unit (ICU), for the setting of SELSR0 and IELSRn registers.

**Figure 11.6 Canceling of Snooze mode when an interrupt request signal is generated**

### 11.8.3 Return to Software Standby Mode

Table 11.8 shows the snooze end requests that can be used as triggers to return to Software Standby mode. The snooze end requests are available only in Snooze mode. If the requests are generated when the MCU is not in Snooze mode, they are ignored. When multiple requests are selected, each one of the requests invokes transition to Software Standby mode from Snooze mode.

Table 11.9 shows the snooze end conditions that consist of the snooze end requests and the conditions of the peripheral modules. The CTSU, SCI0, ADC120, ADC121, and DTC modules can keep the MCU in Snooze mode until they complete their operation.

An AGT1 underflow as a trigger to return to Software Standby mode cancels Snooze mode without waiting for the completion of the SCI0 operation.

Figure 11.7 shows the timing diagram for the transition from Snooze mode to Software Standby mode. This mode transition occurs according to which snooze end requests are set in the SNZEDCR register. A snooze request is cleared automatically after it is returned to Software Standby mode.

**Table 11.8 Available snooze end requests (triggers to return to Software Standby mode)**

| Snooze end request                                 | Enable/disable control |     |
|--|------------------------|-----|
|  | Register               | Bit |
| AGT1 underflow or measurement complete (AGT1_AGTI) | SNZEDCR                | b0  |
| DTC transfer completion (DTC_COMPLETE)             | SNZEDCR                | b1  |
| Not DTC transfer completion (DTC_TRANSFER)         | SNZEDCR                | b2  |
| ADC120 window A/B compare match (ADC120_WCMPPM)    | SNZEDCR                | b3  |
| ADC120 window A/B compare mismatch (ADC120_WCMPUM) | SNZEDCR                | b4  |
| ADC121 window A/B compare match (ADC121_WCMPPM)    | SNZEDCR                | b5  |
| ADC121 window A/B compare mismatch (ADC121_WCMPUM) | SNZEDCR                | b6  |
| SCI0 address mismatch (SCI0_DCUF)                  | SNZEDCR                | b7  |

**Table 11.9 Snooze end conditions**

| Operating module when a Snooze end request occurs | Snooze end request   |  |
|---|--|--|
|   | AGT1 underflow   | All except AGT1 underflow  |
| DTC   | The MCU transitions to Software Standby mode after all of the modules listed to the left of this column complete operation | The MCU transitions to Software Standby mode after all of the modules complete operation |
| ADC120  |  |  |
| ADC121  |  |  |
| CTSU  |  |  |
| SCI0  | The MCU transitions to Software Standby mode immediately after a snooze end request is generated                           |  |
| All other modules                                 | The MCU transitions to Software Standby mode immediately after a snooze end request is generated                           |  |

Note: If the DTC is used to activate the ADC120, ADC121, CTSU, or SCI, the MCU transitions to Software Standby mode immediately after a Snooze end request is generated.

Figure 11.7 Canceling of Snooze mode when interrupt request signal is not generated

### 11.8.4 Snooze Operation Example

Figure 11.8 shows an example setting for using ELC in Snooze mode.

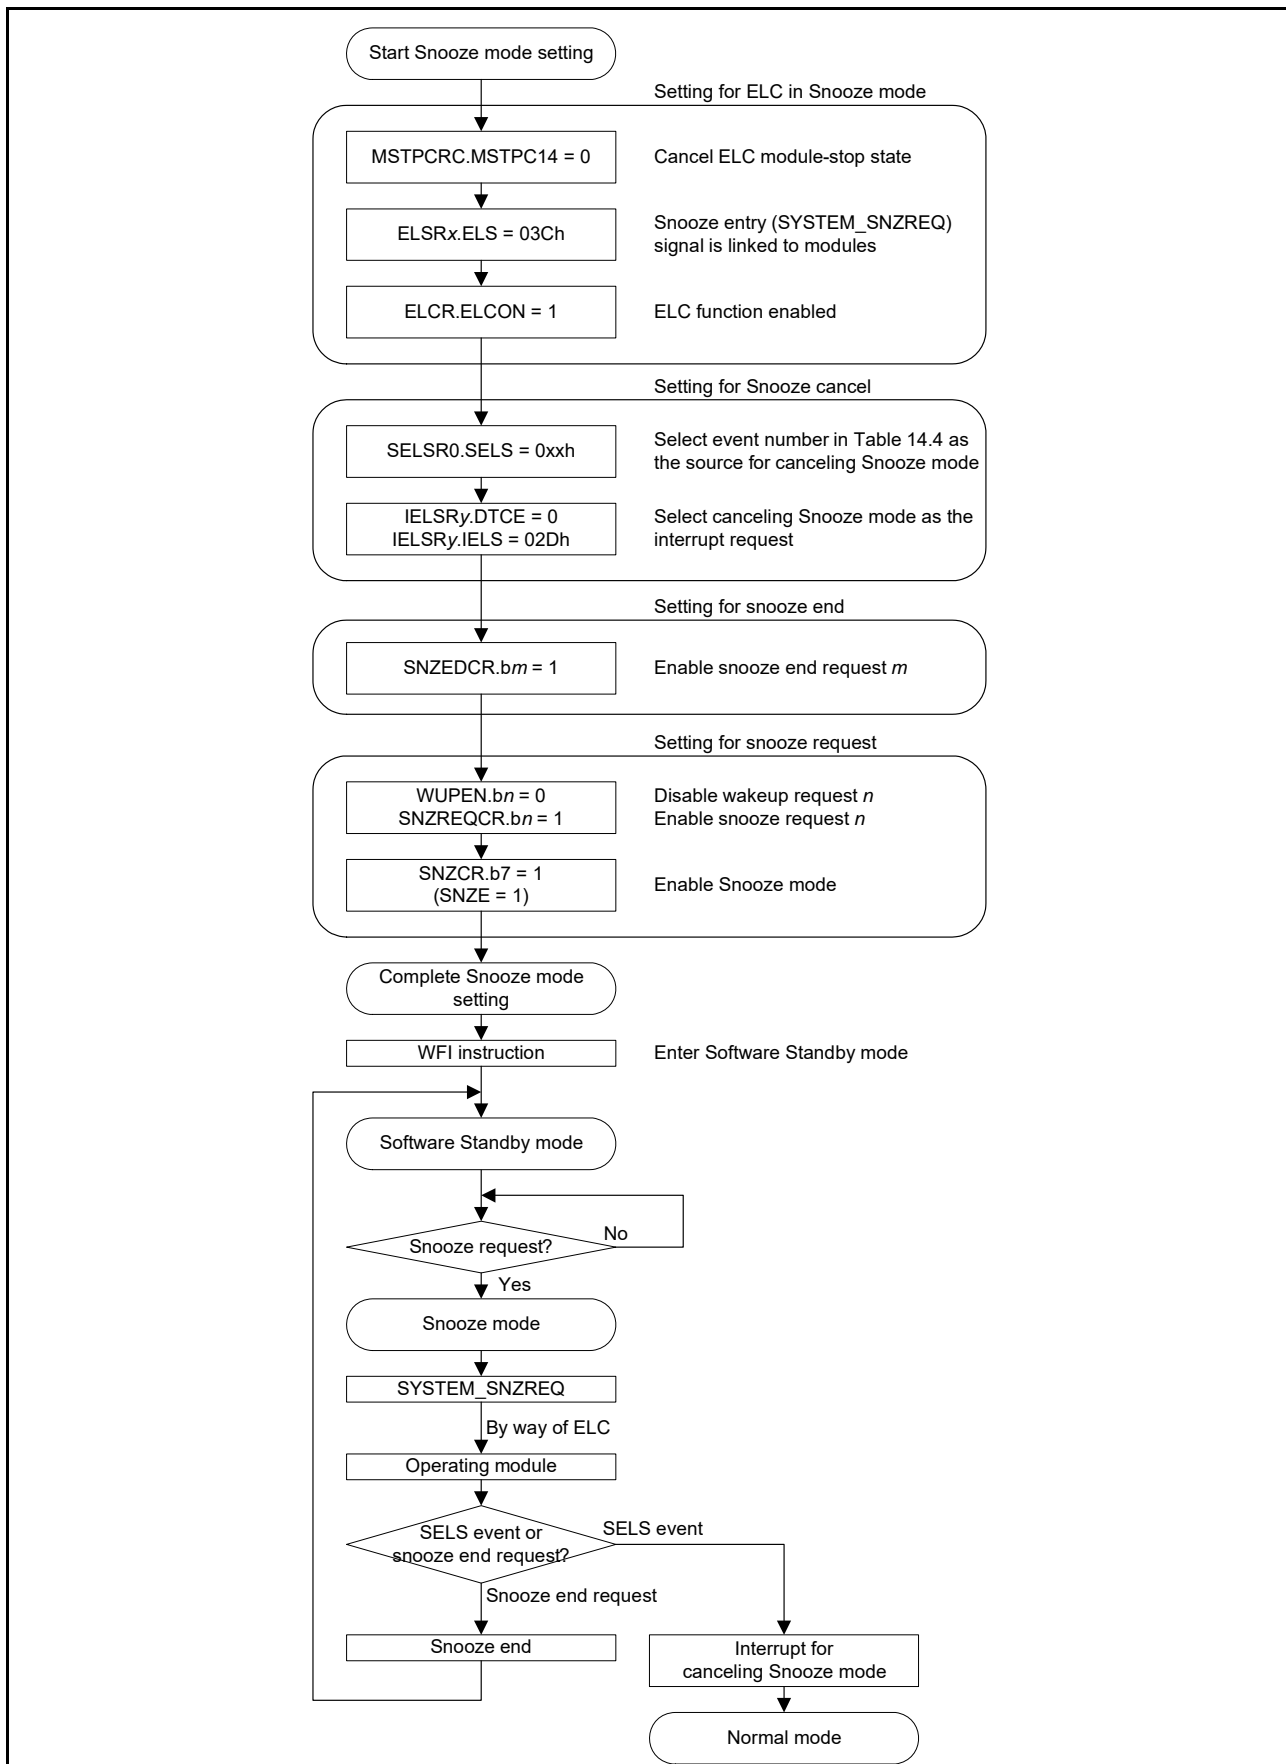

Figure 11.8 Setting example of using ELC in Snooze mode

The MCU can transmit and receive data in SCI0 asynchronous mode without CPU intervention. When using the SCI0 in Snooze mode, use either High-speed mode or Low-speed mode.

Do not use Subosc-speed mode. [Table 11.10](#) shows the maximum transfer rate of SCI0 in Snooze mode.

**Table 11.10 HOCO:  $\pm 1.4\%$  ( $T_a = -20$  to  $105^\circ\text{C}$ ) (Unit: bps)**

| Maximum division ratio of ICLK, PCLKA, PCLKB, PCLKC, PCLKD, FCLK, BCLK, and TRCLK | HOCO frequency        |        |        |                   |        |        |
|---|-----------------------|--------|--------|-------------------|--------|--------|
|   | LOCO is not operating |        |        | LOCO is operating |        |        |
|   | 16 MHz                | 18 MHz | 20 MHz | 16 MHz            | 18 MHz | 20 MHz |
| 1   | 2400                  |        |        | 4800              |        |        |
| 2   |                       |        |        |                   |        |        |
| 4   |                       |        |        |                   |        |        |
| 8   |                       |        |        |                   |        |        |
| 16  |                       |        |        |                   |        |        |
| 32  | 1200                  |        |        | 2400              |        |        |
| 64  |                       |        |        |                   |        |        |

[Figure 11.9](#) shows an example setting for using SCI0 in Snooze mode entry.

Figure 11.9 Setting example of using SCI0 in Snooze mode entry

## 11.9 Deep Software Standby Mode

### 11.9.1 Transition to Deep Software Standby Mode

The MCU enters Deep Software Standby mode when a WFI instruction is executed with the SBYCR.SSBY bit set to 1 and the DPSBYCR.DPSBY bit set to 1. See [Table 11.6](#) for the settings of the related control bits.

In Deep Software Standby mode, the CPU, on-chip peripheral functions except for the RTC alarm, RTC interval, and USB suspend/resume detecting unit, SRAM (not the Standby SRAM), and all oscillators except for the sub-clock oscillator and low-speed on-chip oscillator are stopped. Power consumption is reduced because the internal power supply to these modules is stopped. The contents of all of the CPU registers and internal peripheral modules, except for the RTC alarm, RTC interval, and USB suspend/resume detecting unit, become undefined.

Data in the Standby SRAM is saved if the setting in the DEEPCUT[1:0] bits is 00b. If the setting in the DEEPCUT[1:0] bits is 01b, the internal power supply to the Standby SRAM and the USB resume detecting unit is cut off, and power consumption is reduced. Data in the Standby SRAM becomes undefined at this time.

If the setting in the DEEPCUT[1:0] bits is 11b, the internal power supply to the Standby SRAM and the USB resume detecting unit is cut off, the LVD is stopped, and the low power mode function of the power-on reset circuit is enabled. Therefore, power consumption is further reduced. For details, see [section 55, Electrical Characteristics](#).

When the MCU enters Deep Software Standby mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 1, power supply to the IWDT-dedicated clock and the IWDT is cut off. Counting by the IWDT also stops.

When the OFS0.IWDTSTPCTL bit is 0, the MCU enters Software Standby mode instead of Deep Software Standby mode, regardless of the setting in the OFS0.IWDTSTRT or DPSBYCR.DPSBY bit. When the OFS0.IWDTSTPCTL bit is 0 while the OFS0.IWDTSTRT bit is 0 (auto start mode), the IWDT-dedicated clock and IWDT continue operation.

When the LVD1CR0.RI bit is 1 (selecting the voltage monitor 1 reset) or the LVD2CR0.RI bit is 1 (selecting the voltage monitor 2 reset), the MCU enters Software Standby mode instead of Deep Software Standby mode. The I/O port states are the same as in Software Standby mode.

When the PLL is selected as the clock source, set the following modules to the module-stop state before executing a WFI instruction:

- ETHERC
- EDMAC
- SCE7
- GPT32EH
- GPT32E.

In this case, you must also insert a wait time of at least 750 ns before executing the WFI instruction. The recommended method to measure the wait time is through software. Be sure to consider the worst-case conditions to ensure that the required wait time elapses.

[Figure 11.2](#) shows an example flow for transitioning to Software Standby or Deep Software Standby mode.

Note 1. Conditions on the DTC, DMAC, and IWDT for transition to Software Standby mode must be met before the WFI instruction is executed. For details, see [section 11.7, Software Standby Mode](#).

### 11.9.2 Canceling Deep Software Standby Mode

Deep Software Standby mode is canceled by the interrupts shown in [Table 11.3](#), a RES pin reset, a power-on reset, or a voltage monitor 0 reset. The operations are as follows:

1. Canceling by an interrupt
 

Canceling by interrupts is controlled by DPSIERn (n = 0 to 3) and DPSIFRn (n = 0 to 3). When an available interrupt request is generated, the associated flag in DPSIFRn is set to 1. If the interrupt is enabled in DPSIERn, Deep Software Standby mode is canceled. Rising or falling edge detection can be selected in DPSIEGRn (n = 0 to 2). The detection edge can be selected for the NMI, IRQ0-DS to IRQ13-DS, voltage monitor 1, and voltage monitor 2 interrupts. When a Deep Software Standby mode canceling request occurs, internal power is supplied, the MOCO clock starts to oscillate, and then an internal reset (Deep Software Standby reset) is generated for the entire MCU.

The stable MOCO clock is supplied to the entire MCU and Deep Software Standby reset is canceled. The MCU starts reset exception handling.

When Deep Software Standby mode is canceled by an external interrupt pin or internal interrupt signal, the RSTSR0.DPSRSTF flag is set to 1.

2. Canceling by RES pin reset

When the RES pin is driven low, the MCU cancels Deep Software Standby mode and enters a reset state. Make sure to keep the RES pin low for the time period specified in [section 55, Electrical Characteristics](#). When the RES pin is driven high after the specified time period, the CPU starts reset exception handling.

3. Canceling by power-on reset

Deep Software Standby mode is canceled by a power-on reset, and the MCU starts reset exception handling.

4. Canceling by voltage monitor 0 reset

Deep Software Standby mode is canceled by a voltage monitor 0 reset from the voltage detection circuit, and the MCU starts reset exception handling.

### 11.9.3 Pin States when Deep Software Standby Mode is Canceled

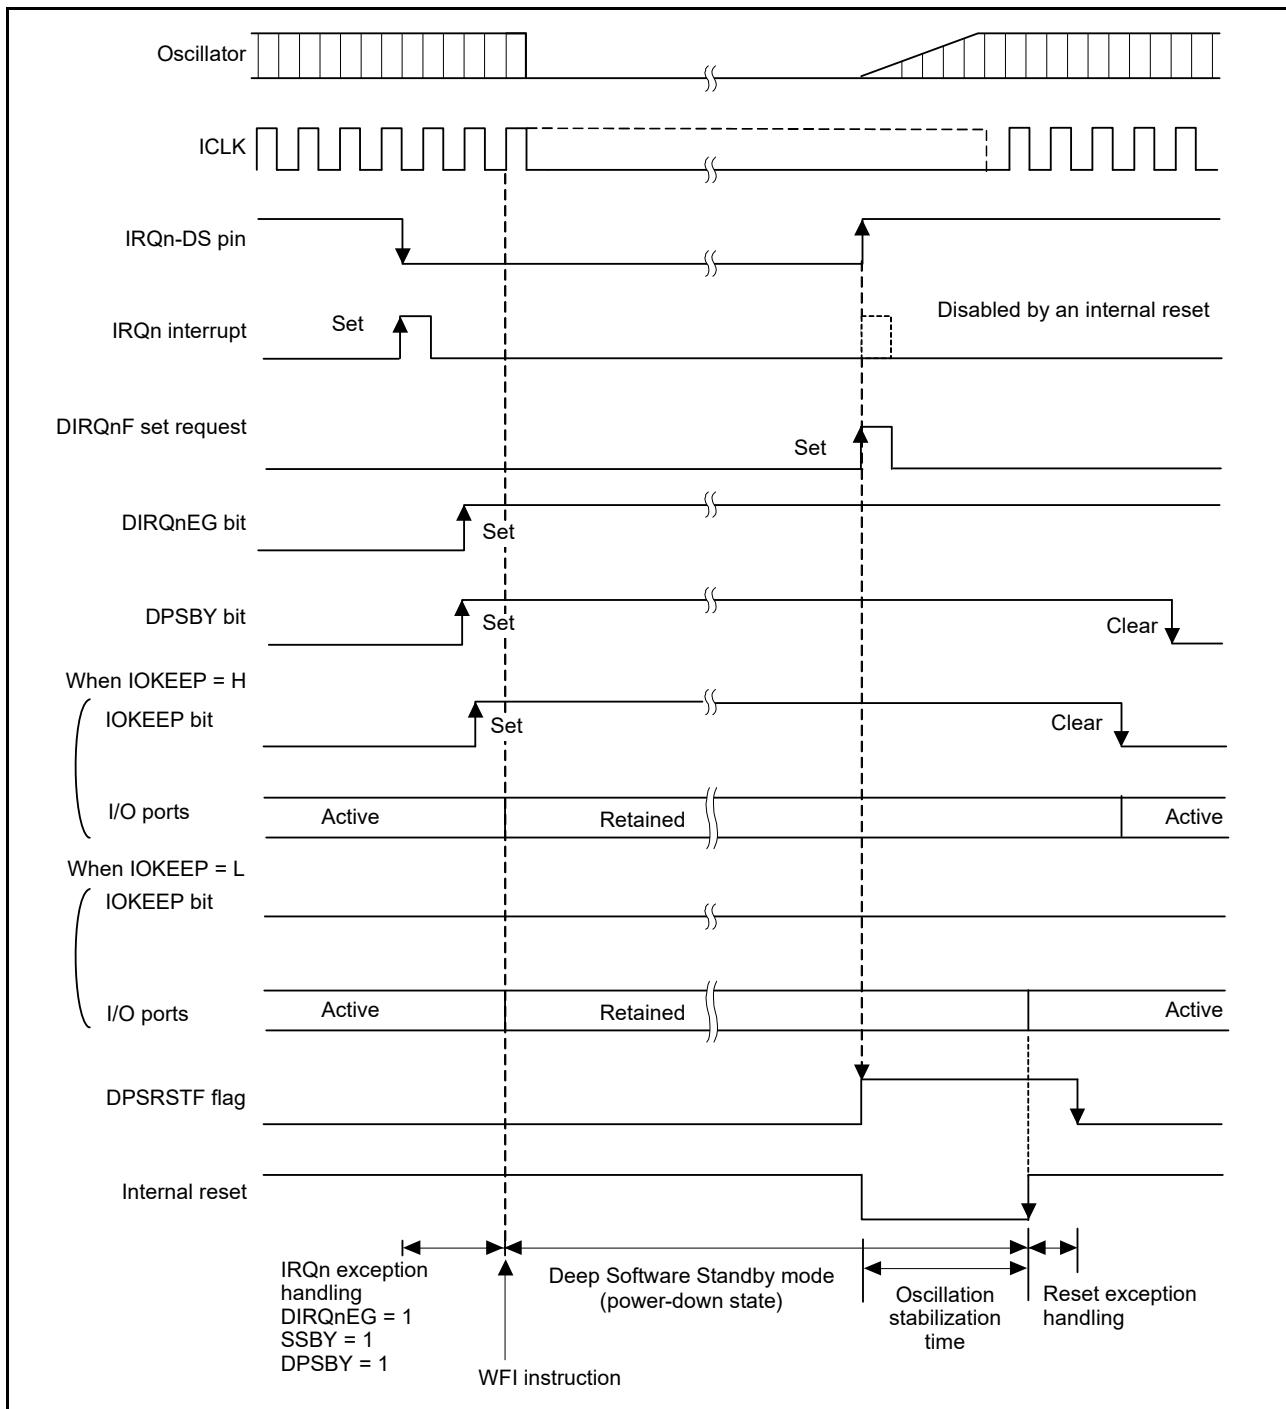

In Deep Software Standby mode, the I/O ports retain the same states from Software Standby mode. The MCU is initialized by an internal reset generated when Deep Software Standby mode is canceled, and reset exception handling starts immediately. The DPSBYCR.IOKEEP bit setting determines whether to initialize the I/O ports or to retain the I/O ports states for Software Standby mode. The following is the state of the I/O ports for each bit setting:

- When the DPSBYCR.IOKEEP bit = 0  
The I/O ports are initialized by an internal reset generated when Deep Software Standby mode is canceled.
- When the DPSBYCR.IOKEEP bit = 1  
Although the MCU is initialized by an internal reset generated when Deep Software Standby mode is canceled, the I/O ports retain their states from Software Standby mode regardless of the MCU internal state. The I/O ports states remain unchanged from Software Standby mode even when settings are made to the I/O ports or peripheral modules. The retained I/O ports states are released by clearing the DPSBYCR.IOKEEP bit to 0, and the MCU operates according to the internal state. The DPSBYCR.IOKEEP bit is not initialized by any internal reset generated when Deep Software Standby mode is canceled.

### 11.9.4 Example of Deep Software Standby Mode Application

#### (1) Entering and exiting Deep Software Standby mode

[Figure 11.10](#) shows an example transition to Deep Software Standby mode on the falling edge of the IRQn-DS pin, and an exit from Deep Software Standby mode on the rising edge of the IRQn-DS pin. In this example, an IRQn interrupt is accepted with the IRQCRi.IRQMD[1:0] bits of the ICU set to 01b (falling edge). After the DPSIEGRy.DIRQnEG bit (y = 0, 1 and n = 0 to 13) is set to 1 (rising edge) and the SBYCR.SSBY and DPSBYCR.DPSBY bits are both set to 1, the WFI instruction is executed. As a result, the MCU transitions to Deep Software Standby mode. Deep Software Standby mode is then canceled on the rising edge of the IRQn-DS pin.

**Figure 11.10 Example of Deep Software Standby mode application**

### 11.9.5 Usage Flow for Deep Software Standby Mode

Figure 11.11 shows an example flow for using Deep Software Standby mode. In this example, the RSTSR0.DPSRSTF flag of the reset function is read after reset exception handling to determine whether the reset is generated by the RES pin or by the cancellation of Deep Software Standby mode. For a reset by the RES pin, the MCU transitions to Deep Software Standby mode after the required register settings are made. For a reset by cancellation of Deep Software Standby mode, the DPSBYCR.IOKEEP bit is set to 0 after the I/O port settings are made.

Figure 11.11 Example flow for using Deep Software Standby mode

## 11.10 Usage Notes

### 11.10.1 Register Access

(1) Invalid register write accesses during specific modes or transitions

Do not write to registers under any of the listed conditions in this section.

[Registers]

- All registers with a peripheral name of SYSTEM.

[Conditions]

- OPCCR.OPCMTSF = 1 or SOPCCR.SOPCMTSF = 1 (during transition of the operating power control mode)
- During the time period from executing a WFI instruction to returning to Normal mode
- When FENTRYR.FENTRYi = 1 (i = 0 to 3) (flash P/E mode) or FENTRYR.FENTRYD = 1 (data flash P/E mode).

## (2) Valid settings for the clock-related registers

Table 11.11 and Table 11.12 show the valid settings of the clock-related registers in each operating power control mode. Do not write any value other than the valid setting. Any other written value is ignored. Each register has certain prohibited settings under conditions other than those related to the operating power control modes. See [section 9, Clock Generation Circuit](#), for these other conditions for each register.

**Table 11.11 Valid settings for the clock-related registers (1)**

| Mode         | Valid settings   |   |                              |                              |                              |                              |                              |                              |
|--------------|--|---|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|
|              | SCKSCR.CKSEL[2:0], CKOCCR.CKOSEL[2:0]  | SCKDIVCR.FCK[2:0], ICK[2:0]   | PLLCR.PLLSTP                 | HOCOCCR.HCSTP                | MOCOCCR.MCSTP                | LOCOCCR.LCSTP                | MOSCCR.MOSTP                 | SOSCCR.SOSTP                 |
| High-speed   | 000b (HOCO)<br>001b (MOCO)<br>010b (LOCO)<br>011b (Main clock)<br>100b (Sub-clock)<br>101b (PLL)*1 | 000b (1/1)<br>001b (1/2)<br>010b (1/4)<br>011b (1/8)<br>100b (1/16)<br>101b (1/32)<br>110b (1/64) | 0 (operating)<br>1 (stopped) | 0 (operating)<br>1 (stopped) | 0 (operating)<br>1 (stopped) | 0 (operating)<br>1 (stopped) | 0 (operating)<br>1 (stopped) | 0 (operating)<br>1 (stopped) |
| Low-speed    | 000b (HOCO)<br>001b (MOCO)<br>010b (LOCO)<br>011b (Main clock)<br>100b (Sub-clock)                 |   | 1 (stopped)                  |                              |                              |                              |                              |                              |
| Subosc-speed | 010b (LOCO)<br>100b (Sub-clock)  | 000b (1/1)  | 1 (stopped)                  | 1 (stopped)                  | 1 (stopped)                  | 0 (operating)<br>1 (stopped) | 1 (stopped)                  | 0 (operating)<br>1 (stopped) |

Note 1. SCKSCR.CKSEL[2:0] only.

**Table 11.12 Valid settings for the clock related registers (2)**

| Operating oscillator              | Valid settings  |              |
|-----------------------------------|-----------------|--------------|
|                                   | OPCCR.OPCM[1:0] | SOPCCR.SOPCM |
| PLL                               | 00b             | 0            |
| High-speed on-chip oscillator     | 00b, 11b        | 0            |
| Middle-speed on-chip oscillator   |                 |              |
| Main clock oscillator             |                 |              |
| Low-speed on-chip oscillator      | 00b, 11b        | 0, 1         |
| Sub-clock oscillator              |                 |              |
| IWDT-dedicated on-chip oscillator |                 |              |

## (3) Invalid register write accesses in subosc-speed mode

Do not write to registers under the listed condition in this section.

[Registers]

- SCKSCR, OPCCR.

[Condition]

- SOPCCR.SOPCM = 1 (Subosc-speed mode).

## (4) Invalid register write accesses by the DTC or DMAC

Do not write to registers listed in this section by the DTC or DMAC.

[Registers]

- MSTPCRA, MSTPCRB, MSTPCRC, MSTPCRD.

### (5) Invalid register write accesses in Snooze mode

Do not write to registers listed in this section in Snooze mode. They must be set before entering Software Standby mode.

[Registers]

- SNZCR, SNZEDCR, SNZREQCR.

### (6) Invalid write access to FLWT.FLWT[2:0]

Do not write any value other than 000b to the FLWT.FLWT[2:0] bits under the listed condition.

[Condition]

- SOPCCR.SOPCM = 1 (Subosc-speed mode)

### (7) Invalid write access when PRCR.PRC1 is 0

Do not write to registers listed in this section when the PRCR.PRC1 bit is 0.

[Registers]

- SBYCR, SNZCR, SNZEDCR, SNZREQCR, OPCCR, SOPCCR, DPSBYCR, DPSIER<sub>n</sub> (n = 0 to 3), DPSIFR<sub>n</sub> (n = 0 to 3), DPSIEGR<sub>n</sub> (n = 0 to 2), and SYOCDCR.

## 11.10.2 I/O Port States

The I/O port states in Software Standby, Deep Software Standby, and Snooze modes (except when modifying in Snooze mode) are the same before entering the modes. Therefore, power consumption is not reduced while the output signals are held high.

## 11.10.3 Module-Stop State of DMAC and DTC

Before writing 1 to MSTPCRA.MSTPA22, clear the DMAST.DMST bit of the DMAC and the DTCST.DTCST bit of the DTC to 0.

## 11.10.4 Internal Interrupt Sources

Interrupts do not operate in the module-stop state. If the module-stop bit is set when an interrupt request is generated, a CPU interrupt source or a DMAC or DTC startup source cannot be cleared. Always disable the associated interrupts before setting the module-stop bits.

## 11.10.5 Input Buffer Control by the DIRQnE Bit (n = 0 to 13)

Setting the DPSIER<sub>y</sub>.DIRQ<sub>nE</sub> bit (y = 0, 1 and n = 0 to 13) to 1 enables the associated input buffer of the IRQ0-DS to IRQ13-DS pins. Although inputs to these pins are sent to the DPSIFR<sub>y</sub>.DIRQ<sub>nF</sub> bits (y = 0, 1 and n = 0 to 13), they are not sent to the ICU, peripheral modules, or I/O ports.

## 11.10.6 Transition to Low Power Modes

Because the MCU does not support wakeup by events, do not enter the low power modes (Sleep, Software Standby, or Deep Software Standby mode) by executing a WFE instruction. Also, do not set the SLEEPDEEP bit of the System Control Register in the Cortex<sup>®</sup>-M4 core, because the MCU does not support low power modes by SLEEPDEEP.

## 11.10.7 Timing of WFI Instruction

It is possible for the WFI instruction to be executed before I/O register and CS/SDRAM area writes are complete, in which case operation might not proceed as intended. This can happen if the WFI is placed immediately after a write to an I/O register or CS/SDRAM area. To avoid this problem, read back the register or CS/SDRAM area that was written to confirm that the write completed.

## 11.10.8 Writing to the WDT and IWDG Registers by the DMAC or DTC in Sleep or Snooze Mode

Do not write to the WDT or IWDG registers by the DMAC or DTC while the WDT or IWDG is stopped after entering Sleep or Snooze mode.

### 11.10.9 Oscillators in Snooze Mode

Oscillators that stop on entering Software Standby mode automatically restart when a trigger for switching to Snooze mode is generated. The MCU does not enter Snooze mode until all of the oscillators stabilize. In Snooze mode, you must disable oscillators that are not required in Snooze mode before entering Software Standby mode. Otherwise, the transition from Software Standby to Snooze mode takes longer.

#### 11.10.10 Snooze Mode Entry by RXD0 Falling Edge

When the SNZCR.RXDREQEN bit is 1, noise on the RXD0 pin might cause the MCU transition from Software Standby to Snooze mode. Any subsequent RXD0 data can be received in Snooze mode by noise on the RXD0 pin. If the MCU does not receive any RXD0 data after the noise, interrupts such as SCI0\_ERI or SCI0\_RXI, and address mismatch events are not generated, the MCU stays in Snooze mode. To avoid this, an AGT1 underflow interrupt must be used to return to Software Standby or Normal mode when using SCI0 in Snooze mode. However, do not use the AGT1 underflow as a source to return to Software Standby mode during an SCI communication. This makes the SCI0 stop the operation in a half-finished state.

#### 11.10.11 Using SCI0 in Snooze Mode

When using SCI0 in Snooze mode, the AGT1 underflow must be used for the interrupt request or Snooze end request. Do not use any other trigger.

When using SCI0 in Snooze mode, the following conditions must be satisfied:

- The clock source must be HOCO
- MOCO, the main clock oscillator, and the PLL must be stopped before entering Software Standby mode
- The RXD0 pin must be kept at the high level before entering Software Standby mode
- A transition to Software Standby mode must not occur during an SCI communication
- The MSTPCRC.MSTPC0 bit must be 1 before entering Software Standby mode.

#### 11.10.12 Conditions of A/D Conversion Start in Snooze Mode

The ADC12 can only be triggered by the ELC in Snooze mode. Do not use a software trigger or ADTRGn pin.

#### 11.10.13 ELC Events in Snooze Mode

Only the ELC events listed in this section are available in Snooze mode. Do not use any other events. If starting peripheral modules for the first time after entering Snooze mode, the Event Link Setting Register (ELSRn) must set a Snooze mode entry event (SYSTEM\_SNZREQ) as the trigger.

- Snooze mode entry (SYSTEM\_SNZREQ)
- DTC transfer end (DTC\_DTCEND)
- ADC12n Window A/B compare match (ADC12n\_WCMPPM) (n = 0, 1)
- ADC12n Window A/B compare mismatch (ADC12n\_WCMPUM) (n = 0, 1)
- Data operation circuit interrupt (DOC\_DOPCI).

#### 11.10.14 Conditions of CTSU in Snooze Mode

The CTSU can only be started by the ELC in Snooze mode.

## 12. Battery Backup Function

### 12.1 Overview

The MCU provides a battery backup function that maintains partial battery powering in the event of a power loss. Switching between VCC and VBATT, the battery-powered area includes RTC, SOSOC, and backup memory.

During normal operation, the battery-powered area is powered by the main power supply, the VCC pin. When a VCC voltage drop is detected, the power source switches to the dedicated battery backup power pin, the VBATT pin. When the voltage rises again, the power source switches back from VBATT to VCC.

#### 12.1.1 Features of Battery Backup Function

The features include:

- Battery power supply switch
- Backup registers
- Time capture pin detection.

#### 12.1.2 Battery Power Supply Switch

When the voltage applied to the VCC pin drops, this feature switches the power supply from the VCC pin to the VBATT pin. When the voltage rises, it switches the power supply from the VBATT pin back to the VCC pin.

#### 12.1.3 Backup Registers

The battery-powered area provides 512 one-byte backup registers. These registers retain data only when VBATT is supplied and VCC is powered off.

#### 12.1.4 Time Capture Pin Detection

The RTC detects input level changes on the time capture pin. For more information, see [section 26, Realtime Clock \(RTC\)](#).

**Note:** When VCC is  $< V_{DET\_BATT}$  and  $> (V_{BATT} + 0.6\text{ V})$ , the injected current flows from the VCC to the VBATT pin through an internal diode. If the power supply battery connected to the VBATT pin cannot support this current injection, for example if the battery is not rechargeable, Renesas strongly recommends that you connect through a low-voltage threshold diode between the power supply battery and the VBATT pin.

**Note:** You must enable voltage monitor 0 resets to use the battery backup function. The voltage monitor 0 level must be higher than the VBATT switch level.

[Figure 12.1](#) shows the configuration of the battery backup function.

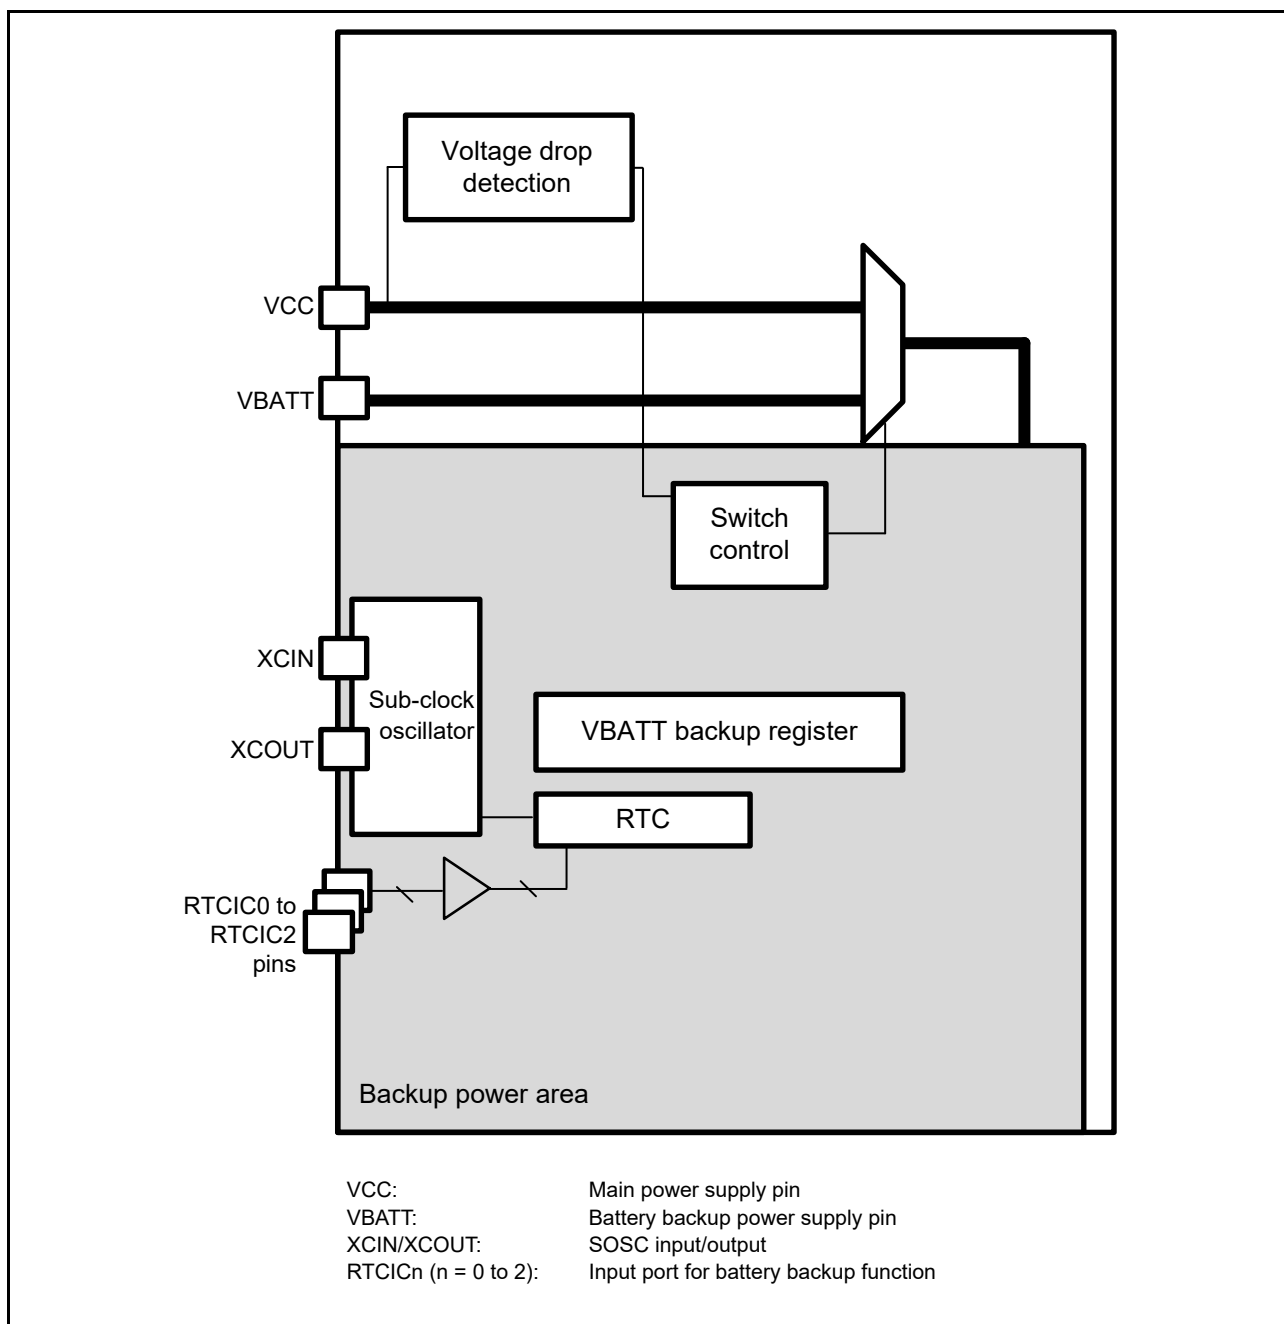

Figure 12.1 Configuration of the battery backup function

## 12.2 Register Descriptions

### 12.2.1 VBATT Backup Register (VBTBKRn) (n = 0 to 511)

Address(es): [SYSTEM.VBTBKR\[0\] 4001 E500h](#) to [SYSTEM.VBTBKR\[511\] 4001 E6FFh](#)

VBTBKRn is an 8-bit access read/write register to store data powered by VBATT. The value of this register is retained when VCC is not powered and VBATT is powered. This register is not initialized by any reset.

## 12.2.2 VBATT Input Control Register (VBTICTLR)

Address(es): SYSTEM.VBTICTLR 4001 E4BBh

|                    | b7 | b6 | b5 | b4 | b3 | b2       | b1       | b0       |
|--------------------|----|----|----|----|----|----------|----------|----------|
|                    | —  | —  | —  | —  | —  | VCH2INEN | VCH1INEN | VCH0INEN |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | x        | x        | x        |

x: Undefined

| Bit      | Symbol   | Bit name               | Description  | R/W |
|----------|----------|------------------------|--|-----|
| b0       | VCH0INEN | VBATT CH0 Input Enable | 0: Disable<br>1: Enable.                               | R/W |
| b1       | VCH1INEN | VBATT CH1 Input Enable | 0: Disable<br>1: Enable.                               | R/W |
| b2       | VCH2INEN | VBATT CH2 Input Enable | 0: Disable<br>1: Enable.                               | R/W |
| b7 to b3 | —        | Reserved               | These bits are read as 0. The write value should be 0. | R/W |

The VBTICTLR register selects the VBATT I/O direction as input.

### VCHnINEN bit (VBATT CHn Input Enable Bit) (n = 0 to 2)

The VCHnINEN bit enables the input direction on the associated VBATT channel.

For more information on CH0 to CH2 associated function, see [section 20.5.5, I/O Buffer Specification](#).

## 12.3 Operation

### 12.3.1 Battery Backup Function

When the voltage on the VCC pin drops, power can be supplied to the RTC and sub-clock oscillator from the VBATT pin. When a power supply drop from the VCC pin is detected, the power connection switches from the power supply to the VBATT pin. The power supply from the VCC pin is resumed when the voltage on the VCC pin exceeds VDET<sub>BATT</sub>. This power supply change does not affect the RTC operation.

You must enable voltage monitor 0 resets to use the battery backup function. The RTC supports time capture detection, triggered by a change to the time capture pin input level.

The VBATT pin supplies power to the following modules:

- RTC
- Sub-clock oscillator (including XCIN and XCOOUT pins)
- VBATT Backup Register.

[Table 12.1](#) shows the operating states in VBATT mode.

**Table 12.1 Operating states in VBATT mode (1 of 2)**

| Operating state                          | VBATT mode                    |
|--|-------------------------------|
| Transition condition                     | Detection of VCC voltage drop |
| Canceling method other than reset        | Detection of VCC voltage rise |
| State after cancellation by an interrupt | —                             |
| State after cancellation by a reset      | —                             |
| Main clock oscillator                    | Stopped                       |
| Sub-clock oscillator                     | Operating                     |
| High-speed on-chip oscillator            | Stopped                       |

**Table 12.1 Operating states in VBATT mode (2 of 2)**

| Operating state                   | VBATT mode   |
|-----------------------------------|--|
| Middle-speed on-chip oscillator   | Stopped  |
| Low-speed on-chip oscillator      | Stopped  |
| IWDT-dedicated on-chip oscillator | Stopped  |
| PLL                               | Stopped  |
| CPU                               | Stopped (undefined)  |
| SRAM (ECC SRAM included)          | Stopped (undefined)  |
| Standby SRAM                      | Stopped (undefined)  |
| VBATT Backup Register             | Stopped (retained)   |
| Flash memory                      | Stopped (retained)   |
| Realtime Clock (RTC)              | Selectable when selecting clock that serves as the count source  |
| AGTn (n = 0, 1)                   | Stopped (undefined)  |
| Low Voltage Detection (LVD)       | Stopped  |
| Power-on reset circuit            | Stopped  |
| Other peripheral modules          | Stopped (undefined)  |
| I/O ports                         | <ul style="list-style-type: none"> <li>• RTCICn ports (n = 0 to 2): Operating</li> <li>• Other than the specified ports: Undefined.</li> </ul> |

Note: Selectable means that operating or stopped is selectable in the control registers. Some modules are also controlled by the associated module-stop bit.

Note: Stopped (retained) means that the contents of the internal registers are retained but the operations are suspended.

Note: Stop (undefined) means that the contents of the internal registers are undefined and power to the internal circuit is cut off.

Figure 12.2 shows the switching sequence of the battery backup function.

**Figure 12.2 Switching sequence for the battery backup function**

### 12.3.2 VBATT Battery Power Supply Switch Usage

The battery power supply switch can switch the power supply from the VCC pin to the VBATT pin when the voltage applied to the VCC pin drops. When the voltage rises, this switch changes the power supply from the VBATT pin to the VCC pin.

Note: You must enable voltage monitor 0 resets to use the battery backup function. Voltage monitor 0 level must be higher than the VBATT switch level.

### 12.3.3 VBATT Backup Register Usage

Use the VBATT backup registers VBTBKRn, where n = 0 to 511, to store or restore data with an 8-bit read or write operation.

## 12.4 Usage Notes

1. When the voltage level on VBATT is lower than the guaranteed operation range, operation of the sub-clock oscillator and RTC cannot be guaranteed. The RTC must be initialized to restart the power supply after the VBATT pin falls below the guaranteed operating voltage.
2. If a reset is generated while writing to the registers described in this section, the register values might be lost.
3. When VCC is higher than  $V_{DET\text{BATT}}$ , the VCC and VBATT pins are separated. When VCC is lower than  $V_{DET\text{BATT}}$  and the switch is connected to the VBATT pin, and if the voltage on VBATT drops lower than (VCC - 0.6 V), current might flow into the VBATT pin through the parasitic diode between the VCC and VBATT pins.
4. During RTC operation using the voltage from the VBATT pin and the I/O ports (P402, P403 and P404) within the backup, the power supply area can only be used as time capture event input pins for the RTC.

## 13. Register Write Protection

### 13.1 Overview

The register write protection function protects important registers from being overwritten because of software errors. The registers to be protected are set with the Protect Register (PRCR).

Table 13.1 lists the association between the PRCR bits and the registers to be protected.

**Table 13.1 Association between PRCR bits and registers to be protected**

| PRCR bit | Registers to be protected   |
|----------|---|
| PRC0     | <ul style="list-style-type: none"> <li>Registers related to the clock generation circuit:<br/>SCKDIVCR, SCKDIVCR2, SCKSCR, PLLCCR, PLLCR, BCKCR, MOSCCR, HOCOGR, MOCOGR, CKOCR, TRCKCR, OSTDCR, OSTDSR, EBCKOCR, SDCKOCR, MOCOUTCR, HOCOUTCR, MOSCWTCR, MOMCR, SOSCCR, SOMCR, LOCOGR, LOCOUTCR, HOCOWTCR, FLLCR1, FLLCR2</li> </ul> |
| PRC1     | <ul style="list-style-type: none"> <li>Registers related to the low power modes:<br/>SBYCR, SNZCR, SNZEDCR, SNZREQCR, OPCCR, SOPCCR, DPSBYCR, DPSIER0-3, DPSIFR0-3, DPSIEGR0-2, SYOCDCCR, STCONR</li> <li>Registers related to the battery backup function:<br/>VBTBKRn (n = 0 to 511), VBTICTLR</li> </ul>                         |
| PRC3     | <ul style="list-style-type: none"> <li>Registers related to the LVD:<br/>LVD1CR1, LVD1SR, LVD2CR1, LVD2SR, LVCMPCCR, LVDLVL, LVD1CR0, LVD2CR0</li> </ul>  |

### 13.2 Register Descriptions

#### 13.2.1 Protect Register (PRCR)

Address(es): [SYSTEM.PRCR 4001 E3FEh](#)

| Bit       | Symbol                     | Bit name      | Function  | R/W |
|-----------|----------------------------|---------------|---|-----|
| b0        | <a href="#">PRC0</a>       | Protect Bit 0 | Enables writing to the registers related to the clock generation circuit:<br>0: Disable writes<br>1: Enable writes.   | R/W |
| b1        | <a href="#">PRC1</a>       | Protect Bit 1 | Enables writing to the registers related to the low power modes and the battery backup function:<br>0: Disable writes<br>1: Enable writes.                                  | R/W |
| b2        | —                          | Reserved      | This bit is read as 0. The write value should be 0.   | R/W |
| b3        | <a href="#">PRC3</a>       | Protect Bit 3 | Enables writing to the registers related to the LVD:<br>0: Disable writes<br>1: Enable writes.  | R/W |
| b7 to b4  | —                          | Reserved      | These bits are read as 0. The write value should be 0.  | R/W |
| b15 to b8 | <a href="#">PRKEY[7:0]</a> | PRC Key Code  | These bits control write access to the PRCR register. To modify the PRCR register, write A5h to the upper 8 bits and the target value to the lower 8 bits as a 16-bit unit. | W*1 |

Note 1. Write data is not retained. Always reads 00h.

#### PRCn bits (Protect Bit n) (n = 0, 1, 3)

The PRCn bits enable or disable writing to the protected registers listed in Table 13.1. Setting PRCn to 1 or 0 enables or disables writing, respectively.

## 14. Interrupt Controller Unit (ICU)

### 14.1 Overview

The Interrupt Controller Unit (ICU) controls which event signals are linked to the NVIC, DTC, and DMAC modules. The ICU also controls non-maskable interrupts. [Table 14.1](#) lists the ICU specifications, [Figure 14.1](#) shows a block diagram, and [Table 14.2](#) lists the I/O pins.

**Table 14.1 ICU specifications**

| Parameter                                | Specifications  |  |
|--|---|--|
| Interrupts                               | Peripheral function interrupts <ul style="list-style-type: none"> <li>Interrupts from peripheral modules</li> <li>Number of sources: 301 (select factors within event list numbers 64 to 511)</li> </ul>  |  |
|  | External pin interrupts <ul style="list-style-type: none"> <li>Interrupt detection on low level, falling edge, rising edge, rising and falling edges</li> <li>One of these detection methods can be set for each source.</li> <li>Digital filter function supported</li> <li>16 sources, with interrupts from IRQ0 to IRQ15 pins.</li> </ul>  |  |
|  | DTC and DMAC control  | The DTC and DMAC can be activated using interrupt sources* <sup>1</sup>        |
|  | Interrupt sources for NVIC  | 96 sources   |
| Non-maskable interrupts* <sup>2</sup>    | NMI pin interrupt <ul style="list-style-type: none"> <li>Interrupt from the NMI pin</li> <li>Interrupt detection on falling edge or rising edge</li> <li>Digital filter function supported.</li> </ul>  |  |
|  | Oscillation stop detection interrupt* <sup>3</sup>  | Interrupt on detecting that the main oscillator has stopped                    |
|  | WDT underflow/refresh error* <sup>3</sup>   | Interrupt on an underflow of the down-counter or occurrence of a refresh error |
|  | IWDT underflow/refresh error* <sup>3</sup>  | Interrupt on an underflow of the down-counter or occurrence of a refresh error |
|  | Voltage monitor 1 interrupt* <sup>3</sup>   | Voltage monitor interrupt of low voltage detection detector 1 (LVD1)           |
|  | Voltage monitor 2 interrupt* <sup>3</sup>   | Voltage monitor interrupt of low voltage detection detector 2 (LVD2)           |
|  | RPEST   | Interrupt on SRAM parity error   |
|  | RECCST  | Interrupt on SRAM ECC error  |
|  | BUSSST  | Interrupt on MPU bus slave error   |
|  | BUSMST  | Interrupt on MPU bus master error  |
|  | SPEST   | Interrupt on CPU stack pointer monitor   |
| Return from low power mode* <sup>4</sup> | <ul style="list-style-type: none"> <li>Sleep mode: return is initiated by non-maskable interrupts or any other interrupt source</li> <li>Software Standby mode: return is initiated by non-maskable interrupts</li> <li>Interrupts can be selected in the WUPEN register.</li> <li>Snooze mode: return is initiated by non-maskable interrupts</li> <li>Interrupts can be selected in the SELSR0 and WUPEN registers.</li> </ul> See <a href="#">section 14.2.8, SYS Event Link Setting Register (SELSR0)</a> , and <a href="#">section 14.2.9, Wake Up Interrupt Enable Register (WUPEN)</a> . |  |

Note 1. For the DTC and DMAC activation sources, see [Table 14.4](#).

Note 2. Non-maskable interrupts can be enabled only once after a reset release.

Note 3. These non-maskable interrupts can also be used as event signals. When used as interrupts, do not change the value of the NMIER register from the reset state. To enable voltage monitor 1 and voltage monitor 2 interrupts, set the LVD1CR1.IRQSEL and LVD2CR1.IRQSEL bits to 1.

Note 4. For return from Deep Software Standby mode, see [section 11.9, Deep Software Standby Mode](#).

Figure 14.1 ICU block diagram

Table 14.2 lists the ICU input/output pins.

Table 14.2 ICU I/O pins

| Pin name      | I/O   | Description                        |
|---------------|-------|------------------------------------|
| NMI           | Input | Non-maskable interrupt request pin |
| IRQ0 to IRQ15 | Input | External interrupt request pins    |

## 14.2 Register Descriptions

This chapter does not describe the Arm® NVIC internal registers. For information on these registers, see the *ARM® Cortex®-M4 Processor Technical Reference Manual* (ARM DDI 0439D).

### 14.2.1 IRQ Control Register i (IRQCRi) (i = 0 to 15)

Address(es): ICU.IRQCR0 4000 6000h, ICU.IRQCR1 4000 6001h, ICU.IRQCR2 4000 6002h, ICU.IRQCR3 4000 6003h, ICU.IRQCR4 4000 6004h, ICU.IRQCR5 4000 6005h, ICU.IRQCR6 4000 6006h, ICU.IRQCR7 4000 6007h, ICU.IRQCR8 4000 6008h, ICU.IRQCR9 4000 6009h, ICU.IRQCR10 4000 600Ah, ICU.IRQCR11 4000 600Bh, ICU.IRQCR12 4000 600Ch, ICU.IRQCR13 4000 600Dh, ICU.IRQCR14 4000 600Eh, ICU.IRQCR15 4000 600Fh

| Bit    | Symbol       | Bit name                                  | Description  | R/W |
|--------|--------------|---|--|-----|
| b1, b0 | IRQMD[1:0]   | IRQi Detection Sense Select               | b1 b0<br>0 0: Falling edge<br>0 1: Rising edge<br>1 0: Rising and falling edges<br>1 1: Low level. | R/W |
| b3, b2 | —            | Reserved                                  | These bits are read as 0. The write value should be 0.   | R/W |
| b5, b4 | FCLKSEL[1:0] | IRQi Digital Filter Sampling Clock Select | b5 b4<br>0 0: PCLKB<br>0 1: PCLKB/8<br>1 0: PCLKB/32<br>1 1: PCLKB/64.                             | R/W |
| b6     | —            | Reserved                                  | This bit is read as 0. The write value should be 0.  | R/W |
| b7     | FLTEN        | IRQi Digital Filter Enable                | 0: Disable<br>1: Enable.   | R/W |

IRQCRi register changes must satisfy the following conditions:

- For a CPU interrupt or DTC trigger:  
Change the IRQCRi register setting before setting the target IELSRn register (n = 0 to 95).  
You can change the register values only when the IELSRn.IELS[8:0] bits are 000h.
- For a DMAC trigger:  
Change the IRQCRi register setting before setting the target DELSRn register (n = 0 to 7).  
You can change the register values only when the DELSRn.DELR[8:0] bits are 000h.
- For a wakeup enable signal:  
Change the IRQCRi register setting before setting the target WUPEN.IRQWUPEN[n] (n = 0 to 15).  
You can only change the register values when the target WUPEN.IRQWUPEN[n] is 0.

#### IRQMD[1:0] bits (IRQi Detection Sense Select)

The IRQMD[1:0] bits set the detection sensing method for the IRQi external pin interrupt sources. For more information on the settings, see [section 14.4.4, External Pin Interrupts](#).

#### FCLKSEL[1:0] bits (IRQi Digital Filter Sampling Clock Select)

The FCLKSEL[1:0] bits select the digital filter sampling clock for the IRQi external pin interrupt requests, selectable to:

- PCLKB (every cycle)
- PCLKB/8 (once every 8 cycles)
- PCLKB/32 (once every 32 cycles)
- PCLKB/64 (once every 64 cycles).

For details on the digital filter, see [section 14.4.3, Digital Filter](#).

**FLTEN bit (IRQi Digital Filter Enable)**

The FLTEN bit enables the digital filter used for the IRQi external pin interrupt sources. The filter is enabled when FLTEN is 1 and disabled when FLTEN is 0. The IRQi pin level is sampled at the cycle specified in FCLKSEL[1:0]. When the sampled level matches three times, the output level from the digital filter changes. For details on the digital filter, see [section 14.4.3, Digital Filter](#).

**14.2.2 Non-Maskable Interrupt Status Register (NMISR)**

Address(es): ICU.NMISR 4000 6140h

|                    |     |     |       |        |         |        |       |       |       |    |    |        |        |       |        |
|--------------------|-----|-----|-------|--------|---------|--------|-------|-------|-------|----|----|--------|--------|-------|--------|
| b15                | b14 | b13 | b12   | b11    | b10     | b9     | b8    | b7    | b6    | b5 | b4 | b3     | b2     | b1    | b0     |

| Bit        | Symbol  | Bit name  | Description   | R/W |
|------------|---------|---|---|-----|
| b0         | IWDTST  | IWDT Underflow/Refresh Error Status Flag              | 0: Interrupt not requested<br>1: Interrupt requested.   | R   |
| b1         | WDTST   | WDT Underflow/Refresh Error Status Flag               | 0: Interrupt not requested<br>1: Interrupt requested.   | R   |
| b2         | LVD1ST  | Voltage Monitor 1 Interrupt Status Flag               | 0: Interrupt not requested<br>1: Interrupt requested.   | R   |
| b3         | LVD2ST  | Voltage Monitor 2 Interrupt Status Flag               | 0: Interrupt not requested<br>1: Interrupt requested.   | R   |
| b5, b4     | —       | Reserved  | These bits are read as 0.   | R   |
| b6         | OSTST   | Main Oscillation Stop Detection Interrupt Status Flag | 0: Interrupt not requested for main oscillation stop<br>1: Interrupt requested for main oscillation stop. | R   |
| b7         | NMIST   | NMI Status Flag                                       | 0: NMI pin interrupt not requested<br>1: NMI pin interrupt requested.                                     | R   |
| b8         | RPEST   | SRAM Parity Error Interrupt Status Flag               | 0: Interrupt not requested<br>1: Interrupt requested.   | R   |
| b9         | RECCST  | SRAM ECC Error Interrupt Status Flag                  | 0: Interrupt not requested<br>1: Interrupt requested.   | R   |
| b10        | BUSSSST | MPU Bus Slave Error Interrupt Status Flag             | 0: Interrupt not requested<br>1: Interrupt requested.   | R   |
| b11        | BUSMST  | MPU Bus Master Error Interrupt Status Flag            | 0: Interrupt not requested<br>1: Interrupt requested.   | R   |
| b12        | SPEST   | CPU Stack Pointer Monitor Interrupt Status Flag       | 0: Interrupt not requested<br>1: Interrupt requested.   | R   |
| b15 to b13 | —       | Reserved  | These bits are read as 0.   | R   |

The NMISR register monitors the status of non-maskable interrupt sources. Writes to the NMISR register are ignored. The setting in the Non-Maskable Interrupt Enable Register (NMIER) does not affect the status flags in this register. Before the end of the non-maskable interrupt handler, check that all of the bits in this register are set to 0 to confirm that no other NMI requests have occurred during handler processing.

**IWDTST flag (IWDT Underflow/Refresh Error Status Flag)**

The IWDTST flag indicates an IWDT underflow/refresh error interrupt request. It is read-only and cleared by the NMICLR.IWDTCLR bit.

[Setting condition]

When an IWDT underflow/refresh error interrupt occurs and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.IWDTCLR bit.

**WDTST flag (WDT Underflow/Refresh Error Status Flag)**

The WDTST flag indicates a WDT underflow/refresh error interrupt request. It is read-only and cleared by the NMICLR.WDTCLR bit.

[Setting condition]

When a WDT underflow/refresh error interrupt occurs.

[Clearing condition]

When 1 is written to the NMICLR.WDTCLR bit.

**LVD1ST flag (Voltage Monitor 1 Interrupt Status Flag)**

The LVD1ST flag indicates a request for voltage monitor 1 interrupt. It is read-only and cleared by the NMICLR.LVD1CLR bit.

[Setting condition]

- When a voltage monitor 1 interrupt occurs and this interrupt source is enabled.

[Clearing condition]

- When 1 is written to the NMICLR.LVD1CLR bit.

**LVD2ST flag (Voltage Monitor 2 Interrupt Status Flag)**

The LVD2ST flag indicates a request for voltage monitor 2 interrupt. It is read-only and cleared by the NMICLR.LVD2CLR bit.

[Setting condition]

- When a voltage monitor 2 interrupt occurs and this interrupt source is enabled.

[Clearing condition]

- When 1 is written to the NMICLR.LVD2CLR bit.

**OSTST flag (Main Oscillation Stop Detection Interrupt Status Flag)**

The OSTST flag indicates a main oscillation stop detection interrupt request. It is read-only and cleared by the NMICLR.OSTCLR bit.

[Setting condition]

- When an oscillation stop detection interrupt occurs.

[Clearing condition]

- When 1 is written to the NMICLR.OSTCLR bit.

**NMIST flag (NMI Status Flag)**

The NMIST flag indicates an NMI pin interrupt request. It is read-only and cleared by the NMICLR.NMIST bit.

[Setting condition]

- When an edge specified in the NMICR.NMIMD bit is input to the NMI pin.

[Clearing condition]

- When 1 is written to the NMICLR.NMIST bit.

**RPEST flag (SRAM Parity Error Interrupt Status Flag)**

The RPEST flag indicates an SRAM parity error interrupt request.

[Setting condition]

- When an interrupt occurs in response to an SRAM parity error.

[Clearing condition]

- When 1 is written to the NMICLR.RPECLR bit.

#### RECCST flag (SRAM ECC Error Interrupt Status Flag)

The RECCST flag indicates an SRAM ECC error interrupt request.

[Setting condition]

- When an interrupt occurs in response to an SRAM ECC error.

[Clearing condition]

- When 1 is written to the NMICLR.RECCCLR bit.

#### BUSSST flag (MPU Bus Slave Error Interrupt Status Flag)

The BUSST flag indicates a bus slave error interrupt request.

[Setting condition]

- When an interrupt occurs in response to a bus slave error.

[Clearing condition]

- When 1 is written to the NMICLR.BUSSCLR bit.

#### BUSMST flag (MPU Bus Master Error Interrupt Status Flag)

The BUSMST flag indicates a bus master error interrupt request.

[Setting condition]

- When an interrupt occurs in response to a bus master error.

[Clearing condition]

- When 1 is written to the NMICLR.BUSMCLR bit.

#### SPEST flag (CPU Stack Pointer Monitor Interrupt Status Flag)

The SPEST flag indicates a CPU stack pointer monitor interrupt request.

[Setting condition]

- When an interrupt occurs in response to a CPU stack pointer monitor error.

[Clearing condition]

- When 1 is written to the NMICLR.SPECLR bit.

### 14.2.3 Non-Maskable Interrupt Enable Register (NMIER)

Address(es): ICU.NMIER 4000 6120h

|                    | b15 | b14 | b13 | b12   | b11        | b10        | b9         | b8    | b7    | b6    | b5 | b4 | b3         | b2         | b1        | b0         |

| b10        | BUSSEN | MPU Bus Slave Error Interrupt Enable        | 0: Disable<br>1: Enable.                               | R/(W)<br>*1, *2 |
| b11        | BUSMEN | MPU Bus Master Error Interrupt Enable       | 0: Disable<br>1: Enable.                               | R/(W)<br>*1, *2 |
| b12        | SPEEN  | CPU Stack Pointer Monitor Interrupt Enable  | 0: Disable<br>1: Enable.                               | R/(W)<br>*1, *2 |
| b15 to b13 | —      | Reserved                                    | These bits are read as 0. The write value should be 0. | R/W             |

Note 1. You can write 1 to this bit only once after reset. Subsequent write accesses are invalid. Writing 0 to this bit is invalid.

Note 2. Do not write 1 to this bit when the source is used as an event signal.

#### **IWDTEN bit (IWDT Underflow/Refresh Error Interrupt Enable)**

The IWDTEN bit enables IWDT underflow/refresh error interrupts as an NMI trigger.

#### **WDTEN bit (WDT Underflow/Refresh Error Interrupt Enable)**

The WDTEN bit enables WDT underflow/refresh error interrupts as an NMI trigger.

#### **LVD1EN bit (Voltage Monitor 1 Interrupt Enable)**

The LVD1EN bit enables voltage monitor 1 interrupts as an NMI trigger.

#### **LVD2EN bit (Voltage Monitor 2 Interrupt Enable)**

The LVD2EN bit enables voltage monitor 2 interrupts as an NMI trigger.

#### **OSTEN bit (Oscillation Stop Detection Interrupt Enable)**

The OSTEN bit enables main oscillation stop detection interrupts as an NMI trigger.

#### **NMIEN bit (NMI Pin Interrupt Enable)**

The NMIEN bit enables NMI pin interrupts as an NMI trigger.

#### **RPEEN bit (SRAM Parity Error Interrupt Enable)**

The RPEEN bit enables SRAM parity error interrupts as an NMI trigger.

#### **RECCEN bit (SRAM ECC Error Interrupt Enable)**

The RECCEN bit enables SRAM ECC error interrupts as an NMI trigger.

#### **BUSSEN bit (MPU Bus Slave Error Interrupt Enable)**

The BUSSEN bit enables bus slave error interrupts as an NMI trigger.

#### **BUSMEN bit (MPU Bus Master Error Interrupt Enable)**

The BUSMEN bit enables bus master error interrupts as an NMI trigger.

#### **SPEEN bit (CPU Stack Pointer Monitor Interrupt Enable)**

The SPEEN bit enables CPU stack pointer monitor interrupts as an NMI trigger.

### 14.2.4 Non-Maskable Interrupt Status Clear Register (NMICLR)

Address(es): ICU.NMICLR 4000 6130h

|  |     |     |            |             |             |            |            |            |            |    |    |             |             |            |             |

| b7         | NMICLR  | NMI Clear               | 0: No effect<br>1: Clear the NMISR.NMIST flag.         | R/(W) <sup>*1</sup> |
| b8         | RPECLR  | SRAM Parity Error Clear | 0: No effect<br>1: Clear the NMISR.RPEST flag.         | R/(W) <sup>*1</sup> |
| b9         | RECCCLR | SRAM ECC Error Clear    | 0: No effect<br>1: Clear the NMISR.RECCST flag.        | R/(W) <sup>*1</sup> |
| b10        | BUSSCLR | Bus Slave Error Clear   | 0: No effect<br>1: Clear the NMISR.BUSSST flag.        | R/(W) <sup>*1</sup> |
| b11        | BUSMCLR | Bus Master Error Clear  | 0: No effect<br>1: Clear the NMISR.BUSMST flag.        | R/(W) <sup>*1</sup> |
| b12        | SPECLR  | SPEST Clear             | 0: No effect<br>1: Clear the NMISR.SPEST flag.         | R/(W) <sup>*1</sup> |
| b15 to b13 | —       | Reserved                | These bits are read as 0. The write value should be 0. | R/(W) <sup>*1</sup> |

Note 1. Only write 1 to this bit.

#### IWDTCLR bit (IWDT Clear)

Writing 1 to the IWDTCLR bit clears the NMISR.IWDTST flag. This bit is read as 0.

#### WDTCLR bit (WDT Clear)

Writing 1 to the WDTCLR bit clears the NMISR.WDTST flag. This bit is read as 0.

#### LVD1CLR bit (LVD1 Clear)

Writing 1 to the LVD1CLR bit clears the NMISR.LVD1ST flag. This bit is read as 0.

#### LVD2CLR bit (LVD2 Clear)

Writing 1 to the LVD2CLR bit clears the NMISR.LVD2ST flag. This bit is read as 0.

#### OSTCLR bit (OST Clear)

Writing 1 to the OSTCLR bit clears the NMISR.OSTST flag. This bit is read as 0.

#### NMICLR bit (NMI Clear)

Writing 1 to the NMICLR bit clears the NMISR.NMIST flag. This bit is read as 0.

**RPECLR bit (SRAM Parity Error Clear)**

Writing 1 to the RPECLR bit clears the NMISR.RPEST flag. This bit is read as 0.

**RECCCLR bit (SRAM ECC Error Clear)**

Writing 1 to the RECCCLR bit clears the NMISR.RECCST flag. This bit is read as 0.

**BUSSCLR bit (Bus Slave Error Clear)**

Writing 1 to the BUSSCLR bit clears the NMISR.BUSSST flag. This bit is read as 0.

**BUSMCLR bit (Bus Master Error Clear)**

Writing 1 to the BUSMCLR bit clears the NMISR.BUSMSST flag. This bit is read as 0.

**SPECLR bit (SPEST Clear)**

Writing 1 to the SPECLR bit clears the NMISR.SPEST flag. This bit is read as 0.

**14.2.5 NMI Pin Interrupt Control Register (NMICR)**

Address(es): ICU.NMICR 4000 6100h

| Bit      | Symbol        | Bit name                                 | Description  | R/W |
|----------|---------------|--|--|-----|
| b0       | NMIMD         | NMI Detection Set                        | 0: Falling edge<br>1: Rising edge.                                     | R/W |
| b3 to b1 | —             | Reserved                                 | These bits are read as 0. The write value should be 0.                 | R/W |
| b5, b4   | NFCLKSEL[1:0] | NMI Digital Filter Sampling Clock Select | b5 b4<br>0 0: PCLKB<br>0 1: PCLKB/8<br>1 0: PCLKB/32<br>1 1: PCLKB/64. | R/W |
| b6       | —             | Reserved                                 | This bit is read as 0. The write value should be 0.                    | R/W |
| b7       | NFLTEN        | NMI Digital Filter Enable                | 0: Disable<br>1: Enable.   | R/W |

Change the NMICR register settings before enabling NMI pin interrupts (before setting NMIER.NMIEN to 1).

**NMIMD bit (NMI Detection Set)**

The NMIMD bit selects the detection sensing method for the NMI pin interrupts.

**NFCLKSEL[1:0] bits (NMI Digital Filter Sampling Clock Select)**

The NFCLKSEL[1:0] bits select the digital filter sampling clock for the NMI pin interrupts, selectable to:

- PCLKB (every cycle)
- PCLKB/8 (once every 8 cycles)
- PCLKB/32 (once every 32 cycles)
- PCLKB/64 (once every 64 cycles).

For details of the digital filter, see [section 14.4.3, Digital Filter](#).

**NFLTEN bit (NMI Digital Filter Enable)**

The NFLTEN bit enables the digital filter used for NMI pin interrupts. The filter is enabled when NFLTEN is 1 and disabled when NFLTEN is 0. The NMI pin level is sampled at the cycle specified in NMIFLTC.NFCLKSEL[1:0]. When

the sampled level matches three times, the output level from the digital filter changes. For details of the digital filter, see [section 14.4.3, Digital Filter](#).

### 14.2.6 ICU Event Link Setting Register n (IELSRn) (n = 0 to 95)

Address(es): ICU.IELSR0 4000 6300h, ICU.IELSR1 4000 6304h, ICU.IELSR2 4000 6308h, ICU.IELSR3 4000 630Ch,.....  
.....ICU.IELSR92 4000 6470h, ICU.IELSR93 4000 6474h, ICU.IELSR94 4000 6478h, ICU.IELSR95 4000 647Ch

| Bit        | Symbol                    | Bit name              | Description   | R/W                |
|------------|---------------------------|-----------------------|---|--------------------|
| b8 to b0   | <a href="#">IELS[8:0]</a> | ICU Event Link Select | b8<br>b0<br>00000000: Disable interrupts to the associated NVIC or DTC module<br>00000001 to 11111111: Event signal number to be linked.<br>For details, see <a href="#">Table 14.4</a> . | R/W <sup>1</sup>   |
| b15 to b9  | —                         | Reserved              | These bits are read as 0. The write value should be 0.  | R/W                |
| b16        | <a href="#">IR</a>        | Interrupt Status Flag | 0: No interrupt request occurred<br>1: Interrupt request occurred.  | R/(W) <sup>2</sup> |
| b23 to b17 | —                         | Reserved              | These bits are read as 0. The write value should be 0.  | R/W                |
| b24        | <a href="#">DTCE</a>      | DTC Activation Enable | 0: Disable<br>1: Enable.  | R/W                |
| b31 to b25 | —                         | Reserved              | These bits are read as 0. The write value should be 0.  | R/W                |

Note 1. This register requires halfword or word access.

Note 2. Writing 1 to the IR flag is prohibited.

The IELSRn register selects the IRQ source used by the NVIC. For details, see [Table 14.4, IELSRn](#), where n = 0 to 95, corresponds to the NVIC IRQ input source numbers 0 to 95.

#### [IELS\[8:0\] bits \(ICU Event Link Select\)](#)

The IELS[8:0] bits link an event signal to the associated NVIC or DTC module. All IELS[8:0] bits must be written to simultaneously.

#### [IR flag \(Interrupt Status Flag\)](#)

The IR flag indicates an individual interrupt request from the event specified in IELS[8:0].

[Setting condition]

- When an interrupt request is received from the associated peripheral module or IRQi pin.

[Clearing conditions]

- When 0 is written to the bit. DTCE must be set to 0 before writing 0 to the IR flag.

To clear the IR flag:

1. Negate the input interrupt signal.
2. Read access the peripheral once and wait for 2 clock cycles of the target module clock.
3. Clear the IR flag by writing 0.

**DTCE bit (DTC Activation Enable)**

When the DTCE bit is set to 1, the associated event is selected as the source for DTC activation.

[Setting condition]

- When 1 is written to the DTCE bit.

[Clearing conditions]

- When the specified number of transfers is complete. For chain transfers, when the specified number of transfers for the last chain transfer is complete.
- When 0 is written to the bit.

**14.2.7 DMAC Event Link Setting Register n (DELSRn) (n = 0 to 7)**

Address(es): [ICU.DELSR0 4000 6280h](#), [ICU.DELSR1 4000 6284h](#), [ICU.DELSR2 4000 6288h](#), [ICU.DELSR3 4000 628Ch](#), [ICU.DELSR4 4000 6290h](#), [ICU.DELSR5 4000 6294h](#), [ICU.DELSR6 4000 6298h](#), [ICU.DELSR7 4000 629Ch](#)

| Bit        | Symbol                    | Bit name                       | Description  | R/W     |
|------------|---------------------------|--------------------------------|--|---------|
| b8 to b0   | <a href="#">DELS[8:0]</a> | DMAC Event Link Select         | b8 b0<br>00000000: Disable DMA start requests to the associated DMAC module<br>00000001 to 11111111: Event signal number to be linked. For details, see <a href="#">Table 14.4</a> . | R/W*1   |
| b15 to b9  | —                         | Reserved                       | These bits are read as 0. The write value should be 0.   | R/W     |
| b16        | <a href="#">IR</a>        | Interrupt Status Flag for DMAC | 0: No interrupt request is generated<br>1: An interrupt request is generated.  | R/(W)*2 |
| b31 to b17 | —                         | Reserved                       | These bits are read as 0. The write value should be 0.   | R/W     |

Note 1. This register requires halfword or word access.

Note 2. Writing 1 to the IR flag is prohibited.

**DELS[8:0] bits (DMAC Event Link Select)**

The DELS[8:0] bits link an event signal to the DMAC module. All DELS[8:0] bits must be written to simultaneously.

**IR flag (Interrupt Status Flag for DMAC)**

The IR flag is the status flag of an individual DMA transfer request. This flag corresponds to DELS[8:0] bits of the same register.

[Setting condition]

The flag is set to 1 when a DMA transfer request is generated from the corresponding peripheral module or IRQi pin.

[Clearing conditions]

- When 0 is written to the flag.
- At the start of the DMA transfer after the DMA transfer request is issued.

### 14.2.8 SYS Event Link Setting Register (SELSR0)

Address(es): ICU.SELSR0 4000 6200h

| Bit       | Symbol    | Bit name              | Description  | R/W |
|-----------|-----------|-----------------------|--|-----|
| b8 to b0  | SELS[8:0] | SYS Event Link Select | b8 to b0<br>00000000: Disable event output to the associated low-power mode module<br>00000001 to 11111111: Event signal number to be linked.<br>For details, see <a href="#">Table 14.4</a> . | R/W |
| b15 to b9 | —         | Reserved              | These bits are read as 0. The write value should be 0.   | R/W |

Note: This register requires halfword access.

The SELSR0 register selects the events that wake the CPU from Snooze mode. You can only use the events listed in [Table 14.4](#) checked under “Canceling Snooze using SELSR0”. Events specified in this register are defined as ICU\_SNZCANCEL (02Dh) in [Table 14.4](#). When 02Dh is set in IELSRn.IELS, the SELSR0 event interrupt occurs.

#### SELS[8:0] bits (SYS Event Link Select)

All SELS[8:0] bits must be written to simultaneously.

### 14.2.9 Wake Up Interrupt Enable Register (WUPEN)

Address(es): ICU.WUPEN 4000 61A0h

| Bit        | Symbol         | Bit name  | Description  | R/W |
|------------|----------------|---|--|-----|
| b15 to b0  | IRQWUPEN[15:0] | IRQ Interrupt Software Standby Returns Enable     | 0: Disable Software Standby returns by IRQ interrupts<br>1: Enable Software Standby returns by IRQ interrupts.         | R/W |

| b27 | <a href="#">USBFSWUPEN</a>  | USBFS Interrupt Software Standby Returns Enable                | 0: Disable Software Standby returns by USBFS interrupts<br>1: Enable Software Standby returns by USBFS interrupts.                               | R/W |
| b28 | <a href="#">AGT1UDWUPEN</a> | AGT1 Underflow Interrupt Software Standby Returns Enable       | 0: Disable Software Standby returns by AGT1 underflow interrupts<br>1: Enable Software Standby returns by AGT1 underflow interrupts.             | R/W |
| b29 | <a href="#">AGT1CAWUPEN</a> | AGT1 Compare Match A Interrupt Software Standby Returns Enable | 0: Disable Software Standby returns by AGT1 compare match A interrupts<br>1: Enable Software Standby returns by AGT1 compare match A interrupts. | R/W |
| b30 | <a href="#">AGT1CBWUPEN</a> | AGT1 Compare Match B Interrupt Software Standby Returns Enable | 0: Disable Software Standby returns by AGT1 compare match B interrupts<br>1: Enable Software Standby returns by AGT1 compare match B interrupts. | R/W |
| b31 | <a href="#">IIC0WUPEN</a>   | IIC0 Address Match Interrupt Software Standby Returns Enable   | 0: Disable Software Standby returns by IIC0 address match interrupts<br>1: Enable Software Standby returns by IIC0 address match interrupts.     | R/W |

The bits in this register control whether the associated interrupt can wake up the CPU from Software Standby mode.

#### **[IRQWUPEN\[15:0\]](#) bits (IRQ Interrupt Software Standby Returns Enable)**

The [IRQWUPEN\[15:0\]](#) bits enable the use of IRQn interrupts to cancel Software Standby mode.

#### **[IWDTWUPEN](#) bit (IWDT Interrupt Software Standby Returns Enable)**

The [IWDTWUPEN](#) bit enables the use of IWDT interrupts to cancel Software Standby mode.

#### **[KEYWUPEN](#) bit (Key Interrupt Software Standby Returns Enable)**

The [KEYWUPEN](#) bit enables the use of key interrupts to cancel Software Standby mode.

#### **[LVD1WUPEN](#) bit (LVD1 Interrupt Software Standby Returns Enable)**

The [LVD1WUPEN](#) bit enables the use of LVD1 interrupts to cancel Software Standby mode.

#### **[LVD2WUPEN](#) bit (LVD2 Interrupt Software Standby Returns Enable)**

The [LVD2WUPEN](#) bit enables the use of LVD2 interrupts to cancel Software Standby mode.

#### **[ACMPHS0WUPEN](#) bit (ACMPHS0 Interrupt Software Standby Returns Enable)**

The [ACMPHS0WUPEN](#) bit enables the use of ACMPHS0 interrupts to cancel Software Standby mode.

#### **[RTCALMWUPEN](#) bit (RTC Alarm Interrupt Software Standby Returns Enable)**

The [RTCALMWUPEN](#) bit enables the use of RTC alarm interrupts to cancel Software Standby mode.

#### **[RTCPRDWUPEN](#) bit (RTC Period Interrupt Software Standby Returns Enable)**

The [RTCPRDWUPEN](#) bit enables the use of RTC period interrupts to cancel Software Standby mode.

**USBFSWUPEN bit (USBFS Interrupt Software Standby Returns Enable)**

The USBFSWUPEN bit enables the use of USBFS interrupts to cancel Software Standby mode.

**AGT1UDWUPEN bit (AGT1 Underflow Interrupt Software Standby Returns Enable)**

The AGT1UDWUPEN bit enables the use of AGT1 underflow interrupts to cancel Software Standby mode.

**AGT1CAWUPEN bit (AGT1 Compare Match A Interrupt Software Standby Returns Enable)**

The AGT1CAWUPEN bit enables the use of AGT1 compare match A interrupts to cancel Software Standby mode.

**AGT1CBWUPEN bit (AGT1 Compare Match B Interrupt Software Standby Returns Enable)**

The AGT1CBWUPEN bit enables the use of AGT1 compare match B interrupts to cancel Software Standby mode.

**IIC0WUPEN bit (IIC0 Address Match Interrupt Software Standby Returns Enable)**

The IIC0WUPEN bit enables the use of IIC0 interrupts to cancel Software Standby mode.

### 14.3 Vector Table

The ICU detects two types of interrupts, maskable and non-maskable. Interrupt priorities are set up in the Arm NVIC. See the NVIC chapter of the *ARM® Cortex®-M4 Processor Technical Reference Manual* (ARM DDI 0439D).

#### 14.3.1 Interrupt Vector Table

Table 14.3 describes the interrupt vectors. The addresses conform to the NVIC specifications.

**Table 14.3** Interrupt vector table (1 of 3)

| Exception number | IRQ number | Vector offset | Source     | Description  |
|------------------|------------|---------------|------------|--|
| 0                | -          | 000h          | Arm        | Initial stack pointer                                |
| 1                | -          | 004h          | Arm        | Initial program counter (reset vector)               |
| 2                | -          | 008h          | Arm        | Non-maskable interrupt (NMI)                         |
| 3                | -          | 00Ch          | Arm        | Hard fault   |
| 4                | -          | 010h          | Arm        | MemManage fault                                      |
| 5                | -          | 014h          | Arm        | Bus fault  |
| 6                | -          | 018h          | Arm        | Usage fault  |
| 7                | -          | 01Ch          | Arm        | Reserved   |
| 8                | -          | 020h          | Arm        | Reserved   |
| 9                | -          | 024h          | Arm        | Reserved   |
| 10               | -          | 028h          | Arm        | Reserved   |
| 11               | -          | 02Ch          | Arm        | Supervisor call (SVCall)                             |
| 12               | -          | 030h          | Arm        | Debug Monitor  |
| 13               | -          | 034h          | Arm        | Reserved   |
| 14               | -          | 038h          | Arm        | Pendable request for system service (PendableSrvReq) |
| 15               | -          | 03Ch          | Arm        | System tick timer (SysTick)                          |
| 16               | 0          | 040h          | ICU.IELSR0 | Event selected in the ICU.IELSR0 register            |
| 17               | 1          | 044h          | ICU.IELSR1 | Event selected in the ICU.IELSR1 register            |
| 18               | 2          | 048h          | ICU.IELSR2 | Event selected in the ICU.IELSR2 register            |
| 19               | 3          | 04Ch          | ICU.IELSR3 | Event selected in the ICU.IELSR3 register            |
| 20               | 4          | 050h          | ICU.IELSR4 | Event selected in the ICU.IELSR4 register            |
| 21               | 5          | 054h          | ICU.IELSR5 | Event selected in the ICU.IELSR5 register            |
| 22               | 6          | 058h          | ICU.IELSR6 | Event selected in the ICU.IELSR6 register            |
| 23               | 7          | 05Ch          | ICU.IELSR7 | Event selected in the ICU.IELSR7 register            |

**Table 14.3** Interrupt vector table (2 of 3)

| Exception number | IRQ number | Vector offset | Source      | Description                                |
|------------------|------------|---------------|-------------|--|
| 24               | 8          | 060h          | ICU.IELSR8  | Event selected in the ICU.IELSR8 register  |
| 25               | 9          | 064h          | ICU.IELSR9  | Event selected in the ICU.IELSR9 register  |
| 26               | 10         | 068h          | ICU.IELSR10 | Event selected in the ICU.IELSR10 register |

| 99               | 83         | 18Ch          | ICU.IELSR83 | Event selected in the ICU.IELSR83 register |
| 100              | 84         | 190h          | ICU.IELSR84 | Event selected in the ICU.IELSR84 register |
| 101              | 85         | 194h          | ICU.IELSR85 | Event selected in the ICU.IELSR85 register |
| 102              | 86         | 198h          | ICU.IELSR86 | Event selected in the ICU.IELSR86 register |
| 103              | 87         | 19Ch          | ICU.IELSR87 | Event selected in the ICU.IELSR87 register |
| 104              | 88         | 1A0h          | ICU.IELSR88 | Event selected in the ICU.IELSR88 register |
| 105              | 89         | 1A4h          | ICU.IELSR89 | Event selected in the ICU.IELSR89 register |
| 106              | 90         | 1A8h          | ICU.IELSR90 | Event selected in the ICU.IELSR90 register |
| 107              | 91         | 1ACh          | ICU.IELSR91 | Event selected in the ICU.IELSR91 register |
| 108              | 92         | 1B0h          | ICU.IELSR92 | Event selected in the ICU.IELSR92 register |
| 109              | 93         | 1B4h          | ICU.IELSR93 | Event selected in the ICU.IELSR93 register |
| 110              | 94         | 1B8h          | ICU.IELSR94 | Event selected in the ICU.IELSR94 register |
| 111              | 95         | 1BCh          | ICU.IELSR95 | Event selected in the ICU.IELSR95 register |

### 14.3.2 Event Numbers

The following table lists heading details for [Table 14.4](#), which describes each event number.

| Heading                              | Description   |
|--------------------------------------|---|
| Interrupt request source             | Name of the source generating the interrupt request   |
| Name                                 | Name of the interrupt   |
| Connect to NVIC                      | "√" indicates the interrupt can be used as a CPU interrupt (IELSRn setting)   |
| Invoke DTC                           | "√" indicates the interrupt can be used to request DTC activation (IELSRn setting)  |
| Invoke DMAC                          | "√" indicates the interrupt can be used to request DMAC activation (DELSRn setting)   |
| Canceling Snooze mode                | "√" indicates the interrupt can be used to request a return from Snooze mode using SELSR0. Otherwise, "√" indicates it can be used directly |
| Canceling Software Standby mode      | "√" indicates the interrupt can be used to request a return from Software Standby mode  |
| Canceling Deep Software Standby mode | "√" indicates the interrupt can be used to request a return from Deep Software Standby mode   |

**Table 14.4** Event table (1 of 8)

| Event number | Interrupt request source | Name          | IELSRn          |            | DELSRn      | Canceling Snooze mode | Canceling Software Standby mode | Canceling Deep Software Standby mode |
|--------------|--------------------------|---------------|-----------------|------------|-------------|-----------------------|---------------------------------|--------------------------------------|
|              |                          |               | Connect to NVIC | Invoke DTC | Invoke DMAC |                       |                                 |                                      |

| 1CEh         |                          | SDHI_MMC1_ODMSDBREQ | -               | ✓          | ✓           | -                     | -                               | -                                    |

Note 1. Only supported when CMPCTL0.CSTEN = 1.

Note 2. Only supported when KRCTL.KRMD = 1.

Note 3. Only the first edge detection is valid.

Note 4. Only interrupts after DTC transfer are supported.

Note 5. Using SELSR0.

## 14.4 Interrupt Operation

The ICU performs the following functions:

- Detecting interrupts
- Enabling and disabling interrupts
- Selecting interrupt request destinations such as CPU interrupt, DTC activation, or DMAC activation.

### 14.4.1 Detecting Interrupts

External pin interrupt requests are detected by either the edge or level (falling edge, rising edge, rising and falling edges, or low level) of the interrupt signal. Set the IRQMD[1:0] bits in the IRQCRi register to select the detection mode for the IRQi pins. For interrupt sources associated with peripheral modules, see [section 14.3.2, Event Numbers](#). Events must be accepted by the NVIC before an interrupt occurs and is accepted by the CPU.

**Figure 14.2** Interrupt path of the ICU and CPU: NVIC

Use the procedures in this section to detect interrupts:

- General operations during an interrupt
  - When a non-software interrupt occurs:  
The IELSRn.IR flag and Interrupt Set/Clear-Pending register (NVIC) are set.
  - When a software interrupt occurs:  
Set the Interrupt Set-Pending register.
  - When an interrupt is complete:  
Clear the IELSRn.IR flag in the software.  
The Interrupt Set/Clear-Pending register clears automatically.
- When interrupts are enabled
  - a. Set the Interrupt Set-Enable register (NVIC).
  - b. Set the IELSRn.IELS bits as the interrupt source.
  - c. Specify the operation settings for the event source.
- When interrupts are disabled
  - d. Disable the settings for the event source.
  - e. Clear the IELSRn.IELS bits (IELSRn.IELS = 0000h). Clear the IELSRn.IR flag as required.
  - f. Clear the Interrupt Clear-Enable register. Clear the Interrupt Clear-Pending register as required.
- When polling for interrupts

- g. Set the Interrupt Clear-Enable register (disabling interrupts).
- h. Set the IELSRn.IELS bits (selecting the source).
- i. Specify the operation settings for the event source.
- j. Poll the Interrupt Set-Pending register.
- k. When polling is no longer required, follow the procedure for clearing an interrupt when it is complete. Clear the IELSRn.IR flag through software.

#### 14.4.2 Selecting Interrupt Request Destinations

The interrupt output destination, CPU, DTC, or DMAC, can be independently selected for each interrupt source. The available destinations are fixed for each interrupt, as described in [Table 14.4](#).

Note: Do not use an interrupt request destination setting that is not indicated by a “✓” in the event list ([Table 14.4](#)).

If you select the CPU or DTC in one IELSRn register, setting the same interrupt factor in any other IELSRn register is prohibited. Similarly, if you select the DMAC in one DELSRn register, setting the same interrupt factor in any other DELSRn register is prohibited.

Note: Setting the same interrupt factor for IELSRn and DELSRn is prohibited.

If the DMAC or DTC is selected as the destination for requests from an IRQi pin, you must set the IRQMD[1:0] bits in IRQCRi for that interrupt to select edge detection.

##### 14.4.2.1 CPU interrupt request

When IELSRn.DTCE = 0, the event specified in the IELSRn register is output to the NVIC. Set the IELSRn.IELS bits to the target event and the IELSRn.DTCE bit to 0.

##### 14.4.2.2 DTC activation

When IELSRn.DTCE = 1, the event specified in the IELSRn register is output to the DTC. After DTC transmission completes, the associated interrupt occurs. Use the following procedure:

1. Set the IELSRn.IELS bits to the target event and the IELSRn.DTCE bit to 1.
2. Set the DTC module start bit (DTCST.DTCST) to 1.

[Table 14.5](#) shows operation when the DTC is the request destination.

**Table 14.5 Operations when the DTC is activated**

| Interrupt request destination | DISEL*1 | Remaining transfer operations | Operations per request       | IR*2  | Interrupt request destination after transfer                       |
|-------------------------------|---------|-------------------------------|------------------------------|---|--|
| DTC*3                         | 1       | ≠ 0                           | DTC transfer → CPU interrupt | Cleared on interrupt acceptance by the CPU                                | DTC  |
|                               |         | = 0                           | DTC transfer → CPU interrupt | Cleared on interrupt acceptance by the CPU                                | The IELSRn.DTCE bit is cleared and the CPU becomes the destination |
|                               | 0       | ≠ 0                           | DTC transfer                 | Cleared at the start of DTC data transfer after DTC transfer data is read | DTC  |
|                               |         | = 0                           | DTC transfer → CPU interrupt | Cleared on interrupt acceptance by the CPU                                | The IELSRn.DTCE bit is cleared and the CPU becomes the destination |

Note 1. Set the interrupt request mode for the DTC in the DTC.MRB.DISEL bit.

Note 2. When the IELSRn.IR flag is 1, an interrupt request (DTC activation request) that occurs again is ignored.

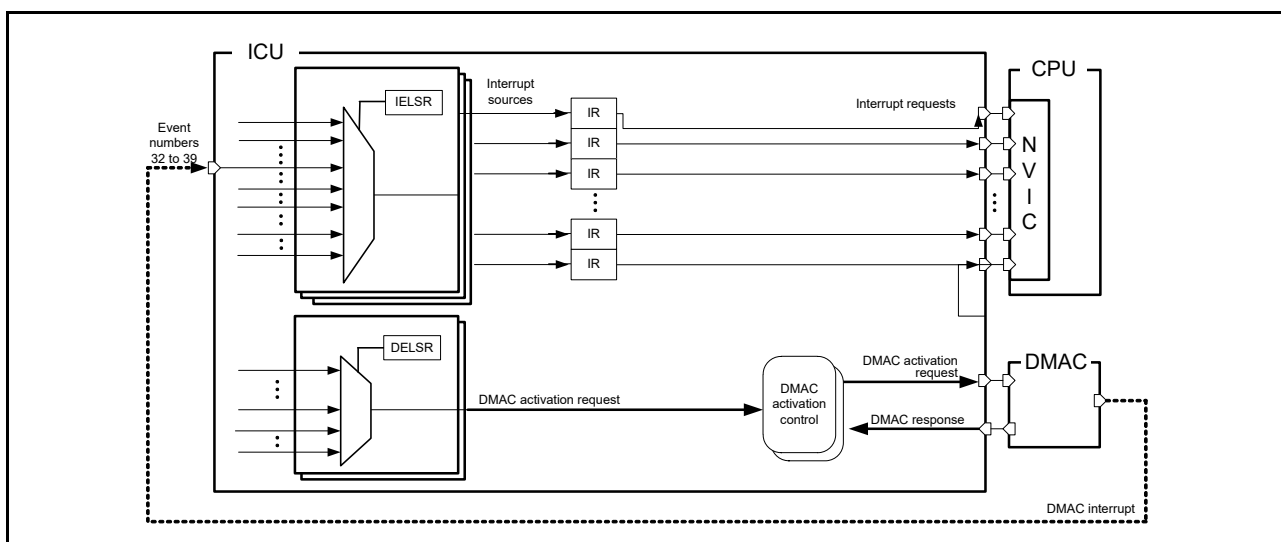

Note 3. For chain transfers, DTC transfer continues until the last chain transfer ends. At this point, the DISEL bit state and the remaining transfer count determine whether a CPU interrupt occurs, the IELSRn.IR flag clear timing, and the interrupt request

destination after transfer. See [Table 18.3, Chain transfer conditions](#), in [section 18, Data Transfer Controller \(DTC\)](#).

### 14.4.2.3 DMAC activation

Events specified in the DELSRn registers are output to the DMAC. When using interrupts, you must select the DMAC as the interrupt source in the IELSRn.IELS[8:0] bits and enable DMAC output by setting IELSRn.DTCE to 1. When IELSRn.DTCE is 0, the events specified in the IELSRn registers are output to the NVIC. Use the following procedure:

1. Set the DELSRn.DELS[8:0] bits to the target event.
2. When using interrupts, set the IELSRn.IELS bit to DMAC interrupts as the source, and set the IELSRn.DTCE bit to 1.
3. Set the activation source for the target DMAC channel (DMACm.DMTMD.DCTG[1:0]) to 01b (interrupt module detection).
4. Set the DMAC transfer enable bit for the target DMAC channel (DMACm.DMCNT.DTE) to 1.
5. Set the DMAC operation enable bit (DMACm.DMAST.DMST) to 1.

**Figure 14.3** DMAC request trigger and interrupt path

### 14.4.3 Digital Filter

A digital filter function is provided for the external interrupt request pins (IRQ<sub>i</sub>, *i* = 0 to 15) and NMI pin interrupt. It samples input signals on the filter PCLKB sampling clock and removes any signal with a pulse width less than 3 sampling cycles.

To use the digital filter for an IRQ<sub>i</sub> pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the IRQCR<sub>i</sub>.FCLKSEL[1:0] bits.
2. Set the IRQCR<sub>i</sub>.FLTEN bit to 1 (digital filter enabled).

To use the digital filter for the NMI pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the NMICR.NFCLKSEL[1:0] bits.
2. Set the NMICR.NFLTEN bit to 1 (digital filter enabled).

[Figure 14.4](#) shows an example of digital filter operation.

**Figure 14.4 Digital filter operation example**

Before entering Software Standby mode, disable the digital filters by clearing the IRQCRi.FLTEN and NMICR.NFLTEN bits. The clock for the ICU stops in Software Standby mode. On exiting Software Standby, the circuit detects the edge by comparing the state before standby to the state after standby release. If the input changes during Software Standby, an incorrect edge might be detected. You can enable the digital filters again after exiting Software Standby mode.

#### 14.4.4 External Pin Interrupts

To use external pin interrupts:

1. Clear the IRQCRi.FLTEN bit ( $i = 0$  to 15) to 0 (digital filter disabled).
2. Set or confirm the I/O port settings.
3. Set the IRQMD[1:0] bits, FCLKSEL[1:0] bits, and FLTEN bit of the IRQCRi register.
4. Select the IRQ pin as follows:
  - If the IRQ pin is to be used for CPU interrupt requests, set the IELSRn.IELS bits and set the IELSRn.DTCE bit to 0
  - If the IRQ pin is to be used for DTC activation, set the IELSRn.IELS bits and set the IELSRn.DTCE bit to 1
  - If the IRQ pin is to be used for DMAC activation, set the DELSRn.DELS bits.

#### 14.5 Non-Maskable Interrupt Operation

The following sources can trigger a non-maskable interrupt:

- NMI pin interrupt
- Oscillation stop detection interrupt
- WDT underflow/refresh error interrupt
- IWDT underflow/refresh error interrupt
- Voltage monitor 1 interrupt
- Voltage monitor 2 interrupt
- SRAM parity error interrupt
- SRAM ECC error interrupt
- MPU bus master error interrupt
- MPU bus slave error interrupt
- CPU stack pointer monitor interrupt.

Non-maskable interrupts can only be used with the CPU, not to activate the DTC or DMAC. Non-maskable interrupts take precedence over all other interrupts. The non-maskable interrupt states can be verified in the Non-Maskable Interrupt Status Register (NMISR). Confirm that all bits in the NMISR are 0 before returning from the NMI handler.

Non-maskable interrupts are disabled by default. To use non-maskable interrupts, you must:

1. Clear the NMICR.NFLTEN bit to 0 (digital filter disabled) to use the NMI pin.
2. Set the NMIMD bit, NFCLKSEL[1:0] bits, and NFLTEN bit of NMICR register to use the NMI pin.
3. Write 1 to the NMICLR.NMICLR bit to clear the NMISR.NMIST flag to 0 to use the NMI pin.
4. Enable the non-maskable interrupt by writing 1 to the associated bit in the Non-Maskable Interrupt Enable Register (NMIER).

After 1 is written to the NMIER register, subsequent write access to the NMIEN bit in NMIER is ignored. An NMI interrupt cannot be disabled when enabled, except by a reset.

## 14.6 Return from Low Power Modes

Table 14.4 lists the interrupt sources you can use to exit Sleep or Software Standby mode. For more information, see section 11, Low Power Modes. Sections 14.6.1 to 14.6.3 describe how to use interrupts to return from Sleep, Software Standby, and Snooze modes. For Deep Software Standby, see section 11.9, Deep Software Standby Mode.

### 14.6.1 Return from Sleep Mode

To return from Sleep mode in response to an interrupt:

1. Select the CPU as the interrupt request destination.
2. Enable the interrupt in the NVIC.

To return from Sleep mode in response to a non-maskable interrupt, use the NMIER register to enable the target interrupt request.

### 14.6.2 Return from Software Standby Mode

The ICU can return from Software Standby mode using a non-maskable interrupt or an interrupt selected in the WUPEN register. See section 14.2.9, Wake Up Interrupt Enable Register (WUPEN).

To return from Software Standby mode:

1. Select the interrupt source that enables return from Software Standby.
  - For non-maskable interrupts, use the NMIER register to enable the target interrupt request
  - For maskable interrupts, use the WUPEN register to enable the target interrupt request.
2. Select the CPU as the interrupt request destination.
3. Enable the interrupt in the NVIC.

Interrupt requests through the IRQ pins that do not satisfy these conditions are not detected while the clock is stopped in Software Standby mode.

### 14.6.3 Return from Snooze Mode

The ICU can return from Snooze mode using the interrupts provided for this mode.

To return to Normal mode from Snooze mode:

1. Use either of the following methods to select the event that you want to trigger a return to Normal mode from Snooze mode:
  - Set the event that you want to trigger a return to Normal mode from Snooze mode in SELSR0.SEL and set the value 02Dh (ICU\_SNZCANCEL) in IELSRn.IELS.
  - Set the event that you want to trigger a return to Normal mode from Snooze mode in IELSRn.IELS.
2. Select the CPU as the interrupt request destination.

3. Enable the interrupt in the NVIC.

Note: In Snooze mode, a clock is supplied to the ICU. If an event selected in IELSRn is detected, the CPU can acknowledge the interrupt after returning to Normal mode from Software Standby mode. If an event selected in DELSRn is detected, the DMAC can acknowledge the interrupt after returning to Normal mode from Software Standby mode.

## 14.7 Using the WFI Instruction with Non-Maskable Interrupts

Whenever a WFI instruction is executed, confirm that all status flags in the NMISR register are 0.

## 14.8 Reference

*ARM® Cortex®-M4 Processor Technical Reference Manual (ARM DDI 0439D).*

## 15. Buses

### 15.1 Overview

Table 15.1 lists the bus specifications, Figure 15.1 shows the bus configuration, and Table 15.2 lists the addresses assigned for each bus.

This bus interface can also apply to connect LCD Intel 8080 and Motorola 6800 interfaces.

**Table 15.1 Bus specifications**

| Bus type                  |  | Specifications   |
|---------------------------|--|--|
| Main bus                  | ICode bus (CPU)  | <ul style="list-style-type: none"> <li>Connected to the CPU</li> <li>Connected to the on-chip memory (code flash memory, SRAMHS).</li> </ul>                                   |
|                           | DCode bus (CPU)  | <ul style="list-style-type: none"> <li>Connected to the CPU</li> <li>Connected to the on-chip memory (code flash memory, SRAMHS).</li> </ul>                                   |
|                           | System bus (CPU)   | <ul style="list-style-type: none"> <li>Connected to the CPU</li> <li>Connected to the on-chip memory, internal peripheral buses, and external bus.</li> </ul>                  |
|                           | DMA bus  | <ul style="list-style-type: none"> <li>Connected to the DMAC and DTC</li> <li>Connected to the on-chip memory, internal peripheral buses, and external bus.</li> </ul>         |
|                           | ETHER bus  | <ul style="list-style-type: none"> <li>Connected to the EDMAC</li> <li>Connected to the on-chip memory, internal peripheral buses, and external bus.</li> </ul>                |
| Slave interface           | Memory bus 1   | <ul style="list-style-type: none"> <li>Connected to code flash memory</li> </ul>   |
|                           | Memory bus 2   | <ul style="list-style-type: none"> <li>Connected to SRAMHS</li> </ul>  |
|                           | Memory bus 3   | <ul style="list-style-type: none"> <li>Connected to code flash memory and SRAMHS through the DMA bus and ETHER bus</li> </ul>  |
|                           | Memory bus 4   | <ul style="list-style-type: none"> <li>Connected to SRAM0</li> </ul>   |
|                           | Memory bus 5   | <ul style="list-style-type: none"> <li>Connected to Standby SRAM</li> </ul>  |
|                           | Internal peripheral bus 1  | <ul style="list-style-type: none"> <li>Connected to system control related to peripheral modules</li> </ul>  |

|                           | QSPI area  | <ul style="list-style-type: none"> <li>Connected to the external SPI devices</li> </ul>  |

Note 1. P/E: Programming and erasure.

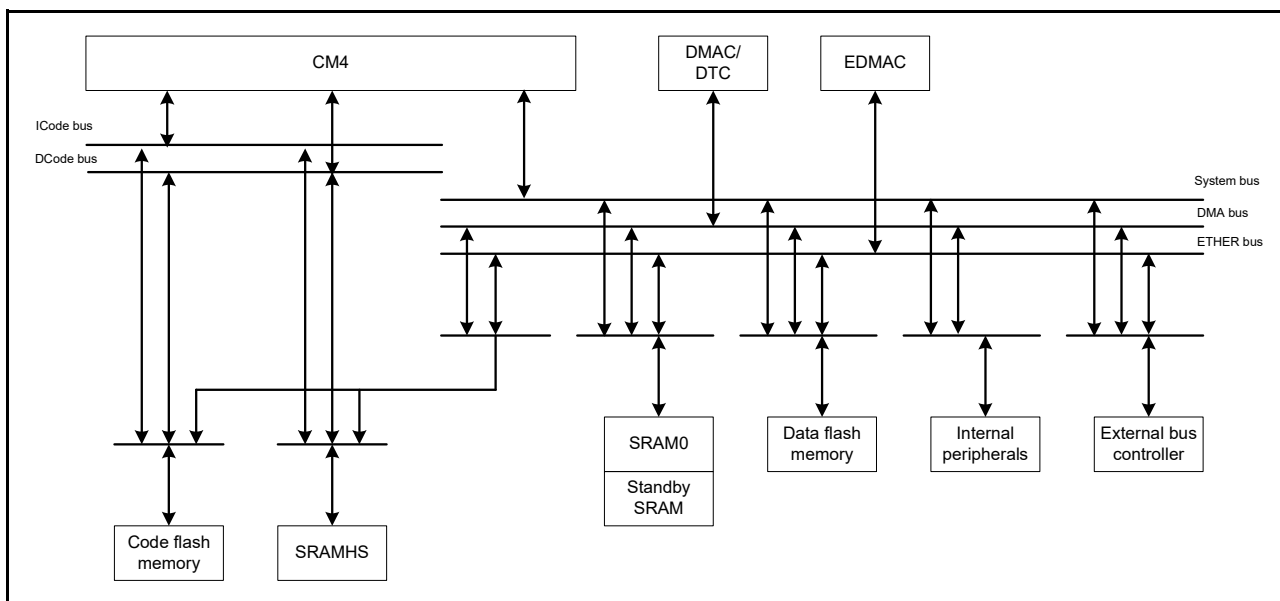

Figure 15.1 Bus configuration

Table 15.2 Addresses assigned for each bus

| Addresses                | Bus                       | Area  |
|--------------------------|---------------------------|---|
| 0000 0000h to 01FF FFFFh | Memory bus 1, 3           | Code flash memory                                   |
| 1FFE 0000h to 1FFF FFFFh | Memory bus 2, 3           | SRAMHS  |
| 2000 0000h to 2003 FFFFh | Memory bus 4              | SRAM0   |
| 2004 0000h to 200F FFFFh | Memory bus 5              | Standby SRAM  |
| 4000 0000h to 4001 FFFFh | Internal peripheral bus 1 | Peripheral I/O registers                            |
| 4004 0000h to 4005 FFFFh | Internal peripheral bus 3 |   |
| 4006 0000h to 4007 FFFFh | Internal peripheral bus 4 |   |
| 4008 0000h to 4009 FFFFh | Internal peripheral bus 5 |   |
| 400C 0000h to 400D FFFFh | Internal peripheral bus 7 |   |
| 4010 0000h to 407F FFFFh | Internal peripheral bus 9 | Flash memory (in P/E*1), data flash memory, and TSN |
| 6000 0000h to 67FF FFFFh | External bus              | QSPI area   |
| 8000 0000h to 97FF FFFFh | External bus              | CS area and SDRAM area                              |

Note 1. P/E: Programming and erasure.

## 15.2 Description of Buses

### 15.2.1 Main Buses

The main buses for the CPU constitute the ICode bus, DCode bus, and system bus:

- The ICode and DCode buses are connected to the code flash memory and SRAMHS. The ICode bus is used for instruction access to the CPU, and the DCode bus is used for data access to the CPU.
- The system bus is connected to the SRAM0, Standby SRAM, data flash memory, internal peripheral buses, and external bus. It is used for instruction and data accesses to the CPU.

The main bus for modules other than the CPU consists of the DMA bus, and ETHER bus:

- The DMA bus is connected to the code flash memory, SRAMHS, SRAM0, Standby SRAM, data flash memory, and external bus
- The ETHER bus is connected to the code flash memory, SRAMHS, SRAM0, Standby SRAM, data flash memory,

and external bus.

Different master and slave transfer combinations can proceed simultaneously.

Arbitration between the DMAC and DTC for the mastership of the DMA bus occurs in the DMAC and DTC. The following fixed-priority order is used:

DMAC0 > DMAC1 > DMAC2 > DMAC3 > DMAC4 > DMAC5 > DMAC6 > DMAC7 > DTC.

Only one DTC and DMAC channels that have accepted the activation requests can issue the bus mastership request. In addition, requests for bus access from masters other than the DTC are not accepted during reads of transfer control information for the DTC.

The arbitration protocol is selectable as either fixed-priority or round-robin. For more information, see [section 15.3.19, Slave Bus Control Register \(BUSSCNT<slave>\)](#).

## 15.2.2 Slave Interface

Products using the Cortex<sup>®</sup>-M4 core contain ICode and DCode bus areas and a system bus area.

To create the ICode and DCode bus areas, a bus matrix connects the ICode bus, DCode bus, and memory bus 3 from the main bus to the slave interfaces of the code flash memory and SRAMHS. Bus access to the slave interfaces is arbitrated between the three buses. The arbitration protocol is selectable as either fixed-priority or round-robin. For more information, see [section 15.3.19, Slave Bus Control Register \(BUSSCNT<slave>\)](#).

To create the system bus area, a bus matrix connects the system bus, DMA bus, and ETHER bus from the main bus to the slave interfaces of the SRAM0, Standby SRAM, data flash memory, internal peripherals, and external bus. Bus access to the slave interfaces is arbitrated between the three buses. The arbitration protocol is selectable as either fixed-priority or round-robin. For more information, see [section 15.3.19, Slave Bus Control Register \(BUSSCNT<slave>\)](#).

For connections from the main bus to the slave interfaces, see the slave interfaces in [Table 15.1](#). For a description of the external bus, see [section 15.2.3, External Bus](#).

Different master and slave transfer combinations can proceed simultaneously.

## 15.2.3 External Bus

The external bus controller arbitrates requests for bus access on the external address space from the CPU system bus, DMAC bus, and ETHER bus. The priority order can be set using the external bus priority control bits (BUSSCNT.ARBMET[1:0]). For more information, see [section 15.3.19, Slave Bus Control Register \(BUSSCNT<slave>\)](#).

The bus system provides an external space for the QSPI. See [section 37, Quad Serial Peripheral Interface \(QSPI\)](#).

[Table 15.3](#) lists the external bus specifications and [Table 15.4](#) lists the I/O pins.

**Table 15.3 External bus specifications (1 of 2)**

| Parameter              | Specifications   |
|------------------------|--|
| External address space | <ul style="list-style-type: none"> <li>• The external address space is divided into 8 CS areas (CS0 to CS7) and the SDRAM area (SDCS) for management</li> <li>• Chip select signals can be output for each area</li> <li>• The bus width can be set for each area:               <ul style="list-style-type: none"> <li>- Separate bus: Selectable to 8-bit or 16-bit bus space</li> <li>- Address/data multiplexed bus: Selectable to 8-bit or 16-bit bus space</li> </ul> </li> <li>• Endian mode can be specified for each area.</li> </ul> |

**Table 15.3 External bus specifications (2 of 2)**

| Parameter             | Specifications   |
|-----------------------|--|
| CS area controller    | <ul style="list-style-type: none"> <li>Recovery cycles can be inserted: <ul style="list-style-type: none"> <li>Read recovery: Up to 15 cycles</li> <li>Write recovery: Up to 15 cycles</li> </ul> </li> <li>Cycle wait function: Wait for up to 31 cycles (for page access, up to 7 cycles)</li> <li>Use wait control to set up: <ul style="list-style-type: none"> <li>Assertion and negation timing of chip select signals (CS0 to CS7)</li> <li>Assertion timing of the read signal (RD) and write signals (WR0/WR and WR1)</li> <li>Timing of data output starts and ends</li> </ul> </li> <li>Write access modes: <ul style="list-style-type: none"> <li>Single-write strobe mode and byte strobe mode</li> </ul> </li> <li>Separate bus or address/data multiplexed bus can be set for each area.</li> </ul> |

Half of the BCLK cycles can be supplied by setting the EBCLK Pin Output Select bit, BCKCR.BCLKDIV, in the External Bus Clock Control Register. For more information, see <a href="#">section 9, Clock Generation Circuit</a>.</li> <li>The SDRAM area controller (SDRAMC) operates in synchronization with the SDRAM clock (SDCLK).</li> </ul>   |

Note 1. BCLK and SDCLK must operate at the same frequency when the SDRAM is in use.

**Table 15.4 External bus I/O pins (1 of 2)**

| Pin name                   | I/O    |             | Description   |
|----------------------------|--------|-------------|---|
| EBCLK, SDCLK*1             | Output | CSC, SDRAMC | Clock output pin  |
| A20 to A00*2               | Output | CSC, SDRAMC | Address output pins   |
| D15 to D00<br>DQ15 to DQ00 | I/O    | CSC, SDRAMC | D15 to D00 are CSC data input/output pins<br>DQ15 to DQ00 are SDRAMC data input/output pins <ul style="list-style-type: none"> <li>D015 to D00, DQ15 to DQ00 pins are enabled when the 16-bit bus space is specified</li> <li>D07 to D00, DQ07 to DQ00 pins are enabled when the 8-bit bus space is specified.</li> </ul>   |
| BC0                        | Output | CSC         | <ul style="list-style-type: none"> <li>Strobe signal that indicates (when low) that D07 to D00 are valid during access to an external address space in single-write strobe mode, active-low</li> <li>When an 8-bit bus space is specified, this output pin is always held low regardless of the write access mode.</li> </ul>   |
| BC1                        | Output | CSC         | <ul style="list-style-type: none"> <li>Strobe signal that indicates (when low) that D15 to D08 are valid during access to an external address space in single-write strobe mode, active-low</li> <li>This pin is not used when the 8-bit bus space is specified.</li> </ul>   |
| CS0*3                      | Output | CSC         | Chip select signal for area 0 (CS0), active-low   |
| CS1*3                      | Output | CSC         | Chip select signal for area 1 (CS1), active-low   |
| CS2*3                      | Output | CSC         | Chip select signal for area 2 (CS2), active-low   |
| CS3*3                      | Output | CSC         | Chip select signal for area 3 (CS3), active-low   |
| CS4                        | Output | CSC         | Chip select signal for area 4 (CS4), active-low   |
| CS5                        | Output | CSC         | Chip select signal for area 5 (CS5), active-low   |
| CS6                        | Output | CSC         | Chip select signal for area 6 (CS6), active-low   |
| CS7                        | Output | CSC         | Chip select signal for area 7 (CS7), active-low   |
| RD                         | Output | CSC         | Strobe signal that indicates that a read from an external address space (CS0 to CS7) is in progress, active-low   |
| WR0/WR*4                   | Output | CSC         | <ul style="list-style-type: none"> <li>WR0 signal is a strobe signal that indicates that a write to an external address space is in progress in byte strobe mode, and D07 to D00 are valid, active-low</li> <li>WR signal is a strobe signal that indicates that a write to an external address space is in progress in single-write strobe mode, active-low</li> <li>When an 8-bit bus space is specified, this output pin is held low during a write access regardless of the write access mode.</li> </ul> |

**Table 15.4 External bus I/O pins (2 of 2)**

| Pin name | I/O    |        | Description   |
|----------|--------|--------|---|
| WR1      | Output | CSC    | <ul style="list-style-type: none"> <li>Strobe signal that indicates that D15 to D08 are valid during a write to an external address space in byte strobe mode, active-low</li> <li>This signal is invalid in single-write strobe mode</li> <li>This pin is not used when the 8-bit bus space is specified.</li> </ul> |
| ALE      | Output | CSC    | Address latch signal when address/data multiplexed bus is selected  |
| WAIT     | Input  | CSC    | Wait request signal used when accessing the external address space (CS0 to CS7), active-low   |
| CKE      | Output | SDRAMC | Clock enable signal   |
| SDCS     | Output | SDRAMC | Chip select signal, active-low  |
| RAS      | Output | SDRAMC | Row address strobe signal, active-low   |
| CAS      | Output | SDRAMC | Column address strobe signal, active-low  |
| WE       | Output | SDRAMC | Write enable signal, active-low   |
| DQM0     | Output | SDRAMC | I/O data mask enable signal for DQ07 to DQ00  |
| DQM1     | Output | SDRAMC | I/O data mask enable signal for DQ15 to DQ08  |

Note 1. The EBCLK and the SDCLK pin functions are shared by the CS area controller (CSC) and the SDRAM area controller (SDRAMC).

When using the CSC and the SDRAMC simultaneously, the SDCLK pin function is valid.

Note 2. The A20 to A00 pin functions are shared by the CSC and the SDRAMC.

When using the CSC only:

The A00 and BC0 pin functions share the same pin, and either becomes valid according to the area, with the function being A00 in byte strobe mode and BC0 in single-write strobe mode. Setting the 8-bit external bus width is prohibited in single-write strobe mode.

When using the SDRAMC only:

The A15 to A00 pin functions are valid.

The A00 and DQM1 pin functions share the same pin, and either becomes valid according to the external bus width.

When selecting 8-bit bus width, the pin function is A00. When selecting 16-bit bus width, the pin function is DQM1.

When using the CSC and the SDRAMC simultaneously:

The A20 to A16 pin functions are valid for CSC. The A15 to A00 pin functions are shared by the CSC and the SDRAMC.

In the SDRAMC functions, the A00 and the DQM1 pin function works as described.

In the CSC functions, the A00 and the BC0 pin function works as described.

Note 3. The CS0 to CS3 (CSC) and SDRAMC pin functions share the same pin. When using the CSC and the SDRAMC simultaneously, the CS0 to CS3 pin functions are invalid.

Note 4. The WR0 signal and WR signal are identical. The WR0 signal is referred to as WR in single-write strobe mode.

### 15.2.4 Parallel Operations

Parallel operations are possible when different bus masters request access to different slave modules. For example, if the CPU fetches an instruction from the flash and an operand from the SRAM, the DMAC can handle transfers between a peripheral bus and the external bus at the same time.

An example of parallel operations is shown in [Figure 15.2](#). In this example, the CPU uses the instruction and operand buses for simultaneous access to the flash and SRAM, respectively. Additionally, the DMAC/DTC, and EDMAC simultaneously use the DMA bus (DMAC/DTC), and ETHER bus (EDMAC) for access to a peripheral bus or external bus during access to the flash memory and SRAM by the CPU.

Figure 15.2 Example of parallel operations

### 15.2.5 Bus Settings

Set up the external bus with the following registers:

- Mode settings:  
CSn Mode Register (CSnMOD), CSn Wait Control Register 1 (CSnWCR1), CSn Wait Control Register 2 (CSnWCR2), CSn Control Register (CSnCR), CSn Recovery Cycle Setting Register (CSnREC), CS Recovery Cycle Insertion Enable Register (CSRECEN), and Bus Priority Control Register (BUSSCNT)
- I/O port assignments:  
PmnPFS.PMR = 1 and PmnPFS.PSEL[4:0] = 0Bh
- Frequency of the external bus clock (BCLK) and SDRAM clock (SDCLK):  
SCKDIVCR register.

See [section 20, I/O Ports](#), for information on PmnPFS and [section 9, Clock Generation Circuit](#) for information on SCKDIVCR.

### 15.2.6 Restrictions

#### (1) Endianness constraint

Memory space must be little-endian to execute code on the Cortex®-M4 core.

## 15.3 Register Descriptions

### 15.3.1 CSn Control Register (CSnCR) (n = 0 to 7)

Address(es): [BUS.CS0CR 4000 3802h](#)

Value after reset:

| Bit | Symbol | Bit name         | Description                                  | R/W |
|-----|--------|------------------|--|-----|
| b0  | EXENB  | Operation Enable | 0: Disable operation<br>1: Enable operation. | R/W |

| Bit        | Symbol            | Bit name                                      | Description   | R/W |
|------------|-------------------|---|---|-----|
| b3 to b1   | —                 | Reserved                                      | These bits are read as 0. The write value should be 0.  | R/W |
| b5, b4     | <b>BSIZE[1:0]</b> | External Bus Width Select                     | b5 b4<br>0 0: 16-bit bus space<br>0 1: Setting prohibited<br>1 0: 8-bit bus space<br>1 1: Setting prohibited.                       | R/W |
| b7, b6     | —                 | Reserved                                      | These bits are read as 0. The write value should be 0.  | R/W |
| b8         | <b>EMODE</b>      | Endian Mode                                   | 0: Little-endian<br>1: Big-endian.  | R/W |
| b11 to b9  | —                 | Reserved                                      | These bits are read as 0. The write value should be 0.  | R/W |
| b12        | <b>MPXEN</b>      | Address/Data Multiplexed I/O Interface Select | 0: Separate bus interface is selected for area n<br>1: Address/data multiplexed I/O interface is selected for area n. (n = 0 to 7). | R/W |
| b15 to b13 | —                 | Reserved                                      | These bits are read as 0. The write value should be 0.  | R/W |

Do not attempt to write to the CSnCR register while the external bus is being accessed.

#### **EXENB bit (Operation Enable)**

The EXENB bit enables operation of the associated CS area. On MCU reset, operation is enabled (EXENB = 1) only for area 0. Operation in other areas is disabled (EXENB = 0). Attempts to access disabled areas have no effect.

When the CSC and SDRAMC are in use at the same time, BCLK and SDCLK must operate at the same frequency.

#### **BSIZE[1:0] bits (External Bus Width Select)**

The BSIZE[1:0] bits specify the data bus width for the associated area.

#### **EMODE bit (Endian Mode)**

The EMODE bit specifies the endianness for the associated area. The Cortex<sup>®</sup>-M4 core is fixed at little-endian order, so instruction code can only be allocated to external spaces with little-endian specified. If an area is specified as big-endian, no instruction code can be allocated to it.

#### **MPXEN bit (Address/Data Multiplexed I/O Interface Select)**

The MPXEN bit specifies separate bus interface or address/data multiplexed I/O interface of each area.

### 15.3.2 CSn Recovery Cycle Register (CSnREC) (n = 0 to 7)

Address(es): [BUS.CS0REC 4000 380Ah](#), [BUS.CS1REC 4000 381Ah](#), [BUS.CS2REC 4000 382Ah](#), [BUS.CS3REC 4000 383Ah](#),  
[BUS.CS4REC 4000 384Ah](#), [BUS.CS5REC 4000 385Ah](#), [BUS.CS6REC 4000 386Ah](#), [BUS.CS7REC 4000 387Ah](#)

| Bit        | Symbol                    | Bit name                          | Description   | R/W |    |  |       |   |                                   |       |   |                         |       |   |                          |       |   |                          |       |   |                          |       |   |                          |       |   |                          |       |   |                          |       |   |                          |       |   |                          |       |   |                           |       |   |                           |       |   |                           |       |   |                           |       |   |                           |       |   |                            |     |

| b15 to b12 | —                         | Reserved                          | These bits are read as 0. The write value should be 0.  | R/W |    |  |       |   |                                   |       |   |                         |       |   |                          |       |   |                          |       |   |                          |       |   |                          |       |   |                          |       |   |                          |       |   |                          |       |   |                          |       |   |                           |       |   |                           |       |   |                           |       |   |                           |       |   |                           |       |   |                            |     |

Do not attempt to write to the CSnREC register while the external bus is being accessed.

When the preceding bus access is from a separate bus, CSnREC is valid when the recovery cycle insertion is enabled in the Separate Bus Recovery Cycle Insertion Enable bit (RCVEN<sub>i</sub> (i = 0 to 7)) in CSRECEN. When the preceding bus access is an address/data multiplexed bus access, CSnREC is valid when the recovery cycle insertion is enabled with the Multiplexed Bus Recovery Cycle Insertion Enable bit (RCVENM<sub>j</sub> (j = 0 to 7)) in CSRECEN. For more information, see [section 15.5.4, Insertion of Recovery Cycles](#).

#### [RRCV\[3:0\] bits \(Read Recovery\)](#)

The RRCV[3:0] bits specify the number of recovery cycles inserted after a read access on the external bus for CSn (n = 0 to 7). When recovery cycle insertion is enabled and a value other than 0000b is set, 1 to 15 recovery cycles are inserted when:

- After a read access to the external bus, a read access is made to the external bus in the same area

- After a read access to the external bus, a read access is made to the external bus in a different area
- After a read access to the external bus, a write access is made to the external bus in the same area
- After a read access to the external bus, a write access is made to the external bus in a different area.

### WRCV[3:0] bits (Write Recovery)

The WRCV[3:0] bits specify the number of recovery cycles inserted after a write access on the external bus for CS<sub>n</sub> (n = 0 to 7). When recovery cycle insertion is enabled and a value other than 0000b is set, 1 to 15 recovery cycles are inserted when:

- After a write access to the external bus, a read access is made to the external bus in the same area
- After a write access to the external bus, a read access is made to the external bus in a different area
- After a write access to the external bus, a write access is made to the external bus in the same area
- After a write access to the external bus, a write access is made to the external bus in a different area.

### 15.3.3 CS Recovery Cycle Insertion Enable Register (CSRECEN)

Do not attempt to write to the CSRECEN register while the external bus is being accessed. For more information on insertion recovery cycles, see [15.5.4 Insertion of Recovery Cycles](#).

#### RCVEN<sub>i</sub> bit (Separate Bus Recovery Cycle Insertion Enable i) (i = 0 to 7)

The RCVEN<sub>i</sub> bit enables the insertion of read or write recovery cycles when, after a read or write access on the external bus, a read or write access is made on the external bus to the same or different area.

#### RCVENM<sub>j</sub> bit (Multiplexed Bus Recovery Cycle Insertion Enable j) (j = 0 to 7)

The RCVENM<sub>j</sub> bit enables the insertion of read or write recovery cycles when, after a read or write access on the external bus, a read or write access is made on the external bus to the same or different area.

**Table 15.5** Insertion of recovery cycles

| Access type                     | External address space | Insertion of recovery cycles  | Associated bits (Separate/Multiplexed) |
|---------------------------------|------------------------|---|--|
| Read access after read access   | Same area              | Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area | RCVEN0/RCVENM0                         |
|                                 | Different area         | Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area | RCVEN1/RCVENM1                         |
| Write access after read access  | Same area              | Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area | RCVEN2/RCVENM2                         |
|                                 | Different area         | Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area | RCVEN3/RCVENM3                         |
| Read access after write access  | Same area              | Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area | RCVEN4/RCVENM4                         |
|                                 | Different area         | Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area | RCVEN5/RCVENM5                         |

### 15.3.4 CSn Mode Register (CSnMOD) (n = 0 to 7)

Address(es): [BUS.CS0MOD 4000 3002h](#), [BUS.CS1MOD 4000 3012h](#), [BUS.CS2MOD 4000 3022h](#), [BUS.CS3MOD 4000 3032h](#),  
[BUS.CS4MOD 4000 3042h](#), [BUS.CS5MOD 4000 3052h](#), [BUS.CS6MOD 4000 3062h](#), [BUS.CS7MOD 4000 3072h](#)

|       |     |     |     |     |     |       |       |    |    |    |    |       |    |    |       |
|-------|-----|-----|-----|-----|-----|-------|-------|----|----|----|----|-------|----|----|-------|
| b15   | b14 | b13 | b12 | b11 | b10 | b9    | b8    | b7 | b6 | b5 | b4 | b3    | b2 | b1 | b0    |
| PRMOD | —   | —   | —   | —   | —   | PWENB | PRENB | —  | —  | —  | —  | EWENB | —  | —  | WRMOD |
| 0     | 0   | 0   | 0   | 0   | 0   | 0     | 0     | 0  | 0  | 0  | 0  | 0     | 0  | 0  | 0     |

Value after reset:

| Bit        | Symbol                | Bit name                     | Description  | R/W |
|------------|-----------------------|------------------------------|--|-----|
| b0         | <a href="#">WRMOD</a> | Write Access Mode Select     | 0: Byte strobe mode<br>1: Single-write strobe mode.                                  | R/W |
| b2, b1     | —                     | Reserved                     | These bits are read as 0. The write value should be 0.                               | R/W |
| b3         | <a href="#">EWENB</a> | External Wait Enable         | 0: Disable<br>1: Enable.   | R/W |
| b7 to b4   | —                     | Reserved                     | These bits are read as 0. The write value should be 0.                               | R/W |
| b8         | <a href="#">PRENB</a> | Page Read Access Enable      | 0: Disable<br>1: Enable.   | R/W |
| b9         | <a href="#">PWENB</a> | Page Write Access Enable     | 0: Disable<br>1: Enable.   | R/W |
| b14 to b10 | —                     | Reserved                     | These bits are read as 0. The write value should be 0.                               | R/W |
| b15        | <a href="#">PRMOD</a> | Page Read Access Mode Select | 0: Normal access compatible mode<br>1: External data read continuous assertion mode. | R/W |

Do not write to the CSnMOD register while access to the CSn area is in progress.

#### [WRMOD](#) bit (Write Access Mode Select)

The WRMOD bit selects the write access operating mode. Writing 0 selects byte strobe mode, in which data writes are controlled by the WRn signals (n = 0 to 1) associated with the respective byte positions. Writing 1 selects single-write strobe mode, in which data writes are controlled by the BCn (n = 0 to 1) and WR signals associated with the respective byte positions.

Note: Setting the external bus width to 8 bits is prohibited in single-write strobe mode.

**Table 15.6 Control signals for write access modes**

| Write access mode        | Pin name |         |     |     |
|--------------------------|----------|---------|-----|-----|
|                          | WR1      | WR0/WR  | BC1 | BC0 |
| Byte strobe mode         | ✓        | ✓ (WR0) | ×   | ×   |
| Single-write strobe mode | ×        | ✓ (WR)  | ✓   | ✓   |

✓: Enabled, ×: Disabled

#### [EWENB](#) bit (External Wait Enable)

The EWENB bit enables external waits. Writing 0 disables the WAIT signal. Writing 1 selects external wait and allows the WAIT signal to control the number of waits per cycle. In this state, wait cycles are inserted when the WAIT signal is low.

#### [PRENB](#) bit (Page Read Access Enable)

The PRENB bit enables page read accesses.

Note: When the address/data multiplexed I/O interface is selected with the CSnCR.MPXEN bit, PRENB should not be set to enable page read accesses. Page read accesses are not supported in the address/data multiplexed I/O interface.

**PWENB bit (Page Write Access Enable)**

The PWENB bit enables page write accesses.

Note: When the address/data multiplexed I/O interface is selected with the CSnCR.MPXEN bit, PWENB should not be set to enable page write accesses. Page write accesses are not supported in the address/data multiplexed I/O interface.

**PRMOD bit (Page Read Access Mode Select)**

The PRMOD bit selects the operating mode for page read accesses. Writing 0 selects normal access compatible mode, in which the RD signal is negated and an RD assert wait is inserted each time a unit of data is read. When there is no RD assert wait, the RD signal is negated only in the final transfer of the external bus access.

Writing 1 selects external data read continuous assertion mode, in which an RD assert wait is inserted and the RD signal is continuously asserted during the wait.

**15.3.5 CSn Wait Control Register 1 (CSnWCR1) (n = 0 to 7)**

Address(es): [BUS.CS0WCR1 4000 3004h](#), [BUS.CS1WCR1 4000 3014h](#), [BUS.CS2WCR1 4000 3024h](#), [BUS.CS3WCR1 4000 3034h](#),  
[BUS.CS4WCR1 4000 3044h](#), [BUS.CS5WCR1 4000 3054h](#), [BUS.CS6WCR1 4000 3064h](#), [BUS.CS7WCR1 4000 3074h](#)

| Bit        | Symbol                        | Bit name                       | Description   | R/W |

| b10 to b8  | <a href="#">CSPRWAIT[2:0]</a> | Page Read Cycle Wait Select*2  | b10 b8<br>0 0 0: Do not insert wait<br>0 0 1: Insert wait of 1 clock cycle<br>0 1 0: Insert wait of 2 clock cycles<br>0 1 1: Insert wait of 3 clock cycles<br>1 0 0: Insert wait of 4 clock cycles<br>1 0 1: Insert wait of 5 clock cycles<br>1 1 0: Insert wait of 6 clock cycles<br>1 1 1: Insert wait of 7 clock cycles. | R/W |
| b15 to b11 | —                             | Reserved                       | These bits are read as 0. The write value should be 0.  | R/W |

| Bit        | Symbol       | Bit name                       | Description  | R/W |
|------------|--------------|--------------------------------|--|-----|
| b20 to b16 | CSWWAIT[4:0] | Normal Write Cycle Wait Select | b20      b16<br>0 0 0 0: Do not insert wait<br>0 0 0 1: Insert wait of 1 clock cycle<br>0 0 1 0: Insert wait of 2 clock cycles<br>0 0 1 1: Insert wait of 3 clock cycles<br>...<br>1 1 1 0: Insert wait of 29 clock cycles<br>1 1 1 1: Insert wait of 30 clock cycles<br>1 1 1 1: Insert wait of 31 clock cycles.  | R/W |
| b23 to b21 | —            | Reserved                       | These bits are read as 0. The write value should be 0.   | R/W |
| b28 to b24 | CSRWAIT[4:0] | Normal Read Cycle Wait Select  | b28      b24<br>0 0 0 0: Do not insert wait<br>0 0 0 1: Insert wait of 1 clock cycle<br>0 0 1 0: Insert wait of 2 clock cycles<br>0 0 1 1: Insert wait of 3 clock cycles.<br>...<br>1 1 1 0: Insert wait of 29 clock cycles<br>1 1 1 1: Insert wait of 30 clock cycles<br>1 1 1 1: Insert wait of 31 clock cycles. | R/W |
| b31 to b29 | —            | Reserved                       | These bits are read as 0. The write value should be 0.   | R/W |

Note 1. The CSPWWAIT[2:0] value is only valid when the CSnMOD.PWENB bit is set to 1.

Note 2. The CSPRWAIT[2:0] value is only valid when the CSnMOD.PRENB bit is set to 1.

Do not attempt to write to the CSnWCR1 register while the external bus is being accessed. Set each of these bits within a range of the restrictions described in [section 15.5.7, Constraints, \(1\) Constraints on using a separate bus interface](#) or [section 15.5.7, Constraints, \(2\) Constraints on using address/data multiplexed bus interface](#), according to the bus interface used.

#### CSPWWAIT[2:0] bits (Page Write Cycle Wait Select)

The CSPWWAIT[2:0] bits specify the number of wait cycles to be inserted into the second and subsequent accesses during a page write cycle. The setting is enabled when the CSnMOD.PWENB bit is set to 1.

Note: The settings must satisfy  $1 \leq \text{CSnWCR2.WDON}[2:0] \text{ value} \leq \text{CSnWCR2.WRON}[2:0] \text{ value} \leq \text{CSnWCR1.CSPWWAIT}[2:0] \text{ value}$ , and  $\text{CSnWCR2.CSON}[2:0] \text{ value} \leq \text{CSnWCR2.WRON}[2:0] \text{ value} \leq \text{CSnWCR1.CSPWWAIT}[2:0] \text{ value}$ .

#### CSPRWAIT[2:0] bits (Page Read Cycle Wait Select)

The CSPRWAIT[2:0] bits specify the number of wait cycles to be inserted into the second and subsequent accesses during a page read cycle. The setting is enabled when the CSnMOD.PRENB bit is set to 1.

Note: The settings must satisfy  $\text{CSnWCR2.CSON}[2:0] \text{ value} \leq \text{CSnWCR2.RDON}[2:0] \text{ value} \leq \text{CSnWCR1.CSPRWAIT}[2:0] \text{ value}$ .

#### CSWWAIT[4:0] bits (Normal Write Cycle Wait Select)

The CSWWAIT[4:0] bits specify the number of wait cycles to be inserted into the first access during a normal write cycle or page write cycle.

Note: The settings must satisfy  $1 \leq \text{CSnWCR2.WDON}[2:0] \text{ value} \leq \text{CSnWCR2.WRON}[2:0] \text{ value} \leq \text{CSnWCR1.CSWWAIT}[4:0] \text{ value}$ , and  $\text{CSnWCR2.CSON}[2:0] \text{ value} \leq \text{CSnWCR2.WRON}[2:0] \text{ value} \leq \text{CSnWCR1.CSWWAIT}[4:0] \text{ value}$ .

#### CSRWAIT[4:0] bits (Normal Read Cycle Wait Select)

The CSRWAIT[4:0] bits specify the number of wait cycles to be inserted into the first access during a normal read cycle or page read cycle.

Note: The settings must satisfy CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.RDON[2:0] value  $\leq$  CSnWCR1.CSRWAIT[4:0] value.

### 15.3.6 CSn Wait Control Register 2 (CSnWCR2) (n = 0 to 7)

Address(es): [BUS.CS0WCR2 4000 3008h](#), [BUS.CS1WCR2 4000 3018h](#), [BUS.CS2WCR2 4000 3028h](#), [BUS.CS3WCR2 4000 3038h](#), [BUS.CS4WCR2 4000 3048h](#), [BUS.CS5WCR2 4000 3058h](#), [BUS.CS6WCR2 4000 3068h](#), [BUS.CS7WCR2 4000 3078h](#)

| b30 to b28 | <a href="#">CSON[2:0]</a> | CS Assert Wait Select         | b30 b28<br>0 0 0: Do not insert wait<br>0 0 1: Insert wait of 1 clock cycle<br>0 1 0: Insert wait of 2 clock cycles<br>0 1 1: Insert wait of 3 clock cycles<br>1 0 0: Insert wait of 4 clock cycles<br>1 0 1: Insert wait of 5 clock cycles<br>1 1 0: Insert wait of 6 clock cycles<br>1 1 1: Insert wait of 7 clock cycles. | R/W |
| b31        | —                         | Reserved                      | This bit is read as 0. The write value should be 0.  | R/W |

Do not attempt to write to the CSnWCR2 register while the external bus is being accessed. Set each of these bits within a range of the restrictions described in [section 15.5.7, Constraints, \(1\) Constraints on using a separate bus interface](#), or [section 15.5.7, Constraints, \(2\) Constraints on using address/data multiplexed bus interface](#), according to the bus interface used.

#### **CSROFF[2:0] bits (Read-Access CS Extension Cycle Select)**

The CSROFF[2:0] bits specify the number of wait cycles to be inserted during the period from the end of a wait cycle (RD signal negated) until the CSn signal (n = 0 to 7) is negated in read access mode.

#### **CSWOFF[2:0] bits (Write-Access CS Extension Cycle Select)**

The CSWOFF[2:0] bits specify the number of wait cycles to be inserted during the period from the end of a wait cycle (WRn signal (n = 0, 1) negated) until the CSn signal (n = 0 to 7) is negated in write access mode.

Note: The settings must satisfy CSnWCR2.WDOFF[2:0] value ≤ CSnWCR2.CSWOFF[2:0] value.

#### **WDOFF[2:0] bits (Write Data Output Extension Cycle Select)**

The WDOFF[2:0] bits specify the number of wait cycles to be inserted during the period from the end of a wait cycle (WRn signal (n = 0, 1) negated) until the write-data output is complete in write access mode.

Note: The settings must satisfy CSnWCR2.WDOFF[2:0] value ≤ CSnWCR2.CSWOFF[2:0] value.

**AWAIT[1:0] bits (Address Cycle Wait Select)**

The AWAIT[1:0] bits specify the number of wait cycles to be inserted into an address output cycle with the address/data multiplexed I/O interface.

Note: CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.AWAIT[1:0] value.  
 For read access, satisfy CSnWCR2.AWAIT[1:0] value + 2  $\leq$  CSnWCR2.RDON[2:0] value  $\leq$  CSnWCR1.CSRWAIT[4:0] value.  
 For write access, satisfy CSnWCR2.AWAIT[1:0] value + 2  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSWWAIT[4:0] value and CSnWCR2.AWAIT[1:0] value + 2  $\leq$  CSnWCR2.WDON[2:0] value  $\leq$  CSnWCR1.CSWWAIT[4:0] value.

**RDON[2:0] bits (RD Assert Wait Select)**

The RDON[2:0] bits specify the number of wait cycles to be inserted before the RD signal is asserted.

Note: For normal read access, satisfy CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.RDON[2:0] value  $\leq$  CSnWCR1.CSRWAIT[4:0] value.  
 For page read access, satisfy CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.RDON[2:0] value  $\leq$  CSnWCR1.CSPRWAIT[2:0] value.  
 When the address/data multiplexed I/O interface is selected, satisfy CSnWCR2.AWAIT[1:0] value + 2  $\leq$  CSnWCR2.RDON[2:0] value  $\leq$  CSnWCR1.CSRWAIT[4:0] value.

**WRON[2:0] bits (WR Assert Wait Select)**

The WRON[2:0] bits specify the number of wait cycles to be inserted before the WRn signal (n = 0, 1) is asserted.

Note: For normal write access, satisfy 1  $\leq$  CSnWCR2.WDON[2:0] value  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSWWAIT[4:0] value, and CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSWWAIT[4:0] value.  
 For page write access, satisfy 1  $\leq$  CSnWCR2.WDON[2:0] value  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSPWAIT[2:0] value, and CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSPWAIT[2:0] value.  
 When the address/data multiplexed I/O interface is selected, satisfy CSnWCR2.AWAIT[1:0] value + 2  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSWWAIT[4:0] value.

**WDON[2:0] bits (Write Data Output Wait Select)**

The WDON[2:0] bits specify the number of wait cycles to be inserted before the write data is output.

Note: For normal write access, satisfy 1  $\leq$  CSnWCR2.WDON[2:0] value  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSWWAIT[4:0] value.  
 For page write access, satisfy 1  $\leq$  CSnWCR2.WDON[2:0] value  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSPWAIT[2:0] value.  
 When the address/data multiplexed I/O interface is selected, satisfy CSnWCR2.AWAIT[1:0] value + 2  $\leq$  CSnWCR2.WDON[2:0] value  $\leq$  CSnWCR1.CSWWAIT[4:0] value.

**CSON[2:0] bits (CS Assert Wait Select)**

The CSON[2:0] bits specify the number of wait cycles to be inserted before the CSn signal (n = 0 to 7) is asserted.

Note: For normal read access, satisfy CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.RDON[2:0] value  $\leq$  CSnWCR1.CSRWAIT[4:0] value.  
 For page read access, satisfy CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.RDON[2:0] value  $\leq$  CSnWCR1.CSPRWAIT[2:0] value.  
 For normal write access, satisfy CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSWWAIT[4:0] value.  
 For page write access, satisfy CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSPWAIT[2:0] value.  
 When the address/data multiplexed I/O interface is selected, satisfy CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.AWAIT[1:0] value.

### 15.3.7 SDC Control Register (SDCCR)

Address(es): [BUS.SDCCR 4000 3C00h](#)

| Bit      | Symbol                     | Bit name               | Description   | R/W |
|----------|----------------------------|------------------------|---|-----|
| b0       | <a href="#">EXENB</a>      | Operation Enable       | 0: Disable<br>1: Enable.  | R/W |
| b3 to b1 | —                          | Reserved               | These bits are read as 0. The write value should be 0.  | R/W |
| b5, b4   | <a href="#">BSIZE[1:0]</a> | SDRAM Bus Width Select | b5 b4<br>0 0: 16-bit bus space<br>0 1: Setting prohibited<br>1 0: 8-bit bus space<br>1 1: Setting prohibited. | R/W |
| b7, b6   | —                          | Reserved               | These bits are read as 0. The write value should be 0.  | R/W |

#### **EXENB bit (Operation Enable)**

The EXENB bit enables the operation of the SDRAM address space. On reset, operation is disabled (EXENB = 0). Attempts to access disabled areas have no effect.

When CSC and SDRAMC are in use at the same time, BCLK and SDCLK must operate at the same frequency.

### 15.3.8 SDC Mode Register (SDCMOD)

Address(es): [BUS.SDCMOD 4000 3C01h](#)

| Bit      | Symbol                | Bit name    | Description   | R/W |
|----------|-----------------------|-------------|---|-----|
| b0       | <a href="#">EMODE</a> | Endian Mode | 0: Endian order of SDRAM address space is the same as the endian order of the operating mode<br>1: Endian order of SDRAM address space is not the endian order of the operating mode. | R/W |
| b7 to b1 | —                     | Reserved    | These bits are read as 0. The write value should be 0.  | R/W |

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

#### **EMODE bit (Endian Mode)**

The EMODE bit specifies the endianness for the SDRAM address space. The Cortex<sup>®</sup>-M4 core is fixed at little-endian order, so instruction code can only be allocated to external spaces with little-endian specified. If an area is specified as big-endian, no instruction code can be allocated to it.

### 15.3.9 SDRAM Self-Refresh Control Register (SDSELF)

Address(es): [BUS.SDSELF 4000 3C10h](#)

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol | Bit name                  | Description  | R/W |
|----------|--------|---------------------------|--|-----|
| b0       | SFEN   | SDRAM Self-Refresh Enable | 0: Disable<br>1: Enable.                               | R/W |
| b7 to b1 | —      | Reserved                  | These bits are read as 0. The write value should be 0. | R/W |

Set the SDSELF register only when the conditions in [Table 15.14](#) are satisfied. Otherwise, operation is not guaranteed.

#### SFEN bit (SDRAM Self-Refresh Enable)

The SFEN bit controls the self-refresh operation. Setting this bit to 1 initiates an auto-refresh cycle, after which self-refresh begins. Clearing this bit to 0 ends the self-refresh, and auto-refresh resumes. When the bit is set to 1, the write value takes effect when the self-refresh operation starts. When it is cleared to 0, the write value has already taken effect when auto-refresh starts after the end of the self-refresh.

### 15.3.10 SDRAM Refresh Control Register (SDRFCSR)

Address(es): [BUS.SDRFCSR 4000 3C14h](#)

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 1

| Bit        | Symbol    | Bit name   | Description   | R/W |     |     |     |    |    |    |                       |    |    |    |             |   |   |   |             |   |   |   |             |   |   |   |                       |   |   |   |             |   |   |   |             |   |   |   |             |   |   |   |             |   |   |   |              |   |   |   |              |   |   |   |              |   |   |   |              |   |   |   |              |   |   |   |              |   |   |   |               |     |   |   |              |     |

#### RFC[11:0] bits (Auto-Refresh Request Interval Setting)

The RFC[11:0] bits specify the auto-refresh request interval. They can be written to at any time, regardless of the state of

the Auto-Refresh Operation Enable bit (RFEN) in SDRFEN. If auto-refresh is enabled, the write value takes effect after the end of the auto-refresh cycles. The refresh counter uses SDCLK.

### REFW[3:0] bits (Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting)

The REFW[3:0] bits specify the number of auto-refresh cycles and the number of self-refresh clearing cycles. They can be written to at any time, regardless of the state of the Auto-Refresh Operation Enable bit (RFEN) in SDRFEN. If an auto-refresh cycle is in progress, the value written to the bits while auto-refresh is enabled takes effect after the cycle completes.

**Note:** Auto-refresh requests are not accepted while the SDRAM is being accessed. This means they must sometimes wait until the access completes for the auto-refresh interval to be extended. Set the RFC[11:0] bits to an auto-refresh request interval value that meets the specifications of the SDRAM being used. Additionally, make sure to set the auto-refresh request interval to a duration longer than the auto-refresh cycle. The auto-refresh interval cannot be automatically adjusted when the frequency is changed during operation. In this case, perform a self-refresh operation and set the auto-refresh interval to an appropriate value for the frequency again.

#### 15.3.10.1 Auto-refresh request interval and RFC set value

The SDRAMC (SDRAM area controller) includes a 12-bit refresh counter that generates auto-refresh requests at fixed intervals. Use the following equation to calculate the set value for the RFC[11:0] bits from the auto-refresh request interval:

$$\text{RFC} = (\text{Auto-refresh request interval} / \text{SDCLK cycle}) - 1$$

**Note:** Auto-refresh requests are not accepted while the SDRAM is being accessed. They must wait until the access completes. However, the counter value is updated regardless of whether or not the request was accepted. If two or more auto-refresh requests are generated while the SDRAM is being accessed, the second and subsequent requests are ignored.

#### 15.3.11 SDRAM Auto-Refresh Control Register (SDRFEN)

Address(es): [BUS.SDRFEN 4000 3C16h](#)

| Bit      | Symbol | Bit name                      | Description  | R/W |
|----------|--------|-------------------------------|--|-----|
| b0       | RFEN   | Auto-Refresh Operation Enable | 0: Disable<br>1: Enable.                               | R/W |
| b7 to b1 | —      | Reserved                      | These bits are read as 0. The write value should be 0. | R/W |

#### RFEN bit (Auto-Refresh Operation Enable)

The RFEN bit enables auto-refresh operation. When auto-refresh is required, set the RFEN bit to 1 before SDRAM access.

Clearing this bit to 0 while auto-refreshing is enabled causes RFEN to be cleared to 0 and auto-refresh operation to halt after the end of the auto-refresh cycle. The interval at which refresh requests are generated is determined by the value in the Auto-Refresh Request Interval Setting bits (RFC[11:0]) in the SDRAM Refresh Control Register (SDRFCR).

### 15.3.12 SDRAM Initialization Sequence Control Register (SDICR)

Address(es): [BUS.SDICR 4000 3C20h](#)

| Bit      | Symbol                | Bit name                      | Description  | R/W |
|----------|-----------------------|-------------------------------|--|-----|
| b0       | <a href="#">INIRQ</a> | Initialization Sequence Start | 0: Invalid<br>1: Start initialization sequence.        | R/W |
| b7 to b1 | —                     | Reserved                      | These bits are read as 0. The write value should be 0. | R/W |

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

#### INIRQ bit (Initialization Sequence Start)

Setting the INIRQ bit to 1 starts the SDRAM initialization sequence and automatically sets the Initialization Status bit (INIST) in the SDRAM Status Register (SDSR) to 1. The INIST bit clears automatically after the initialization sequence ends. The value written to the INIRQ bit is not retained.

Note: Set the INIRQ bit to start the SDRAM initialization sequence only when the conditions in [Table 15.14](#) are satisfied. Otherwise, operation is not guaranteed.

| 1 0 0    | 0                         | 11 cycles                            |  |     |    |  |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |            |     |
| 1 0 0    | 1                         | 12 cycles                            |  |     |    |  |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |            |     |
| 1 0 1    | 0                         | 13 cycles                            |  |     |    |  |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |            |     |
| 1 0 1    | 1                         | 14 cycles                            |  |     |    |  |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |            |     |
| 1 1 0    | 0                         | 15 cycles                            |  |     |    |  |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |            |     |
| 1 1 0    | 1                         | 16 cycles                            |  |     |    |  |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |            |     |
| 1 1 1    | 0                         | 17 cycles                            |  |     |    |  |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |            |     |
| 1 1 1    | 1                         | 18 cycles.                           |  |     |    |  |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |          |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |           |       |   |            |     |

| Bit        | Symbol    | Bit name                             | Description  | R/W |
|------------|-----------|--------------------------------------|--|-----|
| b7 to b4   | ARFC[3:0] | Initialization Auto-Refresh Count    | b7 b4<br>0 0 0 0: Setting prohibited<br>0 0 0 1: 1 time<br>0 0 1 0: 2 times<br>0 0 1 1: 3 times<br>0 1 0 0: 4 times<br>0 1 0 1: 5 times<br>0 1 1 0: 6 times<br>0 1 1 1: 7 times<br>1 0 0 0: 8 times<br>1 0 0 1: 9 times<br>1 0 1 0: 10 times<br>1 0 1 1: 11 times<br>1 1 0 0: 12 times<br>1 1 0 1: 13 times<br>1 1 1 0: 14 times<br>1 1 1 1: 15 times. | R/W |
| b10 to b8  | PRC[2:0]  | Initialization Precharge Cycle Count | b10 b8<br>0 0 0: 3 cycles<br>0 0 1: 4 cycles<br>0 1 0: 5 cycles<br>0 1 1: 6 cycles<br>1 0 0: 7 cycles<br>1 0 1: 8 cycles<br>1 1 0: 9 cycles<br>1 1 1: 10 cycles.   | R/W |
| b15 to b11 | —         | Reserved                             | These bits are read as 0. The write value should be 0.   | R/W |

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

#### ARFI[3:0] bits (Initialization Auto-Refresh Interval)

The ARFI[3:0] bits specify the interval at which the auto-refresh commands are issued in the SDRAM initialization sequence.

#### ARFC[3:0] bits (Initialization Auto-Refresh Count)

The ARFC[3:0] bits specify the number of times auto-refresh is to be performed in the SDRAM initialization sequence.

#### PRC[2:0] bits (Initialization Precharge Cycle Count)

The PRC[2:0] bits specify the number of precharged cycles in the SDRAM initialization sequence.

Note: Implement settings that satisfy the specifications of the connected SDRAM before starting the initialization sequence.

### 15.3.14 SDRAM Address Register (SDADR)

Address(es): BUS.SDADR 4000 3C40h

Value after reset: 0 0 0 0 0 0 0 0

| Bit    | Symbol   | Bit name                 | Description  | R/W |
|--------|----------|--------------------------|--|-----|
| b1, b0 | MXC[1:0] | Address Multiplex Select | b1 b0<br>0 0: 8-bit shift<br>0 1: 9-bit shift<br>1 0: 10-bit shift<br>1 1: 11-bit shift. | R/W |

| Bit      | Symbol | Bit name | Description  | R/W |
|----------|--------|----------|--|-----|
| b7 to b2 | —      | Reserved | These bits are read as 0. The write value should be 0. | R/W |

Set SDADR only when the conditions in [Table 15.14](#) are satisfied. Otherwise, operation is not guaranteed.

### **MXC[1:0] bits (Address Multiplex Select)**

The MXC[1:0] bits select the size of the shift towards the lower half of the row address in row address/column address multiplexing. For details, see [Table 15.17](#).

### 15.3.15 SDRAM Timing Register (SDTR)

Address(es): [BUS.SDTR 4000 3C44h](#)

|                    |     |     |          |     |         |     |     |     |     |     |     |     |     |         |          |     |
|--------------------|-----|-----|----------|-----|---------|-----|-----|-----|-----|-----|-----|-----|-----|---------|----------|-----|

|                    | —   | —   | —        | —   | —       | —   | —   | —   | —   | —   | —   | —   | —   | —       | RAS[2:0] |     |
| Value after reset: | 0   | 0   | 0        | 0   | 0       | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0       | 0        | 0   |
|                    | b15 | b14 | b13      | b12 | b11     | b10 | b9  | b8  | b7  | b6  | b5  | b4  | b3  | b2      | b1       | b0  |
|                    | —   | —   | RCD[1:0] |     | RP[2:0] |     |     | WR  | —   | —   | —   | —   | —   | CL[2:0] |          |     |
| Value after reset: | 0   | 0   | 0        | 0   | 0       | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0       | 1        | 0   |

| Bit        | Symbol                   | Bit name                | Description   | R/W |
|------------|--------------------------|-------------------------|---|-----|
| b2 to b0   | <a href="#">CL[2:0]</a>  | SDRAMC Column Latency   | $b_2 \ b_0$<br>0 0 0: Setting prohibited<br>0 0 1: 1 cycle<br>0 1 0: 2 cycles<br>0 1 1: 3 cycles<br>1 0 0: Setting prohibited<br>1 0 1: Setting prohibited<br>1 1 0: Setting prohibited<br>1 1 1: Setting prohibited. | R/W |
| b7 to b3   | —                        | Reserved                | These bits are read as 0. The write value should be 0.  | R/W |
| b8         | <a href="#">WR</a>       | Write Recovery Interval | 0: 1 cycle<br>1: 2 cycles.  | R/W |
| b11 to b9  | <a href="#">RP[2:0]</a>  | Row Precharge Interval  | $b_{11} \ b_9$<br>0 0 0: 1 cycle<br>0 0 1: 2 cycles<br>0 1 0: 3 cycles<br>0 1 1: 4 cycles<br>1 0 0: 5 cycles<br>1 0 1: 6 cycles<br>1 1 0: 7 cycles<br>1 1 1: 8 cycles.  | R/W |
| b13, b12   | <a href="#">RCD[1:0]</a> | Row Column Latency      | $b_{13} \ b_{12}$<br>0 0: 1 cycle<br>0 1: 2 cycles<br>1 0: 3 cycles<br>1 1: 4 cycles.   | R/W |
| b15, b14   | —                        | Reserved                | These bits are read as 0. The write value should be 0.  | R/W |
| b18 to b16 | <a href="#">RAS[2:0]</a> | Row Active Interval     | $b_{18} \ b_{16}$<br>0 0 0: 1 cycle<br>0 0 1: 2 cycles<br>0 1 0: 3 cycles<br>0 1 1: 4 cycles<br>1 0 0: 5 cycles<br>1 0 1: 6 cycles<br>1 1 0: 7 cycles<br>1 1 1: Setting prohibited.                                   | R/W |
| b31 to b19 | —                        | Reserved                | These bits are read as 0. The write value should be 0.  | R/W |

The SDTR register specifies the timing for read and write accesses to the SDRAM. For more information, see [section 15.6.11.3, Timing register settings and access timing](#).

Set the SDTR register only when the conditions in [Table 15.14](#) are satisfied. Otherwise, operation is not guaranteed.

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

#### CL[2:0] bits (SDRAMC Column Latency)

The CL[2:0] bits specify the column latency of the SDRAM controller. This setting only affects the latency setting on the SDRAM controller side. To specify the column latency for externally connected SDRAM, use the SDRAM mode register (SDMOD).

#### WR bit (Write Recovery Interval)

The WR bit specifies the interval that must elapse between the SDRAM write command (WRIT) and deactivation (PALL).

#### RP[2:0] bits (Row Precharge Interval)

The RP[2:0] bits specify the minimum number of cycles that must elapse between the SDRAM deactivation command (PALL) and the next valid command.

#### RAS[2:0] bits (Row Active Interval)

The RAS[2:0] bits specify the minimum interval that must elapse between the SDRAM row activation command (ACTV) and deactivation (PALL). The value specified in these bits must be less than or equal to the sum of the row column latency (RCD[1:0]) and column latency (CL[2:0]) settings.

### 15.3.16 SDRAM Mode Register (SDMOD)

Address(es): [BUS.SDMOD 4000 3C48h](#)

| Bit       | Symbol   | Bit name              | Description  | R/W |
|-----------|----------|-----------------------|--|-----|
| b14 to b0 | MR[14:0] | Mode Register Setting | Writing to these bits triggers a mode register set command | R/W |
| b15       | —        | Reserved              | This bit is read as 0. The write value should be 0.        | R/W |

The SDMOD register specifies the value to be written to the SDRAM mode register. Writing to SDMOD causes a mode register set command to be issued automatically to the SDRAM. Set SDMOD only when the conditions in [Table 15.14](#) are satisfied. Otherwise, operation is not guaranteed.

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

#### MR[14:0] bits (Mode Register Setting)

Writing to the MR[14:0] bits causes a mode register set command to be issued to the SDRAM, and the setting in the MR[14:0] bits is output to the lower bits of the address. For more information, see [section 15.6.10, Setting the Mode Register](#).

Note: Set a burst length of 1 for the SDRAM. Operation is not guaranteed with any other burst length setting.

Note: The SDRAM column latency must match the setting in the SDRAMC Column Latency setting (CL[2:0]) in the SDRAM Timing Register (SDTR). Operation is not guaranteed if the latency settings do not agree.

Note: Make sure the SRFST, INIST, and MRSST status bits in the SDRAM Status Register (SDSR) are all 0.

### 15.3.17 SDRAM Status Register (SDSR)

Address(es): [BUS.SDSR 4000 3C50h](#)

| Bit      | Symbol                | Bit name                                | Description   | R/W |
|----------|-----------------------|---|---|-----|
| b0       | <a href="#">MRSST</a> | Mode Register Setting Status            | 0: Mode register setting not in progress<br>1: Mode register setting in progress.     | R   |
| b2, b1   | —                     | Reserved                                | These bits are read as 0  | R   |
| b3       | <a href="#">INIST</a> | Initialization Status                   | 0: Initialization sequence not in progress<br>1: Initialization sequence in progress. | R   |
| b4       | <a href="#">SRFST</a> | Self-Refresh Transition/Recovery Status | 0: Transition/recovery not in progress<br>1: Transition/recovery in progress.         | R   |
| b7 to b5 | —                     | Reserved                                | These bits are read as 0  | R   |

#### [MRSST bit \(Mode Register Setting Status\)](#)

When set to 1, the MRSST bit indicates that SDRAM mode register setting is in progress.

#### [INIST bit \(Initialization Status\)](#)

When set to 1, the INIST bit indicates that the SDRAM initialization sequence is in progress.

#### [SRFST bit \(Self-Refresh Transition/Recovery Status\)](#)

When set to 1, the SRFST bit indicates that a transition to or recovery from a self-refresh operation is in progress for the SDRAM. The in progress interval begins when the bits in [Table 15.7](#) are written to and lasts until the associated commands are issued.

Note: Execution of a self-refresh, initialization sequence, or mode register setting can only be performed when all the status bits are 0. Do not rewrite the registers and bits in [Table 15.7](#) when any of the SRFST, INIST, or MRSST status bits is set to 1.

**Table 15.7 Registers and bits requiring status bit checking**

| Function                | Register | Bits     |
|-------------------------|----------|----------|
| Self-refresh            | SDSELF   | SFEN     |
| Initialization sequence | SDICR    | INIRQ    |
| Mode register setting   | SDMOD    | MR[14:0] |

### 15.3.18 Master Bus Control Register (BUSMCNT<master>)

Address(es): BUS.BUSMCNTM4I 4000 4000h, BUS.BUSMCNTM4D 4000 4004h, BUS.BUSMCNTSYS 4000 4008h, BUS.BUSMCNTDMA 4000 400Ch, BUS.BUSMCNTEDM 4000 4010h

|                    |       |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |

|-----------|-------------|----------------------|--|-----|
| b3 to b0  | —           | Reserved             | These bits are read as 0. The write value should be 0.   | R/W |
| b5, b4    | ARBMET[1:0] | Arbitration Method   | Specifies the group priorities.<br>b5 b4<br>0 0: Fixed priority<br>0 1: Round-robin<br>1 0: Setting prohibited<br>1 1: Setting prohibited. | R/W |
| b7, b6    | —           | Reserved             | These bits are read as 0. The write value should be 0.   | R/W |
| b8        | EWRES       | Early Write Response | 0: Disable early write response<br>1: Enable early write response.   | R/W |
| b15 to b9 | —           | Reserved             | These bits are read as 0. The write value should be 0.   | R/W |

Note: Changing reserved bits from the initial value of 0 is prohibited. Operation during the change is not guaranteed.

Table 15.8 lists the registers associated with each bus type.

#### ARBMET[1:0] bits (Arbitration Method)

The ARBMET[1:0] bits specify the arbitration protocol, with priority defined for all bus masters. For fixed priority, see Table 15.9. For round-robin, see Table 15.10.

#### EWRES bit (Early Write Response)

The EWRES bit indicates whether the next write request is accepted before the response for the current write transaction occurs. When the value is 1, the next write request is accepted and high-speed transfer is possible, but AHB-Lite error responses are not detected. Bus errors are returned to the requesting master IP using the error response protocol for AHB-Lite. For details on errors that occur on each bus, see section 15.7, Bus Error Monitoring Section. Only use the BUSSCNTMBIU, BUSSCNTP0B, and BUSSCNTTEXT registers.

**Table 15.9 Bus priorities with fixed-priority arbitration (ARBMET[1:0] = 00b)**

| Slave Bus Control Register     | Slave interface                       | Priority order                                   |
|--------------------------------|---------------------------------------|--|
| BUSSCNTFLI                     | Memory bus 1                          | Memory bus 3 > DCode bus (CPU) > ICode bus (CPU) |
| BUSSCNTTRAMH                   | Memory bus 2                          | Memory bus 3 > DCode bus (CPU) > ICode bus (CPU) |
| BUSSCNTMBIU                    | Memory bus 3                          | ETHER bus > DMA bus                              |
| BUSSCNTTRAM0                   | Memory bus 4                          | ETHER bus > DMA bus > system bus (CPU)           |
| BUSSCNTTRAM1                   | Memory bus 5                          | ETHER bus > DMA bus > system bus (CPU)           |
| BUSSCNTPnB (n = 0, 2, 3, 4, 6) | Internal peripheral bus 1, 3, 4, 5, 7 | DMA bus > system bus (CPU)                       |
| BUSSCNTFBU                     | Internal peripheral bus 9             | ETHER bus > DMA bus > system bus (CPU)           |
| BUSSCNTTEXT                    | External bus (CS and SDRAM areas)     | ETHER bus > DMA bus > system bus (CPU)           |
| BUSSCNTTEXT2                   | External bus (QSPI area)              | ETHER bus > DMA bus > system bus (CPU)           |

**Table 15.10 Bus priorities with round-robin priority arbitration (ARBMET[1:0] = 01b)**

| Slave Bus Control Register     | Slave interface                       | Priority order*1                                     |
|--------------------------------|---------------------------------------|--|
| BUSSCNTFLI                     | Memory bus 1                          | Memory bus 3 <=> DCode bus (CPU) <=> ICode bus (CPU) |
| BUSSCNTRAMH                    | Memory bus 2                          | Memory bus 3 <=> DCode bus (CPU) <=> ICode bus (CPU) |
| BUSSCNTMBIU                    | Memory bus 3                          | ETHER bus <=> DMA bus                                |
| BUSSCNTRAM0                    | Memory bus 4                          | ETHER bus <=> DMA bus <=> system bus (CPU)           |
| BUSSCNTRAM1                    | Memory bus 5                          | ETHER bus <=> DMA bus <=> system bus (CPU)           |
| BUSSCNTpNB (n = 0, 2, 3, 4, 6) | Internal peripheral bus 1, 3, 4, 5, 7 | DMA bus <=> system bus (CPU)                         |
| BUSSCNTFBU                     | Internal peripheral bus 9             | ETHER bus <=> DMA bus <=> system bus (CPU)           |
| BUSSCNTEXT                     | External bus (CS and SDRAM areas)     | ETHER bus <=> DMA bus <=> system bus (CPU)           |
| BUSSCNTEXT2                    | External bus (QSPI area)              | ETHER bus <=> DMA bus <=> system bus (CPU)           |

Note 1. Round-robin priority is denoted by <=>.

### 15.3.20 Bus Error Address Register (BUSnERRADD) (n = 1 to 5)

Address(es): [BUS.BUS1ERRADD 4000 4800h](#), [BUS.BUS2ERRADD 4000 4810h](#), [BUS.BUS3ERRADD 4000 4820h](#), [BUS.BUS4ERRADD 4000 4830h](#), [BUS.BUS5ERRADD 4000 4840h](#)

| Bit       | Symbol      | Bit name          | Description   | R/W |
|-----------|-------------|-------------------|---|-----|
| b31 to b0 | BERAD[31:0] | Bus Error Address | When a bus error occurs, these bits store the error address | R   |

Note: This register is cleared only by reset other than MPU related reset. For more information, see [section 6, Resets](#), and [section 16, Memory Protection Unit \(MPU\)](#).

[Table 15.8](#) lists the registers associated with each bus type.

#### BERAD[31:0] bits (Bus Error Address)

When a bus error occurs, the BERAD[31:0] bits store the access address. For more information, see the BUSnERRSTAT.ERRSTAT bit description and [section 15.7, Bus Error Monitoring Section](#).

A value of BUSnERRADD.BERAD[31:0] (n = 1 to 5) is only valid when BUSnERRSTAT.ERRSTAT (n = 1 to 5) is set to 1.

### 15.3.21 Bus Error Status Register (BUSnERRSTAT) (n = 1 to 5)

Address(es): [BUS.BUS1ERRSTAT 4000 4804h](#), [BUS.BUS2ERRSTAT 4000 4814h](#), [BUS.BUS3ERRSTAT 4000 4824h](#),  
[BUS.BUS4ERRSTAT 4000 4834h](#), [BUS.BUS5ERRSTAT 4000 4844h](#)

| Bit      | Symbol                  | Bit name            | Description  | R/W |
|----------|-------------------------|---------------------|--|-----|
| b0       | <a href="#">ACCSTAT</a> | Error Access Status | Access status when the error occurred:<br>1: Write access<br>0: Read access. | R   |
| b6 to b1 | —                       | Reserved            | These bits are read as 0. The write value should be 0.                       | R/W |
| b7       | <a href="#">ERRSTAT</a> | Bus Error Status    | 0: No bus error occurred<br>1: Bus error occurred.                           | R   |

Note: This register is cleared only by reset other than MPU related reset. For more information, see [section 6, Resets](#), and [section 16, Memory Protection Unit \(MPU\)](#).

[Table 15.8](#) lists the registers associated with each bus type.

#### [ACCSTAT bit \(Error Access Status\)](#)

The ACCSTAT bit indicates the access status, write access or read access, when an error occurs on the associated bus. For more information, see the BUSnERRSTAT.ERRSTAT bit description and [section 15.7, Bus Error Monitoring Section](#).

The value is only valid when BUSnERRSTAT.ERRSTAT (n = 1 to 5) is set to 1.

#### [ERRSTAT bit \(Bus Error Status\)](#)

The ERRSTAT bit indicates whether a bus error occurred. When an error occurs on the associated bus, the access address and status of write or read access are stored. BUSnERRSTATn.ERRSTAT (n = 1 to 5) is set to 1.

The following types of errors can occur on each bus:

- Illegal address access
- Bus master MPU error
- Bus slave MPU error
- Time out.

When detecting bus master MPU errors or bus slave MPU errors, and reset is selected in the respective OAD bit, BUSnERRSTAT.ERRSTAT (n = 1 to 5) is not set to 1 if the bus access that caused the MPU error completes later than the internal reset signal being generated, which may occur depending on the wait setting.

When detecting bus master MPU errors or bus slave MPU errors, and NMI is selected in the respective OAD bit, BUSnERRSTAT.ERRSTAT (n = 1 to 5) is set to 1 when the bus access that caused the MPU error completes.

For more information on errors that occur on each bus, see [section 15.7, Bus Error Monitoring Section](#), and [section 16, Memory Protection Unit \(MPU\)](#).

## 15.4 Endianness and Data Alignment

The external bus has a data alignment function to control which byte of the data bus (D15 to D08, D07 to D00) is used when accessing the external address space (the CS and SDRAM areas). Alignment is based on the bus specifications of the area to be accessed (8-bit or 16-bit bus space), the data size, and the endian order.

### 15.4.1 Data Alignment Control for the CS Areas

#### (1) 16-bit bus space

When a 16-bit bus space is selected in the BSIZE[1:0] bits in CSnCR, address buses A20 to A01 are enabled to output address signals in 16-bit units, and the address bus A00 is disabled (always outputs low).

When byte strobe mode is selected (WRMOD = 0 in CSnMOD), the WR0 and WR1 pins are enabled. The BC0 and BC1 pins are not used.

When single-write strobe mode is selected (WRMOD = 1 in CSnMOD), only the WR0 pin is enabled, and it always outputs low during write access, regardless of the data size. The WR1 pin is invalid (always outputs high). The valid byte position is indicated by the BC0 and BC1 pins.

The valid positions of control signals and data external to the chip differ depending on the endian order. See [Figure 15.3](#) and [Figure 15.4](#).

Page access can occur for accesses to data in 32-bit units. Page access can only occur when an access does not extend over a 32-bit boundary and causes no change in the BC0 and BC1 signals. The situations in which page access occurs are indicated by the letter (p) in [Figure 15.3](#) and [Figure 15.4](#).

| Data size | Accessed address | Number of accesses | Bus cycle | Unit of data | Address  | Control signals and data bus |         |     |     |
|-----------|------------------|--------------------|-----------|--------------|----------|------------------------------|---------|-----|-----|
|           |                  |                    |           |              |          | WR1/BC1                      | WR0/BC0 | RD  |     |

(p): Page access (only when page access is enabled in the PRENB and PWENB bits in CSnMOD).

**Figure 15.4 Data alignment in 16-bit bus space with big-endian order for CS areas**

## (2) 8-bit bus space

When an 8-bit bus space is selected in the BSIZE[1:0] bits in CSnCR, the address buses A20 to A00 are enabled to output address signals in byte units.

In 8-bit bus space, only the WR0 pin is valid, regardless of the write access mode, and it always outputs low during write access. The WR1 and BC0 pins are not used.

The valid positions of data external to the chip are D07 to D00, and WR0 is used as the control signal, regardless of the endian mode. See [Figure 15.5](#) and [Figure 15.6](#).

Page access can occur for accesses to data in 16-bit or 32-bit units. Page access can only occur when an access does not extend over a 32-bit boundary. The situations in which page access occurs are indicated by the letter (p) in [Figure 15.5](#) and [Figure 15.6](#).

| Data size | Accessed address | Number of accesses | Bus cycle | Unit of data | Address  | RD          |     |         |     |
|-----------|------------------|--------------------|-----------|--------------|----------|-------------|-----|---------|-----|
|           |                  |                    |           |              |          | WR1/BC1     |     | WR0/BC0 |     |
|           |                  |                    |           |              |          | Data bus    |     |         |     |

Figure 15.6 Data alignment in 8-bit bus space with big-endian order for CS areas

### 15.4.2 Data Alignment Control for the SDRAM Area

#### (1) 16-bit bus space

When a 16-bit bus space is selected in the BSIZE[1:0] bits in SDCCR, address buses A26 to A01 are enabled to output address signals in 16-bit units, and the address bus A00 is disabled (always outputs low). The valid byte position is indicated by the DQM0 and DQM1 signals.

External data is accessed using the DQ15 to DQ08 and DQ07 to DQ00 pins and DQM0 and DQM1 control signals. Data can be accessed in either 8-bit or 16-bit units at a time.

The valid positions of control signals and data external to the chip differ depending on the endian order. See [Figure 15.7](#) and [Figure 15.8](#).

| Data size | Accessed address | Number of accesses | Bus cycle | Unit of data | Address | Control signals |             |      |      |
|-----------|------------------|--------------------|-----------|--------------|---------|-----------------|-------------|------|------|
|           |                  |                    |           |              |         | DQM1            | DQM0        | WE   |      |

|           |                  |                    |           |              |         | Data bus        |             |      |      |
|           |                  |                    |           |              |         | DQ15            | DQ08        | DQ07 | DQ00 |
| 8 bits    | 4n               | One                | First     | 8 bits       | 4n      | [ 7   0 ]       |             |      |      |
|           | 4n+1             | One                | First     | 8 bits       | 4n      | [ 7   0 ]       |             |      |      |
|           | 4n+2             | One                | First     | 8 bits       | 4n+2    | [ 7   0 ]       |             |      |      |
|           | 4n+3             | One                | First     | 8 bits       | 4n+2    | [ 7   0 ]       |             |      |      |
| 16 bits   | 4n               | One                | First     | 16 bits      | 4n      | [ 15   8 ]      | [ 7   0 ]   |      |      |
|           | 4n+2             | One                | First     | 16 bits      | 4n+2    | [ 15   8 ]      | [ 7   0 ]   |      |      |
| 32 bits   | 4n               | Two                | First     | 16 bits      | 4n      | [ 31   24 ]     | [ 23   16 ] |      |      |
|           |                  |                    | Second    | 16 bits      | 4n+2    | [ 15   8 ]      | [ 7   0 ]   |      |      |

**Figure 15.8 Data alignment in 16-bit bus space with big-endian order for SDRAM area**

#### (2) 8-bit bus space

When an 8-bit width is selected in the BSIZE[1:0] bits in SDCCR, address buses A26 to A00 are enabled to output address signals in 8-bit units.

External data is accessed using the DQ07 to DQ00 pins and DQM0 control signal. 8-bit data is accessed in single 8-bit accesses, 16-bit data with two 8-bit accesses, and 32-bit data with four 8-bit accesses.

The valid positions of control signals and data external to the chip differ depending on the endian order. See [Figure 15.9](#) and [Figure 15.10](#).

| Data size | Accessed address | Number of accesses | Bus cycle | Unit of data | Address | Data bus |      |      |          |
|-----------|------------------|--------------------|-----------|--------------|---------|----------|------|------|----------|
|           |                  |                    |           |              |         | DQM1     | DQM0 | WE   | Data bus |
|           |                  |                    |           |              |         | DQ15     | DQ08 | DQ07 | DQ00     |
| 8 bits    | 4n               | One                | First     | 8 bits       | 4n      | 7        | 0    |      |          |
|           | 4n+1             | One                | First     | 8 bits       | 4n+1    | 7        | 0    |      |          |
|           | 4n+2             | One                | First     | 8 bits       | 4n+2    | 7        | 0    |      |          |
|           | 4n+3             | One                | First     | 8 bits       | 4n+3    | 7        | 0    |      |          |
| 16 bits   | 4n               | Two                | First     | 8 bits       | 4n      | 7        | 0    |      |          |
|           |                  |                    | Second    | 8 bits       | 4n+1    | 15       | 8    |      |          |
|           | 4n+2             | Two                | First     | 8 bits       | 4n+2    | 7        | 0    |      |          |
|           |                  |                    | Second    | 8 bits       | 4n+3    | 15       | 8    |      |          |
| 32 bits   | 4n               | Four               | First     | 8 bits       | 4n      | 7        | 0    |      |          |
|           |                  |                    | Second    | 8 bits       | 4n+1    | 15       | 8    |      |          |
|           |                  |                    | Third     | 8 bits       | 4n+2    | 23       | 16   |      |          |
|           |                  |                    | Fourth    | 8 bits       | 4n+3    | 31       | 24   |      |          |

Figure 15.9 Data alignment in 8-bit bus space with little-endian order for SDRAM area

| Data size | Accessed address | Number of accesses | Bus cycle | Unit of data | Address | Data bus |      |      |          |

Figure 15.10 Data alignment in 8-bit bus space with big-endian order for SDRAM area

## 15.5 Operation of CS Area Controller

### 15.5.1 Separate Bus

This section describes the periods shown in the timing diagrams. The CS area controller (CSC) operates in synchronization with the external bus clock, BCLK. Operation cycles, such as wait cycles, specified in the CSC register, are counted on BCLK. In the following description, the frequencies of BCLK and EBCLK pin output are the same, unless otherwise noted. Access through the external bus starts at the same point as the output of a rising edge on the EBCLK pin. However, if the external bus clock, BCLK, and the output on the EBCLK pin are at different frequencies,

the wait settings can cause the start of access for the second and subsequent rounds to coincide with the falling edge of the output on the EBCLK pin. See [Figure 15.16](#) to [Figure 15.20](#). If recovery cycles are inserted for bus access, the setting for the number of recovery cycles can also cause the start of access for the second and subsequent rounds to coincide with the falling edge of the output on the EBCLK pin. See [Figure 15.38](#).

**(a) Tw1 to Twn (clock cycles for waiting for a normal read cycle or normal write cycle)**

The period from Tw1 to Twn is the number of clock cycles from the start of access through the external bus clock to 1 cycle before the strobe signal is valid. The number of cycles is selectable from 0 to 31. Within this period, the timing of CSn, RD, and WRn assertion (driving the signals low) is determined by the respective wait settings. The wait periods are controlled by the CS Assert Wait Select bits (CSON), the RD Assert Wait Select bits (RDON), the WR Assert Wait Select bits (WRON), and the Write-Data Output Wait Select bits (WDON) in CSn Wait Control Register 2 (CSnWCR2). The number of clock cycles for each of these wait periods is selectable as a value from 0 to 7, counted from the start of external bus access. The selectable number of cycles is also within the overall number of clock cycles required for waiting to read or write.

**(b) Tend (clock cycle where the strobe signal is valid)**

Tend is the next clock cycle after completion of the wait period for a normal cycle of read or write, or for a cycle of page reading or page writing. If the wait select bit for these cycles is 0, bus access starts on the clock cycle where the strobe signal is valid. The RD and WRn signals are negated in the next clock cycle. For a read access, the clock cycle where the strobe signal is valid is where the data to be read is sampled. If an external wait is enabled, the wait signal is sampled on the cycle where the strobe signal is valid. The bus cycle is extended if the wait signal is low. The bus cycle completes in the next clock cycle if the wait signal is high. Tend indicates the cycle where sampling of the wait signal starts.

After the first cycle where the strobe signal is valid during page access, second and subsequent page access operations (see [section \(e\)](#), [Tpw1 to Tpwn \(page read cycle wait or page write cycle wait\)](#)) start in the next cycle, except during write access with a setting other than 0 for write-data output extension clock cycles (see [section \(d\)](#), [Tdw1 to Tdwn \(clock cycles for write-data output extension\)](#)). If the setting for the RD or WR assertion wait is any value other than 0, the RD and WRn signals are negated in the next clock cycle. If the setting is 0, assertion continues. Additionally, the CSn signal continues to be asserted rather than negated.

**(c) Tn1 to Tnm (clock cycles for CS extension)**

For normal access, Tn1 to Tnm represent the clock cycles of the period following the cycle where the strobe signal is valid (Tend) up to negation of the CSn signal. For read or write access, the negation timing can be controlled by the read-access CS Extension Cycle Select bits (CSROFF) and the write-access CS Extension Cycle Select bits (CSWOFF) in the CSn Wait Control Register 2 (CSnWCR2). The number of cycles is counted from the cycle following the cycle where the strobe signal is valid.

For page access, Tn1 to Tnm represent the clock cycles of the period following the last cycle where the strobe signal is valid up to negation of the CSn signal.

For write access, setting the Write Data Output Extension Cycle Select bits (WDOFF) controls extension of the period where the address and output data is valid.

**(d) Tdw1 to Tdwn (clock cycles for write-data output extension)**

For write access, if the wait setting for the write-data output extension is any value other than 0, the specified clock cycles are inserted from the cycle following the cycle where the strobe signal is valid (Tend).

For normal access, this period is inserted within the clock cycle period for CS extension (Tn1 to Tnm).

For page access, this period is inserted within the clock cycle period where the strobe signal is valid and subsequent page accesses, or within the clock cycle period for the CS extension (Tn1 to Tnm). Valid address and data output are extended over this period, and the WRn signal is negated.

**(e) Tpw1 to Tpwn (page read cycle wait or page write cycle wait)**

For the second and subsequent bus cycles during page access, the values for a page read cycle wait or page write cycle wait are used instead of the settings for a normal read or write cycle wait. The settings in the WR Assert Wait Select bits become enabled in the same way as for the first access. The RD assertion control operation depends on the page read access mode setting (the PRMOD bit in CSnMOD) as follows:

- CSnMOD.PRMOD = 0: A wait for RD assertion is inserted in the same way as for the first access, and the RD

signal is negated

- CSnMOD.PRMOD = 1: Although a wait for RD assertion is inserted in the same way as for normal-access compatibility mode, the RD signal continues to be asserted over this period.

(f) Tr1 to Trn (recovery cycles)

Recovery cycles can be inserted from the point where a bus cycle is complete (CSn signal negation). The number of recovery cycles can be controlled by setting the Read Recovery (RRCV) or Write Recovery (WRCV) bits in the CSn Recovery Cycle Register (CSnREC). Both numbers of recovery cycles are counted from the end of a bus cycle (CSn negation) and can be selected from 0 to 15 cycles. For more information, see [section 15.5.4, Insertion of Recovery Cycles](#).

(1) Normal access

When the PRENB and PWENB bits in CSnMOD are set to 0 to disable page read and page write access, all bus accesses take the form of normal read and write operations. Even when these bits are set to 1 to enable page read and page write access, bus access other than page access takes the form of normal read and write operations. [Figure 15.11](#) to [Figure 15.13](#) show the normal access operations.

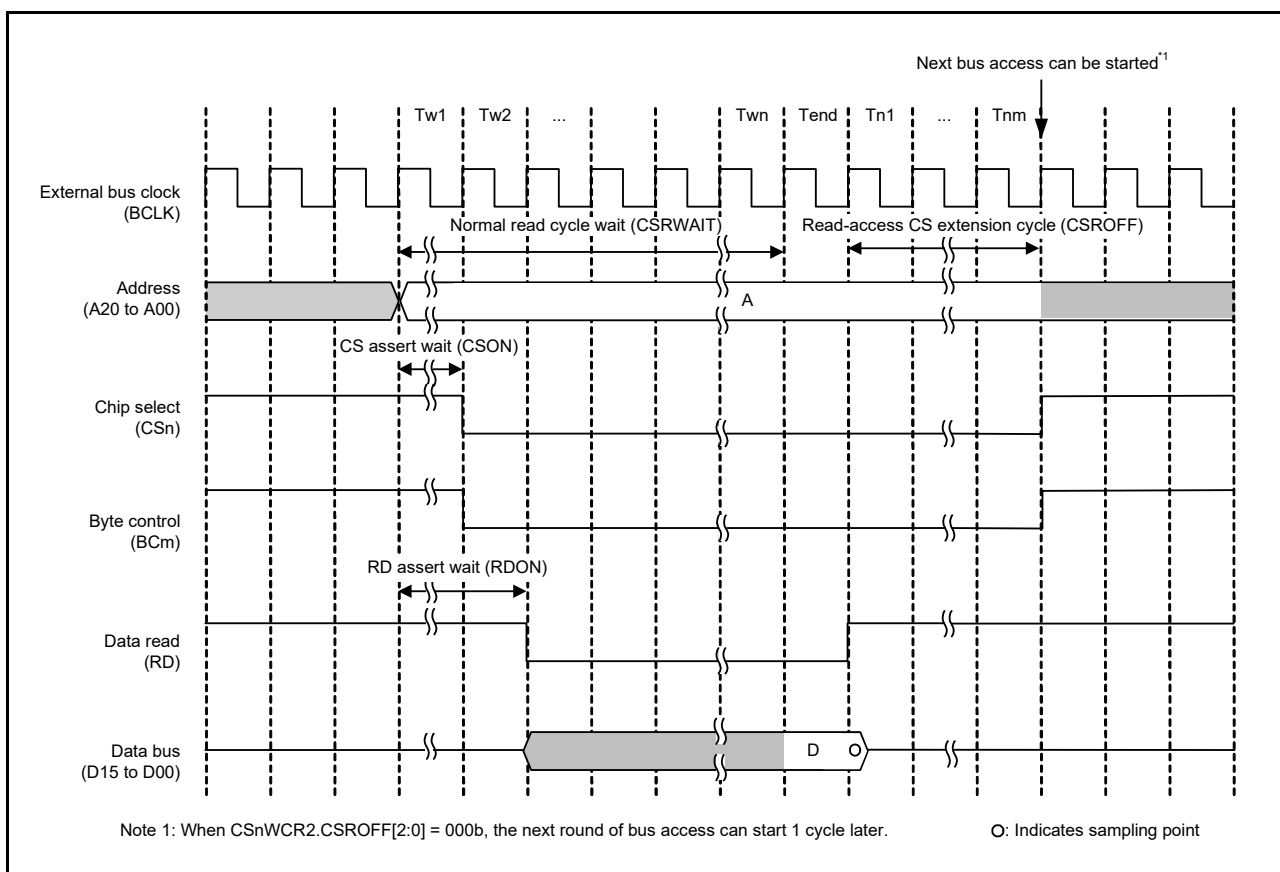

Figure 15.11 Bus timing for normal read operation (n = 0 to 7, m = 0, 1)

Figure 15.12 Bus timing for normal write operation in single-write strobe mode (n = 0 to 7, m = 0, 1)

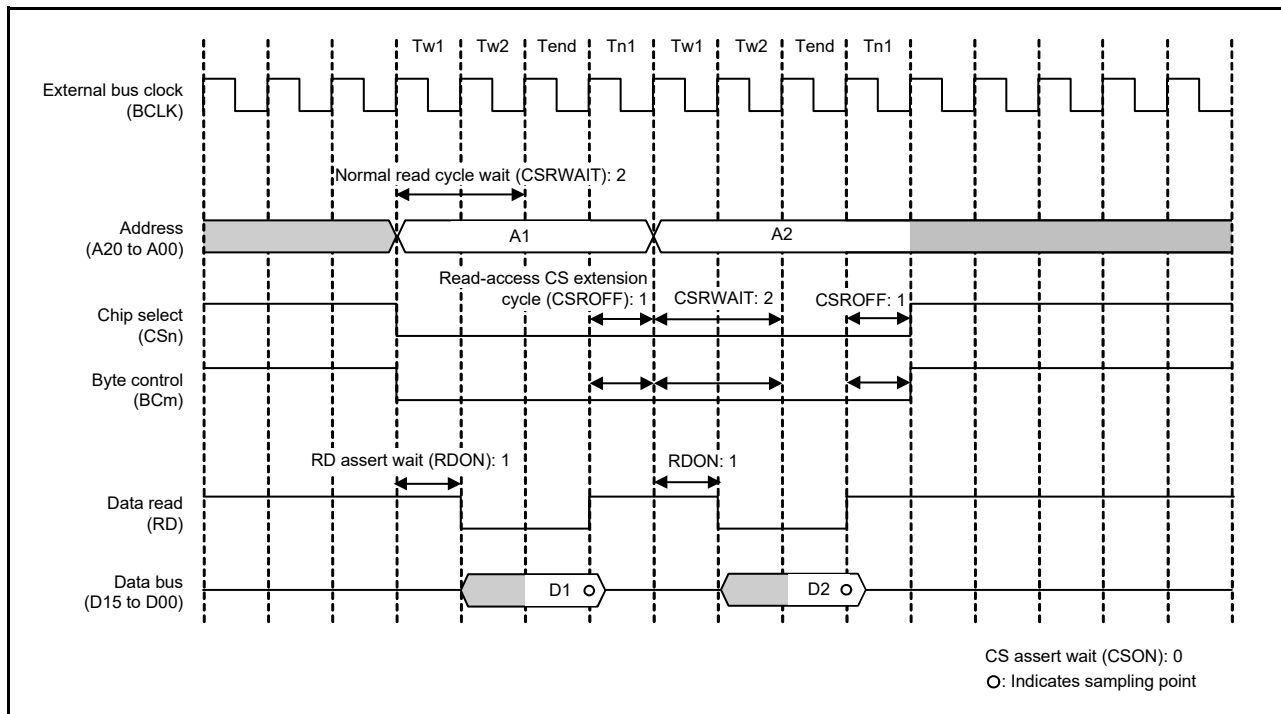

Figure 15.13 Example of normal access operation for read and write (n = 0 to 7, m = 0, 1)

When two or more rounds of external bus access are required in response to a single request for transfer from a bus master, normal access operations are repeated. See section (a), Tw1 to Twn (clock cycles for waiting for a normal read cycle or normal write cycle) to section (d), Tdwl to Tdwn (clock cycles for write-data output extension). Figure 15.14 and Figure 15.15 show examples of operations when two rounds of bus access are generated in response to a single transfer request. If the recovery cycle insertion condition is satisfied, recovery cycles (section (f), Tr1 to Trn (recovery

cycles)) are also inserted in the second and subsequent external bus accesses. See Figure 15.36.

The values in the wait control registers shown in the figures are example settings. In your application, set the registers appropriately for the specifications of connected devices.

**Figure 15.14** Example of normal read operation when two rounds of bus access are generated in response to a single transfer request ( $n = 0$  to  $7$ ,  $m = 0$ ,  $1$ )

**Figure 15.15** Example of normal write operation when two rounds of bus access are generated in response to a single transfer request in single-write strobe mode ( $n = 0$  to  $7$ ,  $m = 0$ ,  $1$ )

Figure 15.16 to Figure 15.20 show examples of normal accesses made when BCLK/2 is selected as the frequency division in the EBCLK Pin Output Select bit.

Figure 15.16 Example of normal access when BCLK/2 is selected in the EBCLK Pin Output Select bit (n = 0 to 7, m = 0, 1)

**Figure 15.18** Example of normal write operation when BCLK/2 is selected in the EBCLK Pin Output Select bit (n = 0 to 7, m = 0, 1)

**Figure 15.19** Example of normal read operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request (n = 0 to 7, m = 0, 1)

**Figure 15.20** Example of normal write operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request ( $n = 0$  to  $7$ ,  $m = 0, 1$ )

(2) Page access

When the PRENB and PWENB bits in CSnMOD are set to 1 to enable page read and page write access, the bus access for page access operations becomes page reading and writing. Page access can only occur when two or more rounds of external bus access are required for a single transfer request from the bus master. However, normal access is made when split accesses are not aligned or access extends across the 32-bit boundary. See Figure 15.3 to Figure 15.6 for the conditions under which page access occurs.

Figure 15.21 and Figure 15.22 show examples of page access operations.

Figure 15.21 Page read access timing (n = 0 to 7, m = 0, 1)

Figure 15.22 Page write access timing (n = 0 to 7, m = 0, 1)

Figure 15.23 and Figure 15.24 show examples of operations for access to a 16-bit bus space in 32 bits. The values of the wait control registers shown in the figures are example settings. In your application, set the registers appropriately for the specifications of connected devices.

Figure 15.23 Example page read access operation when 16-bit bus space is accessed in 32 bits (n = 0 to 7)

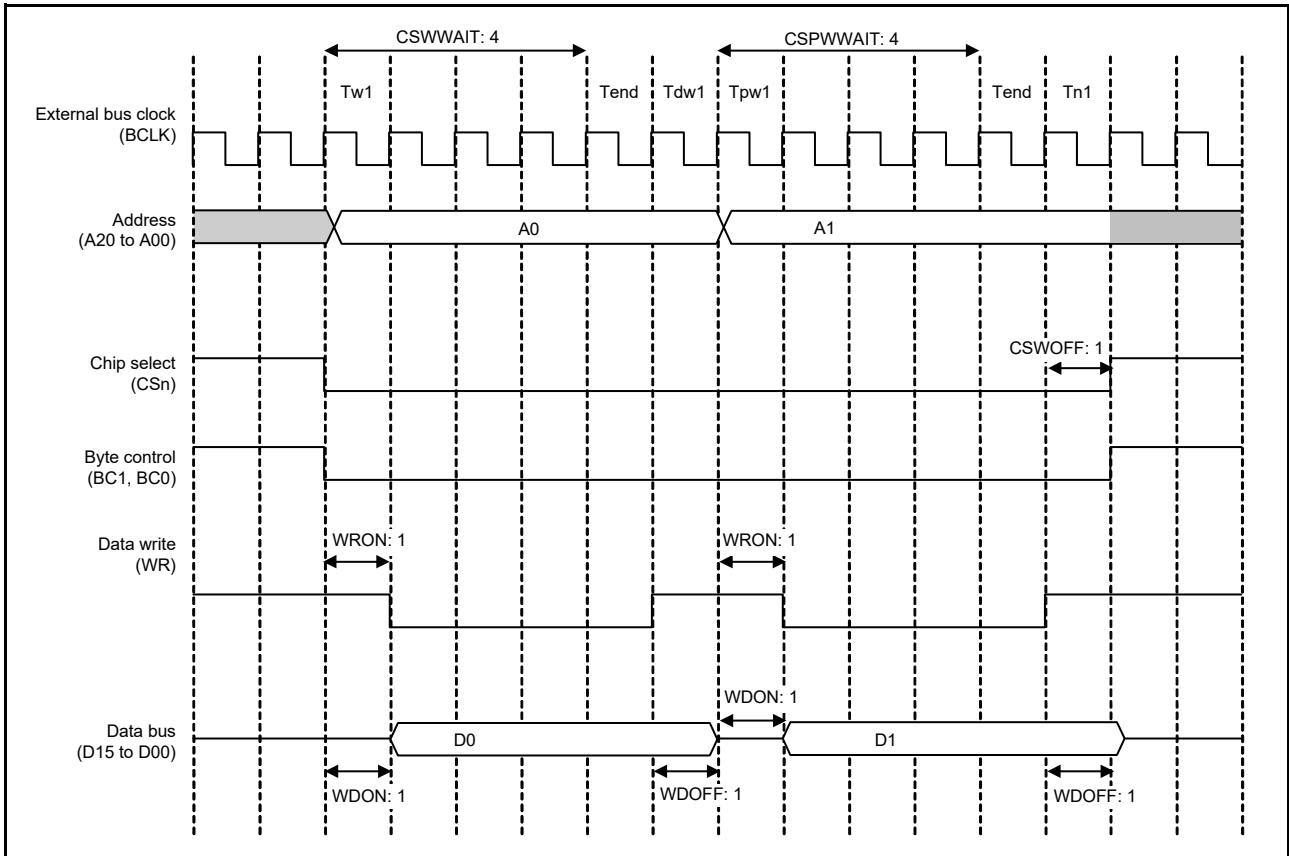

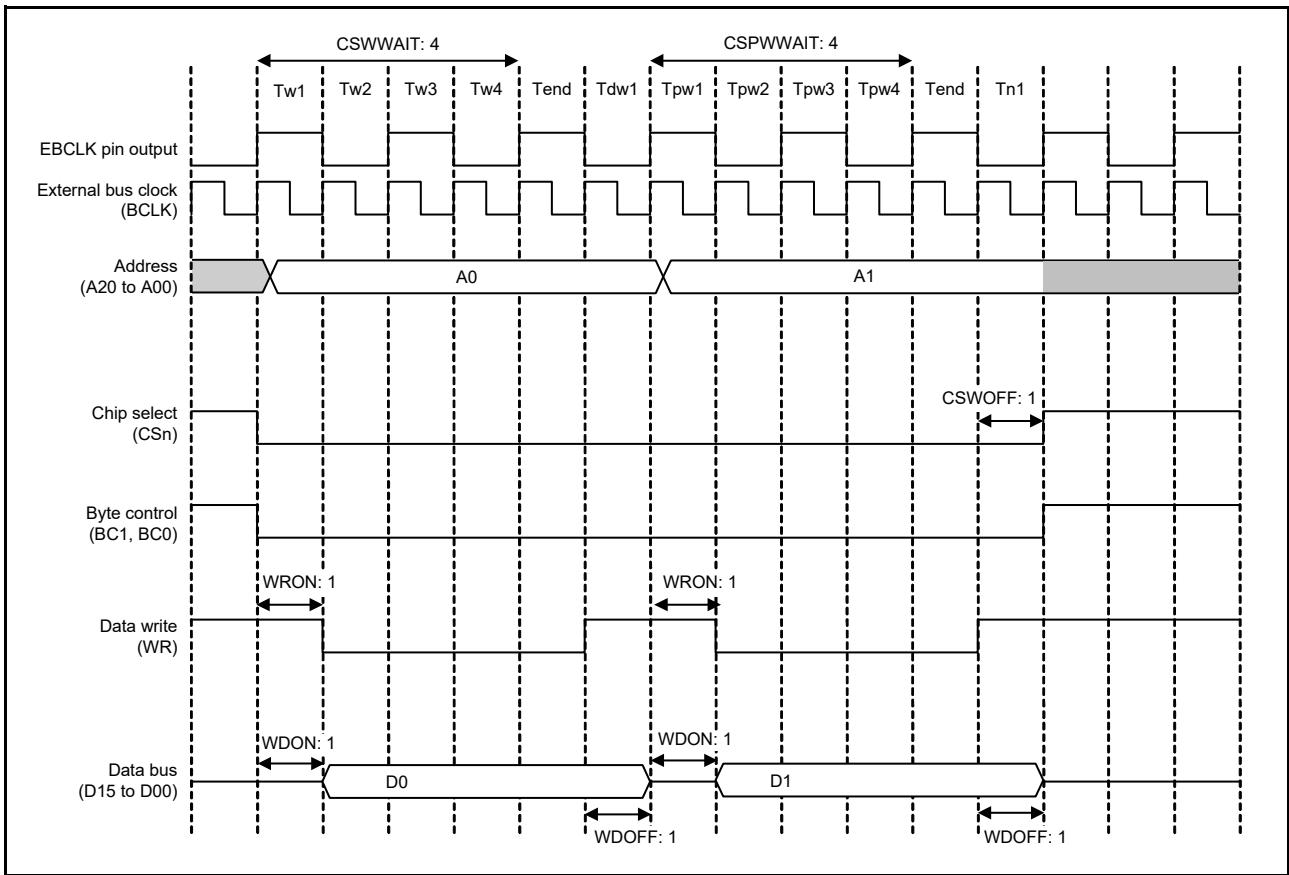

Figure 15.24 Example page write access operation when 16-bit bus space is accessed in 32 bits in single-write strobe mode (n = 0 to 7)

Figure 15.25 and Figure 15.26 show examples of page access operations when BCLK/2 is selected as the frequency division in the EBCLK Pin Output Select bit.

**Figure 15.25** Example page read access operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request (n = 0 to 7)

**Figure 15.26** Example page write access operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request, in single-write strobe mode (n = 0 to 7)

### 15.5.2 Address/Data Multiplexed Bus

When the address/data Multiplexed I/O Interface Select bit (MPXEN) in CSnCR is set to 1, addresses and data can be multiplexing input/output to/from the D15 to D00 pins in the corresponding area. Using this function enables direct connection of this LSI to peripheral LSIs requiring address/data multiplexing. When 8-bit width is selected with the BSIZE[1:0] bits in CSnCR, D7 to D00 are multiplexed with A07 to A00. When 16-bit width is selected, D15 to D00 are multiplexed with A15 to A00. In the address/data multiplexed I/O space, accesses are controlled with the ALE, RD, WRn, and BCn signals.

Byte strobe mode or single-write strobe mode is selectable in the same way as for a separate bus. However, with regard to the BCn signals within the address cycle, the byte-control signal is output for the data being read or written.

During the address/data multiplexed I/O space access, after the number of wait cycles specified by the address cycle wait select bits (AWAIT[1:0]) in CSnWCR2 is inserted in the address output cycle, data access is performed.

#### Ta1 to Tan (Address Cycle Wait)

The period Ta1 to Tan is valid only when the address/data multiplexed I/O space is specified. This period is made up of the number of clock cycles between the start of external bus access and 1 cycle before the address latch (ALE) signal is negated. The number of cycles are selectable within the range from zero to three. Addresses are output until the next cycle of ALE signal negation (address cycle). The timing of ALE signal is the same as that of CS assertion. After the address cycle, a data cycle is started. CSnWCR1 and CSnWCR2 should be set so that an address cycle and a data cycle do not overlap.

Page access to the address/data multiplexed I/O space is invalid. When the PRENB or PWENB bit in CSnMOD is set to 1 to enable page-read or page-write access, these settings are ignored and normal read or write operation is performed.

Figure 15.27 to Figure 15.29 show examples of operations with the address/data multiplexed I/O interface

Figure 15.27 Example of read access operation with address/data multiplexed I/O interface (n = 0 to 7)

Figure 15.28 Example of write access operation with address/data multiplexed I/O interface (m = 0, 1)

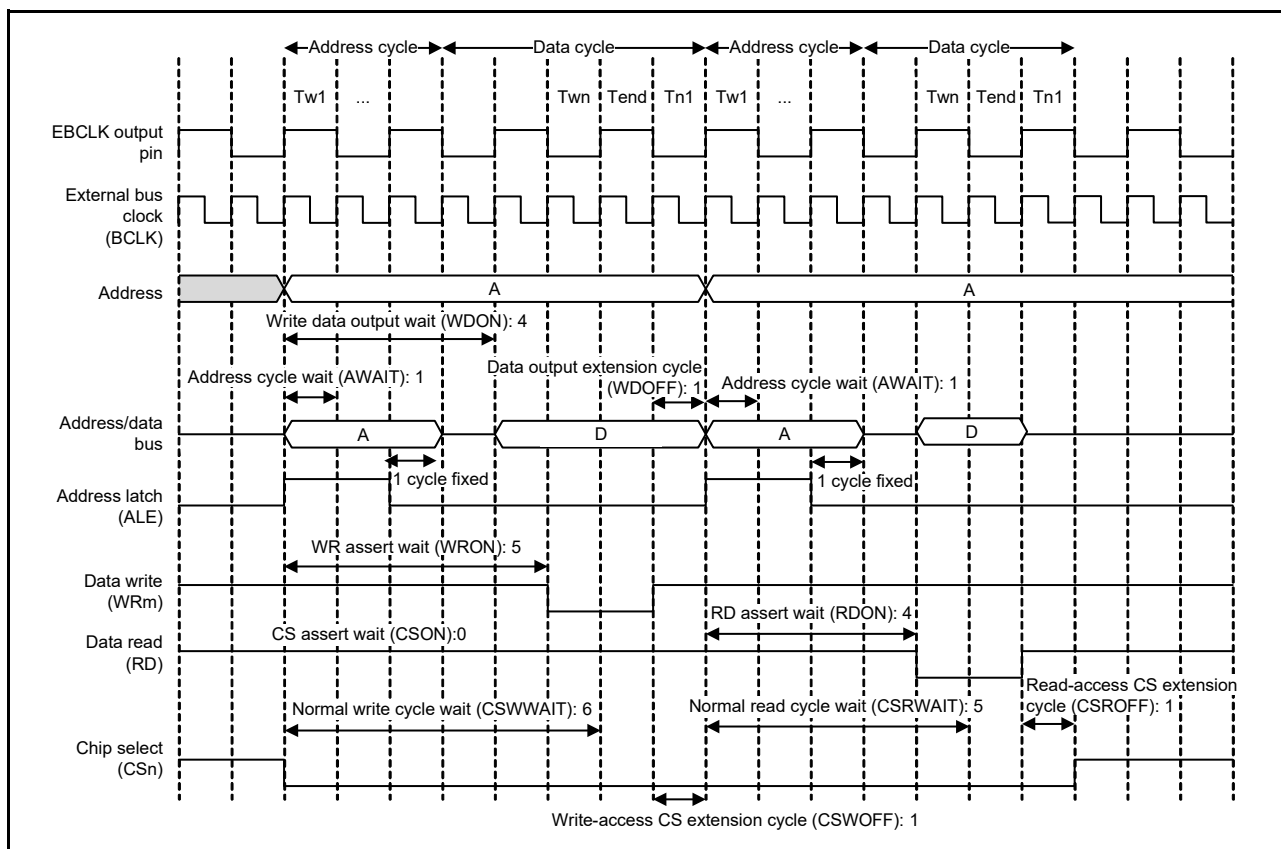

Figure 15.29 Example of bus timing with address/data multiplexed I/O interface (m = 0, 1)

### 15.5.3 External Wait Function

Wait cycles can be extended by the WAIT signal beyond the length of the normal access cycle wait specified in the CSRWAIT[4:0] and CSWWAIT[4:0] bits in CSnWCR1, and the page access cycle wait specified in the CSPRWAIT[2:0] and CSPWWAIT[2:0] bits in CSnWCR1.

When external wait is enabled (EWENB = 1 in CSnMOD), wait cycles are inserted while the WAIT signal is held low. When external wait is disabled (EWENB = 0 in CSnMOD), the WAIT signal has no effect. All wait cycles specified in CSnWCR1 are inserted independently of the WAIT signal.

#### (1) Normal access

Sampling of the WAIT signal begins on completion of the wait cycle (Tend) specified in CSnWCR1. The bus cycle is extended while the WAIT signal is held low. The wait cycle ends (Tend) at the next cycle after the WAIT signal goes high.

#### (2) Page access

The first access operation is the same as the normal access operation. Sampling of the WAIT signal begins on completion of the wait cycle (Tend) specified in the CSnWCR1 register. The bus cycle is extended while the WAIT signal is held low. The wait cycle (Tend) ends at the next cycle after the WAIT signal goes high.

For the second and subsequent accesses, sampling of the WAIT signal begins on completion of the page access wait cycle (Tend). The page access wait cycle is extended while the WAIT signal is held low, and ends (Tend) at the next cycle after the WAIT signal goes high.

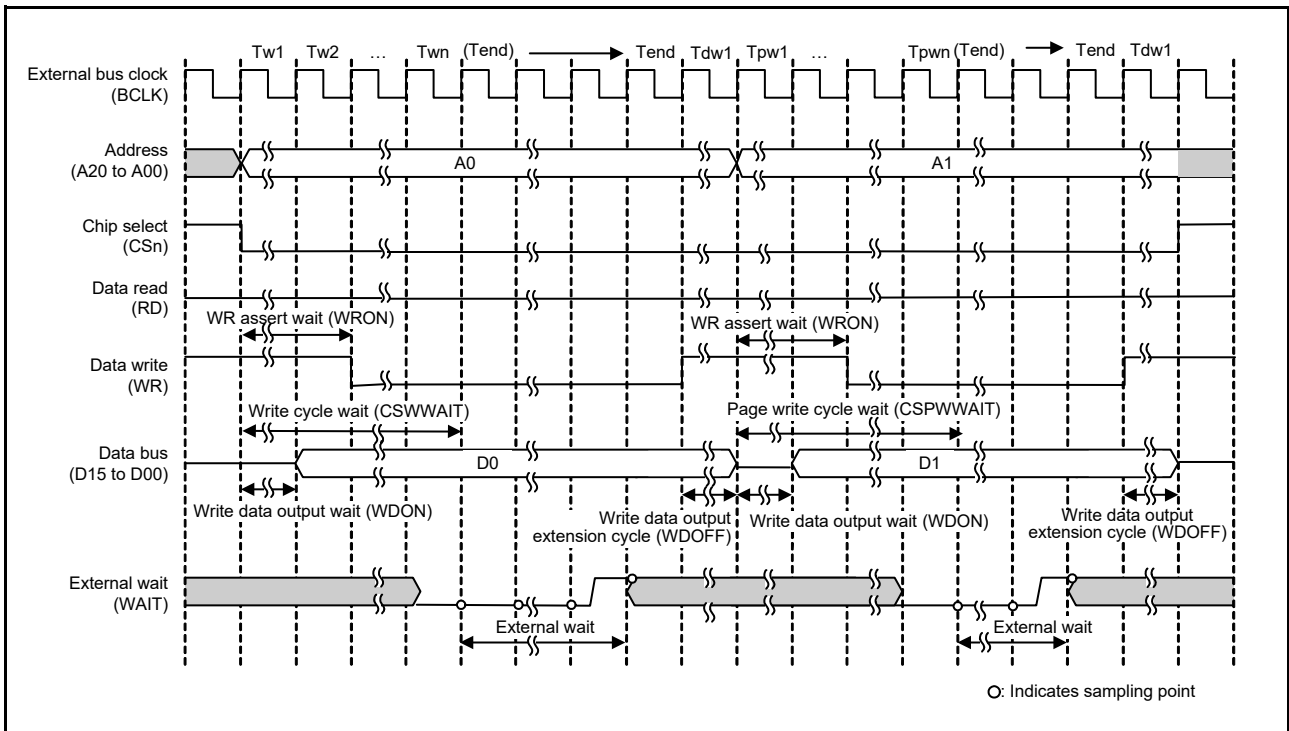

Figure 15.30 to Figure 15.33 show examples of external wait insertion timing with the separate bus interface.

**Figure 15.30** Example external wait timing for page read access to 16-bit bus space (when 1/1 BCLK is selected with the BCLK Pin Output Select bit) (n = 0 to 7, m = 0, 1)

**Figure 15.31** Example external wait timing for page read access to 16-bit bus space (when 1/2 BCLK is Selected with the BCLK Pin Output Select bit) (n = 0 to 7, m = 0, 1)

**Figure 15.32** Example external wait timing for page write access to 16-bit bus space in byte strobe mode (when 1/1 BCLK is selected with the BCLK Pin Output Select bit) (n = 0 to 7, m = 0, 1)

**Figure 15.33** Example external wait timing for page write access to 16-bit bus space in byte strobe mode (when 1/2 BCLK is selected with the BCLK Pin Output Select bit) (n = 0 to 7, m = 0, 1)

(3) Address/data multiplexed I/O interface

In a data cycle with the address/data multiplexed I/O interface, programmed waits and pin waits using the WAIT pin can be inserted in the same way as that with the separate bus interface.

Address cycles are not affected by the wait control settings. Figure 15.34 shows an example of external wait insertion timing with the address/data multiplexed I/O interface.

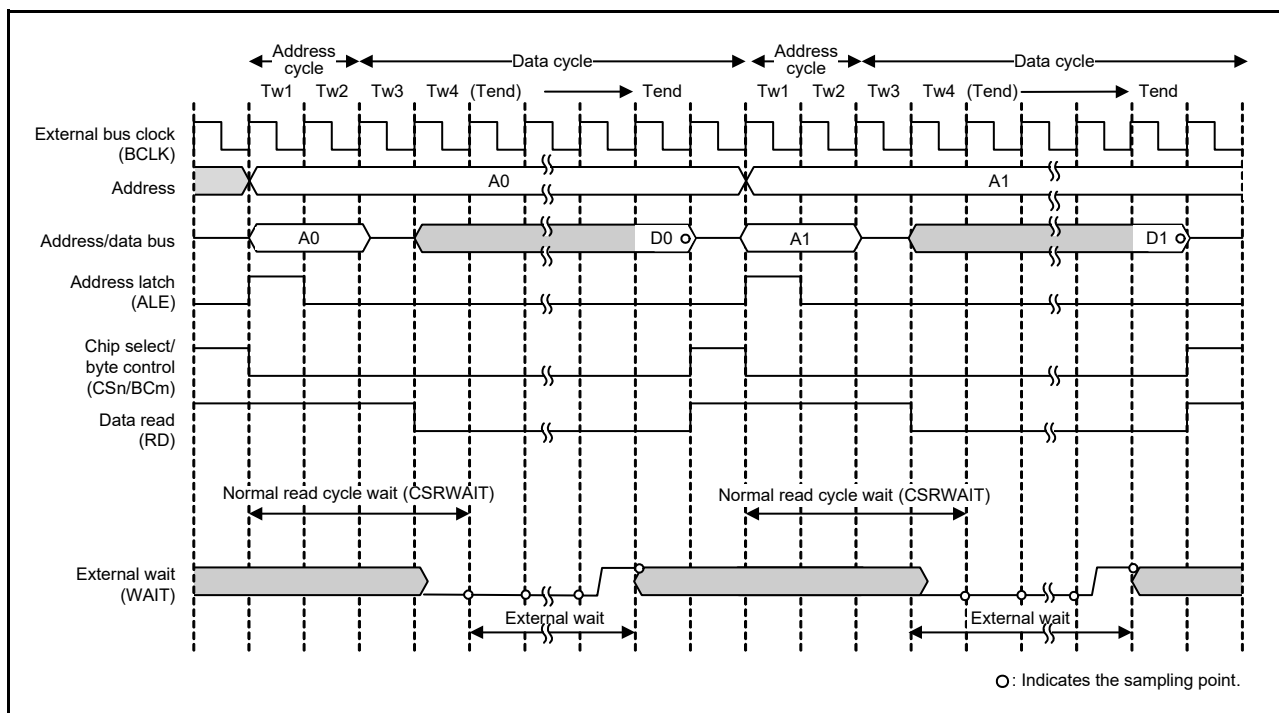

Figure 15.34 Example external wait Insertion timing with address/data multiplexed I/O interface ( $m = 0, 1$ )

### 15.5.4 Insertion of Recovery Cycles

Recovery cycles can be inserted between consecutive rounds of external bus access by setting the Recovery Cycle Insertion Enable bit in CSRECEN to 1.

The number of recovery cycles to be inserted after read cycles and write cycles can be independently set for each area using CSnREC. When the preceding bus cycle is a write access, the number of write recovery cycles must be set with the WRCV[3:0] bits for the associated area. When the preceding bus cycle is a read access, the number of read recovery cycles must be set with the RRCV[3:0] bits for the associated area. For example, when a CS1 read access occurs after a CS0 read access, the number of recovery cycles to be inserted between them is set in the RRCV[3:0] bits in CS0REC.

Recovery cycle insertion can be enabled or disabled with RCVEN<sub>i</sub> ( $i = 0$  to 7) in CSRECEN when the preceding bus access is a separate bus access, and with RCVENM<sub>j</sub> ( $j = 0$  to 7) when the preceding bus access is an address/data multiplexed bus access.

Recovery cycles can be inserted on any of the following conditions:

- After a read access to the external bus, a read access is made to the external bus in the same area
- After a read access to the external bus, a read access is made to the external bus in a different area
- After a read access to the external bus, a write access is made to the external bus in the same area
- After a read access to the external bus, a write access is made to the external bus in a different area
- After a write access to the external bus, a read access is made to the external bus in the same area
- After a write access to the external bus, a read access is made to the external bus in a different area
- After a write access to the external bus, a write access is made to the external bus in the same area
- After a write access to the external bus, a write access is made to the external bus in a different area.

The recovery cycle starts at the end of the preceding bus cycle, for example when the CS<sub>n</sub> signal ( $n = 0$  to 7) is negated. A high-level period of the CS<sub>n</sub> signal is inserted for the specified recovery cycle period starting from this point.

In the fastest case, the CS<sub>n</sub> signal for the next round of bus access is asserted immediately after the end of the recovery cycles. Even if the next request for access to an external address space is generated during the recovery period, the next access over the external bus starts immediately after the end of the recovery cycles.

When two or more external bus access cycles are required for a single transfer request from a bus master, and the recovery cycle insertion condition is satisfied, recovery cycles are also inserted between these bus access cycles. However, when page read access is enabled ( $CSnMOD.PRENB = 1$ ) or page write access is enabled ( $CSnMOD.PWENB = 1$ ), recovery cycles are not inserted except after the last bus access cycle of the transfer, even if the recovery cycle insertion condition is satisfied. See Figure 15.37.

Similarly, during normal access with page access enabled, recovery cycles are not inserted between bus access cycles but only after the last bus access cycle of the transfer. With the address/data multiplexed I/O interface, when the recovery cycle insertion condition is satisfied, recovery cycles are inserted between bus access cycles regardless of the page access enable setting.

Figure 15.35 to Figure 15.37 show examples of recovery cycle insertion with the separate bus interface.

Figure 15.35 Example recovery cycle insertion with separate bus interface ( $m = 0, 1$ )

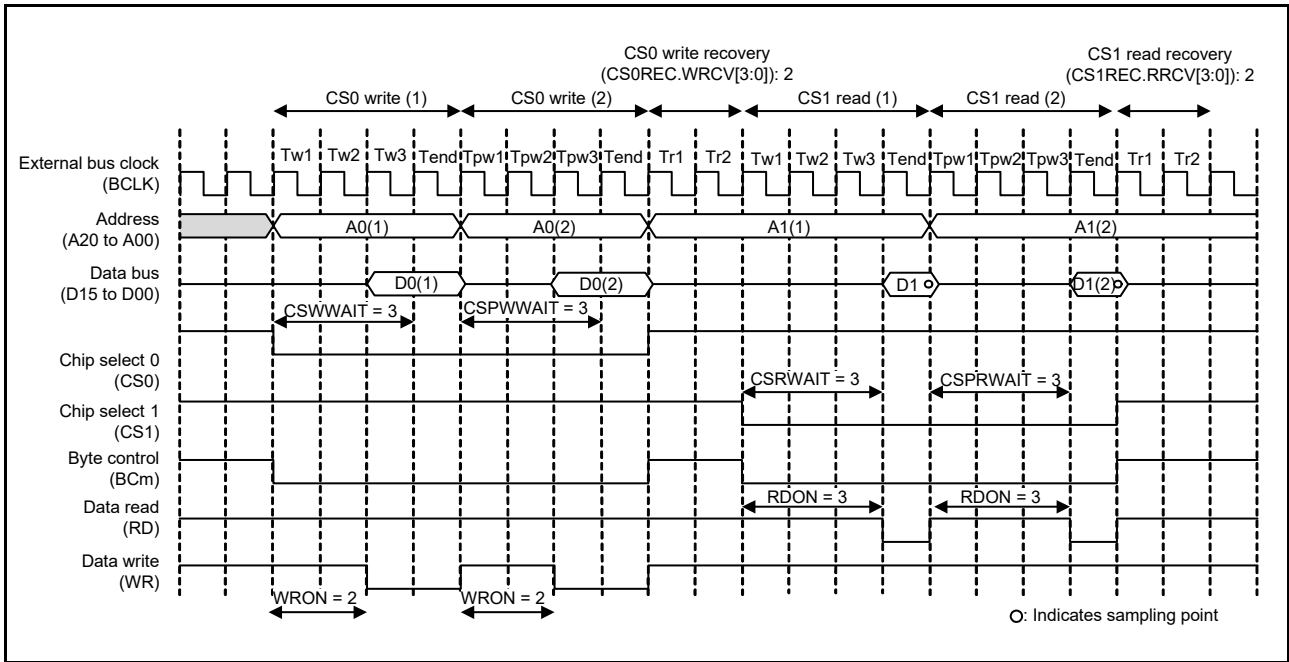

Figure 15.36 Example recovery cycle insertion when bus access is split, with separate bus interface and normal access ( $m = 0, 1$ )

**Figure 15.37** Example recovery cycle insertion when bus access is split, with separate bus interface and page access (m = 0, 1)

Figure 15.38 shows an example operation when BCLK/2 is selected as the frequency division in the EBCLK Pin Output Select bit.

**Figure 15.38** Example operation for recovery cycles when BCLK/2 is selected in the EBCLK Pin Output Select bit, with normal access through a separate bus interface (m = 0, 1)

With the address/data multiplexed I/O interface, recovery cycles are inserted in the same way as that with the separate bus interface. Figure 15.39 and Figure 15.40 show examples of recovery cycle insertion with the address/data multiplexed I/O interface.

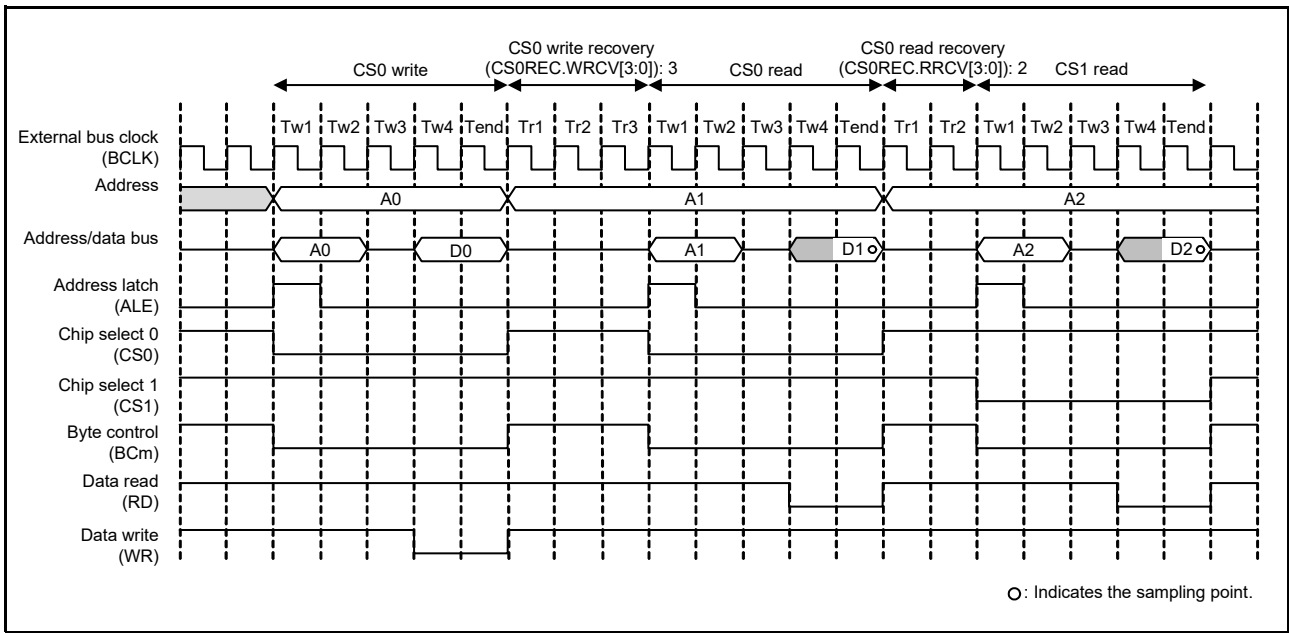

Figure 15.39 Example of recovery cycle insertion with address/data multiplexed I/O interface (m = 0, 1)

Figure 15.40 Example of recovery cycle insertion when a bus access is split with address/data multiplexed I/O interface (m = 0, 1)

### 15.5.5 No Access State

When no external address space is accessed, the CS<sub>n</sub>, BC<sub>n</sub>, WR<sub>n</sub>, RD signals are high, ALE signal is low, and D15 to D00 are in the high-impedance state.

### 15.5.6 Write Buffer Function (External Bus)

In write access, the main bus is released by writing data to the write buffer before the access is complete. This allows the next round of bus access to start. However, if the next access is to an external address space or to a register of the external bus controller, it is suspended until the external bus operations already in progress are complete.

Figure 15.41 shows an example of operation when the write buffer function is in use. When this function is in use, if the next operation after an external write is an internal access, the internal access is executed in parallel with the external write, for example without waiting for completion of the latter operation.

Figure 15.41 Example operation when the write buffer function is in use

### 15.5.7 Constraints

#### (1) Constraints on using a separate bus interface

Table 15.11 lists the constraints that apply to bits in the CSn Wait Control Register 1 (CSnWCR1) and CSn Wait Control Register 2 (CSnWCR2) when normal and page accesses occur.

Even if the Page Read Access Enable bit or Page Write Access Enable bit in the CSn Mode Register is set to enable (CSnMOD.PRENB = 1 or CSnMOD.PWENB = 1), the first page access or access that does not fall within the scope of a page access is a normal access operation. Because of this, constraints on normal access must be satisfied.

Table 15.11 Constraints on normal access and page access

| Constraints on normal access |                          | Constraints on page access |                           |
|------------------------------|--------------------------|----------------------------|---------------------------|
| Reading                      | Writing                  | Reading                    | Writing                   |
| $CSON[2:0] \leq CSRWAIT$     | $1 \leq WDON[2:0]$       | $CSON[2:0] \leq CSPRWAIT$  | $1 \leq WDON[2:0]$        |
| $RDON[2:0] \leq CSRWAIT$     | $CSON[2:0] \leq CSWWAIT$ | $RDON[2:0] \leq CSPRWAIT$  | $CSON[2:0] \leq CSPWWAIT$ |
| $CSON[2:0] \leq RDON$        | $WRON[2:0] \leq CSWWAIT$ | $CSON[2:0] \leq RDON$      | $WRON[2:0] \leq CSPWWAIT$ |
|                              | $WDON[2:0] \leq CSWWAIT$ |                            | $WDON[2:0] \leq CSPWWAIT$ |
|                              | $WDOFF[2:0] \leq CSWOFF$ |                            | $WDOFF[2:0] \leq CSWOFF$  |
|                              | $WDON[2:0] \leq WRON$    |                            | $WDON[2:0] \leq WRON$     |
|                              | $CSON[2:0] \leq WRON$    |                            | $CSON[2:0] \leq WRON$     |

Note: When two or more external bus access cycles are required for a single transfer request from a bus master, and the recovery cycle insertion condition is satisfied, with page read access enabled (CSnMOD.PRENB = 1) or page write access enabled (CSnMOD.PWENB = 1), recovery cycles are not inserted between bus access cycles and are inserted only after the last bus access cycle of the transfer.

#### (2) Constraints on using address/data multiplexed bus interface

In the address/data multiplexed I/O space, page accesses are invalid. If a page access setting is specified, the setting is ignored and the normal read or write operation is performed.

Table 15.12 Constraints at the time of normal access

| Constraints at the time of normal access |                            |
|--|----------------------------|
| Reading                                  | Writing                    |
| $CSON[2:0] \leq CSRWAIT$                 | $CSON[2:0] \leq CSWWAIT$   |
| $RDON[2:0] \leq CSRWAIT$                 | $WRON[2:0] \leq CSWWAIT$   |
| $CSON[2:0] \leq RDON$                    | $WDON[2:0] \leq CSWWAIT$   |
| $AWAIT[1:0] + 2 \leq RDON$               | $WDOFF[2:0] \leq CSWOFF$   |
| $CSON[2:0] \leq AWAIT$                   | $WDON[2:0] \leq WRON$      |
|  | $CSON[2:0] \leq WRON$      |
|  | $AWAIT[1:0] + 2 \leq WRON$ |
|  | $AWAIT[1:0] + 2 \leq WDON$ |
|  | $CSON[2:0] \leq AWAIT$     |

### (3) Constraint on pin multiplexing between the A00 and BC0 functions

Setting the single-write strobe mode is prohibited in the 8-bit bus space.

### (4) Constraints when BCLK/2 is selected in the EBCLK Pin Output Select bit

When 1/2 cycle of BCLK is selected in the EBCLK Pin Output Select bit, the external bus access cycle starts on the rising edge of the EBCLK pin output. However, when 2 or more external bus access cycles are generated for a single transfer request from a bus master, the second or subsequent external bus access cycle can start on the falling edge of the EBCLK pin output, depending on the wait cycle settings. Set the registers appropriately for the specifications of connected devices.

### (5) Instruction code constraint

You must fix the instruction code to little-endian order.

## 15.6 SDRAM Area Controller Operation

This section describes how the SDRAM area controller (SDRAMC) is enabled and the SDRAM bus width is set, followed by a description of the SDRAMC operations, including read, write, auto-refresh, self-refresh, initialization sequence, and mode register settings.

### 15.6.1 Enabling/Disabling SDRAM Access and Setting the SDRAM Bus Width

SDRAM access can be enabled or disabled using the SDC Control Register (SDCCR). The SDRAM bus width can also be set using SDCCR. The refresh operation is available even when the operation of the SDRAM address space is disabled, as long as self-refresh or auto-refresh is enabled.

### 15.6.2 No Access State

When no external address space is accessed, the SDCS, WE, RAS and CAS signals are high.

### 15.6.3 Insertion of Recovery Cycles

When access to the SDRAM area follows access to the CS area, data recovery cycles are inserted for the CS area controller (CSC). If the number of recovery cycles for the CSC is 0, the ACT command for the next SDRAM access is issued immediately after negation of CSn signal at the earliest. If the number of recovery cycles are not 0, the ACT command is issued 2 cycles after the specified recovery cycle period elapsed after negation of CSn signal at the earliest. Because no data conflicts can occur during access to the SDRAM area, there is no need to set data recovery cycles for the SDRAM (fixed to 0 cycle).

Figure 15.42 Example of recovery timing for SDRAM access

### 15.6.4 Write Buffer Function

In write access, the main bus is released by writing data to the write buffer before access is complete. This allows the next round of bus access to start. However, if the next access is to an external address space or to a register of the external bus controller, it is suspended until the external bus operations already in progress are complete.

### 15.6.5 SDRAM Commands

To control the SDRAM, the SDRAMC issues a command for each bus cycle. Commands are defined by a combination of the SDCS, RAS, CAS, WE, CKE, and other signals. Table 15.13 lists the commands issued by the SDRAMC.

Table 15.13 SDRAMC commands

| Name | Abbreviation | Command            | SDCS | RAS | CAS | WE | CKE |   | BA1 | BA0 |
|------|--------------|--------------------|------|-----|-----|----|-----|---|-----|-----|
|      |              |                    |      |     |     |    | n-1 | n |     |     |
| DESL | DSL          | Device deselect    | H    | x   | x   | x  | H   | x | x   | x   |
| ACTV | ACT          | Bank active        | L    | L   | H   | H  | H   | x | V   | V   |
| READ | RD           | Read               | L    | H   | L   | H  | H   | x | V   | V   |
| WRIT | WRI          | Write              | L    | H   | L   | L  | H   | x | V   | V   |
| PALL | PRA          | All bank precharge | L    | L   | H   | L  | H   | x | x   | x   |
| REF  | RFA          | Auto-refresh       | L    | L   | L   | H  | H   | x | x   | x   |
| MRS  | MRS          | Mode register set  | L    | L   | L   | L  | H   | x | L   | L   |
| SELF | RFS          | Self-refresh entry | L    | L   | L   | H  | H   | L | x   | x   |
| SELF | RFX          | Self-refresh end   | H    | x   | x   | x  | L   | H | x   | x   |

Note: H = high level, L = low level, V = valid, x = don't care.  
 n = command issue cycle, n - 1 = 1 cycle before the command is issued.

### 15.6.6 Conditions for Setting the SDRAMC Registers

The SDRAMC registers must only be modified when all the conditions shown in Table 15.14 are satisfied.

**Table 15.14 Conditions for register modification**

| Function or operation   | Registers | Conditions   |
|-------------------------|-----------|--|
| Self-refresh            | SDSELF*1  | <ul style="list-style-type: none"> <li>• SDRAM access is disabled (SDCCR.EXENB = 0*2)</li> <li>• Auto-refresh operation is enabled (SDRFEN.RFEN = 1).</li> </ul>   |
| Auto-refresh            | SDRFCR    | Self-refresh operation is disabled (SDSELF.SFEN = 0)   |
|                         | SDRFEN    | <ul style="list-style-type: none"> <li>• SDRAM access is disabled (SDCCR.EXENB = 0*2)</li> <li>• Self-refresh operation is disabled (SDSELF.SFEN = 0).</li> </ul>  |
| Initialization sequence | SDIR*1    | SDICR is not set yet, and the same conditions as for SDICR modification are satisfied  |
|                         | SDICR*1   | <ul style="list-style-type: none"> <li>• SDRAM access is disabled (SDCCR.EXENB = 0*2)</li> <li>• Auto-refresh operation is disabled (SDRFEN.RFEN = 0)</li> <li>• Self-refresh operation is disabled (SDSELF.SFEN = 0).</li> </ul>  |
| Address register        | SDADR     | <ul style="list-style-type: none"> <li>• SDRAM access is disabled (SDCCR.EXENB = 0*2)</li> <li>• Auto-refresh operation is disabled (SDRFEN.RFEN = 0)</li> <li>• Self-refresh operation is disabled (SDSELF.SFEN = 0).</li> </ul>  |
| Timing register         | SDTR      | <ul style="list-style-type: none"> <li>• Self-refresh operation is in progress (SDSELF.SFEN = 1)</li> </ul> or <ul style="list-style-type: none"> <li>• SDRAM access is disabled (SDCCR.EXENB = 0*2)</li> <li>• Auto-refresh operation is disabled (SDRFEN.RFEN = 0)</li> <li>• Self-refresh operation is disabled (SDSELF.SFEN = 0).</li> </ul> |
| Mode register           | SDMOD*1   | <ul style="list-style-type: none"> <li>• SDRAM access is disabled (SDCCR.EXENB = 0*2)</li> <li>• Self-refresh operation is disabled (SDSELF.SFEN = 0).</li> </ul>  |

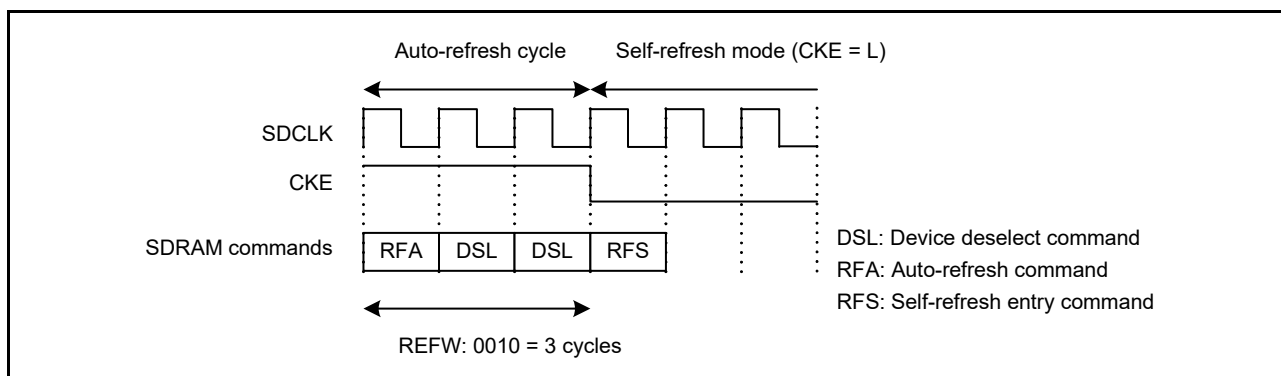

Note 1. Before modifying this register, confirm that all the status bits in SDSR are 0.

Note 2. After writing 0 to the EXENB bit, confirm that it is cleared to 0.

### 15.6.7 Self-Refresh

Transition to or recovery from self-refresh mode is controlled with the SDRAM Self-Refresh Control Register (SDSELF). Immediately before the transition to self-refresh mode, an auto-refresh operation is performed. In self-refresh mode, the CKE signal is low. Immediately after recovery from self-refresh mode, the auto-refresh cycle starts.

Figure 15.43 and Figure 15.44 show timing examples of the transition to and recovery from self-refresh mode.

**Figure 15.43 Example timing for transition to self-refresh mode when SDRFCR.REFW[3:0] = 0010b (3 cycles)**

**Figure 15.44** Example timing for recovery from self-refresh mode

### (1) Self-refresh in Software Standby mode

When invoking self-refresh in Software Standby mode, first follow the procedure shown in [section 15.6.11.2, Procedure for transitioning to and recovering from self-refresh mode](#). Next, set up the transition to Software Standby mode. In this mode, set the Output Port Enable bit (OPE) in the Standby Control Register (SBYCR) to 1 to hold the output state of the address bus and bus control signals.

After canceling Software Standby mode, follow the procedure shown in [section 15.6.11.2, Procedure for transitioning to and recovering from self-refresh mode](#). For details on invoking and canceling Software Standby mode, see [section 11, Low Power Modes](#).

### (2) Self-refresh in Deep Software Standby mode

Deep Software Standby mode is invoked from within Software Standby mode. On this transition, the pin states remain unchanged. Therefore, invoking of self-refresh in Deep Software Standby mode can be handled the same as for Software Standby mode with one additional setting. You must also set the I/O Port Keep bit (IOKEEP) in the Deep Software Standby mode Control Register (DPSBYCR) to 1.

Because the SDRAMC is reset internally when Deep Software Standby mode is canceled, the SDRAM control registers must be set again. After canceling Software Standby mode, follow the procedure in this section to cancel self-refresh.

[Figure 15.45](#) shows self-refresh timing in Deep Software Standby mode. For details on invoking and canceling Deep Software Standby mode, see [section 11, Low Power Modes](#).

To cancel self-refresh mode:

1. Set DPSBYCR.IOKEEP to 1 to keep the CKE signal output low in Deep Software Standby mode.
2. Start the clock supply to the SDRAMC.
3. Set the SDRAM control registers (SDCMOD, SDADR, and SDTR) again. These registers were initialized by an internal reset on entering Deep Software Standby mode.
4. Enable an auto-refresh operation by setting SDRFEN.RFEN to 1.
5. Check that all the status bits in SDSR are cleared to 0 and set SDSELF.SFEN to 1 to select self-refresh mode again.
6. Modify the port settings for the SDRAM interface.
7. Set SDCKOCR.SDCKOEN to 1 to start the clock supply to the SDRAM with the SDCLK pin.
8. Check that all the status bits in SDSR are cleared to 0 and set SDSELF.SFEN to 0 to cancel self-refresh mode.

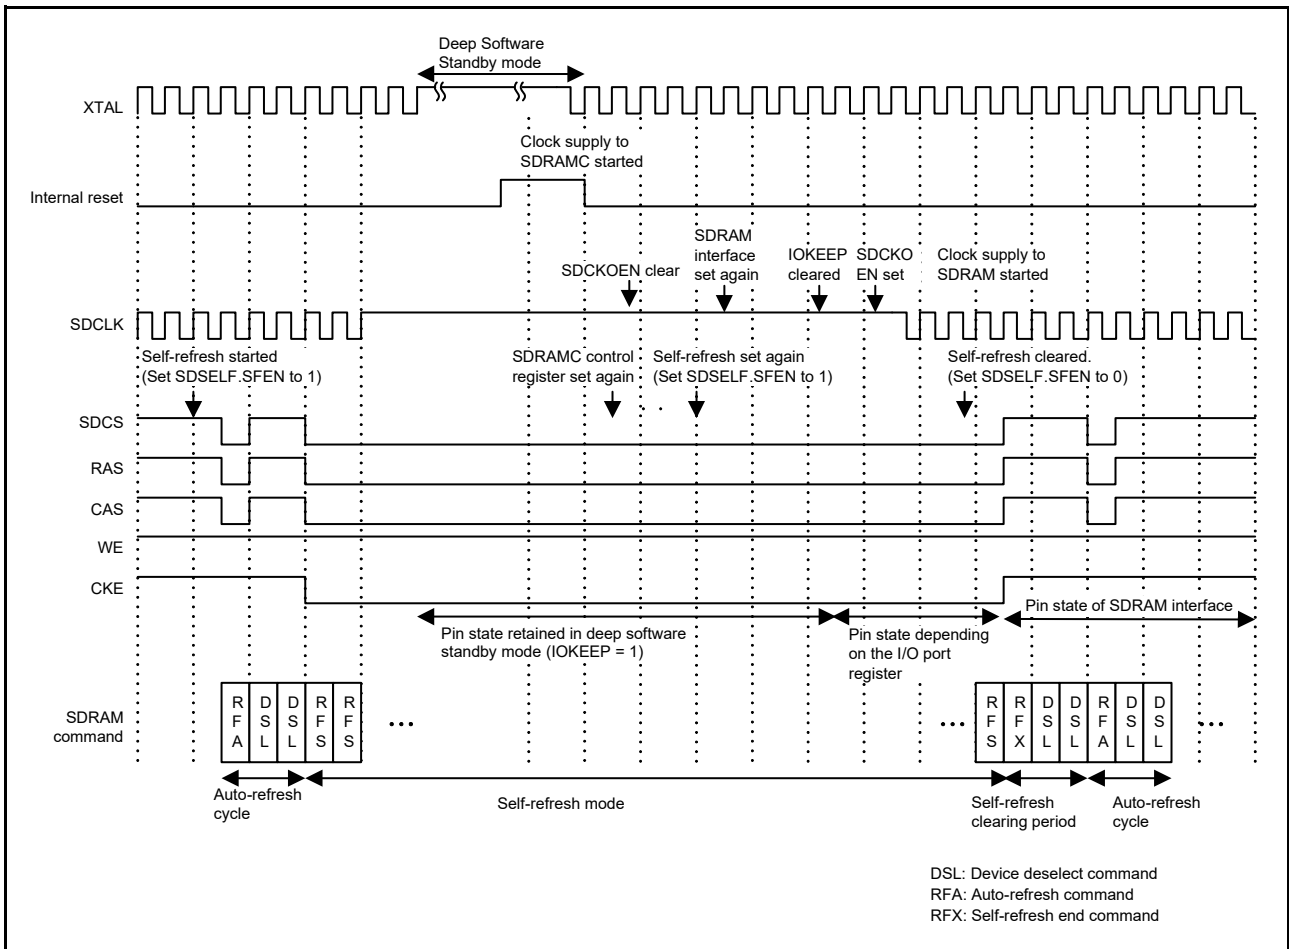

Figure 15.45 Example timing for self-refresh cycle in Deep Software Standby mode

### 15.6.8 Auto-Refresh

The auto-refresh cycle can be started by setting the Auto-Refresh Operation Enable bit (RFEN) in the SDRAM Auto-Refresh Control Register (SDRFEN) to 1. After the cycle starts, refresh requests are generated at fixed intervals determined by the refresh counter. However, because refresh requests are not accepted during read or write access, the auto-refresh cycle might be suspended.

If an SDRAM access and a refresh request are generated at the same time, the refresh request takes precedence. A CS area access and a refresh request can be made at the same if the SDCKOEN, RAS, CAS, WE, and CKE signals, which are required for issuing the refresh command, are exclusively provided for SDRAM access.

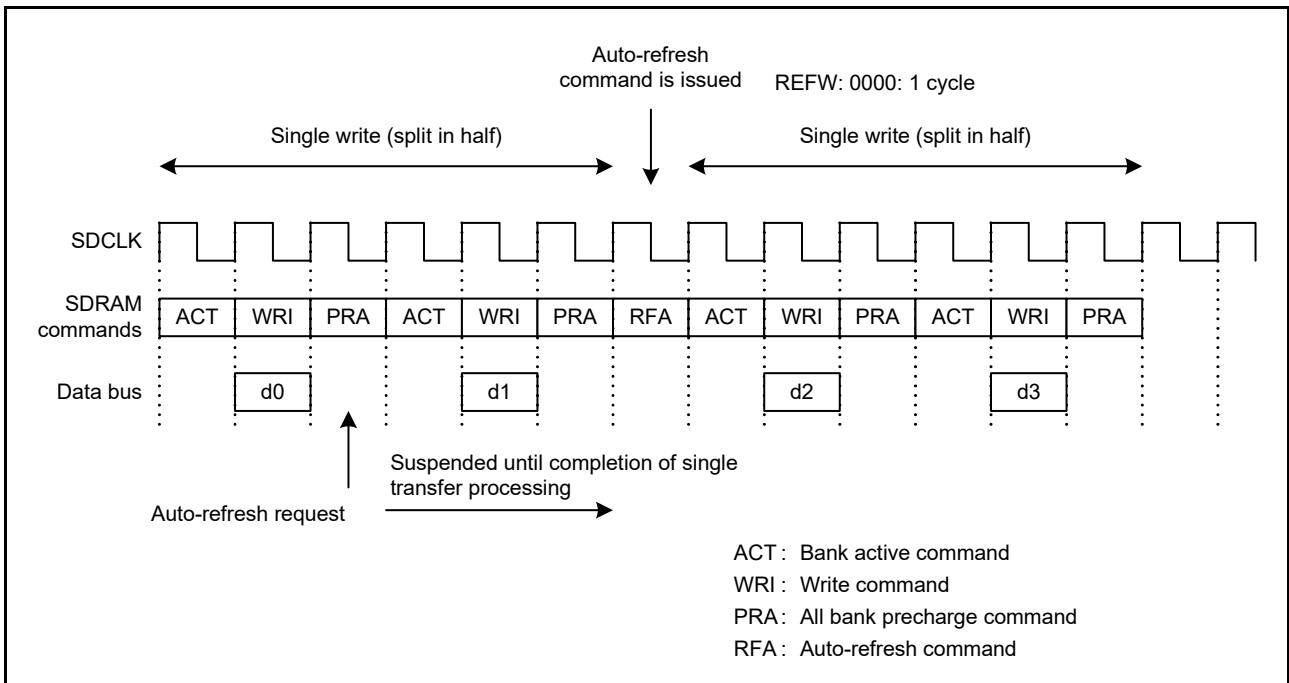

The refresh counter is halted during a self-refresh operation. After recovery from the self-refresh mode, the auto-refresh cycle starts and the counter value is reset, resuming the counter operation.

Figure 15.46 shows a timing example of an auto-refresh cycle.

**Figure 15.46 Example timing for auto-refresh cycle (1)**

Figure 15.47 shows examples of operation when an auto-refresh request is generated during single access.

**Figure 15.47 Example timing for auto-refresh cycle (2), when the auto-refresh request is made during single access**

### 15.6.9 Initialization Sequencer

The SDRAMC has a sequencer to issue SDRAM initialization commands. After a reset, the initialization sequencer must be activated without fail. Operation is not guaranteed if the SDRAM is not initialized.

The SDRAM initialization sequencer issues an all-bank precharge command followed by auto-refresh commands  $n$  times, where  $n = 1$  to 15. The SDRAM initialization sequence timing can be set using the SDRAM Initialization Register (SDIR). The SDRAM initialization sequence can be activated using the SDRAM Initialization Sequence Control Register (SDICR). These registers must be set only when the conditions listed in Table 15.14 are satisfied.

Figure 15.48 shows a timing example of the SDRAM initialization sequence. When the ARFC[3:0] bits in SDIR are set so that auto-refresh operation is performed two or more times, auto-refresh cycles are repeated in the initialization sequence accordingly.

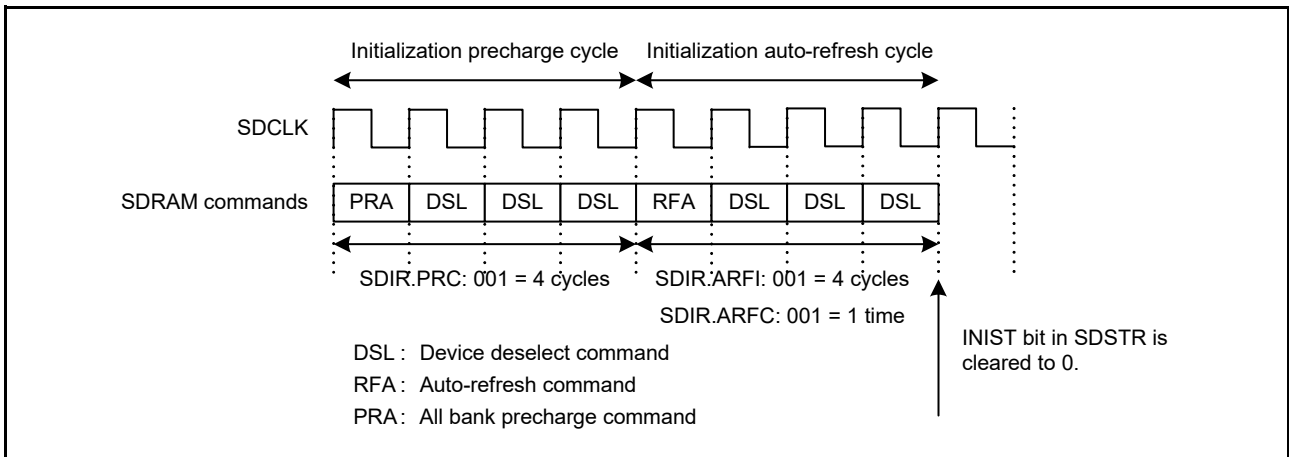

Figure 15.48 Example timing for SDRAM initialization sequence

### 15.6.10 Setting the Mode Register

Setting the SDRAM Mode Register (SDMOD) allows the mode register set command to be issued to the SDRAM and the value set in the MR[14:0] bits in SDMOD to be output to the lower bits of the address, specifically to A14 to A00 for 8-bit bus width or A15 to A01 for 16-bit bus width. Before setting the mode register, set the SDRAM Bus Width Select bits in the SDC Control Register (SDCCR.BSIZE[1:0]) to determine the data bus width of the SDRAM.

Figure 15.49 shows the mode register setting timing.

Figure 15.49 Mode register setting timing

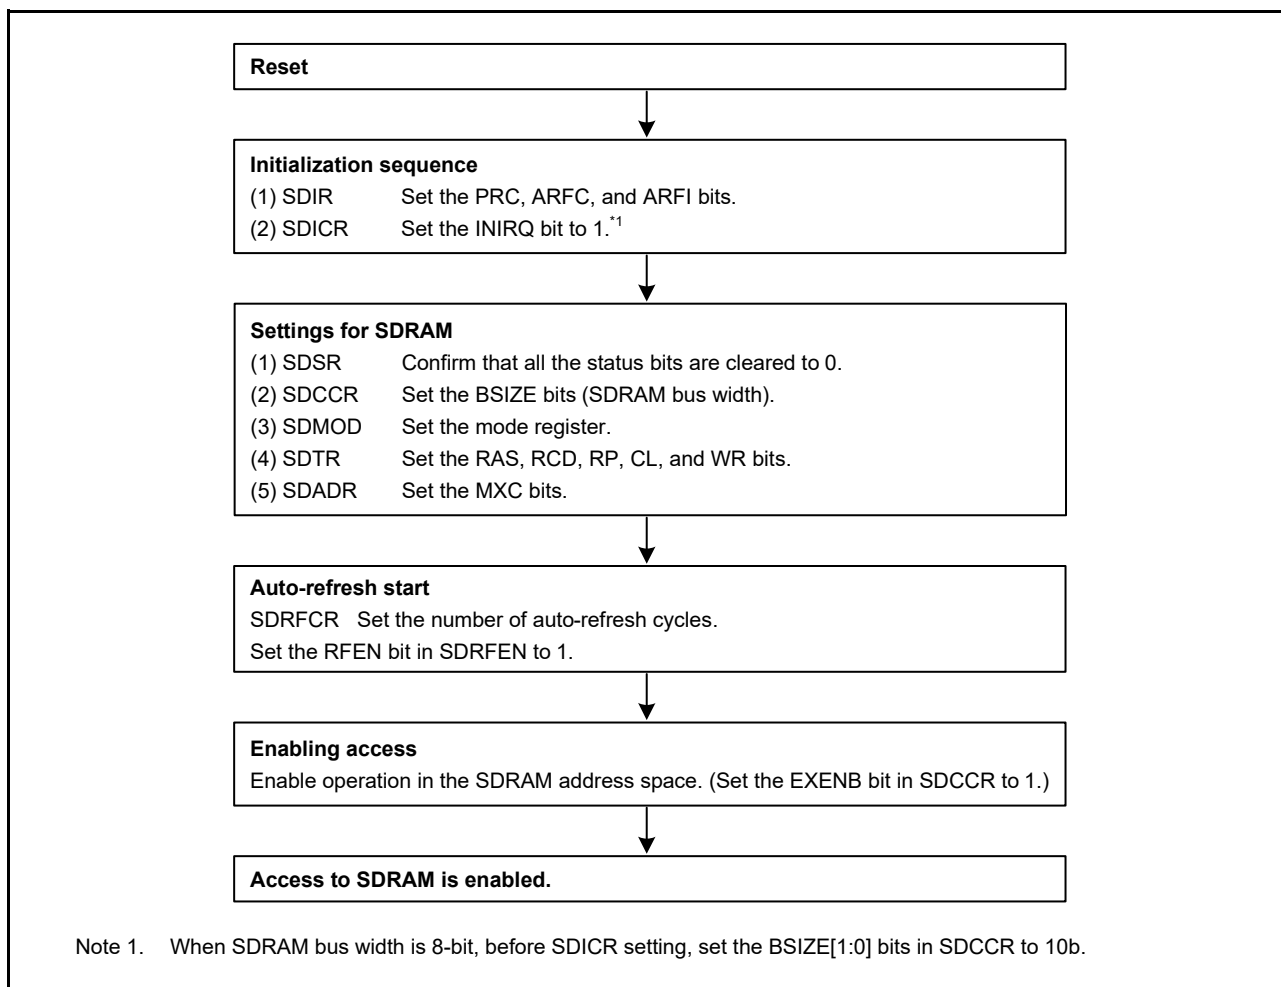

### 15.6.11 SDRAMC Setting Examples

This section describes the following:

- SDRAMC setting procedure
- Timing register setting examples
- Procedure for transitioning to and recovering from self-refresh mode.

#### 15.6.11.1 SDRAMC access procedure

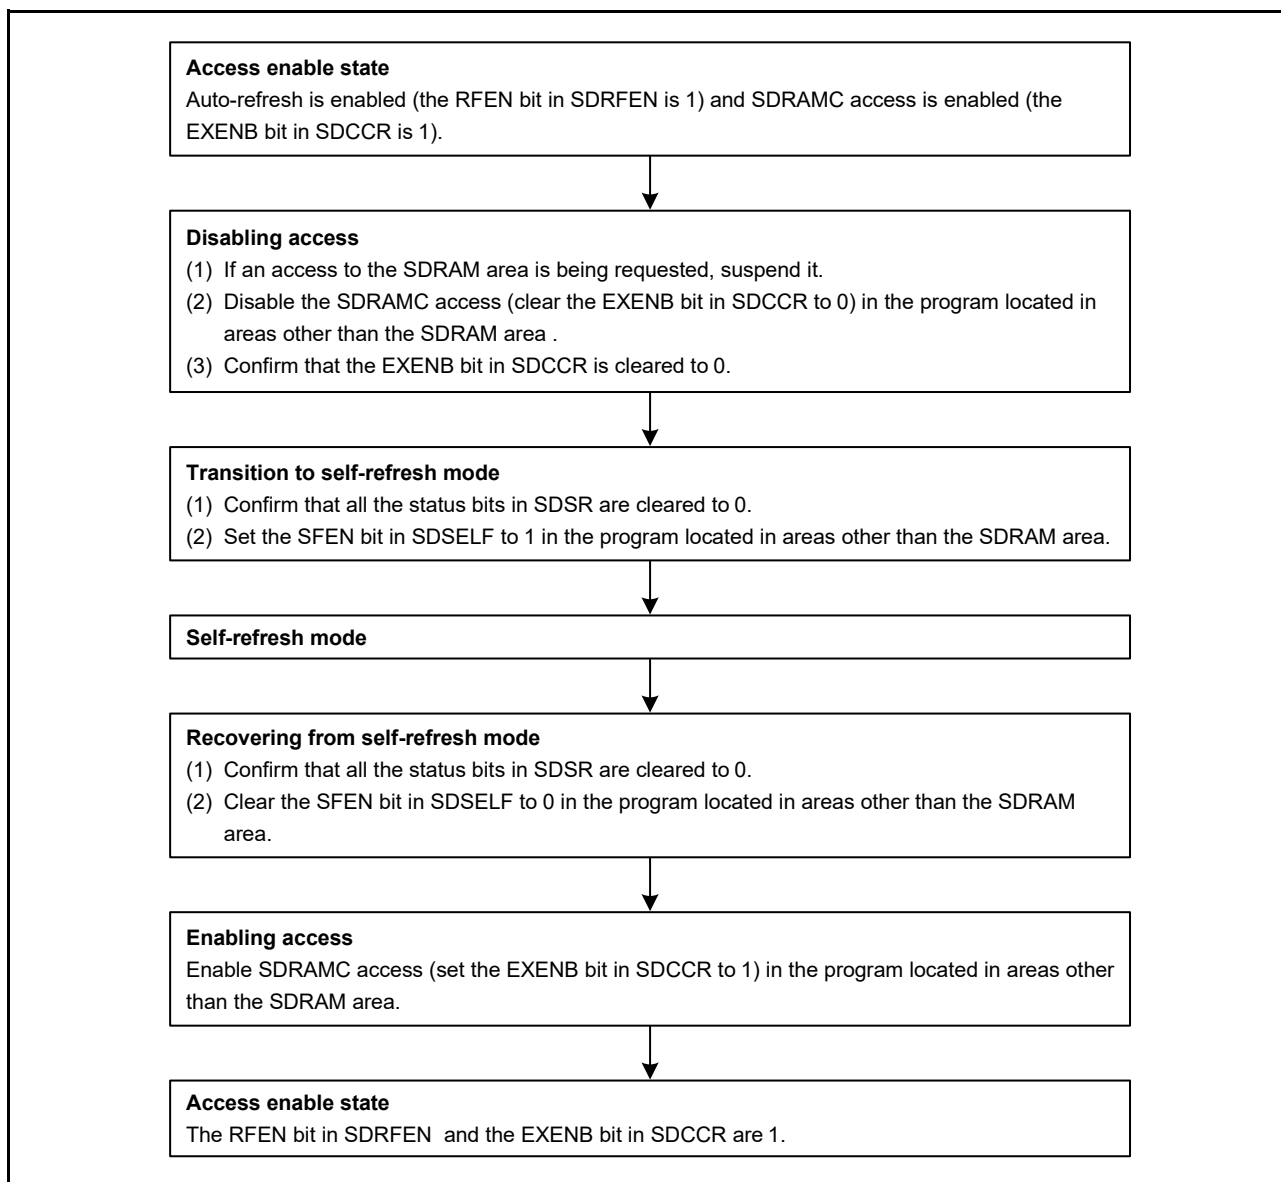

Figure 15.50 shows the SDRAMC setting procedure.

**Figure 15.50 SDRAMC setting procedure**

### 15.6.11.2 Procedure for transitioning to and recovering from self-refresh mode

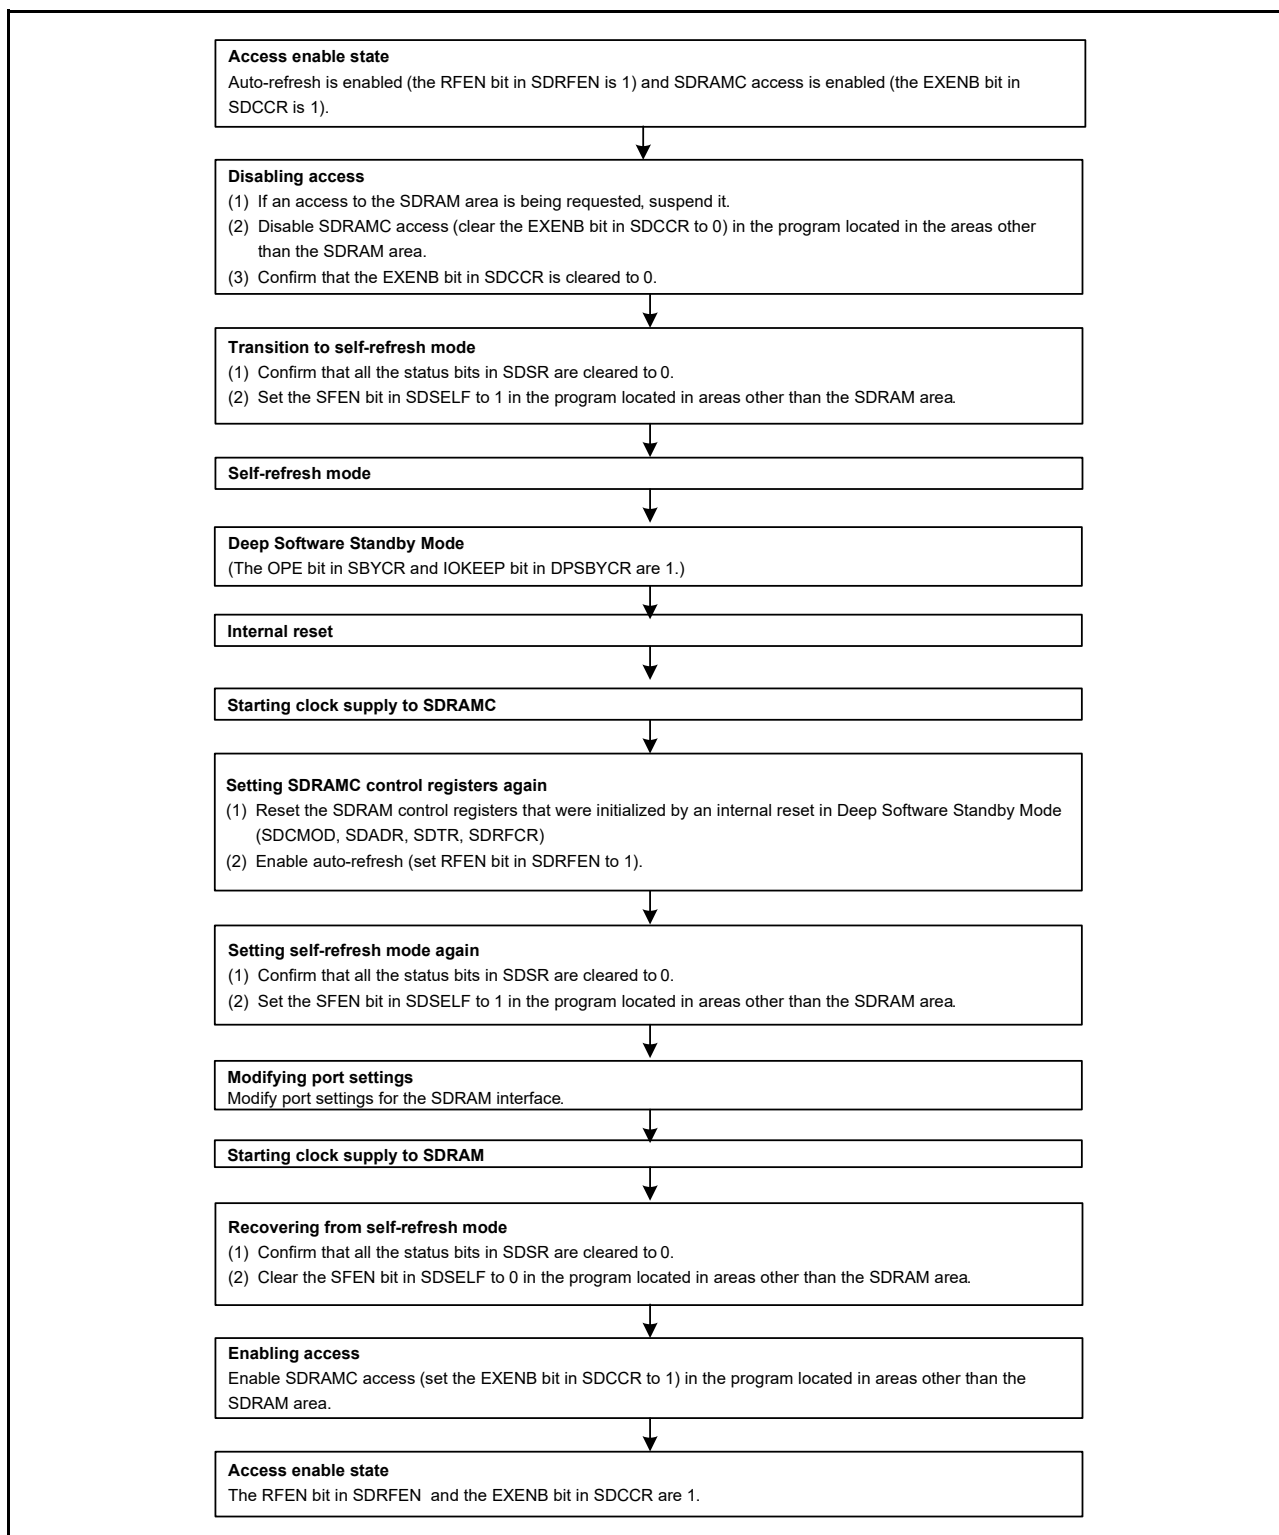

Figure 15.51 shows the procedure for transitioning to and recovering from self-refresh mode.

**Figure 15.51 Procedure for transitioning to and recovering from self-refresh mode**

Note: Self-refresh mode cannot be invoked during SDRAM access. SDRAM access must be disabled during both transition to and recovery from self-refresh mode. Follow the programming instructions shown in [Figure 15.52](#). Before transitioning to self-refresh mode, disable access to the SDRAM area. During transition to self-refresh mode, self-refresh operation, and recovery from self-refresh mode, do not allow any operand access or instruction fetch, including prefetch to the SDRAM area, to be generated.

[Figure 15.52](#) shows the procedure for transitioning to and recovering from self-refresh mode in Deep Software Standby mode.

**Figure 15.52 Procedure for transitioning to and recovering from self-refresh mode in Deep Software Standby mode**

### 15.6.11.3 Timing register settings and access timing

This section describes the relationship between read and write timing and the settings in the SDRAM Timing Register (SDTR).

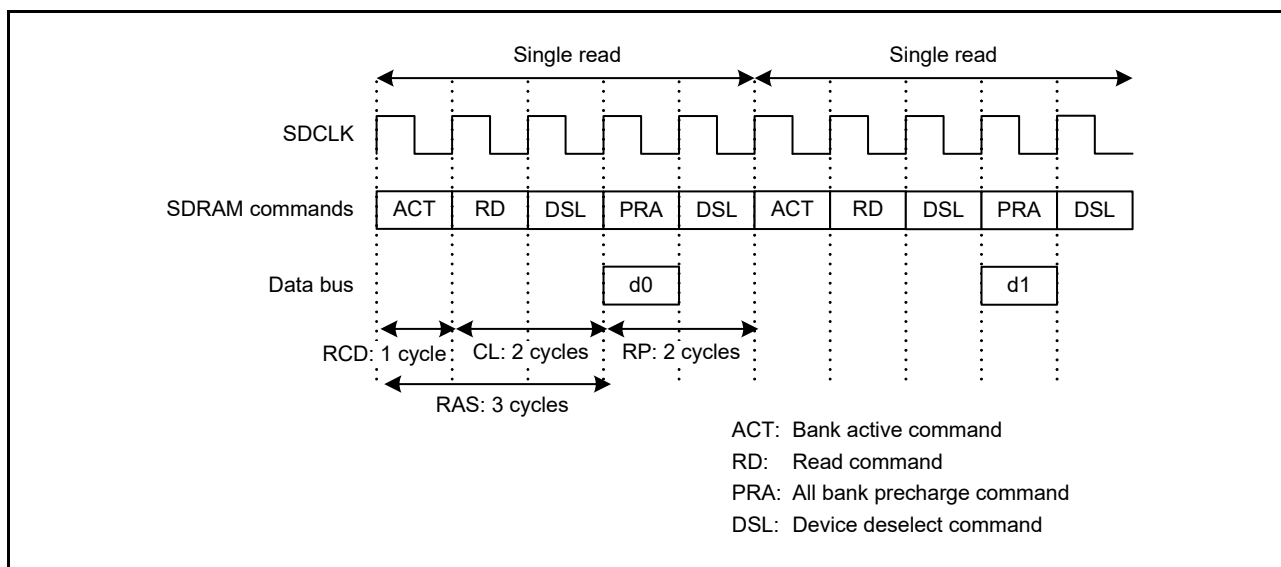

(1) Single read timing examples

Figure 15.53 to Figure 15.57 show the relationship between single read timing and the SDTR register settings. Table 15.15 shows the correspondence between the figures and the SDTR register settings.

During read access, the next bus access is enabled at the earliest 2 cycles after the read data becomes valid. However, if two or more accesses occur for one transfer request, the next bus access is enabled at the earliest 1 cycle after the read data becomes valid, as shown in Figure 15.57.

**Table 15.15 Correspondence between timing figures and STDR register settings for single read timing**

| Figure number              | RAS[2:0] settings | Number of cycles | RCD[1:0] settings | Number of cycles | RP[2:0] settings | Number of cycles | CL[2:0] settings | Number of cycles |
|----------------------------|-------------------|------------------|-------------------|------------------|------------------|------------------|------------------|------------------|

(2) Single write timing examples

Figure 15.58 to Figure 15.59 show the relationship between the single write timing and the SDTR register settings. Table 15.16 shows the association between the figures and the SDTR register settings. During write access, the next bus access is enabled at the earliest 2 cycles after an all bank precharge command (PRA) is issued. However, if two or more accesses occur for one transfer request, the next bus access is enabled at the earliest 1 cycle after the PRA is issued, as shown in Figure 15.62.

### 15.6.12 Address Multiplexing

In the SDRAM space, row and column addresses are multiplexed. The size of the shift in a row address must be specified in the Address Multiplex Select bits (SDADR.MXC[1:0]) in the SDRAM Address Register (SDADR). Additionally, in the SDRAM space, the address precharge-select command (Precharge-sel) is output to the upper bits of column addresses. Table 15.17 shows the relationship between the SDADR.MXC[1:0] settings and the shift amount.

Table 15.17 Address multiplexing

| MXC [1:0] | Shift amount | Data bus width | Address | Address pins external to the MCU |     |     |     |      |      |     |     |     |     |     |     |     |     |     |     |
|-----------|--------------|----------------|---------|----------------------------------|-----|-----|-----|------|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|           |              |                |         | A15                              | A14 | A13 | A12 | A11  | A10  | A09 | A08 | A07 | A06 | A05 | A04 | A03 | A02 | A01 | A00 |
| 00        | 8 bits       | 8 bits         | Row     | A23                              | A22 | A21 | A20 | A19  | A18* | A17 | A16 | A15 | A14 | A13 | A12 | A11 | A10 | A09 | A08 |
|           |              |                | Column  | A23                              | A22 | A21 | A20 | A19  | P    | A09 | A08 | A07 | A06 | A05 | A04 | A03 | A02 | A01 | A00 |
|           |              | 16 bits        | Row     | A23                              | A22 | A21 | A20 | A19* | A18  | A17 | A16 | A15 | A14 | A13 | A12 | A11 | A10 | A09 | A08 |

|           |              |                | Column  | A25                              | A24 | A23 | A22 | A21  | P    | A09 | A08 | A07 | A06 | A05 | A04 | A03 | A02 | A01 | A00 |
|           |              | 16 bits        | Row     | A25                              | A24 | A23 | A22 | A21* | A20  | A19 | A18 | A17 | A16 | A15 | A14 | A13 | A12 | A11 | A10 |
|           |              |                | Column  | A25                              | A24 | A23 | A22 | P    | A10  | A09 | A08 | A07 | A06 | A05 | A04 | A03 | A02 | A01 | A00 |
| 11        | 11 bits      | 8 bits         | Row     | A26                              | A25 | A24 | A23 | A22  | A21* | A20 | A19 | A18 | A17 | A16 | A15 | A14 | A13 | A12 | A11 |
|           |              |                | Column  | A26                              | A25 | A24 | A23 | A10  | P    | A09 | A08 | A07 | A06 | A05 | A04 | A03 | A02 | A01 | A00 |
|           |              | 16 bits        | Row     | A26                              | A25 | A24 | A23 | A22* | A21  | A20 | A19 | A18 | A17 | A16 | A15 | A14 | A13 | A12 | A11 |
|           |              |                | Column  | A26                              | A25 | A24 | A11 | P    | A10  | A09 | A08 | A07 | A06 | A05 | A04 | A03 | A02 | A01 | A00 |

Note: P: Precharge-select command (Precharge-sel) is output.  
 \*: When the PALL command is issued, Precharge-sel = 1 (high) is output. When the Active command is issued, the associated address is output.

## 15.6.13 Example SDRAM Connections

### 15.6.13.1 16-bit bus space

[Figure 15.63](#) shows an example connection to two 512-Mb SDRAMs with a 13-bit row address, 11-bit column address, and 8-bit bus.

Figure 15.63 SDRAM connection example with 512-Mb x 2 and 8-bit bus

Figure 15.64 shows an example connection to a 512-Mb SDRAMs with a 13-bit row address, 10-bit column address, and 16-bit bus.

**Figure 15.64 SDRAM connection example with 512-Mb × 1 and 16-bit bus**

Figure 15.65 shows an example connection to a 256-Mb SDRAMs with a 13-bit row address, 9-bit column address, and 16-bit bus.

Figure 15.65 SDRAM connection example with 256-Mb × 1 and 16-bit bus

### 15.6.14 Constraints

#### (1) Low-power states

In Software Standby and Deep Software Standby modes, auto-refresh operation is not available because the clock supply to the SDRAMC is stopped. To retain the data in the SDRAM when the SDRAM is externally connected, use the self-refresh function. For the procedure for transitioning to and recovering from self-refresh mode, see [section 15.6.7, Self-Refresh](#).

#### (2) Setting the SDRAM Timing Register

Set the RAS[2:0] bits in the SDRAM Timing Register (SDTR) to a value less than or equal to the sum of the row column latency (SDTR.RCD[1:0]) and column latency (SDTR.CL[2:0]) settings. Operation is not guaranteed if this condition is not satisfied.

#### (3) Instruction code constraint

You must fix the instruction code to little-endian order.

## 15.7 Bus Error Monitoring Section

This monitoring system monitors each individual area, and whenever it detects an error, it returns the error to the requesting master IP using the AHB-Lite error response protocol.

### 15.7.1 Bus Error Types

The following types of errors can occur on each bus:

- Illegal address access
- Bus master MPU error
- Bus slave MPU error
- Timeout.

Table 15.18 lists the address ranges where access leads to illegal address access errors. The reserved area in the slave does not trigger an illegal address access error. For more information on the bus master MPU and bus slave MPU, see section 16, Memory Protection Unit (MPU).

### 15.7.2 Operation When a Bus Error Occurs

When a bus error occurs, operation is not guaranteed and the error is returned to the requesting master IP. The bus errors that occur for each master are stored in the BUSnERRADD and BUSnERRSTAT registers. These registers must only be cleared by a reset. For more information, see section 15.3.20, Bus Error Address Register (BUSnERRADD) (n = 1 to 5) and section 15.3.21, Bus Error Status Register (BUSnERRSTAT) (n = 1 to 5).

Note: The DMAC and DTC do not receive bus errors. If the DMAC or DTC accesses the bus, the transfer continues. For other masters that receive bus errors, see section 30, Ethernet DMA Controller (EDMAC).

### 15.7.3 Conditions Leading to Illegal Address Access Errors

Table 15.18 lists the address spaces for each bus that trigger illegal address access errors.

**Table 15.18 Conditions leading to illegal address access errors (1 of 2)**

| Address                  | Slave bus name               | Master bus                 |     |       |
|--------------------------|------------------------------|----------------------------|-----|-------|
|                          |                              | CPU (ICode, DCode, System) | DMA | ETHER |
| 0000 0000h to 01FF FFFFh | Memory bus 1<br>Memory bus 3 | —                          | —   | —     |
| 0200 0000h to 027F FFFFh | Memory mapping area          | *1                         | E   | E     |
| 0280 0000h to 1FFD FFFFh | Reserved                     | E                          | E   | E     |
| 1FFE 0000h to 1FFF FFFFh | Memory bus 2<br>Memory bus 3 | —                          | —   | —     |
| 2000 0000h to 2003 FFFFh | Memory bus 4                 | —                          | —   | —     |
| 2004 0000h to 200F FFFFh | Memory bus 5                 | —                          | —   | —     |
| 2010 0000h to 3FFF FFFFh | Reserved                     | E                          | E   | E     |
| 4000 0000h to 4001 FFFFh | Peripheral bus 1             | —                          | —   | E     |
| 4002 0000h to 4003 FFFFh | Reserved                     | E                          | E   | E     |
| 4004 0000h to 4005 FFFFh | Peripheral bus 3             | —                          | —   | E     |
| 4006 0000h to 4007 FFFFh | Peripheral bus 4             | —                          | —   | E     |
| 4008 0000h to 4009 FFFFh | Peripheral bus 5             | —                          | —   | E     |
| 400A 0000h to 400B FFFFh | Reserved                     | —                          | —   | E     |
| 400C 0000h to 400D FFFFh | Peripheral bus 7             | —                          | —   | E     |
| 400E 0000h to 400F FFFFh | Reserved                     | E                          | E   | E     |
| 4010 0000h to 407F FFFFh | Peripheral bus 9             | —                          | —   | —     |
| 4080 0000h to 5FFF FFFFh | Reserved                     | E                          | E   | E     |
| 6000 0000h to 67FF FFFFh | QSPI area                    | —                          | —   | —     |
| 6800 0000h to 7FFF FFFFh | Reserved                     | E                          | E   | E     |
| 8000 0000h to 97FF FFFFh | CS/SDRAM area                | —                          | —   | —     |

**Table 15.18 Conditions leading to illegal address access errors (2 of 2)**

| Address                  | Slave bus name        | Master bus                 |     |       |
|--------------------------|-----------------------|----------------------------|-----|-------|
|                          |                       | CPU (ICode, DCode, System) | DMA | ETHER |
| 9800 0000h to DFFF FFFFh | Reserved              | E                          | E   | E     |
| E000 0000h to FFFF FFFFh | System for Cortex®-M4 | —                          | E   | E     |

E: Path where an illegal address access error occurs.

Note 1. The bus module does not detect whether the MMF switched the address. Therefore, if the MMF is enabled and the CPU accesses 0200 0000h, no error occurs. This depends on the switched address.

If the MMF is disabled and the CPU accesses 0200 0000h, the bus module can detect the error.

The bus module detects an access error resulting from access to a reserved area, for example if no area is assigned to the slave.

- 0200 0000h to 1FFD FFFFh: access error detection
- 0000 0000h to 01FF FFFFh: memory bus 1 no access error detection.

#### 15.7.4 Timeout

For some peripheral modules, a timeout error occurs with the module-stop function. When there is no response from the slave for a certain period of time, a timeout error is detected. A timeout error is returned to the requesting master IP using the AHB-Lite error response protocol.

### 15.8 Notes on using Flash Cache

When using flash cache through access from the CPU, the Arm MPU should also be set to cacheable. See references 1. and 2. for more information.

## 16. Memory Protection Unit (MPU)

### 16.1 Overview

The MCU provides four Memory Protection Units (MPUs) and a CPU stack pointer monitor function. [Table 16.1](#) lists the MPU specifications and [Table 16.2](#) shows the behavior on detection of each MPU error.

**Table 16.1 MPU specifications**

| Classification        | Module/Function           | Description   |
|-----------------------|---------------------------|---|
| Illegal memory access | Arm® Cortex®-M4 CPU       | <ul style="list-style-type: none"> <li>Arm CPU has a default memory map. If the CPU makes an illegal access, an exception interrupt occurs.</li> <li>MPU can change a default memory map.</li> </ul>      |

For information on error access for the Arm MPU, see [section 16.7](#). For information on error access for other MPUs, see [section 15.3.20, Bus Error Address Register \(BUSnERRADD\) \(n = 1 to 5\)](#) and [section 15.3.21, Bus Error Status Register \(BUSnERRSTAT\) \(n = 1 to 5\)](#) in [section 15, Buses](#).

## 16.2 CPU Stack Pointer Monitor

The CPU stack pointer monitor detects underflows and overflows of the stack pointer. Because the Arm CPU has two stack pointers, a Main Stack Pointer (MSP) and Process Stack Pointer (PSP), it supports two CPU stack pointer monitors. If a stack pointer underflow or overflow is detected, the CPU stack pointer monitor generates a reset or a non-maskable interrupt.

The CPU stack pointer monitor is enabled by setting the Stack Pointer Monitor Enable bit in the Stack Pointer Monitor Access Control Register (MSPMPUCTL, PSPMPUCTL) to 1.

Table 16.3 lists the specifications of the CPU stack pointer monitor, Figure 16.1 shows a block diagram, and Figure 16.2 shows the register setting flow.

**Table 16.3 CPU stack pointer monitor specifications**

| Parameter  | Description   |
|--|---|
| Protected region   | SRAM region   |
| Number of regions  | 2 regions: <ul style="list-style-type: none"> <li>• Main Stack Pointer</li> <li>• Process Stack Pointer.</li> </ul> |
| Address specification for individual regions                           | Region start and end addresses configurable   |
| Stack pointer monitor enable or disable setting for individual regions | Stack pointer monitor for individual regions can be enabled or disabled   |
| Operation on error detection   | Reset or non-maskable interrupts can be generated   |
| Register protection  | Registers can be protected from illegal writes  |

Figure 16.1 CPU stack pointer monitor block diagram

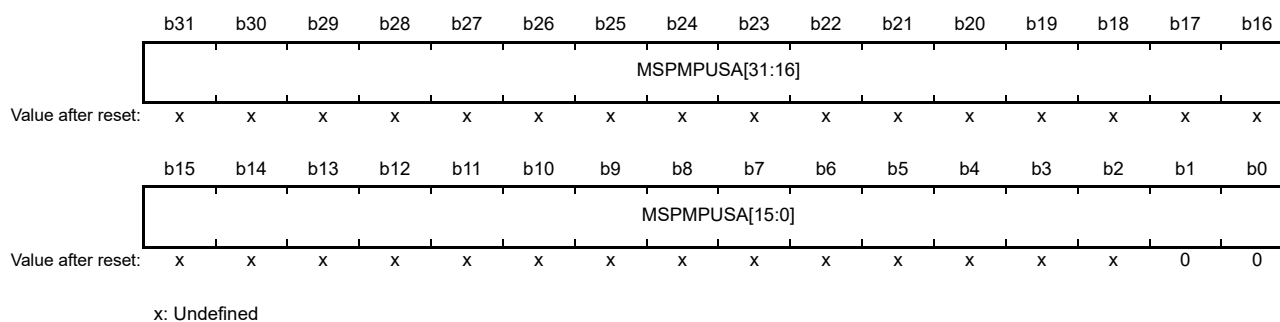

Figure 16.2 Register setting flow

### 16.2.1 Register Descriptions

Note: Bus access must be stopped before writing to MPU registers.

#### 16.2.1.1 Main Stack Pointer Monitor Start Address Register (MSPMPUSA)

Address(es): [SPMON.MSPMPUSA 4000 0D08h](#)

| Bit       | Symbol         | Bit name             | Description   | R/W |
|-----------|----------------|----------------------|---|-----|
| b31 to b0 | MSPMPUSA[31:0] | Region Start Address | Address where the region starts, for use in region determination. The lower 2 bits should be 0. The value range must be 1FF0 0000h to 200F FFFCh, excluding reserved areas. | R/W |

The MSPMPUSA and MSPMPUEA registers specify the CPU stack region in the SRAM (1FF0 0000h to 200F FFFCh, excluding reserved areas). For SRAM area to be covered, see [Figure 4.1, Memory map](#).

### 16.2.1.2 Main Stack Pointer Monitor End Address Register (MSPMPUEA)

Address(es): [SPMON.MSPMPUEA 4000 0D0Ch](#)

| Bit       | Symbol         | Bit name           | Description   | R/W |
|-----------|----------------|--------------------|---|-----|
| b31 to b0 | MSPMPUEA[31:0] | Region End Address | Address where the region ends, for use in region determination. The lower 2 bits should be 1. The value range must be 1FF0 0003h to 200F FFFFh, excluding reserved areas. | R/W |

### 16.2.1.3 Process Stack Pointer Monitor Start Address Register (PSPMPUSA)

Address(es): [SPMON.PSPMPUSA 4000 0D18h](#)

| Bit       | Symbol         | Bit name             | Description   | R/W |
|-----------|----------------|----------------------|---|-----|
| b31 to b0 | PSPMPUSA[31:0] | Region Start Address | Address where the region starts, for use in region determination. The lower 2 bits should be 0. The value range must be 1FF0 0000h to 200F FFFCh, excluding reserved areas. | R/W |

The PSPMPUSA and MSPMPUEA registers specify the CPU stack region in the SRAM (1FF0 0000h to 200F FFFFh, excluding reserved areas). For SRAM area to be covered, see [Figure 4.1, Memory map](#).

### 16.2.1.4 Process Stack Pointer Monitor End Address Register (PSPMPUEA)

Address(es): [SPMON.PSPMPUEA 4000 0D1Ch](#)

| Bit       | Symbol         | Bit name           | Description   | R/W |
|-----------|----------------|--------------------|---|-----|
| b31 to b0 | PSPMPUEA[31:0] | Region End Address | Address where the region ends, for use in region determination. The lower 2 bits should be 1. The value range must be 1FF0 0003h to 200F FFFFh, excluding reserved areas. | R/W |

### 16.2.1.5 Stack Pointer Monitor Operation After Detection Register (MSPMPUOAD, PSPMPUOAD)

Address(es): [SPMON.MSPMPUOAD 4000 0D00h](#), [SPMON.PSPMPUOAD 4000 0D10h](#)

| Bit       | Symbol                   | Bit name                  | Description  | R/W     |
|-----------|--------------------------|---------------------------|--|---------|
| b0        | <a href="#">OAD</a>      | Operation after Detection | 0: Non-maskable interrupt<br>1: Reset.                 | R/W     |
| b7 to b1  | —                        | Reserved                  | These bits are read as 0. The write value should be 0. | R/W     |
| b15 to b8 | <a href="#">KEY[7:0]</a> | Key Code                  | These bits enable or disable writes to the OAD bit.    | R/(W)*1 |

Note 1. Write data is not saved.

#### [OAD bit \(Operation after Detection\)](#)

The OAD bit selects either a reset or a non-maskable interrupt to occur when a stack pointer underflow or overflow is detected by the CPU stack pointer monitor. The main and the process stack pointer monitors each use an OAD bit to determine which signal is generated when a stack pointer underflow or overflow is detected. When writing to the OAD bit, write A5h simultaneously to the KEY[7:0] bits using halfword access.

#### [KEY\[7:0\] bits \(Key Code\)](#)

The KEY[7:0] bits enable or disable writes to the OAD bit. When writing to the OAD bit, write A5h simultaneously to the KEY[7:0] bits. When values other than A5h are written to the KEY[7:0] bits, the OAD bit is not updated. The KEY[7:0] bits are always read as 00h.

### 16.2.1.6 Stack Pointer Monitor Access Control Register (MSPMPUCTL, PSPMPUCTL)

Address(es): SPMON.MSPMPUCTL 4000 0D04h, SPMON.PSPMPUCTL 4000 0D14h

| Bit       | Symbol | Bit name                         | Description  | R/W |
|-----------|--------|----------------------------------|--|-----|
| b0        | ENABLE | Stack Pointer Monitor Enable     | 0: Disable stack pointer monitor<br>1: Enable stack pointer monitor.                                   | R/W |
| b7 to b1  | —      | Reserved                         | These bits are read as 0. The write value should be 0.   | R/W |
| b8        | ERROR  | Stack Pointer Monitor Error Flag | 0: No stack pointer overflow or underflow occurred<br>1: Stack pointer overflow or underflow occurred. | R/W |
| b15 to b9 | —      | Reserved                         | These bits are read as 0. The write value should be 0.   | R/W |

Note 1. The initial value depends on the reset generation source.

#### ENABLE bit (Stack Pointer Monitor Enable)

The ENABLE bit enables or disables the stack pointer monitor function, independently set for the main stack pointer monitor and the process stack pointer monitor.

When the MSPMPUCTL.ENABLE bit is set to 1, the following registers are available:

- MSPMPUSA
- MSPMPUEA
- MSPMPUOAD.

When the PSPMPUCTL.ENABLE bit is set to 1, the following registers are available:

- PSPMPUSA
- PSPMPUEA
- PSPMPUOAD.

#### ERROR bit (Stack Pointer Monitor Error Flag)

The ERROR bit indicates the status of the stack pointer monitor. Each stack pointer monitor has an independent ERROR bit.

[Setting condition]

- Overflow or underflow of the stack pointer.

[Clearing condition]

- 0 is written to this bit
- A reset other than the bus master MPU error reset, bus slave MPU error reset, and stack pointer error reset.

Note: Only 0 can be written to the ERROR bit.

### 16.2.1.7 Stack Pointer Monitor Protection Register (MSPMPUPT, PSPMPUPT)

Address(es): SPMON.MSPMPUPT 4000 0D06h, SPMON.PSPMPUPT 4000 0D16h

| Bit       | Symbol   | Bit name               | Description  | R/W     |
|-----------|----------|------------------------|--|---------|
| b0        | PROTECT  | Protection of register | 0: Stack pointer monitor register writes are permitted<br>1: Stack pointer monitor register writes are protected. Reads are permitted. | R/W     |
| b7 to b1  | —        | Reserved               | These bits are read as 0. The write value should be 0.   | R/W     |
| b15 to b8 | KEY[7:0] | Key Code               | These bits enable or disable writes to the PROTECT bit.  | R/(W)*1 |

Note 1. Write data is not saved.

#### PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected, independently set for the Main Stack Pointer monitor and the Process Stack Pointer monitor.

MSPMPUPT.PROTECT controls the following Main Stack Pointer protection registers:

- MSPMPUCTL
- MSPMPUSA
- MSPMPUEA.

PSPMPUT.PROTECT controls the following Process Stack Pointer protection registers:

- PSPMPUCTL
- PSPMPUSA
- PSPMPUEA.

When writing to the PROTECT bit, write A5h simultaneously to the KEY[7:0] bits, using halfword access.

#### KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write A5h simultaneously to the KEY[7:0] bits. When other values are written, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 00h.

## 16.2.2 Operation

### 16.2.2.1 Protecting the registers

To protect registers related to the CPU stack pointer monitor, set the associated PROTECT bit.

### 16.2.2.2 Overflow and underflow errors

The CPU stack pointer monitor generates an error if an overflow or underflow error is detected. Set the OAD bit to select whether the error is reported as a non-maskable interrupt or reset. The non-maskable interrupt status is indicated in ICU.NMISR.SPEST, see [section 14, Interrupt Controller Unit \(ICU\)](#). Reset status is indicated in SYSTEM.RSTSR1.SPERF, see [section 6, Resets](#).

When ICU.NMISR.SPEST indicates that a CPU stack pointer monitor interrupt occurred, confirm it by checking the ERROR bit in MSPMPUCTL and PSPMPUCTL to determine whether the error is a main stack pointer monitor error or process stack pointer monitor error.

A non-maskable interrupt remains set when a stack pointer overflows or underflows. To clear the error, clear the non-maskable interrupt flag by writing 1 to ICU.NMICLR.SPECLR. Write 0 to clear the ERROR bit in MSPMPUCTL and PSPMPUCTL.

### 16.3 Arm MPU

The Arm MPU has eight region MPUs and provides full support for:

- Protected regions
- Overlapping protected regions, with ascending priority:  
7 = highest priority  
0 = lowest priority.
- Access permissions
- Export of memory attributes to the system.

Arm MPU mismatches and permission violations invoke the programmable-priority MemManage fault (HardFault) handler. For details, see [section 16.7](#).

### 16.4 Bus Master MPU

The bus master MPU monitors the addresses accessed by the bus masters in the entire address space (0000 0000h to FFFF FFFFh). The access control information, consisting of read and write permissions, can be independently set for up to 32 regions. The bus master MPU monitors access to each region based on these settings. If access to a protected region is detected, the bus master MPU generates a reset or a non-maskable interrupt. For details on error access, see [section 15.3.20](#) and [section 15.3.21](#) in [section 15, Buses](#).

[Table 16.4](#) lists the specifications of the bus master MPU and [Figure 16.3](#) shows a block diagram. [Figure 16.4](#) shows bus master MPU groups A and B.

**Table 16.4 Bus master MPU specifications**

| Parameter  | Specifications   |
|--|--|
| Protected master groups  | <ul style="list-style-type: none"> <li>• Bus master MPU group A: DMA bus</li> <li>• Bus master MPU group B: ETHER bus.</li> </ul>    |
| Protected region   | 0000 0000h to FFFF FFFFh   |
| Number of regions  | <ul style="list-style-type: none"> <li>• Bus master MPU group A: 32 regions</li> <li>• Bus master MPU group B: 8 regions.</li> </ul> |
| Address specification for individual regions                       | Region start and end addresses configurable  |
| Enable/disable setting for memory protection in individual regions | Settings enabled or disabled for the associated region   |
| Access-control settings for individual regions                     | Permission to read and write   |
| Operation on error detection                                       | Reset or non-maskable interrupt  |
| Register protection  | Register can be protected from illegal writes  |

| 0   | 0   | 0   | 0   | 0   | 0   | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0      |

| Bit       | Symbol | Bit name         | Description  | R/W |
|-----------|--------|------------------|--|-----|
| b0        | ENABLE | Region Enable    | 0: Group m region n unit disabled<br>1: Group m region n unit enabled. | R/W |
| b1        | RP     | Read Protection  | 0: Read access permitted<br>1: Read access protected.                  | R/W |
| b2        | WP     | Write Protection | 0: Write access permitted<br>1: Write access protected.                | R/W |
| b15 to b3 | —      | Reserved         | These bits are read as 0. The write value should be 0.                 | R/W |

The ENABLE, RP, and WP bits are individually configurable for each group m region n unit.

#### ENABLE bit (Region Enable)

The ENABLE bit enables or disables the group m region n unit. When the ENABLE bit is set to 1, the RP and WP bits can be set to permit or protect access to the region that is set in MMPUSmn and MMPUEmn. When the ENABLE bit is set to 0, no region is specified for group m region n access.

#### RP bit (Read Protection)

The RP bit enables or disables read protection for group m region n. The RP bit is available when the ENABLE bit is set to 1.

#### WP bit (Write Protection)

The WP bit enables or disables write protection for group m region n. The WP bit is available when the ENABLE bit is set to 1.

**Table 16.5** Function of region control circuit (1 of 2)

| MMPUACmn.ENABLE*1 | MMPUACmn.RP*1 | MMPUACmn.WP*1 | Access | Region | Output of group m region n unit*1 |
|-------------------|---------------|---------------|--------|--------|-----------------------------------|
| 0                 | —             | —             | Read   | —      | Outside of region                 |
|                   |               |               | Write  | —      | Outside of region                 |

**Table 16.5 Function of region control circuit (2 of 2)**

| MMPUACmn.ENABLE*1 | MMPUACmn.RP*1 | MMPUACmn.WP*1 | Access  | Region            | Output of group m region n unit*1 |
|-------------------|---------------|---------------|---------|-------------------|-----------------------------------|
| 1                 | 0             | 0             | Read    | Inside            | Permitted region                  |
|                   |               |               |         | Outside           | Outside of region                 |
|                   |               |               | Write   | Inside            | Permitted region                  |

|                   |               |               |         | Outside           | Outside of region                 |
|                   |               |               | Write   | Inside            | Protected region                  |
|                   |               |               |         | Outside           | Outside of region                 |
|                   | 1             | 0             | Read    | Inside            | Protected region                  |
|                   |               |               |         | Outside           | Outside of region                 |
|                   |               |               | Write   | Inside            | Permitted region                  |
|                   |               |               |         | Outside           | Outside of region                 |
| 1                 | 1             | Read          | Inside  | Protected region  |                                   |
|                   |               |               | Outside | Outside of region |                                   |
|                   |               | Write         | Inside  | Protected region  |                                   |
|                   |               |               | Outside | Outside of region |                                   |

Note 1. m = A or B,  
 In the case of m = A: n = 0 to 31  
 In the case of m = B: n = 0 to 7.

**Table 16.6 Function of master control circuit**

| MMPUCTLm.ENABLE*1 | Output of group m region 0 unit*1 | Output of group m region 1 unit*1 | Output of group A Region 2 to 31 unit, Output of group B Region 2 to 7 unit | Function of group m*1 |
|-------------------|-----------------------------------|-----------------------------------|---|-----------------------|
| 1                 | Protected region                  | Don't care                        | Don't care  | Generate error        |
| 1                 | Don't care                        | Protected region                  | Don't care  | Generate error        |
| 1                 | Don't care                        | Don't care                        | Protected region  | Generate error        |
| 1                 | Outside of region                 | Outside of region                 | Outside of region   | Generate error        |
| Other case        |                                   |                                   |   | No error              |

Note 1. m = A or B.  
 A master MPU error occurs on the following conditions:

- MMPUCTLm.ENABLE = 1, and output of one or more region n units is to a protected region
- MMPUCTLm.ENABLE = 1, and output of all region n units is outside of region.

Other cases are handled as permitted regions.

### 16.4.1.4 Bus Master MPU Control Register (MMPUCTLm) (m = A or B)

Address(es): MMPU.MMPUCTLA 4000 0000h, MMPU.MMPUCTLB 4000 0400h

| Bit | Symbol | Bit name            | Description  | R/W |
|-----|--------|---------------------|--|-----|
| b0  | ENABLE | Master Group Enable | 0: Master group m disabled<br>1: Master group m enabled. | R/W |

| Bit       | Symbol   | Bit name                  | Description   | R/W     |
|-----------|----------|---------------------------|---|---------|
| b1        | OAD      | Operation After Detection | 0: Non-maskable interrupt<br>1: Reset.                          | R/W     |
| b7 to b2  | —        | Reserved                  | These bits are read as 0. The write value should be 0.          | R/W     |
| b15 to b8 | KEY[7:0] | Key Code                  | These bits enable or disable writes to the OAD and ENABLE bits. | R/(W)*1 |

Note 1. Write data is not saved.

#### ENABLE bit (Master Group Enable)

The ENABLE bit enables or disables the bus master MPU function for each master group. When this bit is set to 1, MMPUACmn is available. When this bit is set to 0, MMPUACmn is unavailable, including permission for all regions. The bus master MPU function of each master group uses the ENABLE bit. When writing to the ENABLE bit, write A5h to the KEY[7:0] bits simultaneously using halfword access.

#### OAD bit (Operation After Detection)

The OAD bit selects either a reset or a non-maskable interrupt to occur when access to the protected region is detected by the bus master MPU. The bus master MPU function for each master group uses its OAD bit independently. When writing to the OAD bit, write A5h to the KEY[7:0] bits simultaneously using halfword access.

#### KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the ENABLE and OAD bits. When writing to the ENABLE and OAD bits, write A5h to the KEY[7:0] bits simultaneously. When other values are written, the ENABLE and OAD bits are not updated. The KEY[7:0] bits are always read as 00h.

### 16.4.1.5 Group m Protection of Register (MMPUPTm) (m = A or B)

Address(es): MMPU.MMPUPTA 4000 0102h, MMPU.MMPUPTB 4000 0502h

| Bit       | Symbol   | Bit name               | Description   | R/W     |
|-----------|----------|------------------------|---|---------|
| b0        | PROTECT  | Protection of register | 0: All bus master MPU group m register writes are permitted<br>1: All bus master MPU group m register writes are protected. Read is possible. | R/W     |
| b7 to b1  | —        | Reserved               | These bits are read as 0. The write value should be 0.  | R/W     |
| b15 to b8 | KEY[7:0] | Key Code               | These bits enable or disable writes to the PROTECT bit  | R/(W)*1 |

Note 1. Write data is not saved.

#### PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected. MMPUTm.PROTECT controls the following bus master MPU group m protection registers:

- MMPUSmn
- MMPUEmn
- MMPUACmn
- MMPUCTLm.

When writing to the PROTECT bit, write A5h to the KEY[7:0] bits simultaneously using halfword access.

**KEY[7:0] bits (Key Code)**

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write A5h to the KEY[7:0] bits simultaneously. When other values are written, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 00h.

**16.4.2 Operation**

**16.4.2.1 Memory protection**

The bus master MPU monitors memory access using control settings made individually for the access control regions. If access to a protected region is detected, the bus master MPU generates a memory protection error.

The bus master MPU can be configured for up to 32 protection regions. Protected regions include those with overlapping permitted and protected regions, and those with two overlapping permitted regions.

The bus master MPU provides groups A and B. The memory protection function checks the address of the bus for a unified master group, and all accesses by a master group are protected. The bus master MPU sets the permission for all of the regions after reset. Setting MMPUCTLm.ENABLE to 1 protects all of the regions. A permitted region is set up within the protected region for each region. If access to a protected region is detected, the bus master MPU generates an error.

Figure 16.5 shows the use case of a bus master MPU.

**Figure 16.5 Use case of bus master MPU**

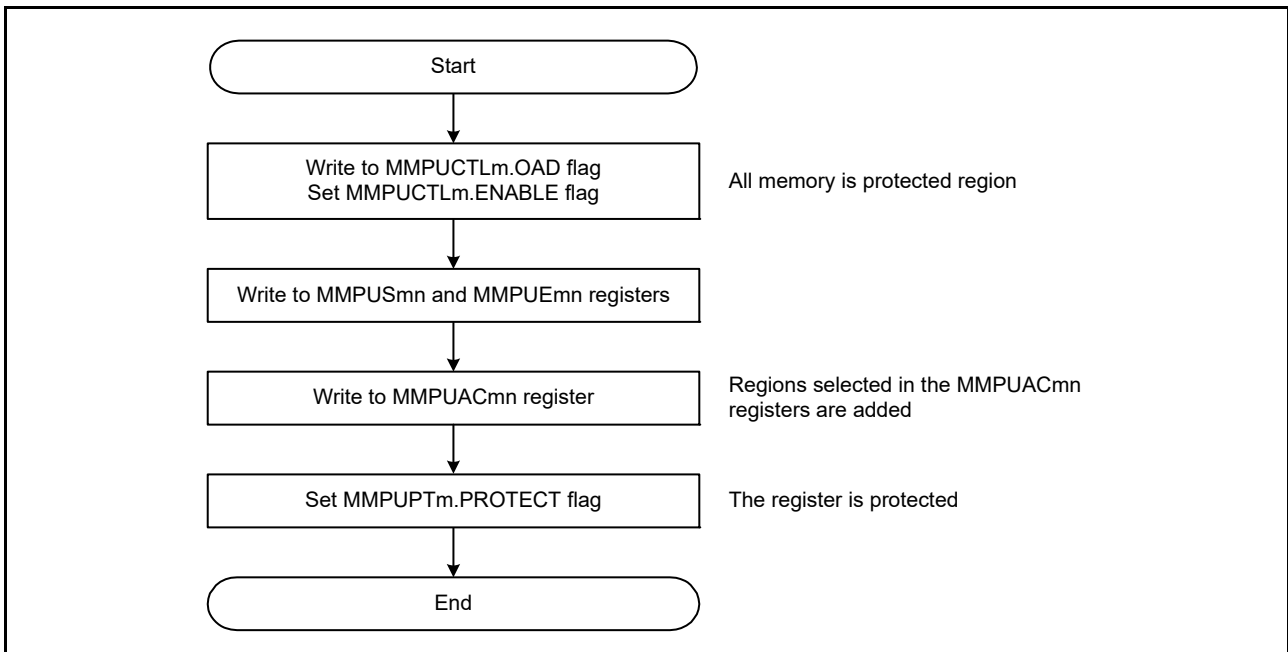

Figure 16.6 shows the access permission or protection for overlapping bus master MPU regions. Access control for overlapping regions is as follows:

- The region is handled as protected when output of one or more region units is a protected region
- The region is handled as protected when output of all region units is outside of the regions
- Other cases are handled as permitted regions.

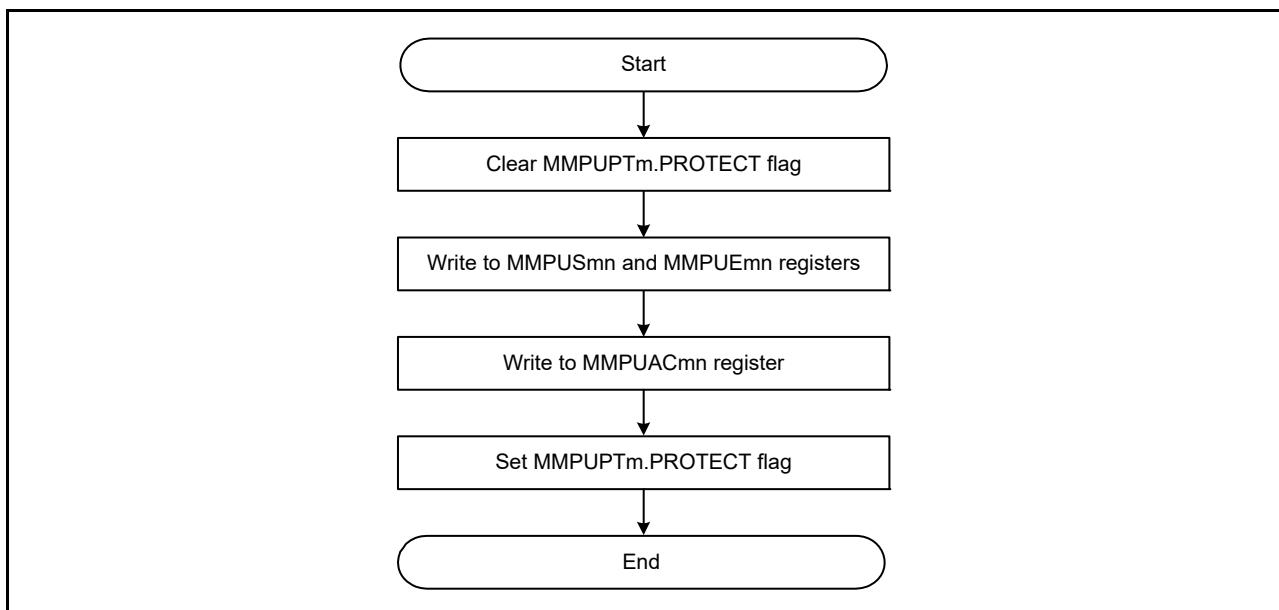

**Figure 16.6 Access permission or protection by overlap of the bus master MPU regions**

Figure 16.7 shows the register setting flow after reset. During this register setting, stop all masters except the CPU.

**Figure 16.7 Register setting flow after reset**

Figure 16.8 shows the register setting flow for adding regions. During this register setting, stop all masters except the CPU.

**Figure 16.8 Register setting flow for region addition**

### 16.4.2.2 Protecting the registers

To protect registers related to the bus master MPU, set the PROTECT bit in the associated MMPUPTm register.

### 16.4.2.3 Memory protection error

The bus master MPU generates an error if access to a protected region is detected. Set the OAD bit to select whether the error is reported as a non-maskable interrupt or reset. The non-maskable interrupt or reset is shared between bus master MPU groups A and B. The non-maskable interrupt status is indicated in ICU.NMISR.BUSMST, see [section 14, Interrupt Controller Unit \(ICU\)](#). Reset status is indicated in SYSTEM.RSTSR1.BUSMRF, see [section 6, Resets](#).

## 16.5 Bus Slave MPU

The bus slave MPU monitors access to the bus slave functions, such as flash or SRAM. The function can be accessed from three bus masters, the CPU, and bus master MPU groups A and B. The bus slave MPU has a separate protection register for each of the three bus masters, with individual access protection control, consisting of read and write permissions. If access to a protected region is detected, the bus slave MPU generates a reset or a non-maskable interrupt, and stores the bus error address, bus error status, and error access status. For details, see [15.3.20](#) and [15.3.21](#) in [section 15, Buses](#).

[Table 16.7](#) lists the specifications of the bus slave MPU and [Figure 16.9](#) shows a block diagram.

**Table 16.7 Bus slave MPU specifications (1 of 2)**

| Specifications                                 | Description   |
|--|---|
| Protected bus masters                          | <ul style="list-style-type: none"> <li>• Bus master MPU group A: DMA bus</li> <li>• Bus master MPU group B: ETHER bus.</li> </ul>   |
| Protected slave functions                      | <ul style="list-style-type: none"> <li>• Memory bus 3: Code flash memory, SRAMHS</li> <li>• Internal peripheral bus 9: Flash memory (in P/E), data flash memory, and TSN</li> <li>• Memory bus 4: SRAM0</li> <li>• Memory bus 5: Standby SRAM</li> <li>• Internal peripheral bus 1: DTC, DMAC, interrupt controller, flash registers, MPU, CSC, SDRAMC, SRAM registers, system controller and bus controller</li> <li>• Internal peripheral bus 3, 4, 5: Other peripherals</li> <li>• Internal peripheral bus 7: Secure IPs (SCE7)</li> <li>• EXBIU: External memory interface (SDRAM, CSC)</li> <li>• EXBIU2: External device interface (QSPI).</li> </ul> |
| Access-control settings for individual regions | Permission to read and write  |

**Table 16.7 Bus slave MPU specifications (2 of 2)**

| Specifications               | Description                                   |
|------------------------------|---|
| Operation on error detection | Reset, non-maskable interrupt, or exception   |
| Register protection          | Register can be protected from illegal writes |

**Figure 16.9 Bus slave MPU block diagram**

### 16.5.1 Register Descriptions

Note: Bus access must be stopped before writing to the MPU registers.

#### 16.5.1.1 Access Control Register for Memory Bus 3 (SMPUMBIU)

Address(es): SMPU.SMPUMBIU 4000 0C10h

|                    |              |              |       |       |     |     |    |    |    |    |            |            |            |            |    |    |

| b4        | RPGRPB | Master Group B Read Protection  | 0: Memory protection for master group B reads disabled<br>1: Memory protection for master group B reads enabled.   | R/W |
| b5        | WPGRPB | Master Group B Write Protection | 0: Memory protection for master group B writes disabled<br>1: Memory protection for master group B writes enabled. | R/W |
| b11 to b6 | —      | Reserved                        | These bits are read as 0. The write value should be 0.   | R/W |

| Bit | Symbol   | Bit name                           | Description  | R/W |
|-----|----------|------------------------------------|--|-----|
| b12 | RPFLI    | Code Flash Memory Read Protection  | 0: Memory protection for code flash memory reads from master group A and B disabled<br>1: Memory protection for code flash memory reads from master group A and B enabled. | R/W |
| b13 | WPFLI    | Code Flash Memory Write Protection | 1: Memory protection for code flash memory writes from master group A and B enabled.<br>This bit is read as 1. The write value should be 1.                                | R/W |
| b14 | RPSRAMHS | SRAMHS Read Protection             | 0: Memory protection for SRAMHS reads from master group A and B disabled<br>1: Memory protection for SRAMHS reads from master group A and B enabled.                       | R/W |
| b15 | WPSRAMHS | SRAMHS Write Protection            | 0: Memory protection for SRAMHS writes from master group A and B disabled<br>1: Memory protection for SRAMHS writes from master group A and B enabled.                     | R/W |

The SMPUMBIU register enables memory protection for the specified master and slave for access from master group A or B to code flash memory and SRAMHS.

#### RPGRPA bit (Master Group A Read Protection)

The RPGRPA bit enables or disables memory protection for reads by master group A on memory bus 3.

#### WPGRPA bit (Master Group A Write Protection)

The WPGRPA bit enables or disables memory protection for writes by master group A on memory bus 3.

#### RPGRPB bit (Master Group B Read Protection)

The RPGRPB bit enables or disables memory protection for reads by master group B on memory bus 3.

#### WPGRPB bit (Master Group B Write Protection)

The WPGRPB bit enables or disables memory protection for writes by master group B on memory bus 3.

#### RPFLI bit (Code Flash Memory Read Protection)

The RPFLI bit enables or disables memory protection for reads by master group A or B on the code flash memory.

#### WPFLI bit (Code Flash Memory Write Protection)

The WPFLI bit enables memory protection for writes by master group A or B on the code flash memory.

#### RPSRAMHS bit (SRAMHS Read Protection)

The RPSRAMHS bit enables or disables memory protection for reads by master group A or B on the SRAMHS.

#### WPSRAMHS bit (SRAMHS Write Protection)

The WPSRAMHS bit enables or disables memory protection for writes by master group A or B on the SRAMHS.

### 16.5.1.2 Access Control Register for Internal Peripheral Bus 9 (SMPUFBIU)

Address(es): SMPU.SMPUFBIU 4000 0C14h

|                    | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5      | b4      | b3      | b2      | b1     | b0    |

#### RPCPU bit (CPU Read Protection)

The RPCPU bit enables or disables memory protection for reads by the CPU on internal peripheral bus 9.

#### WPCPU bit (CPU Write Protection)

The WPCPU bit enables or disables memory protection for writes by the CPU on internal peripheral bus 9.

#### RPGRPA bit (Master Group A Read Protection)

The RPGRPA bit enables or disables memory protection for reads by master group A on internal peripheral bus 9.

#### WPGRPA bit (Master Group A Write Protection)

The WPGRPA bit enables or disables memory protection for writes by master group A on internal peripheral bus 9.

#### RPGRPB bit (Master Group B Read Protection)

The RPGRPB bit enables or disables memory protection for reads by master group B on internal peripheral bus 9.

#### WPGRPB bit (Master Group B Write Protection)

The WPGRPB bit enables or disables memory protection for writes by master group B on internal peripheral bus 9.

**RPCPU bit (CPU Read protection)**

The RPCPU bit enables or disables memory protection for reads by the CPU on memory bus 4.

**WPCPU bit (CPU Write protection)**

The WPCPU bit enables or disables memory protection for writes by the CPU on memory bus 4.

**RPGRPA bit (Master Group A Read protection)**

The RPGRPA bit enables or disables memory protection for reads by master group A on memory bus 4.

**WPGRPA bit (Master Group A Write protection)**

The WPGRPA bit enables or disables memory protection for writes by master group A on memory bus 4.

**RPGRPB bit (Master Group B Read protection)**

The RPGRPB bit enables or disables memory protection for reads by master group B on memory bus 4.

**WPGRPB bit (Master Group B Write protection)**

The WPGRPB bit enables or disables memory protection for writes by master group B on memory bus 4.

**RPCPU bit (CPU Read Protection)**

The RPCPU bit enables or disables memory protection for reads by the CPU on memory bus 5.

**WPCPU bit (CPU Write Protection)**

The WPCPU bit enables or disables memory protection for writes by the CPU on memory bus 5.

**RPGRPA bit (Master Group A Read Protection)**

The RPGRPA bit enables or disables memory protection for reads by master group A on memory bus 5.

**WPGRPA bit (Master Group A Write Protection)**

The WPGRPA bit enables or disables memory protection for writes by master group A on memory bus 5.

**RPGRPB bit (Master Group B Read Protection)**

The RPGRPB bit enables or disables memory protection for reads by master group B on memory bus 5.

**WPGRPB bit (Master Group B Write Protection)**

The WPGRPB bit enables or disables memory protection for writes by master group B on memory bus 5.

**16.5.1.5 Access Control Register for Internal Peripheral Bus 1 (SMPUP0BIU)**

| b4        | RPGRPB | Master Group B Read Protection  | 1: Memory protection for master group B reads enabled.<br>Master group B is protected, and is not detected. This bit is read as 1. The write value should be 1.  | R/W |
| b5        | WPGRPB | Master Group B Write Protection | 1: Memory protection for master group B writes enabled.<br>Master group B is protected, and is not detected. This bit is read as 1. The write value should be 1. | R/W |
| b15 to b6 | —      | Reserved                        | These bits are read as 0. The write value should be 0.   | R/W |

**RPCPU bit (CPU Read Protection)**

The RPCPU bit enables or disables memory protection for reads by the CPU on internal peripheral bus 1.

**WPCPU bit (CPU Write Protection)**

The WPCPU bit enables or disables memory protection for writes by the CPU on internal peripheral bus 1.

**RPGRPA bit (Master Group A Read Protection)**

The RPGRPA bit enables or disables memory protection for reads by master group A on internal peripheral bus 1.

**WPGRPA bit (Master Group A Write Protection)**

The WPGRPA bit enables or disables memory protection for writes by master group A on internal peripheral bus 1.

**RPGRPB bit (Master Group B Read Protection)**

The RPGRPB bit enables memory protection for reads by master group B on internal peripheral bus 1. There is no connection between master group B and internal peripheral bus 1. This bit is read as 1, and the write value should be 1.

**WPGRPB bit (Master Group B Write Protection)**

The WPGRPB bit enables memory protection for writes by master group B on internal peripheral bus 1. There is no connection between master group B and internal peripheral bus 1. This bit is read as 1, and the write value should be 1.

| b15 to b6 | —      | Reserved                        | These bits are read as 0. The write value should be 0.   | R/W |

#### RPCPU bit (CPU Read Protection)

The RPCPU bit enables or disables memory protection for reads by the CPU on internal peripheral buses 3, 4, and 5.

#### WPCPU bit (CPU Write Protection)

The WPCPU bit enables or disables memory protection for writes by the CPU on internal peripheral buses 3, 4, and 5.

#### RPGRPA bit (Master Group A Read Protection)

The RPGRPA bit enables or disables memory protection for reads by master group A on internal peripheral buses 3, 4, and 5.

#### WPGRPA bit (Master Group A Write Protection)

The WPGRPA bit enables or disables memory protection for writes by master group A on internal peripheral buses 3, 4, and 5.

#### RPGRPB bit (Master Group B Read Protection)

The RPGRPB bit enables memory protection for reads by master group B on internal peripheral buses 3, 4, and 5. There is no connection between master group B and internal peripheral buses 3, 4, and 5. This bit is read as 1, and the write value should be 1.

#### WPGRPB bit (Master Group B Write Protection)

The WPGRPB bit enables memory protection for writes by master group B on internal peripheral buses 3, 4, and 5. There is no connection between master group B and internal peripheral buses 3, 4, and 5. This bit is read as 1, and the write value should be 1.

### 16.5.1.7 Access Control Register for Internal Peripheral Bus 7 (SMPUP6BIU)

Address(es): SMPU.SMPUP6BIU 4000 0C28h

| b4        | RPGRPB | Master Group B Read Protection  | 1: Memory protection for master group B reads enabled.<br>Master group B is protected, and is not detected. This bit is read as 1. The write value should be 1.  | R/W |
| b5        | WPGRPB | Master Group B Write Protection | 1: Memory protection for master group B writes enabled.<br>Master group B is protected, and is not detected. This bit is read as 1. The write value should be 1. | R/W |
| b15 to b6 | —      | Reserved                        | These bits are read as 0. The write value should be 0.   | R/W |

#### RPCPU bit (CPU Read Protection)

The RPCPU bit enables or disables memory protection for reads by the CPU on internal peripheral bus 7.

#### WPCPU bit (CPU Write Protection)

The WPCPU bit enables or disables memory protection for writes by the CPU on internal peripheral bus 7.

#### RPGRPA bit (Master Group A Read Protection)

The RPGRPA bit enables or disables memory protection for reads by master group A on internal peripheral bus 7.

#### WPGRPA bit (Master Group A Write Protection)

The WPGRPA bit enables or disables memory protection for writes by master group A on internal peripheral bus 7.

#### RPGRPB bit (Master Group B Read Protection)

The RPGRPB bit enables memory protection for reads by master group B on internal peripheral bus 7. There is no connection between master group B and internal peripheral bus 7. This bit is read as 1, and the write value should be 1.

#### WPGRPB bit (Master Group B Write Protection)

The WPGRPB bit enables memory protection for writes by master group B on internal peripheral bus 7. There is no connection between master group B and internal peripheral bus 7. This bit is read as 1, and the write value should be 1.

### 16.5.1.8 Access Control Register for CS Area and SDRAM Area (SMPUEXBIU)

Address(es): SMPU.SMPUEXBIU 4000 0C30h

| b15 to b6 | —      | Reserved                        | These bits are read as 0. The write value should be 0.   | R/W |

#### RPCPU bit (CPU Read Protection)

The RPCPU bit enables or disables memory protection for reads by the CPU in the CS and SDRAM areas.

#### WPCPU bit (CPU Write Protection)

The WPCPU bit enables or disables memory protection for writes by the CPU in the CS and SDRAM areas.

#### RPGRPA bit (Master Group A Read Protection)

The RPGRPA bit enables or disables memory protection for reads by master group A in the CS and SDRAM areas.

#### WPGRPA bit (Master Group A Write Protection)

The WPGRPA bit enables or disables memory protection for writes by master group A in the CS and SDRAM areas.

#### RPGRPB bit (Master Group B Read Protection)

The RPGRPB bit enables or disables memory protection for reads by master group B in the CS and SDRAM areas.

#### WPGRPB bit (Master Group B Write Protection)

The WPGRPB bit enables or disables memory protection for writes by master group B in the CS and SDRAM areas.

### 16.5.1.9 Access Control Register for QSPI Area (SMPUEXBIU2)

Address(es): SMPU.SMPUEXBIU2 4000 0C34h

|                    |     |     |     |     |     |     |    |    |    |    |            |            |            |            |           |       |
|--------------------|-----|-----|-----|-----|-----|-----|----|----|----|----|------------|------------|------------|------------|-----------|-------|
|                    | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5         | b4         | b3         | b2         | b1        | b0    |
|                    | —   | —   | —   | —   | —   | —   | —  | —  | —  | —  | WPGR<br>PB | RPGRP<br>B | WPGR<br>PA | RPGRP<br>A | WPCP<br>U | RPCPU |
| Value after reset: | 0   | 0   | 0   | 0   | 0   | 0   | 0  | 0  | 0  | 0  | 0          | 0          | 0          | 0          | 0         | 0     |

| Bit       | Symbol | Bit name                        | Description  | R/W |
|-----------|--------|---------------------------------|--|-----|
| b0        | RPCPU  | CPU Read Protection             | 0: Memory protection for CPU reads disabled<br>1: Memory protection for CPU reads enabled.                         | R/W |
| b1        | WPCPU  | CPU Write Protection            | 0: Memory protection for CPU writes disabled<br>1: Memory protection for CPU writes enabled.                       | R/W |
| b2        | RPGRPA | Master Group A Read Protection  | 0: Memory protection for master group A reads disabled<br>1: Memory protection for master group A reads enabled.   | R/W |
| b3        | WPGRPA | Master Group A Write Protection | 0: Memory protection for master group A writes disabled<br>1: Memory protection for master group A writes enabled. | R/W |
| b4        | RPGRPB | Master Group B Read Protection  | 0: Memory protection for master group B reads disabled<br>1: Memory protection for master group B reads enabled.   | R/W |
| b5        | WPGRPB | Master Group B Write Protection | 0: Memory protection for master group B writes disabled<br>1: Memory protection for master group B writes enabled. | R/W |
| b15 to b6 | —      | Reserved                        | These bits are read as 0. The write value should be 0.   | R/W |

#### RPCPU bit (CPU Read Protection)

The RPCPU bit enables or disables memory protection for reads by the CPU in the QSPI area.

#### WPCPU bit (CPU Write Protection)

The WPCPU bit enables or disables memory protection for writes by the CPU in the QSPI area.

#### RPGRPA bit (Master Group A Read Protection)

The RPGRPA bit enables or disables memory protection for reads by master group A in the QSPI area.

#### WPGRPA bit (Master Group A Write Protection)

The WPGRPA bit enables or disables memory protection for writes by master group A in the QSPI area.

#### RPGRPB bit (Master Group B Read Protection)

The RPGRPB bit enables or disables memory protection for reads by master group B in the QSPI area.

#### WPGRPB bit (Master Group B Write Protection)

The WPGRPB bit enables or disables memory protection for writes by master group B in the QSPI area.

### 16.5.1.10 Slave MPU Control Register (SMPUCTL)

Address(es): SMPU.SMPUCTL 4000 0C00h

| Bit       | Symbol   | Bit name                  | Description  | R/W     |
|-----------|----------|---------------------------|--|---------|
| b0        | OAD      | Operation After Detection | 0: Non-maskable interrupt<br>1: Reset.   | R/W     |
| b1        | PROTECT  | Protection of Register    | 0: All bus slave MPU register writes are permitted<br>1: All bus slave MPU register writes are protected. Reads are permitted. | R/W     |
| b7 to b2  | —        | Reserved                  | These bits are read as 0. The write value should be 0.   | R/W     |
| b15 to b8 | KEY[7:0] | Key Code                  | These bits enable or disable writes to the OAD and PROTECT bits  | R/(W)*1 |

Note 1. Write data is not saved.

#### OAD bit (Operation After Detection)

The OAD bit selects either a reset or non-maskable interrupt to occur when access to the protected region is detected by the bus slave MPU. When writing to the OAD bit, write A5h to the KEY[7:0] bits simultaneously using halfword access.

#### PROTECT bit (Protection of Register)

The PROTECT bit enables or disables writes to the associated registers to be protected. SMPUCTL.PROTECT controls the following registers:

- SMPUMBIU
- SMPUFBIU
- SMPUSRAM0
- SMPUSRAM1
- SMPUP0BIU
- SMPUP2BIU
- SMPUP6BIU
- SMPUEXBIU
- SMPUEXBIU2.

When writing to the PROTECT bit, write A5h to the KEY[7:0] bits simultaneously using halfword access.

#### KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the OAD and PROTECT bits. When writing to the OAD and PROTECT bits, write A5h to the KEY[7:0] bits simultaneously. When other values are written, the OAD and PROTECT bits are not updated. The KEY[7:0] bits are always read as 00h.

## 16.5.2 Operation

### 16.5.2.1 Memory protection

The bus slave MPU monitoring functions with access control information that is set for the individual access control registers. If access to a protected region is detected, the bus slave MPU generates a memory protection error.

The bus slave MPU is enabled by writing 1 to the Write Protect (WPCPU or WPGRPA) bit or the Read Protect (RPCPU

or RPGRPA) bit in the access control register (SMPUMBIU, SMPUFBIU, SMPUSRAM0, SMPUSRAM1, SMPUP0BIU, SMPUP2BIU, SMPUP6BIU, SMPUEXBIU and SMPUEXBIU2).

### 16.5.2.2 Protecting the registers

Registers related to the bus slave MPU can be protected with the PROTECT bit in the SMPUCTL register.

### 16.5.2.3 Memory protection error

If access to a protected region is detected, the slave master MPU generates a memory protection error. Set the OAD bit to select whether the error is reported as a non-maskable interrupt or reset.

The non-maskable interrupt status is indicated in ICU.NMISR.BUSSST. For details, see [section 14, Interrupt Controller Unit \(ICU\)](#). The reset status is indicated in SYSTEM.RSTSR1.BUSSRF. For details, see [section 6, Resets](#).

## 16.6 Security MPU

The MCU incorporates a security MPU with four secure regions that include the code flash, the SRAM, and two security functions. The secure regions can be protected from non-secure program accesses. Access to a protected region from a non-secure program is not permitted.

[Table 16.8](#) lists the specifications of the security MPU and [Figure 16.10](#) shows a block diagram of the security MPU.

**Table 16.8 Security MPU specifications**

| Specifications   | Description  |
|--|--|
| Secure regions   | Code flash, SRAM, two security functions               |
| Protected regions  | 0000 0000h to FFFF FFFFh                               |
| Number of regions  | Program Counter: 2 regions<br>Data access: 4 regions   |
| Address specification for individual regions                       | Setting the address where regions start and end        |
| Enable/disable setting for memory protection in individual regions | Settings enabled or disabled for the associated region |

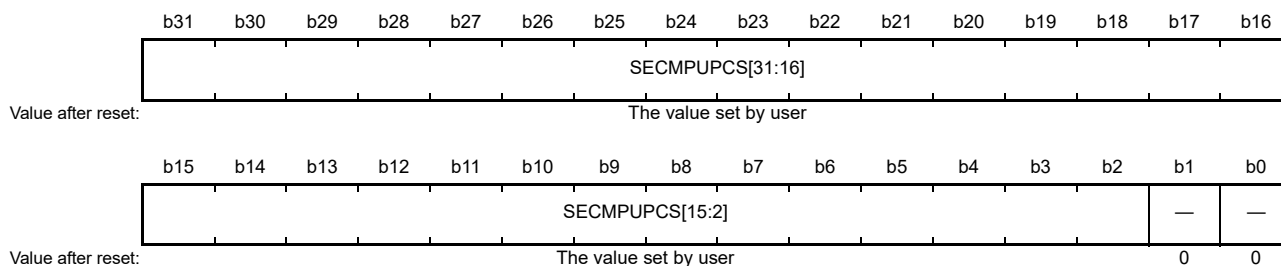

Figure 16.10 Security MPU block diagram

### 16.6.1 Register Descriptions (Option-Setting memory)

All security MPU registers are option-setting memory. Option-setting memory refers to a set of registers that are provided for selecting the state of the microcontroller after a reset. The option-setting memory is allocated in the flash.

#### 16.6.1.1 Security MPU Program Counter Start Address Register (SECMUPCSn) (n = 0, 1)

Address(es): [SECMUPCS0 0000 0408h](#), [SECMUPCS1 0000 0410h](#)

| Bit    | Symbol | Bit name | Description  | R/W |
|--------|--------|----------|--|-----|
| b1, b0 | —      | Reserved | These bits are read as 0. When writing to flash, the write value should always be 0. | R   |

| Bit       | Symbol          | Bit name             | Description  | R/W |
|-----------|-----------------|----------------------|--|-----|
| b31 to b2 | SECMUPPCS[31:2] | Region Start Address | Address where the region starts, for use in region determination | R   |

The SECMUPPCSn and SECMUPPCEn registers specify the security fetch region for the code flash or SRAM (0000 0000h to FFFF FFFFh). The secure program is executed in the memory space defined by the SECMUPPCSn and SECMUPPCEn registers and can access the secure data specified in the SECMUPUSm and SECMUPUEm registers (m = 0 to 3).

The SECMUPPCSn register specifies the start address where the region starts. Setting of the memory mirror space (0200 0000h to 027F FFFFh) for MMF is prohibited.

An address space of greater than 12 bytes is required between the last instruction of the non-secure program and the first instruction of the secure program.

### 16.6.1.2 Security MPU Program Counter End Address Register (SECMUPPCEn) (n = 0, 1)

Address(es): [SECMUPPCE0 0000 040Ch](#), [SECMUPPCE1 0000 0414h](#)

| Bit       | Symbol          | Bit name           | Description  | R/W |
|-----------|-----------------|--------------------|--|-----|
| b1, b0    | —               | Reserved           | These bits are read as 1. When writing to flash, the write value should always be 1. | R   |
| b31 to b2 | SECMUPPCE[31:2] | Region End Address | Address where the region ends, for use in region determination.                      | R   |

The SECMUPPCSn and SECMUPPCEn registers specify the security fetch region of the code flash or SRAM (0000 0000h to FFFF FFFFh).

The SECMUPPCEn register specifies the end address where the region ends.

### 16.6.1.3 Security MPU Region 0 Start Address Register (SECMUPUS0)

Address(es): [SECMUPUS0 0000 0418h](#)

| Bit    | Symbol | Bit name | Description  | R/W |
|--------|--------|----------|--|-----|
| b1, b0 | —      | Reserved | These bits are read as 0. When writing to flash, the write value should always be 0. | R   |

| Bit        | Symbol         | Bit name             | Description  | R/W |
|------------|----------------|----------------------|--|-----|
| b23 to b2  | SECMPUS0[23:2] | Region Start Address | Address where the region starts, for use in region determination.                    | R   |
| b31 to b24 | —              | Reserved             | These bits are read as 0. When writing to flash, the write value should always be 0. | R   |

The SECMPUS0 and SECMPUE0 registers specify the secure region of the flash (0000 0000 to 00FF FFFFh). The memory space defined in the SECMPUS0 and SECMPUE0 registers can only be accessed from the secure program set up in the SECMPUPCSn and SECMPUPCEn registers.

The SECMPUS0 register specifies the start address where the region starts.

Setting of the vector table area is prohibited.

### 16.6.1.4 Security MPU Region 0 End Address Register (SECMPUE0)

Address(es): SECMPUE0 0000 041Ch

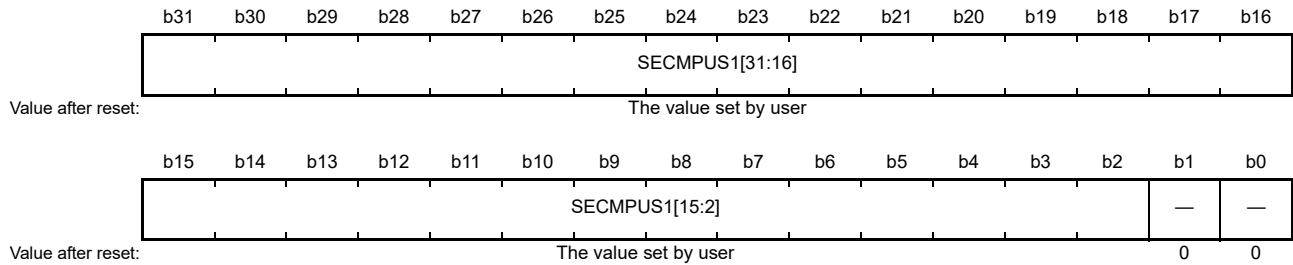

| Bit        | Symbol         | Bit name           | Description  | R/W |
|------------|----------------|--------------------|--|-----|
| b1, b0     | —              | Reserved           | These bits are read as 1. When writing to flash, the write value should always be 1. | R   |
| b23 to b2  | SECMPUE0[23:2] | Region End Address | Address where the region end, for use in region determination.                       | R   |
| b31 to b24 | —              | Reserved           | These bits are read as 0. When writing to flash, the write value should always be 0. | R   |

The SECMPUS0 and SECMPUE0 registers specify the secure region of the flash (0000 0000 to 00FF FFFFh). The memory space defined in the SECMPUS0 and SECMPUE0 registers can only be accessed from the secure program set up in the SECMPUPCSn and SECMPUPCEn registers.

The SECMPUE0 register specifies the end address where the region ends.

### 16.6.1.5 Security MPU Region 1 Start Address Register (SECMPUS1)

Address(es): SECMPUS1 0000 0420h

| Bit        | Symbol          | Bit name             | Description   | R/W |
|------------|-----------------|----------------------|---|-----|
| b1, b0     | —               | Reserved             | These bits are read as 0. When writing to flash, the write value should always be 0.                                | R   |
| b19 to b2  | SECMPUS1[19:2]  | Region Start Address | Address where the region starts, for use in region determination  | R   |
| b31 to b20 | SECMPUS1[31:20] | Region Start Address | Address where the region starts, for use in region determination.<br>The write value should always be 1FFh or 200h. | R   |

The SECMPUS1 and SECMPUE1 registers specify the secure region of the SRAM (1FF0 0000h to 200F FFFFh). The memory space defined in the SECMPUS1 and SECMPUE1 registers can only be accessed from the secure program set up in the SECMPUPCSn and SECMPUPCEn registers.

The SECMPUS1 register specifies the start address where the region starts.

Setting of the stack area and the vector table are prohibited.

### 16.6.1.6 Security MPU Region 1 End Address Register (SECMPUE1)

Address(es): SECMPUE1 0000 0424h

| Bit        | Symbol          | Bit name           | Description  | R/W |
|------------|-----------------|--------------------|--|-----|
| b1, b0     | —               | Reserved           | These bits are read as 1. When writing to flash, the write value should always be 1.                             | R   |
| b19 to b2  | SECMPUE1[19:2]  | Region End Address | Address where the region ends, for use in region determination   | R   |
| b31 to b20 | SECMPUE1[31:20] | Region End Address | Address where the region end, for use in region determination.<br>The write value should always be 1FFh or 200h. | R   |

The SECMPUS1 and SECMPUE1 registers specify the secure region of the SRAM (1FF0 0000h to 200F FFFFh). The memory space defined in the SECMPUS1 and SECMPUE1 registers can only be accessed from the secure program set up the SECMPUPCSn and SECMPUPCEn registers.

The SECMPUE1 register specifies the end address where the region ends.

### 16.6.1.7 Security MPU Region 2 Start Address Register (SECMPUS2)

Address(es): SECMPUS2 0000 0428h

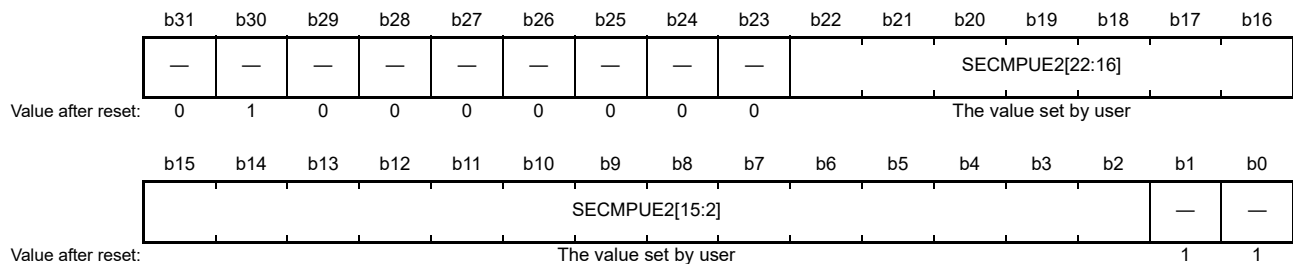

| Bit        | Symbol         | Bit name             | Description  | R/W |
|------------|----------------|----------------------|--|-----|
| b1, b0     | —              | Reserved             | These bits are read as 0. When writing to flash, the write value should always be 0. | R   |
| b22 to b2  | SECMPUS2[22:2] | Region Start Address | Address where the region starts, for use in region determination                     | R   |
| b29 to b23 | —              | Reserved             | These bits are read as 0. When writing to flash, the write value should always be 0. | R   |
| b30        | —              | Reserved             | This bit is read as 1. When writing to flash, the write value should always be 1.    | R   |
| b31        | —              | Reserved             | This bit is read as 0. When writing to flash, the write value should always be 0.    | R   |

The SECMPUS2 and SECMPUE2 registers specify the secure region for security function 1 (400C 0000 to 400D FFFFh and 4010 0000 to 407F FFFFh). The memory space defined in the SECMPUS2 and SECMPUE2 registers can only be accessed from the secure program set up in the SECMPUPCSn and SECMPUPCEn registers.

The SECMPUS2 register specifies the start address where the region starts.

### 16.6.1.8 Security MPU Region 2 End Address Register (SECMPUE2)

Address(es): SECMPUE2 0000 042Ch

| Bit        | Symbol         | Bit name           | Description  | R/W |
|------------|----------------|--------------------|--|-----|
| b1, b0     | —              | Reserved           | These bits are read as 1. When writing to flash, the write value should always be 1. | R   |
| b22 to b2  | SECMPUE2[22:2] | Region End Address | Address where the region ends, for use in region determination                       | R   |
| b29 to b23 | —              | Reserved           | These bits are read as 0. When writing to flash, the write value should always be 0. | R   |

| Bit | Symbol | Bit name | Description   | R/W |
|-----|--------|----------|---|-----|
| b30 | —      | Reserved | This bit is read as 1. When writing to flash, the write value should always be 1. | R   |
| b31 | —      | Reserved | This bit is read as 0. When writing to flash, the write value should always be 0. | R   |

The SECMPUS2 and SECMPUE2 registers specify the secure region for security function 1 (400C 0000 to 400D FFFFh and 4010 0000 to 407F FFFFh). The memory space defined in the SECMPUS2 and SECMPUE2 registers can only be accessed from the secure program set up in the SECMPUPCSn and SECMPUPCEn registers.

The SECMPUE2 register specifies the end address where the region ends.

### 16.6.1.9 Security MPU Region 3 Start Address Register (SECMPUS3)

Address(es): SECMPUS3 0000 0430h

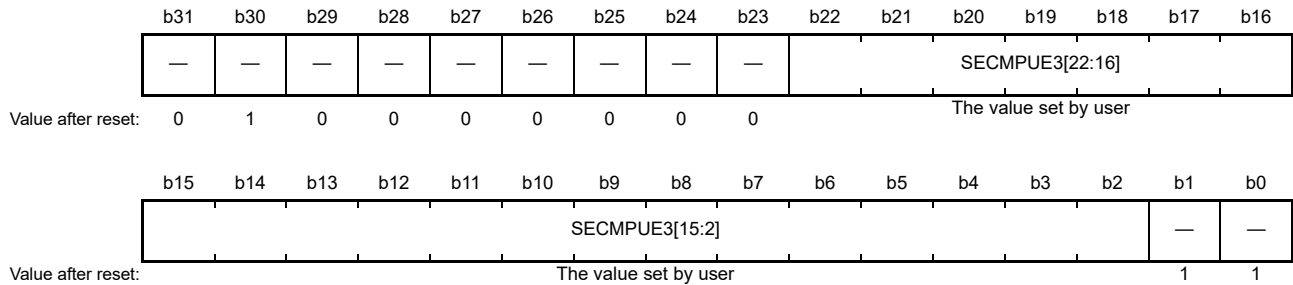

| Bit        | Symbol         | Bit name             | Description  | R/W |
|------------|----------------|----------------------|--|-----|
| b1, b0     | —              | Reserved             | These bits are read as 0. When writing to flash, the write value should always be 0. | R   |
| b22 to b2  | SECMPUS3[22:2] | Region Start Address | Address where the region starts, for use in region determination.                    | R   |
| b29 to b23 | —              | Reserved             | These bits are read as 0. When writing to flash, the write value should always be 0. | R   |
| b30        | —              | Reserved             | This bit is read as 1. When writing to flash, the write value should always be 1.    | R   |
| b31        | —              | Reserved             | This bit is read as 0. When writing to flash, the write value should always be 0.    | R   |

The SECMPUS3 and SECMPUE3 registers specify the secure region for security function 2 (400C 0000h to 400D FFFFh and 4010 0000h to 407F FFFFh). The memory space defined in the SECMPUS3 and SECMPUE3 registers can only be accessed from the secure program set up in the SECMPUPCSn and SECMPUPCEn registers.

The SECMPUS3 register specifies the start address where the region starts.

### 16.6.1.10 Security MPU Region 3 End Address Register (SECMPUE3)

Address(es): SECMPUE3 0000 0434h

| Bit        | Symbol         | Bit name           | Description  | R/W |
|------------|----------------|--------------------|--|-----|
| b1, b0     | —              | Reserved           | These bits are read as 1. When writing to flash, the write value should always be 1. | R   |
| b22 to b2  | SECMPUE3[22:2] | Region End Address | Address where the region ends, for use in region determination.                      | R   |
| b29 to b23 | —              | Reserved           | These bits are read as 0. When writing to flash, the write value should always be 0. | R   |
| b30        | —              | Reserved           | This bit is read as 1. When writing to flash, the write value should always be 1.    | R   |
| b31        | —              | Reserved           | This bit is read as 0. When writing to flash, the write value should always be 0.    | R   |

The SECMPUS3 and SECMPUE3 registers specify the secure region for security function 2 (400C 0000h to 400D FFFFh and 4010 0000h to 407F FFFFh). The memory space defined in the SECMPUS3 and SECMPUE3 registers can only be accessed from the secure program set up in the SECMPUPCSn and SECMPUPCEn registers.

The SECMPUE3 register specifies the end address where the region ends.

### 16.6.1.11 Security MPU Access Control Register (SECMPUAC)

Address(es): SECMPUAC 0000 0438h

| Bit      | Symbol | Bit name            | Description  | R/W |
|----------|--------|---------------------|--|-----|
| b0       | DIS0   | Region 0 Disable    | 0: Security MPU region 0 is enabled<br>1: Security MPU region 0 is disabled.         | R   |
| b1       | DIS1   | Region 1 Disable    | 0: Security MPU region 1 is enabled<br>1: Security MPU region 1 is disabled.         | R   |
| b2       | DIS2   | Region 2 Disable    | 0: Security MPU region 2 is enabled<br>1: Security MPU region 2 is disabled.         | R   |
| b3       | DIS3   | Region 3 Disable    | 0: Security MPU region 3 is enabled<br>1: Security MPU region 3 is disabled.         | R   |
| b7 to b4 | —      | Reserved            | These bits are read as 1. When writing to flash, the write value should always be 1. | R   |
| b8       | DISPC0 | PC Region 0 Disable | 0: Security MPU PC region 0 is enabled<br>1: Security MPU PC region 0 is disabled.   | R   |

| Bit        | Symbol | Bit name            | Description  | R/W |
|------------|--------|---------------------|--|-----|
| b9         | DISPC1 | PC Region 1 Disable | 0: Security MPU PC region 1 is enabled<br>1: Security MPU PC region 1 is disabled.   | R   |
| b15 to b10 | —      | Reserved            | These bits are read as 1. When writing to flash, the write value should always be 1. | R   |

Note: When flash memory is erased, the security MPU is disabled.

Note: To enable or disable the security MPU, see [section 16.6.2, Memory Protection](#).

#### DIS0 bit (Region 0 Disable)

The DIS0 bit enables or disables the security MPU region 0. If security MPU region 0 is enabled, the code flash region within the limits set up by SECMPUS0 and SECMPUE0 is secure data.

#### DIS1 bit (Region 1 Disable)

The DIS1 bit enables or disables the security MPU region 1. If security MPU region 1 is enabled, the SRAM region within the limits set up by SECMPUS1 and SECMPUE1 is secure data.

#### DIS2 bit (Region 2 Disable)

The DIS2 bit enables or disables the security MPU region 2. If security MPU region 2 is enabled, the region within the limits set up by SECMPUS2 and SECMPUE2 is secure data.

#### DIS3 bit (Region 3 Disable)

The DIS3 bit enables or disables the security MPU region 3. If security MPU region 3 is enabled, the region within the limits set up by SECMPUS3 and SECMPUE3 is secure data.

#### DISPC0 bit (PC Region 0 Disable)

The DISPC0 bit enables or disables the security MPU PC region 0. If security MPU PC region 0 is enabled, the code flash or SRAM region within the limits set up by SECMPUPCS0 and SECMPUPCE0 contains a secure program.

#### DISPC1 bit (PC Region 1 Disable)

The DISPC1 bit enables or disables the security MPU PC region 1. If security MPU PC region 1 is enabled, the code flash or SRAM region within the limits set up by SECMPUPCS1 and SECMPUPCE1 contains a secure program.

### 16.6.2 Memory Protection

The security MPU protects the regions (code flash, SRAM, two security function regions) from non-secure program access. If access to the protected region is detected, access becomes invalid.

When the security MPU is enabled, DISPC0 or DISPC1 in the Security MPU Access Control Register (SECMPUAC) must be cleared to 0 and DIS0, DIS1, DIS2, or DIS3 in the Security MPU Access Control Register (SECMPUAC) must be cleared to 0.

When security MPU is disabled, all of bits DISPC0, DISPC1, DIS0, DIS1, DIS2, and DIS3 in the Security MPU Access Control Register (SECMPUAC) must be set to 1.

Other settings of the Security MPU Access Control Register (SECMPUAC) are prohibited.

The security MPU provides protection of secure regions when:

- Secure data is accessed from a non-secure program
- Secure data is accessed from other than the CPU (DMAC, DTC, EDMAC)
- Secure data is accessed from the debugger.

Secure data is accessible only from a secure program.

Note: Secure program: Code flash or SRAM region within the limits set up by SECMPUPCS0 and SECMPUPCE0.  
Code flash or SRAM region within the limits set up by SECMPUPCS1 and SECMPUPCE1.

Non-secure program: All regions outside the secure program.

Secure data: Code flash region within the limits set up by SECMPUS0 and SECMPUE0,

SRAM region within the limits set up by SECMPUS1 and SECMPUE1.

Security function region within the limits set up by SECMPUS2 and SECMPUE2.

Security Function region within the limits set up by SECMPUS3 and SECMPUE3.

**Figure 16.11** Use case of security MPU

### 16.6.2.1 Notes on debug

The protected memory cannot be debugged if the security MPU is enabled. Disable the security MPU when debugging a secure program.

## 17. DMA Controller (DMAC)

### 17.1 Overview

The MCU includes an 8-channel DMA Controller (DMAC) that can transfer data without intervention from the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address.

[Table 17.1](#) lists the DMAC specifications and [Figure 17.1](#) shows a block diagram.

**Table 17.1 DMAC specifications**

| Parameter                                      |                               | Specifications   |
|--|-------------------------------|--|
| Number of channels                             |                               | 8 channels (DMAC <sub>m</sub> , m = 0 to 7)  |
| Transfer space                                 |                               | 4 GB (0000 0000h to FFFF FFFFh, excluding reserved areas)  |
| Maximum transfer volume                        |                               | 64M data units (maximum number of transfers in block transfer mode: 1,024 data units × 65,536 blocks)  |
| DMA activation source                          |                               | Selectable for each channel: <ul style="list-style-type: none"> <li>• Software trigger</li> <li>• Interrupt requests from peripheral modules or trigger from external interrupt input pins.*1</li> </ul>   |
| Channel priority                               |                               | Channel 0 > Channel 1 > Channel 2 > Channel 3... > Channel 7 (Channel 0: highest)  |
| Transfer data                                  | Single data                   | Bit length: 8, 16, 32 bits   |
|  | Block size                    | Number of data: 1 to 1,024   |
| Transfer mode                                  | Normal transfer mode          | <ul style="list-style-type: none"> <li>• One data transfer by one DMA transfer request</li> <li>• Selectable free running mode (total number of data transfers is not specified).</li> </ul>   |
|  | Repeat transfer mode          | <ul style="list-style-type: none"> <li>• One data transfer by one DMA transfer request</li> <li>• Program returns to the transfer start address on completion of the repeat size of data transfer specified for the transfer source or destination</li> <li>• Maximum settable repeat size: 1,024.</li> </ul>                                      |
|  | Block transfer mode           | <ul style="list-style-type: none"> <li>• One data block transfer by one DMA transfer request</li> <li>• Maximum settable block size: 1,024 data.</li> </ul>  |
| Selective functions                            | Extended repeat area function | <ul style="list-style-type: none"> <li>• Allows data to be transferred by repeating the address values in the specified range, with the upper bit values in the transfer address register remaining fixed</li> <li>• Area of 2 bytes to 128 MB individually selectable as the extended repeat area for transfer source and destination.</li> </ul> |
| Interrupt request (DMAC <sub>m</sub> _INT)     | Transfer end interrupt        | Generated on completion of transferring data volume specified in the transfer counter  |
|  | Transfer escape end interrupt | Generated when: <ul style="list-style-type: none"> <li>• The repeat size of data transfer is complete</li> <li>• The source address of the extended repeat area overflows</li> <li>• The destination address of the extended repeat area overflows.</li> </ul>   |
| Event link activation (DMAC <sub>m</sub> _INT) |                               | An event link request is generated after each data transfer (for block transfer, after each block is transferred)  |
| Module-stop function                           |                               | Module-stop state can be set to reduce power consumption   |

Note 1. For details on DMAC activation sources, see [Table 14.3, Interrupt vector table](#), in [section 14, Interrupt Controller Unit \(ICU\)](#).

Figure 17.1 DMAC block diagram

## 17.2 Register Descriptions

### 17.2.1 DMA Source Address Register (DMSAR)

Address(es): [DMAC0.DMSAR 4000 5000h](#), [DMAC1.DMSAR 4000 5040h](#), [DMAC2.DMSAR 4000 5080h](#), [DMAC3.DMSAR 4000 50C0h](#), [DMAC4.DMSAR 4000 5100h](#), [DMAC5.DMSAR 4000 5140h](#), [DMAC6.DMSAR 4000 5180h](#), [DMAC7.DMSAR 4000 51C0h](#)

| Bit       | Description                                 | Setting range                   | R/W |
|-----------|---|---------------------------------|-----|
| b31 to b0 | Specifies the transfer source start address | 0000 0000h to FFFF FFFFh (4 GB) | R/W |

Set DMSAR while DMAC activation is disabled (the DMST bit in DMAST = 0) or DMA transfer is disabled (the DTE bit in DMCNT = 0).

Note: Address alignment in this register must match the transfer data size value selected in the SZ bit in DMTMD.

### 17.2.2 DMA Destination Address Register (DMDAR)

Address(es): [DMAC0.DMDAR 4000 5004h](#), [DMAC1.DMDAR 4000 5044h](#), [DMAC2.DMDAR 4000 5084h](#), [DMAC3.DMDAR 4000 50C4h](#), [DMAC4.DMDAR 4000 5104h](#), [DMAC5.DMDAR 4000 5144h](#), [DMAC6.DMDAR 4000 5184h](#), [DMAC7.DMDAR 4000 51C4h](#)

| Bit       | Description                                      | Setting range                   | R/W |
|-----------|--|---------------------------------|-----|
| b31 to b0 | Specifies the transfer destination start address | 0000 0000h to FFFF FFFFh (4 GB) | R/W |

Set DMDAR while DMAC activation is disabled (the DMST bit in DMAST = 0) or DMA transfer is disabled (the DTE bit in DMCNT = 0).

Note: Address alignment in this register must match the transfer data size value selected in the SZ bit in DMTMD.

### 17.2.3 DMA Transfer Count Register (DMCRA)

Address(es): [DMAC0.DMCRA 4000 5008h](#), [DMAC1.DMCRA 4000 5048h](#), [DMAC2.DMCRA 4000 5088h](#), [DMAC3.DMCRA 4000 50C8h](#), [DMAC4.DMCRA 4000 5108h](#), [DMAC5.DMCRA 4000 5148h](#), [DMAC6.DMCRA 4000 5188h](#), [DMAC7.DMCRA 4000 51C8h](#)

- Normal transfer mode

- Repeat transfer mode, block transfer mode

| Symbol | Bit name                     | Description                                 | R/W |
|--------|------------------------------|---|-----|
| DMCRAL | Lower bits of transfer count | Specifies the number of transfer operations | R/W |
| DMCRAH | Upper bits of transfer count |   | R/W |

Note: In repeat and block transfer modes, set the same value for DMCRAH and DMCRAL.

#### (1) Normal transfer mode (MD[1:0] bits in DMACm.DMTMD = 00b)

In normal transfer mode, DMCRAL functions as a 16-bit transfer counter. The number of transfer operations is one when the setting is 0001h, and 65,535 when it is FFFFh. The value is decremented by one each time data is transferred. A setting of 0000h indicates an unspecified number of transfer operations. Data transfer is performed with the transfer counter stopped, that is, in free running mode.

Do not use DMCRAH in normal transfer mode. Write 0000h to DMCRAH.

#### (2) Repeat transfer mode (MD[1:0] bits in DMACm.DMTMD = 01b)

In repeat transfer mode, DMCRAH specifies the repeat size and DMCRAL functions as a 10-bit transfer counter. The number of transfer operations is one when the setting is 001h, 1,023 when it is 3FFh, and 1,024 when it is 000h. In this mode, a value in the range of 000h to 3FFh (1 to 1,024) can be set for DMCRAH and DMCRAL.

Setting bits [15:10] in DMCRAL is invalid. Write 0 to these bits. The value in DMCRAL is decremented by 1 each time data is transferred until it reaches 000h, at which time the value in DMCRAH is loaded into DMCRAL.

#### (3) Block transfer mode (MD[1:0] bits in DMACm.DMTMD = 10b)

In block transfer mode, DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter. The block size is one when the setting is 001h, 1,023 when it is 3FFh, and 1,024 when it is 000h. In this mode, a value in the

range of 000h to 3FFh can be set for DMCRAH and DMCRAL.

Setting bits [15:10] in DMCRAL is invalid. Write 0 to these bits. The value in DMCRAL is decremented by 1 each time data is transferred until it reaches 000h, at which time the value in DMCRAH is loaded into DMCRAL.

### 17.2.4 DMA Block Transfer Count Register (DMCRB)

Address(es): [DMAC0.DMCRB 4000 500Ch](#), [DMAC1.DMCRB 4000 504Ch](#), [DMAC2.DMCRB 4000 508Ch](#), [DMAC3.DMCRB 4000 50CCh](#), [DMAC4.DMCRB 4000 510Ch](#), [DMAC5.DMCRB 4000 514Ch](#), [DMAC6.DMCRB 4000 518Ch](#), [DMAC7.DMCRB 4000 51CCh](#)

| Bit       | Description   | Setting range                                   | R/W |
|-----------|---|---|-----|
| b15 to b0 | Specifies the number of block or repeat transfer operations | 0001h to FFFFh (1 to 65,535)<br>0000h (65,536). | R/W |

DMCRB specifies the number of operations in block and repeat transfer modes. The number of transfer operations is one when the setting is 0001h, 65,535 when it is FFFFh, and 65,536 when it is 0000h.

In repeat transfer mode, the value is decremented by 1 when the final data of one repeat size is transferred. In block transfer mode, the value is decremented by 1 when the final data of one block size is transferred. Do not use DMCRB in normal transfer mode as the setting is invalid.

### 17.2.5 DMA Transfer Mode Register (DMTMD)

Address(es): [DMAC0.DMTMD 4000 5010h](#), [DMAC1.DMTMD 4000 5050h](#), [DMAC2.DMTMD 4000 5090h](#), [DMAC3.DMTMD 4000 50D0h](#), [DMAC4.DMTMD 4000 5110h](#), [DMAC5.DMTMD 4000 5150h](#), [DMAC6.DMTMD 4000 5190h](#), [DMAC7.DMTMD 4000 51D0h](#)

| Bit      | Symbol                    | Bit name                       | Description   | R/W |
|----------|---------------------------|--------------------------------|---|-----|
| b1, b0   | <a href="#">DCTG[1:0]</a> | Transfer Request Source Select | b1 b0<br>0 0: Software<br>0 1: Interrupts*1 from peripheral modules or external interrupt input pins<br>1 0: Setting prohibited<br>1 1: Setting prohibited.   | R/W |
| b7 to b2 | —                         | Reserved                       | These bits are read as 0. The write value should be 0.  | R/W |
| b9, b8   | <a href="#">SZ[1:0]</a>   | Transfer Data Size Select      | b9 b8<br>0 0: 8 bits<br>0 1: 16 bits<br>1 0: 32 bits<br>1 1: Setting prohibited.  | R/W |
| b11, b10 | —                         | Reserved                       | These bits are read as 0. The write value should be 0.  | R/W |
| b13, b12 | <a href="#">DTS[1:0]</a>  | Repeat Area Select             | b13 b12<br>0 0: Specify destination as the repeat area or block area<br>0 1: Specify source as the repeat area or block area<br>1 0: Do not specify repeat area or block area<br>1 1: Setting prohibited. | R/W |
| b15, b14 | <a href="#">MD[1:0]</a>   | Transfer Mode Select           | b15 b14<br>0 0: Normal transfer<br>0 1: Repeat transfer<br>1 0: Block transfer<br>1 1: Setting prohibited.  | R/W |

Note 1. To select the DMAC activation source, use the DELSRn registers of the ICU. For details on DMAC activation sources, see Table 14.4, Event table in section 14, Interrupt Controller Unit (ICU).

### DTS[1:0] bits (Repeat Area Select)

The DTS[1:0] bits select either the source or destination as the repeat area in repeat transfer mode and the block area in block transfer mode. In normal transfer mode, these bit settings are invalid.

## 17.2.6 DMA Interrupt Setting Register (DMINT)

Address(es): DMAC0.DMINT 4000 5013h, DMAC1.DMINT 4000 5053h, DMAC2.DMINT 4000 5093h, DMAC3.DMINT 4000 50D3h, DMAC4.DMINT 4000 5113h, DMAC5.DMINT 4000 5153h, DMAC6.DMINT 4000 5193h, DMAC7.DMINT 4000 51D3h

| Bit      | Symbol | Bit name   | Description  | R/W |
|----------|--------|--|--|-----|
| b0       | DARIE  | Destination Address Extended Repeat Area Overflow Interrupt Enable | 0: Disable<br>1: Enable.                               | R/W |
| b1       | SARIE  | Source Address Extended Repeat Area Overflow Interrupt Enable      | 0: Disable<br>1: Enable.                               | R/W |
| b2       | RPTIE  | Repeat Size End Interrupt Enable                                   | 0: Disable<br>1: Enable.                               | R/W |
| b3       | ESIE   | Transfer Escape End Interrupt Enable                               | 0: Disable<br>1: Enable.                               | R/W |
| b4       | DTIE   | Transfer End Interrupt Enable                                      | 0: Disable<br>1: Enable.                               | R/W |
| b7 to b5 | —      | Reserved   | These bits are read as 0. The write value should be 0. | R/W |

### DARIE bit (Destination Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow occurs on the destination address when the DARIE bit is set to 1, the DTE bit in DMCNT is set to 0. At the same time, the ESIF flag in DMSTS is set to 1 to indicate an interrupt request triggered by an extended repeat area overflow on the destination address.

When block transfer mode is used with the extended repeat area function, an interrupt occurs after completion of a 1-block size transfer. When the DTE bit is set to 1 in DMACm.DMCNT of the channel associated with the stopped transfer, the transfer resumes from the state it was in when the transfer stopped. If the extended repeat area is not specified for the destination address, this bit is ignored.

### SARIE bit (Source Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow occurs on the source address when the SARIE bit is set to 1, the DTE bit in DMCNT clears to 0. At the same time, the ESIF flag in DMSTS is set to 1 to indicate an interrupt request triggered by an extended repeat area overflow on the source address.

When block transfer mode is used with the extended repeat area function, an interrupt occurs after completion of a 1-block size transfer. When the DTE bit is set to 1 in DMACm.DMCNT of the channel associated with the stopped transfer, the transfer resumes from the state it was in when the transfer stopped.

When the extended repeat area is not specified for the source address, this bit is ignored.

### RPTIE bit (Repeat Size End Interrupt Enable)

When the RPTIE bit is set to 1 in repeat transfer mode, the DTE bit in DMCNT clears to 0 after completion of a 1-repeat size data transfer. At the same time, the ESIF flag in DMSTS is set to 1 to indicate that the repeat size end interrupt request occurred. The repeat size end interrupt request can be generated even when the DTS[1:0] bits in DMTMD are 10b (repeat area or block area is not specified).

When the RPTIE bit is set to 1 in block transfer mode, the DTE bit in DMCNT clears to 0 after completion of a 1-block

data transfer in the same way as repeat transfer mode. At the same time, the ESIF flag in DMSTS is set to 1 to indicate that the repeat size end interrupt request occurred. The repeat size end interrupt request can be generated even when the DTS[1:0] bits in DMTMD are 10b (repeat area or block area is not specified).

### ESIE bit (Transfer Escape End Interrupt Enable)

The ESIE bit enables the transfer escape end interrupt requests (repeat size end interrupt request and extended repeat area overflow interrupt request) that occur during DMA transfer. The interrupt occurs when this bit is 1 and the ESIF flag in DMSTS is set to 1. To clear the transfer escape end interrupt, clear this bit or the ESIF flag in DMSTS to 0.

### DTIE bit (Transfer End Interrupt Enable)

The DTIE bit enables the transfer end interrupt request that occurs on completion of a specified number of data transfers. The interrupt occurs when this bit is 1 and the DTIF flag in DMSTS is set to 1. To clear the transfer end interrupt, clear this bit or the DTIF flag in DMSTS to 0.

## 17.2.7 DMA Address Mode Register (DMAMD)

Address(es): DMAC0.DMAMD 4000 5014h, DMAC1.DMAMD 4000 5054h, DMAC2.DMAMD 4000 5094h, DMAC3.DMAMD 4000 50D4h, DMAC4.DMAMD 4000 5114h, DMAC5.DMAMD 4000 5154h, DMAC6.DMAMD 4000 5194h, DMAC7.DMAMD 4000 51D4h

| Bit       | Symbol    | Bit name                                 | Description   | R/W |     |   |   |   |   |   |   |   |   |     |
|-----------|-----------|--|---|-----|-----|---|---|---|---|---|---|---|---|-----|
| b4 to b0  | DARA[4:0] | Destination Address Extended Repeat Area | Specifies the extended repeat area on the destination address. For details on the settings, see <a href="#">Table 17.2</a> .  | R/W |     |   |   |   |   |   |   |   |   |     |
| b5        | —         | Reserved                                 | This bit is read as 0. The write value should be 0.   | R/W |     |   |   |   |   |   |   |   |   |     |
| b7, b6    | DM[1:0]   | Destination Address Update Mode          | <table border="0"> <tr> <td>b7</td><td>b6</td> </tr> <tr> <td>0</td><td>0</td> </tr> <tr> <td>0</td><td>1</td> </tr> <tr> <td>1</td><td>0</td> </tr> <tr> <td>1</td><td>1</td> </tr> </table> 0 0: Fixed address<br>0 1: Offset addition<br>1 0: Incremented address<br>1 1: Decrement address.   | b7  | b6  | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 1 | R/W |
| b7        | b6        |  |   |     |     |   |   |   |   |   |   |   |   |     |
| 0         | 0         |  |   |     |     |   |   |   |   |   |   |   |   |     |
| 0         | 1         |  |   |     |     |   |   |   |   |   |   |   |   |     |
| 1         | 0         |  |   |     |     |   |   |   |   |   |   |   |   |     |
| 1         | 1         |  |   |     |     |   |   |   |   |   |   |   |   |     |
| b12 to b8 | SARA[4:0] | Source Address Extended Repeat Area      | Specifies the extended repeat area on the source address. For details on the settings, see <a href="#">Table 17.2</a> .   | R/W |     |   |   |   |   |   |   |   |   |     |
| b13       | —         | Reserved                                 | This bit is read as 0. The write value should be 0.   | R/W |     |   |   |   |   |   |   |   |   |     |

### DARA[4:0] bits (Destination Address Extended Repeat Area)

The DARA[4:0] bits specify the extended repeat area on the destination address. The extended repeat area function is realized through an update of the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 MB. The start address of the extended repeat area is set when the lower address overflows the extended repeat area on an address increment. Similarly, the end address of the extended repeat area is set when the lower address underflows the extended repeat area on an address decrement.

Do not specify the extended repeat area on the destination address when a repeat or block area is specified as the transfer destination. When repeat or block transfer is selected, and when DMACm.DMTMD.DTS[1:0] = 00b (the transfer destination is specified as the repeat or block area), write 00000b in the DARA[4:0] bits.

To request an interrupt when an overflow or underflow occurs in the extended repeat area, set the DARIE bit in DMINT to 1. [Table 17.2](#) lists the extended repeat areas associated with each setting.

### DM[1:0] bits (Destination Address Update Mode)

The DM[1:0] bits select the update mode for the destination address.

- When increment is selected and the SZ[1:0] bits in DMTMD are set to 00b, 01b, and 10b, the destination address is incremented by 1, 2, and 4, respectively
- When decrement is selected and the SZ[1:0] bits in DMTMD are set to 00b, 01b, and 10b, the destination address is decremented by 1, 2, and 4, respectively
- When offset addition is selected, the offset specified in the DMACm.DMOFR register is added to the address.

#### SARA[4:0] bits (Source Address Extended Repeat Area)

The SARA[4:0] bits specify the extended repeat area on the source address. The extended repeat area function is realized through an update of the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 MB. The start address of the extended repeat area is set when the lower address overflows the extended repeat area on an address increment. Similarly, the end address of the extended repeat area is set when the lower address underflows the extended repeat area on an address decrement.

Do not specify the extended repeat area on the source address when a repeat or block area is specified as the transfer source. When repeat or block transfer is selected, and when DMACm.DMTMD.DTS[1:0] = 01b (the transfer source is specified as the repeat or block area), write 00000b in the SARA[4:0] bits.

To request an interrupt when an overflow or underflow occurs in the extended repeat area, set the SARIE bit in DMINT to 1. Table 17.2 lists the extended repeat areas associated with each setting.

#### SM[1:0] bits (Source Address Update Mode)

The SM[1:0] bits select the update mode for the source address:

- When increment is selected and the SZ[1:0] bits in DMTMD are set to 00b, 01b, and 10b, the source address is incremented by 1, 2, and 4, respectively
- When decrement is selected and the SZ[1:0] bits in DMTMD are set to 00b, 01b, and 10b, the source address is decremented by 1, 2, and 4, respectively
- When offset addition is selected, the offset specified in the DMACm.DMOFR register is added to the address.

**Table 17.2 SARA[4:0] or DARA[4:0] settings and corresponding repeat areas (1 of 2)**

| SARA[4:0] or DARA[4:0] | Extended repeat area   |
|------------------------|--|
| 00000b                 | Not specified  |
| 00001b                 | 2 bytes specified as extended repeat area by the lower 1 bit of the address    |
| 00010b                 | 4 bytes specified as extended repeat area by the lower 2 bits of the address   |
| 00011b                 | 8 bytes specified as extended repeat area by the lower 3 bits of the address   |
| 00100b                 | 16 bytes specified as extended repeat area by the lower 4 bits of the address  |
| 00101b                 | 32 bytes specified as extended repeat area by the lower 5 bits of the address  |
| 00110b                 | 64 bytes specified as extended repeat area by the lower 6 bits of the address  |
| 00111b                 | 128 bytes specified as extended repeat area by the lower 7 bits of the address |
| 01000b                 | 256 bytes specified as extended repeat area by the lower 8 bits of the address |
| 01001b                 | 512 bytes specified as extended repeat area by the lower 9 bits of the address |
| 01010b                 | 1 KB specified as extended repeat area by the lower 10 bits of the address     |
| 01011b                 | 2 KB specified as extended repeat area by the lower 11 bits of the address     |
| 01100b                 | 4 KB specified as extended repeat area by the lower 12 bits of the address     |
| 01101b                 | 8 KB specified as extended repeat area by the lower 13 bits of the address     |
| 01110b                 | 16 KB specified as extended repeat area by the lower 14 bits of the address    |
| 01111b                 | 32 KB specified as extended repeat area by the lower 15 bits of the address    |
| 10000b                 | 64 KB specified as extended repeat area by the lower 16 bits of the address    |
| 10001b                 | 128 KB specified as extended repeat area by the lower 17 bits of the address   |
| 10010b                 | 256 KB specified as extended repeat area by the lower 18 bits of the address   |
| 10011b                 | 512 KB specified as extended repeat area by the lower 19 bits of the address   |

**Table 17.2 SARA[4:0] or DARA[4:0] settings and corresponding repeat areas (2 of 2)**

| SARA[4:0] or DARA[4:0] | Extended repeat area   |
|------------------------|--|
| 10100b                 | 1 MB specified as extended repeat area by the lower 20 bits of the address   |
| 10101b                 | 2 MB specified as extended repeat area by the lower 21 bits of the address   |
| 10110b                 | 4 MB specified as extended repeat area by the lower 22 bits of the address   |
| 10111b                 | 8 MB specified as extended repeat area by the lower 23 bits of the address   |
| 11000b                 | 16 MB specified as extended repeat area by the lower 24 bits of the address  |
| 11001b                 | 32 MB specified as extended repeat area by the lower 25 bits of the address  |
| 11010b                 | 64 MB specified as extended repeat area by the lower 26 bits of the address  |
| 11011b                 | 128 MB specified as extended repeat area by the lower 27 bits of the address |
| 11100b to 11111b       | Setting prohibited   |

### 17.2.8 DMA Offset Register (DMOFR)

Address(es): [DMAC0.DMOFR 4000 5018h](#), [DMAC1.DMOFR 4000 5058h](#), [DMAC2.DMOFR 4000 5098h](#), [DMAC3.DMOFR 4000 50D8h](#), [DMAC4.DMOFR 4000 5118h](#), [DMAC5.DMOFR 4000 5158h](#), [DMAC6.DMOFR 4000 5198h](#), [DMAC7.DMOFR 4000 51D8h](#)

| Bit       | Description   | Setting range   | R/W |
|-----------|---|---|-----|
| b31 to b0 | Specifies the offset when offset addition is selected as the address update mode for transfer source or destination | 0000 0000h to 00FF FFFFh (0 byte to (16 MB - 1 byte))<br>FF00 0000h to FFFF FFFFh (-16 MB to -1 byte) | R/W |

Only write to this register while DMAC operation is stopped or DMA transfer is disabled, not during data transfer. Setting bits [31:25] is invalid. The value in bit [24] is extended to bits [31:25]. Reading DMOFR returns the extended value.

### 17.2.9 DMA Transfer Enable Register (DMCNT)

Address(es): [DMAC0.DMCNT 4000 501Ch](#), [DMAC1.DMCNT 4000 505Ch](#), [DMAC2.DMCNT 4000 509Ch](#), [DMAC3.DMCNT 4000 50DCh](#), [DMAC4.DMCNT 4000 511Ch](#), [DMAC5.DMCNT 4000 515Ch](#), [DMAC6.DMCNT 4000 519Ch](#), [DMAC7.DMCNT 4000 51DCh](#)

| Bit      | Symbol     | Bit name            | Description  | R/W |
|----------|------------|---------------------|--|-----|
| b0       | <b>DTE</b> | DMA Transfer Enable | 0: Disable<br>1: Enable.                               | R/W |
| b7 to b1 | —          | Reserved            | These bits are read as 0. The write value should be 0. | R/W |

#### DTE bit (DMA Transfer Enable)

The DTE bit enables DMA transfer. To enable DMA transfer, set the DMST bit in DMAST to 1 to enable DMAC activation, then set the DTE bit to 1 to enable DMA transfer for the associated channel.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When 0 is written to this bit
- When the specified volume of data transfer is complete
- When DMA transfer is stopped by a repeat size end interrupt
- When DMA transfer is stopped by an extended repeat area overflow interrupt.

### 17.2.10 DMA Software Start Register (DMREQ)

Address(es): DMAC0.DMREQ 4000 501Dh, DMAC1.DMREQ 4000 505Dh, DMAC2.DMREQ 4000 509Dh, DMAC3.DMREQ 4000 50DDh, DMAC4.DMREQ 4000 511Dh, DMAC5.DMREQ 4000 515Dh, DMAC6.DMREQ 4000 519Dh, DMAC7.DMREQ 4000 51DDh

| Bit      | Symbol | Bit name                                 | Description   | R/W |
|----------|--------|--|---|-----|
| b0       | SWREQ  | DMA Software Start                       | 0: DMA transfer is not requested<br>1: DMA transfer is requested.   | R/W |
| b3 to b1 | —      | Reserved                                 | These bits are read as 0. The write value should be 0.  | R/W |
| b4       | CLRS   | DMA Software Start Bit Auto Clear Select | 0: SWREQ bit is cleared after DMA transfer is started by software<br>1: SWREQ bit is not cleared after DMA transfer is started by software. | R/W |
| b7 to b5 | —      | Reserved                                 | These bits are read as 0. The write value should be 0.  | R/W |

#### SWREQ bit (DMA Software Start)

Writing 1 to the SWREQ bit generates a DMA transfer request. After DMA transfer starts, SWREQ clears to 0 if the CLRS bit is 0. SWREQ does not clear if CLRS bit is 1. The DMA transfer request can be issued again after the transfer is complete.

Note: Setting this bit is valid and DMA transfer by software is enabled only when the DCTG[1:0] bits in DMTMD are set to 00b, specifying software as the DMA activation source. Setting this bit is invalid when the DCTG[1:0] bits in DMTMD are set to any value other than 00b.

To start DMA transfer by software with the CLRS bit set to 0, ensure that the SWREQ bit is 0, then write 1 to the SWREQ bit.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When a DMA transfer request by software is accepted and DMA transfer is started with the CLRS bit set to 0 (the SWREQ bit is cleared after DMA transfer is started by software)
- When 0 is written to this bit.

#### CLRS bit (DMA Software Start Bit Auto Clear Select)

When an SWREQ setting of 1 triggers a transfer request, the CLRS bit specifies whether to clear the SWREQ bit to 0 after DMA transfer starts. When the CLRS bit is set to 0, SWREQ clears to 0 after DMA transfer starts. When the CLRS bit is set to 1, SWREQ does not clear to 0. A DMA transfer request can be issued again after the transfer is complete.

### 17.2.11 DMA Status Register (DMSTS)

Address(es): [DMAC0.DMSTS 4000 501Eh](#), [DMAC1.DMSTS 4000 505Eh](#), [DMAC2.DMSTS 4000 509Eh](#), [DMAC3.DMSTS 4000 50DEh](#), [DMAC4.DMSTS 4000 511Eh](#), [DMAC5.DMSTS 4000 515Eh](#), [DMAC6.DMSTS 4000 519Eh](#), [DMAC7.DMSTS 4000 51DEh](#)

|     |    |    |      |    |    |    |      |
|-----|----|----|------|----|----|----|------|
| b7  | b6 | b5 | b4   | b3 | b2 | b1 | b0   |
| ACT | —  | —  | DTIF | —  | —  | —  | ESIF |

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol | Bit name                           | Description  | R/W   |
|----------|--------|------------------------------------|--|-------|
| b0       | ESIF   | Transfer Escape End Interrupt Flag | 0: No interrupt occurred<br>1: Interrupt occurred.             | R/W*1 |
| b3 to b1 | —      | Reserved                           | These bits are read as 0. Writing to these bits has no effect. | R     |
| b4       | DTIF   | Transfer End Interrupt Flag        | 0: No interrupt occurred<br>1: Interrupt occurred.             | R/W*1 |
| b6, b5   | —      | Reserved                           | These bits are read as 0. Writing to these bits has no effect. | R     |
| b7       | ACT    | DMA Active Flag                    | 0: DMAC operation suspended<br>1: DMAC operating.              | R     |

Note 1. Only 0 can be written to clear the flag.

#### ESIF flag (Transfer Escape End Interrupt Flag)

The ESIF flag indicates that a transfer escape end interrupt occurred.

[Setting conditions]

- In repeat transfer mode, when one repeat size data transfer completes with the RPTIE bit in DMINT set to 1
- In block transfer mode, when one block data transfer completes with the RPTIE bit in DMINT set to 1
- When an extended repeat area overflow on the source address occurs with the SARIE bit in DMINT set to 1, and the SARA[4:0] bits in DMAMD set to any value other than 00000b (extended repeat area is specified on the transfer source address)
- When an extended repeat area overflow on the destination address occurs with the DARIE bit in DMINT set to 1, and the DARA[4:0] bits in DMAMD set to any value other than 00000b (extended repeat area is specified on the transfer destination address).

[Clearing conditions]

- When 0 is written to this flag
- When 1 is written to the DTE bit in DMCNT.

#### DTIF flag (Transfer End Interrupt Flag)

The DTIF flag indicates that a transfer end interrupt occurred.

[Setting conditions]

- In normal transfer mode, when the specified number of unit transfers completes (the value of DMCRAL becomes 0 on completion of transfer)
- In repeat transfer mode, when the specified number of repeat transfer operations completes (the value of DMCRB becomes 0 on completion of transfer)
- In block transfer mode, when the specified number of blocks is transferred (the value of DMCRB becomes 0 on completion of transfer).

[Clearing conditions]

- When 0 is written to this flag
- When 1 is written to the DTE bit in DMCNT.

**ACT flag (DMA Active Flag)**

The ACT flag indicates whether the DMAC is in the idle or active state.

[Setting condition]

- When the DMAC starts a data transfer.

[Clearing condition]

- When the data transfer in response to one transfer request completes.

**17.2.12 DMAC Module Activation Register (DMAST)**

Address(es): DMA.DMAST 4000 5200h

| Bit      | Symbol | Bit name              | Description  | R/W |
|----------|--------|-----------------------|--|-----|
| b0       | DMST   | DMAC Operation Enable | 0: Disabled<br>1: Enabled.                             | R/W |
| b7 to b1 | —      | Reserved              | These bits are read as 0. The write value should be 0. | R/W |

**DMST bit (DMAC Operation Enable)**

Setting the DMST bit to 1 enables DMAC activation for all channels. When the DMST bit is set to 1 (DMAC activation is enabled), and 1 is written to the DMACm.DMCNT.DTE bit (DMA transfer is enabled) for multiple channels, all of the associated channels can be placed in the transfer request ready state at the same time.

When the DMST bit clears to 0 during DMA transfer, DMA transfer is suspended after the current data transfer associated with a single transfer request completes. To resume DMA transfer, set the DMST bit to 1 again.

[Setting condition]

- When 1 is written to this bit.

[Clearing condition]

- When 0 is written to this bit.

**17.3 Operation****17.3.1 Transfer Mode****(1) Normal transfer mode**

In normal transfer mode, one data unit is transferred for one transfer request. You can specify the number of transfer operations, up a maximum of 65,535, in DMACm.DMCRAL. When these bits are set to 0000h, no number of operations is specified and data transfer is performed with the transfer counter stopped (free running mode). A transfer end interrupt request can be generated after completion of the specified number of transfer operations, except when in free running mode. Setting DMACm.DMCRB is invalid in normal transfer mode.

Table 17.3 summarizes the register update operation in normal transfer mode.

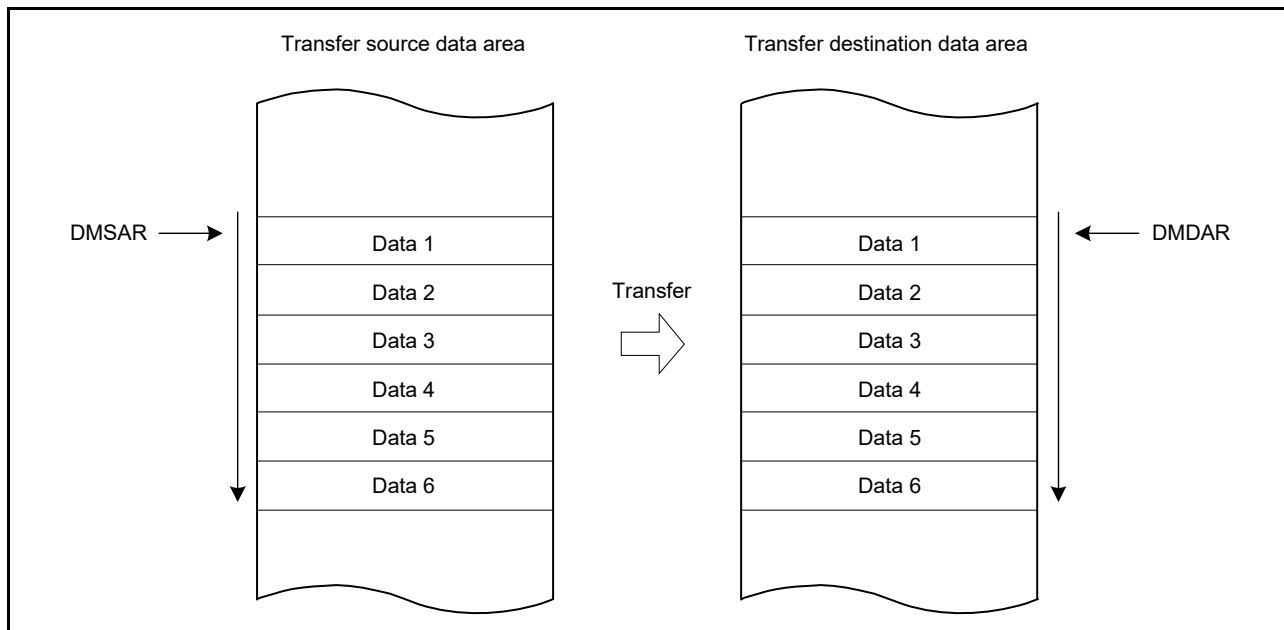

**Table 17.3 Register update operation in normal transfer mode (1 of 2)**

| Register    | Function                     | Update operation after completion of a transfer for one transfer request |
|-------------|------------------------------|--|
| DMACm.DMSAR | Transfer source address      | Increment, decrement, fixed, or offset addition                          |
| DMACm.DMDAR | Transfer destination address | Increment, decrement, fixed, or offset addition                          |

**Table 17.3 Register update operation in normal transfer mode (2 of 2)**

| Register     | Function       | Update operation after completion of a transfer for one transfer request |
|--------------|----------------|--|
| DMACm.DMCRAL | Transfer count | Decremented by 1 or not updated (in free running mode)                   |
| DMACm.DMCRAH | -              | Not updated (not used in normal transfer mode)                           |
| DMACm.DMCRB  | -              | Not updated (not used in normal transfer mode)                           |

Figure 17.2 shows the operation in normal transfer mode.

**Figure 17.2 Operation in normal transfer mode**

**(2) Repeat transfer mode**

In repeat transfer mode, one data unit is transferred for one transfer request. The repeat transfer size, up to a maximum of 1K data units, is set in DMACm.DMCRA. The number of repeat transfers, up to a maximum of 64K, is set in DMACm.DMCRB. The total data transfer size can be set to a maximum of 64M data units (1K data units × 64K repeat transfer operations).

You can specify either the transfer source or destination as a repeat area. When transfer of the repeat size data is complete, the address of the specified repeat area (DMSAR or DMDAR in DMACm) returns to the transfer start address. In this mode, when all data of the specified repeat size is transferred, DMA transfer can be stopped and a repeat size end interrupt can be requested. To resume DMA transfer, write 1 to the DTE bit in DMACm.DMCNT during repeat size end interrupt handling.

A transfer end interrupt request can be generated after completion of the specified number of repeat transfers.

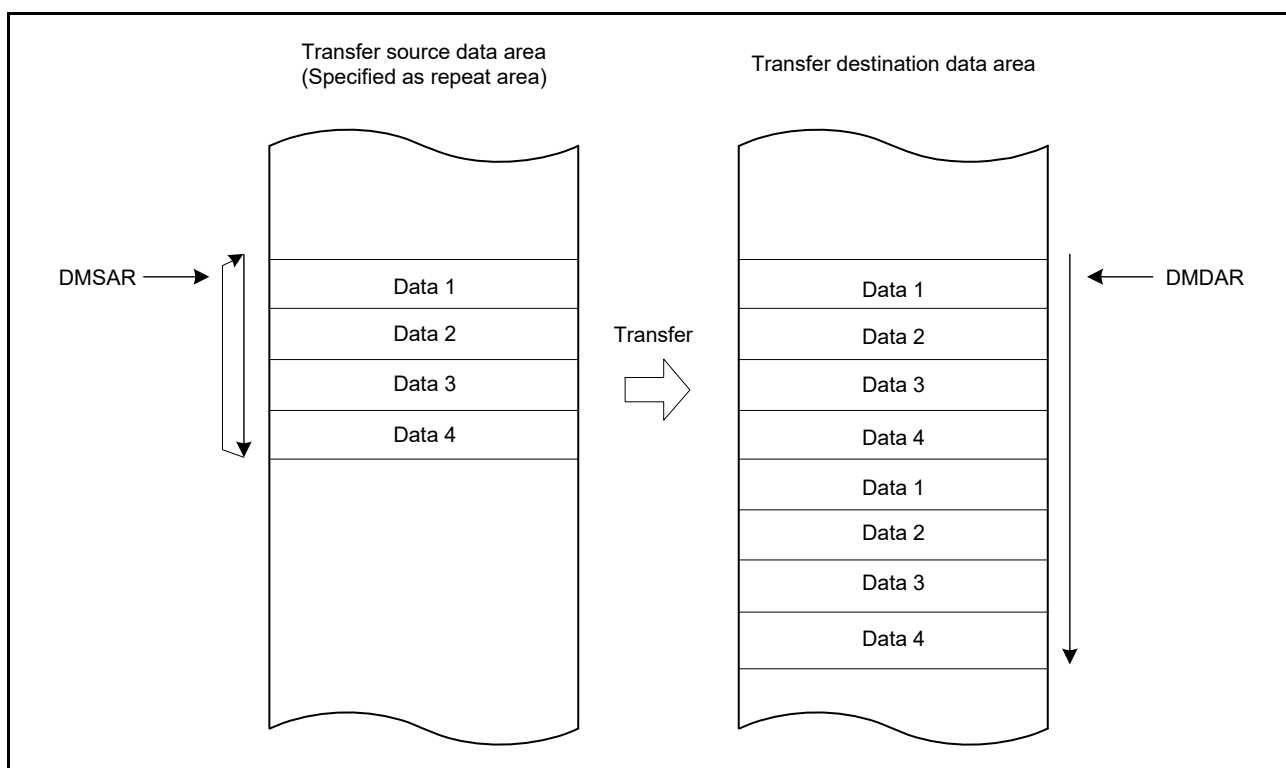

Table 17.4 summarizes the register update operation in repeat transfer mode, and Figure 17.3 shows the operation in repeat transfer mode.

**Table 17.4 Register update operation in repeat transfer mode (1 of 2)**

| Register    | Function                | Update operation after completion of a transfer for one transfer request |  |
|-------------|-------------------------|--|--|
|             |                         | When DMACm.DMCRAL is not 1   | When DMACm.DMCRAL is 1 (transfer of the last repeat size data unit)  |
| DMACm.DMSAR | Transfer source address | Increment, decrement, fixed, or offset addition                          | <ul style="list-style-type: none"> <li>DMACm.DMTMD.DTS[1:0] = 00b<br/>Increment, decrement, fixed, or offset addition</li> <li>DMACm.DMTMD.DTS[1:0] = 01b<br/>Initial value of DMACm.DMSAR</li> <li>DMACm.DMTMD.DTS[1:0] = 10b<br/>Increment, decrement, fixed, or offset addition.</li> </ul> |

**Table 17.4 Register update operation in repeat transfer mode (2 of 2)**

| Register     | Function                            | Update operation after completion of a transfer for one transfer request |  |
|--------------|-------------------------------------|--|--|
|              |                                     | When DMACm.DMCRAL is not 1   | When DMACm.DMCRAL is 1<br>(transfer of the last repeat size data unit)   |
| DMACm.DMDAR  | Transfer destination address        | Increment, decrement, fixed, or offset addition                          | <ul style="list-style-type: none"> <li>DMACm.DMTMD.DTS[1:0] = 00b<br/>Initial value of DMACm.DMDAR</li> <li>DMACm.DMTMD.DTS[1:0] = 01b<br/>Increment, decrement, fixed, or offset addition</li> <li>DMACm.DMTMD.DTS[1:0] = 10b<br/>Increment, decrement, fixed, or offset addition.</li> </ul> |
| DMACm.DMCRAH | Repeat size                         | Not updated  | Not updated  |
| DMACm.DMCRAL | Transfer count                      | Decrement by one   | DMACm.DMCRAH   |
| DMACm.DMCRB  | Count of repeat transfer operations | Not updated  | Decrement by 1   |

**Figure 17.3 Operation in repeat transfer mode**

**(3) Block transfer mode**

In block transfer mode, a single data block is transferred for one transfer request. The block size, up to a maximum of 1K data units, is set in DMACm.DMCRA. The number of block transfers, up to a maximum of 64K, is set in DMACm.DMCRB. A total data transfer size up to a maximum of 64M data units (1K data units × 64K block transfer operations) can be set.

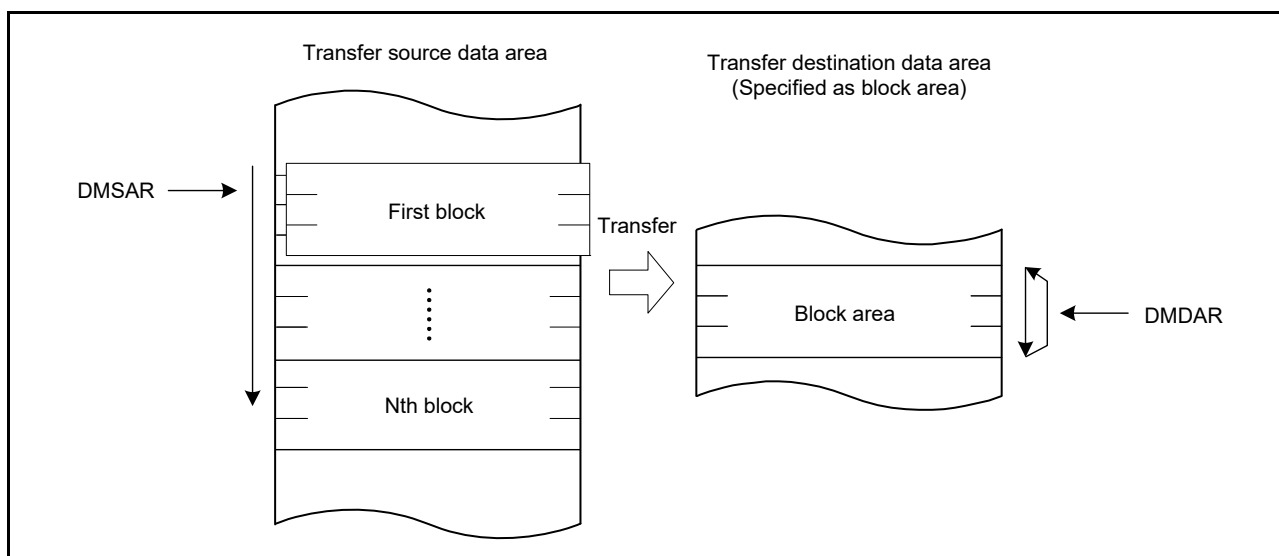

You can specify either the transfer source or destination as a block area. When transfer of a single data block is complete, the address of the specified block area (DMSAR or DMDAR in DMACm) returns to the transfer start address. In this mode, when all data in a single block is transferred, DMA transfer can be stopped and a repeat size end interrupt can be requested. To resume DMA transfer, write 1 to the DTE bit in DMACm.DMCNT during repeat size end interrupt handling.

A transfer end interrupt request can be generated after completion of the specified number of block transfers.

Table 17.5 summarizes the register update operation in block transfer mode, and Figure 17.4 shows the operation in block transfer mode.

**Table 17.5 Register update operation in block transfer mode**

| Register     | Function                           | Update operation after completion of single-block transfer for one transfer request  |
|--------------|------------------------------------|--|
| DMACm.DMSAR  | Transfer source address            | <ul style="list-style-type: none"> <li>• DMACm.DMTMD.DTS[1:0] = 00b<br/>Increment, decrement, fixed, or offset addition</li> <li>• DMACm.DMTMD.DTS[1:0] = 01b<br/>Initial value of DMACm.DMSAR</li> <li>• DMACm.DMTMD.DTS[1:0] = 10b<br/>Increment, decrement, fixed, or offset addition.</li> </ul> |
| DMACm.DMDAR  | Transfer destination address       | <ul style="list-style-type: none"> <li>• DMACm.DMTMD.DTS[1:0] = 00b<br/>Initial value of DMACm.DMDAR</li> <li>• DMACm.DMTMD.DTS[1:0] = 01b<br/>Increment, decrement, fixed, or offset addition</li> <li>• DMACm.DMTMD.DTS[1:0] = 10b<br/>Increment, decrement, fixed, or offset addition.</li> </ul> |
| DMACm.DMCRAH | Block size                         | Not updated  |
| DMACm.DMCRAL | Transfer count                     | DMACm.DMCRAH   |
| DMACm.DMCRB  | Count of block transfer operations | Decrement by 1   |

**Figure 17.4 Operation in block transfer mode**

### 17.3.2 Extended Repeat Area Function

The DMAC supports extended repeat areas on the transfer source and destination addresses, specified separately in the transfer source address register (DMSAR) and transfer destination address register (DMDAR) of DMACm. When this function is set, the address registers repeatedly indicate the addresses of the specified extended repeat areas.

The extended repeat area on the source address is specified in the SARA[4:0] bits in DMACm.DMAMD. The extended repeat area on the destination address is specified in the DARA[4:0] bits in DMACm.DMAMD. You can specify different sizes for the source and destination. However, you must not specify a transfer source or destination that is set as the repeat or block area as the extended repeat area.

When the address register value reaches the end address of the extended repeat area and the extended repeat area overflows, DMA transfer is stopped and an extended repeat area overflow interrupt can be requested. When an overflow occurs in the extended repeat area on the transfer source while the SARIE bit in DMACm.DMINT is set to 1, the ESIF flag in DMACm.DMSTS is set to 1 and the DTE bit in DMACm.DMCNT clears to 0 to stop DMA transfer. At this point, if the ESIE bit in DMACm.DMINT is set to 1, an extended repeat area overflow interrupt is requested. When the DARIE bit in DMACm.DMINT is set to 1, the destination address register becomes a target for the function. To resume DMA transfer, write 1 to the DTE bit in DMACm.DMCNT during interrupt handling.

Figure 17.5 shows an example of the extended repeat area operation.

**Figure 17.5 Example of extended repeat area operation**

When using extended repeat area overflow interrupts in block transfer mode, consider the following points:

- When a transfer is stopped by an extended repeat area overflow interrupt, the address register must be set so that the block size is a power of 2 or the block size boundary is aligned with the extended repeat area boundary. When an overflow on the extended repeat area occurs during a transfer of one block, the overflow interrupt is suspended until transfer of the block is complete, and the transfer overruns.

Figure 17.6 shows an example of using the extended repeat area function in block transfer mode.

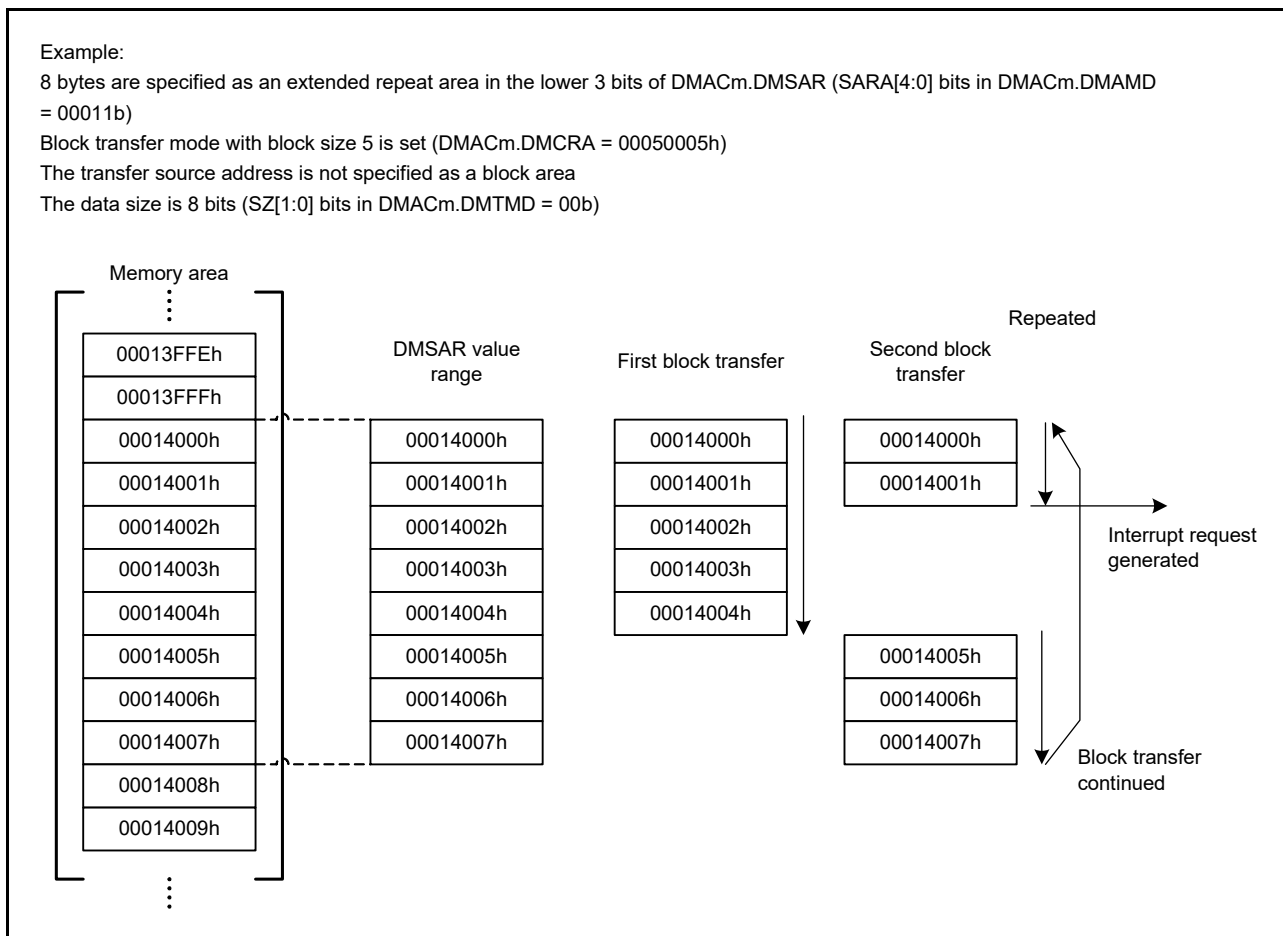

Figure 17.6 Example of extended repeat area function in block transfer mode

### 17.3.3 Address Update Function Using Offset

The source and destination addresses can be updated by fixing, incrementing, decrementing, or adding an offset. When offset addition is selected, the offset specified in the DMA Offset Register (DMACm.DMOFR) is added to the address every time the DMAC performs one data transfer. You can also subtract an offset by setting a negative value in DMACm.DMOFR. The negative value must be in two's complement.

Table 17.6 shows the address update method in each address update mode.

Table 17.6 Address update method in each address update mode

| Address update mode | Settings of DMACm.DMAMD.SM[1:0] and DMACm.DMAMD.DM[1:0] for address update modes | Address update method for different SZ[1:0] settings in DMACm.DMTMD |               |               |
|---------------------|--|---|---------------|---------------|
|                     |  | SZ[1:0] = 00b   | SZ[1:0] = 01b | SZ[1:0] = 10b |
| Address fixed       | 00b  | Fixed   |               |               |
| Offset addition     | 01b  | +DMACm.DMOFR*1  |               |               |
| Increment           | 10b  | +1  | +2            | +4            |
| Decrement           | 11b  | -1  | -2            | -4            |

Note 1. When setting a negative value in the DMA Offset Register, the value must be in two's complement, obtained by the following formula:  
 two's complement of a negative offset value =  $\sim(\text{offset}) + 1$  ( $\sim$  = bit inversion)

#### (1) Basic transfer using offset addition

Figure 17.7 shows an example of address updating using offset addition.

**Figure 17.7 Example of address updating through offset addition**

In [Figure 17.7](#):

- The transfer data is 32 bits long
- Offset addition is set as the transfer source address update mode
- Increment is set as the transfer destination address update mode.

The second and subsequent data units are each read from the source address obtained by adding the offset value to the previous address. The data read from the addresses at the specified intervals is written to continuous locations on the destination.

## (2) Example of XY conversion using offset addition

[Figure 17.8](#) shows XY conversion using offset addition in repeat transfer mode. The settings are as follows:

- DMAC0.DMAMD — Transfer source address update mode: offset addition
- DMAC0.DMAMD — Transfer destination address update mode: destination address is incremented
- DMAC0.DMTMD — Transfer data size select: 32 bits
- DMAC0.DMTMD — Transfer mode select: repeat transfer
- DMAC0.DMTMD — Repeat area select: the source is specified as the repeat area
- DMAC0.DMOFR — Offset address: 10h
- DMAC0.DMCRA — Repeat size: 4h
- DMAC0.DMINT — The repeat size end interrupt is enabled.

**Figure 17.8 XY conversion operation using offset addition in repeat transfer mode**

When a transfer starts, the offset value is added to the transfer source address every time data is transferred. The transfer data is written to continuous destination addresses. When data 4 is transferred:

- The repeat size of the transfers is complete
- The transfer source address returns to the transfer start address (the address of data 1 on the transfer source)
- A repeat size end interrupt is requested.

During the time this interrupt pauses the transfer, perform the following:

- DMAC0.DMSAR — Rewrite the DMA transfer source address to the address of data 5 (in this example, the data 1 address + 4)
- DMAC0.DMCNT — Set the DTE bit to 1.

The DMA transfer resumes from the state when the DMA transfer was stopped. The same operations are repeated until the transfer source data is transposed to the destination area (XY conversion).

Figure 17.9 shows a flow of the XY conversion.

Figure 17.9 XY conversion flow using offset addition in repeat transfer mode

### 17.3.4 Activation Sources

Software, interrupt requests from the peripheral modules, and external interrupt requests can all be specified as DMAC activation sources. Set the DCTG[1:0] bits in DMACm.DMTMD to select the activation source.

### (1) DMAC activation through software

To start DMA transfer through software:

1. Set the DCTG[1:0] bits in DMACm.DMTMD to 00b.
2. Set the DTE bit in DMACm.DMCNT to 1 (enable DMA transfer).
3. Set the DMST bit in DMAST to 1 (enable DMAC activation).
4. Set the SWREQ bit in DMACm.DMREQ to 1 (request DMA).

When the DMAC is activated by software while the CLRS bit in DMACm.DMREQ is 0, the SWREQ bit in DMACm.DMREQ clears to 0 after data transfer starts in response to a DMA transfer request.

When the DMAC is activated by software while the CLRS bit is 1, SWREQ does not clear to 0 after data transfer starts. A DMA transfer request is issued again after completion of a transfer.

### (2) DMAC activation through interrupt requests from on-chip peripheral modules or external interrupt requests

You can specify interrupt requests from on-chip peripheral modules and external interrupt requests as DMAC activation sources. The activation source can be individually selected for each channel in ICU.DELSRn.DELS[8:0] (n = 0 to 7).

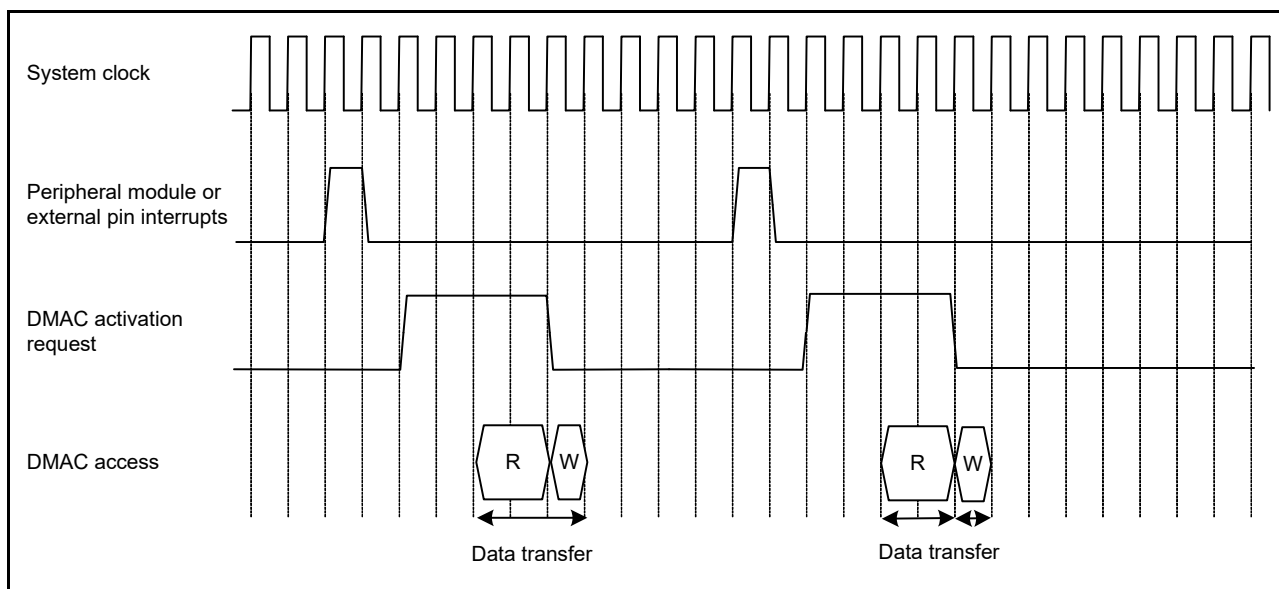

To start DMAC transfer through an interrupt request from an on-chip peripheral module or an external interrupt request:

1. Set the DCTG[1:0] bits in DMACm.DMTMD to 01b (select interrupts from the peripheral modules and the external interrupt pins).
2. Set the DTE bit in DMACm.DMCNT to 1 (enable DMA transfer).
3. Set ICU.DELSRn.DSEL to the event number (select the DMAC event link).
4. Set the DMST bit in DMAST to 1 (enable DMAC activation).

For interrupt requests specified as DMAC activation sources, see [Table 14.3, Interrupt vector table](#) in [section 14, Interrupt Controller Unit \(ICU\)](#).

## 17.3.5 Operation Timing

The following timing diagrams show the minimum number of execution cycles.

**Figure 17.10** DMAC operation timing example 1 with DMA activation by interrupt from peripheral module or external interrupt input pin, in normal transfer mode or repeat transfer mode

**Figure 17.11** DMAC operation timing example 2 with DMA activation by interrupt from peripheral module or external interrupt input pin, in block transfer mode with block size = 4

### 17.3.6 Execution Cycles of DMAC

Table 17.7 lists the execution cycles in one DMAC data transfer operation.

**Table 17.7** DMAC execution cycles

| Transfer mode | Data transfer (read) | Data transfer (write) |
|---------------|----------------------|-----------------------|
| Normal        | $Cr+Cs+1$            | $Cw+Cs$               |
| Repeat        | $Cr+Cs+1$            | $Cw+Cs$               |
| Block*1       | $P \times (Cr+Cs)$   | $P \times (Cw+Cs)$    |

Note: P = Block size (DMCRAH register setting).  
 Cr = Read destination access cycle.  
 Cw = Data write destination access cycle.  
 Cs = When accessing SRAMHS and peripheral modules related to system control: 2 cycles.  
       When accessing elsewhere: 0 cycles.  
       When a slave bus changes by a read/write data transfer, add 1 more cycle.

Note 1. This is the case when the block size is 2 or more. When the block size is 1, normal transfer cycle applies.

Cr and Cw depend on the access destination. For the number of cycles of each access destination, see section 51, SRAM, section 53, Flash Memory, and section 15.2.3, External Bus. The frequency ratio of the system clock and the peripheral clock is also taken into consideration.

The unit for +1 in the data transfer (read) column is 1 system clock cycle, ICLK. For the operation example, see section 17.3.5, Operation Timing.

The DMAC response time is the time from when the DMAC activation source is detected until the DMAC transfer starts.

Table 17.7 does not include the time until the DMAC data transfer starts after the DMAC activation source becomes active.

### 17.3.7 Activating the DMAC

Figure 17.12 shows the register setting procedure.

Figure 17.12 Register setting procedure

### 17.3.8 Starting DMA Transfer

To enable a DMA transfer of channel *m*, set the DTE bit in DMACm.DMCNT to 1 (DMA transfer enabled) and set the DMST bit in DMAST to 1 (DMAC activation enabled). New activation requests are not accepted during the transfer of another DMAC channel or DTC. When the proceeding transfer is complete, channel arbitration selects the DMA transfer request of the highest priority channel, and DMA transfer of that channel starts. When DMA transfer starts, the ACT flag in DMACm.DMSTS is set to 1 (the DMAC is in the active state).

### 17.3.9 Registers during DMA Transfer

The DMAC registers are updated by a DMA transfer. The value to be updated differs according to the other settings and the transfer state. The registers that are updated are DMSAR, DMDAR, DMCRA, DMCRB, DMCNT, and DMACm.DMSTS, described in the following sections. For details on register update operations in each transfer mode, see [Table 17.3](#) to [Table 17.5](#).

#### (1) DMA Source Address Register (DMACm.DMSAR)

After the data for one transfer request is transferred, the contents of DMSAR are updated to the address to be accessed by the next transfer request.

#### (2) DMA Destination Address Register (DMACm.DMDAR)

After the data for one transfer request is transferred, the contents of DMDAR are updated to the address to be accessed by the next transfer request.

#### (3) DMA Transfer Count Register (DMACm.DMCRA)

After the data for one transfer request is transferred, the count value is updated. The update operation depends on the transfer mode selected.

#### (4) DMA Block Transfer Count Register (DMACm.DMCRB)

After the data for one transfer request is transferred, the count value is updated. The update operation depends on the transfer mode selected.

#### (5) DMA Transfer Enable bit (DMACm.DMCNT.DTE)

The DMACm.DMCNT.DTE bit enables or disables data transfer through register write access. It is automatically cleared to 0 by the DMAC based on the DMA transfer state.

The conditions for clearing this bit by the DMAC are as follows:

- When the specified total volume of data transfer is complete
- When DMA transfer is stopped by a repeat size end interrupt
- When DMA transfer is stopped by an extended repeat area overflow interrupt.

Writing to the registers for channels whose associated DMACm.DMCNT.DTE bit is set to 1 is prohibited except for DMACm.DMCNT. Writes are only possible after the bit clears to 0.

#### (6) DMA Active flag (DMACm.DMSTS.ACT)

The ACT flag in DMSTS of DMACm indicates whether the DMACm is in the idle or active state. This flag is set to 1 when the DMAC starts data transfer, and clears to 0 when data transfer for one transfer request is complete. Even when DMA transfer is stopped by write of 0 to the DTE bit in DMACm.DMCNT, this flag remains 1 until DMA transfer is complete.

#### (7) Transfer End Interrupt Flag (DMACm.DMSTS.DTIF)

The DTIF flag in DMACm.DMSTS is set to 1 after DMA transfer of the total transfer size is complete. When both this flag and the DTIE bit in DMACm.DMINT are 1, a transfer end interrupt is requested. This flag is set to 1 when the DMA transfer bus cycle is complete and the ACT flag in DMACm.DMSTS clears to 0, indicating the DMA transfer end. The flag automatically clears to 0 when the DTE bit in DMACm.DMCNT is set to 1 during interrupt handling.

#### (8) Transfer Escape End Interrupt Flag (DMACm.DMSTS.ESIF)

The ESIF flag in DMACm.DMSTS is set to 1 when a repeat size end interrupt or extended repeat area overflow interrupt

is requested. When this bit and the ESIE bit in DMACm.DMINT are 1, a transfer escape end interrupt is requested. This flag is set to 1 when the bus cycle of the DMA transfer that caused the interrupt request is complete and the ACT flag in DMACm.DMSTS clears to 0, indicating the DMA transfer end. The flag automatically clears to 0 when the DTE bit in DMACm.DMCNT is set to 1 during interrupt handling.

You must set the interrupt control register before sending an interrupt request from the DMAC to the CPU or the DTC. For more information, see [section 14, Interrupt Controller Unit \(ICU\)](#).

### 17.3.10 Channel Priority

When multiple DMA transfer requests occur, the DMAC determines the priority of channels that have DMA transfer requests.

The priority is fixed as channel 0 > channel 1 > channel 2 > channel 3 > channel 4 > channel 5 > channel 6 > channel 7. (channel 0 is the highest.)

When a DMA transfer request occurs during data transfer, channel arbitration starts after the final data unit is transferred, and DMA transfer of the highest-priority channel starts.

## 17.4 Ending DMA Transfer

The operation for ending a DMA transfer depends on the transfer end conditions. When a DMA transfer ends, the DTE bit in DMCNT and the ACT flag in DMACm.DMSTS change from 1 to 0.

### 17.4.1 Transfer End by Completion of Specified Total Number of Transfer Operations

#### (1) In normal transfer mode (DMACm.DMTMD.MD[1:0] = 00b)

When the value of DMACm.DMCRAL changes from 1 to 0, DMA transfer ends on the associated channel, the DTE bit in DMACm.DMCNT clears to 0, and the DTIF flag in DMACm.DMSTS is set to 1. If the DTIE bit in DMACm.DMINT is 1 at this time, a transfer end interrupt request is sent to the CPU or the DTC.

#### (2) In repeat transfer mode (DMACm.DMTMD.MD[1:0] = 01b)

When the value of DMACm.DMCRB changes from 1 to 0, DMA transfer ends on the associated channel, the DTE bit in DMACm.DMCNT clears to 0, and the DTIF flag in DMACm.DMSTS is set to 1. If the DTIE bit in DMACm.DMINT is 1 at this time, an interrupt request is sent to the CPU or the DTC.

#### (3) In block transfer mode (DMACm.DMTMD.MD[1:0] = 10b)

When the value of DMACm.DMCRB changes from 1 to 0, DMA transfer ends on the associated channel, the DTE bit in DMACm.DMCNT clears to 0, and the DTIF flag in DMACm.DMSTS is set to 1. If the DTIE bit in DMACm.DMINT is 1 at this time, an interrupt request is sent to the CPU or the DTC.

You must set the interrupt control register before sending an interrupt request from the DMAC to the CPU or the DTC. For more information, see [section 14, Interrupt Controller Unit \(ICU\)](#).

### 17.4.2 Transfer End by Repeat Size End Interrupt

In repeat transfer mode, if the RPTIE bit in DMACm.DMINT is 1, a repeat size end interrupt is requested when transfer of a single repeat size of data is complete. The DTE bit in DMACm.DMCNT clears to 0 and the ESIF flag in DMACm.DMSTS is set to 1. If the ESIE bit in DMACm.DMINT is 1 at this time, an interrupt request is sent to the CPU or the DTC. To resume the transfer, write 1 to the DTE bit in DMACm.DMCNT.

A repeat size end interrupt can also be requested in block transfer mode. When transfer of a single block size of data is complete, the interrupt is requested in the same way as in repeat transfer mode.

You must set the interrupt control register before sending an interrupt request from the DMAC to the CPU or the DTC. For more information, see [section 14, Interrupt Controller Unit \(ICU\)](#).

### 17.4.3 Transfer End by Interrupt on Extended Repeat Area Overflow

When an overflow on the extended repeat area occurs while the extended repeat area is specified and the SARIE or DARIE bit in DMACm.DMINT is 1, an extended repeat area overflow interrupt is requested. The DMA transfer is terminated, the DTE bit in DMACm.DMCNT clears to 0, and the ESIF flag in DMACm.DMSTS is set to 1. If the ESIE

bit in DMACm.DMINT is 1 at this time, an interrupt request is sent to the CPU or the DTC.

If this interrupt is requested during a read cycle, the subsequent write cycle is performed. In block transfer mode, if the interrupt is requested during a 1-block transfer, the remaining data in the block is transferred before transfer stops.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For more information, see [section 14, Interrupt Controller Unit \(ICU\)](#).

### 17.4.4 Precautions for the End of DMA Transfer

A DMA activation request source might occur in the next request after a DMA transfer completes. If this happens, the DMA transfer starts and the DMA activation request is held in DMAC. To prevent this, stop the DMA activation requests by clearing the DELSRn.DSELS[8:0] bits in the ICU to 0.

When the DMA activation request occurs after the last round of the DMA transfer is generated, clear the DMA activation request by setting ICU.DELSRm.IR bit to 0.

## 17.5 Interrupts

Each DMAC channel can output an interrupt request (DMACm\_INT) to the CPU or DTC after transfer for one request is complete. When the transfer destination is the external bus, an interrupt request is generated after completion of a data write to the write buffer, and not to the actual transfer destination.

[Table 17.8](#) lists the interrupt sources and their associated status flags and enable bits. [Figure 17.13](#) shows the schematic logic diagram of the interrupt outputs (DMAC0 to DMAC7). [Figure 17.14](#) shows the DMAC interrupt handling routine for resuming and terminating DMA transfers.

**Table 17.8 Association between interrupt sources, interrupt status flags, and interrupt enable bits**

| Interrupt sources   |   | Interrupt enable bits | Interrupt status flags | Request output enable bits |
|---------------------|---|-----------------------|------------------------|----------------------------|
| Transfer end        |   | —                     | DMACm.DMSTS.DTIF       | DMACm.DMINT.DTIE           |
| Escape transfer end | Repeat size end                                   | DMACm.DMINT.RPTIE     | DMACm.DMSTS.ESIF       | DMACm.DMINT.ESIE           |
|                     | Source address extended repeat area overflow      | DMACm.DMINT.SARIE     |                        |                            |
|                     | Destination address extended repeat area overflow | DMACm.DMINT.DARIE     |                        |                            |

**Figure 17.13 Schematic logic diagram of interrupt outputs for DMAC0 to DMAC7**

Different procedures are used for canceling an interrupt to restart a DMA transfer in the following cases:

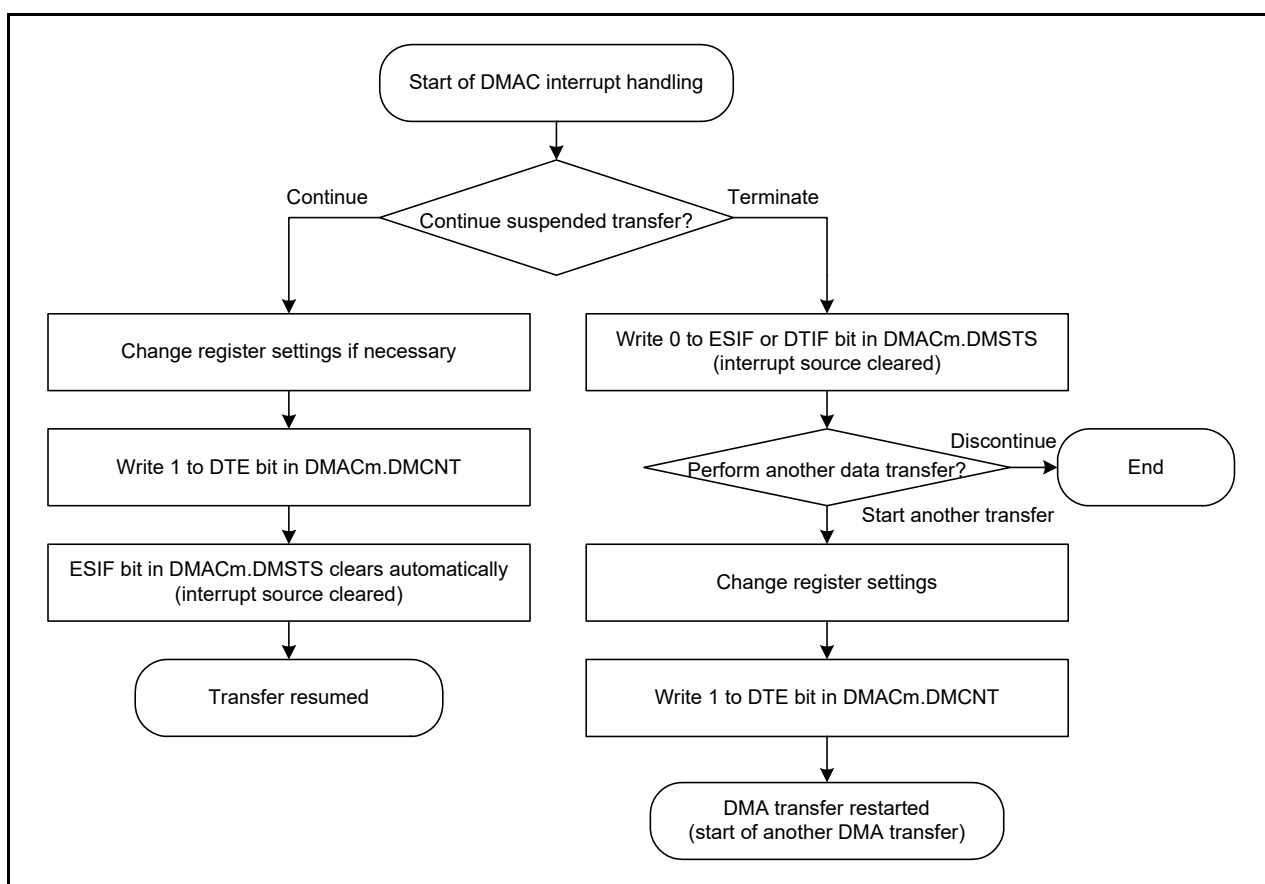

- When terminating a DMA transfer
- When continuing a DMA transfer.

### (1) When terminating a DMA transfer

Write 0 to the DTIF flag in DMACm.DMSTS to clear a transfer end interrupt, and to the ESIF flag in DMACm.DMSTS to clear a repeat size interrupt or an extended repeat area overflow interrupt. DMACm remains in the stopped state. When starting another DMA transfer, set the appropriate registers and set the DTE bit in DMACm.DMCNT to 1 (DMA transfer enabled).

### (2) When continuing a DMA transfer

Write 1 to the DTE bit in DMACm.DMCNT. The ESIF flag in DMSTS of DMACm automatically clears to 0 (interrupt source cleared), and the DMA transfer resumes.

**Figure 17.14** DMAC interrupt handling routine to resume or terminate a DMA transfer

## 17.6 Event Link

Each DMAC channel outputs an event link request signal (DMACm\_INT) every time it completes a data transfer, or a block transfer in block transfer mode. When the transfer destination is the external bus, the signal is generated when writing to the write buffer is accepted. For more information, see [section 19, Event Link Controller \(ELC\)](#).

## 17.7 Low Power Consumption Function

Before entering the module-stop state, Software Standby mode, or Deep Software Standby mode, you must first clear the DMST bit in DMAST to 0 (DMAC suspended) and use the settings in the sections that follow.

### (1) Module-stop function

Writing 1 to the MSTPA22 bit in MSTPCRA enables the module-stop function of the DMAC. If a DMA transfer is in

progress when 1 is written to MSTPA22, the transition to the module-stop state continues after DMA transfer ends. Access to the DMAC registers is prohibited while MSTPA22 is 1. Writing 0 to the MSTPA22 bit releases the DMAC from the module-stop state.

## (2) Software Standby and Deep Software Standby modes

Use the settings described in [section 11.7.1, Transition to Software Standby Mode](#) and [section 11.9.1, Transition to Deep Software Standby Mode](#).

If DMA transfer operations are in progress when the WFI instruction is executed, the DMA transfer completes before the transition to Software Standby mode or Deep Software Standby mode.

## (3) Notes on the low power consumption function

For information on the WFI instruction and register settings, see [section 11.10.7, Timing of WFI Instruction](#).

To perform a DMA transfer after returning from a low power consumption mode, set the DMST bit in DMAST to 1 again. To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DMAC startup request, specify the CPU as the interrupt request destination, as described in [section 14.4.2, Selecting Interrupt Request Destinations](#), then execute the WFI instruction.

## 17.8 Usage Notes

### 17.8.1 DMA Transfer to External Devices

In a DMA transfer to an external device, the ACT flag in DMACm.DMSTS may be set to 0 (DMAC transfer suspended) from the beginning of the final data write to the end of the external bus access.

### 17.8.2 Access to Registers during DMA Transfer

Do not write to the following registers of DMACm while the ACT flag in DMSTS of the associated channel is set to 1 (DMAC active state) or the DTE bit in DMCNT of the associated channel is set to 1 (DMA transfer enabled):

- DMSAR
- DMDAR
- DMCRA
- DMCRB
- DMTMD
- DMINT
- DMAMD
- DMOFR.

### 17.8.3 DMA Transfer to Reserved Areas

DMA transfer to reserved areas is prohibited. If such an access is made, transfer results are not guaranteed. For details on reserved areas, see [section 4, Address Space](#).

### 17.8.4 Setting the DMAC Event Link Setting Register of the Interrupt Controller Unit (ICU.DELSRn)

Before setting the DMAC Event Link Setting Register (ICU.DELSRn), make sure the DMA Transfer Enable bit (DMACm.DMCNT.DTE) is set to 0, disabling DMA transfer. Additionally, ensure that the DTC activation enable register (ICU.IELSRn.DTCE) associated with the event number set in the ICU.DELSRn register is not set to 1. For details on ICU.IELSRn.DTCE and ICU.DELSRn, see [section 14, Interrupt Controller Unit \(ICU\)](#).

### 17.8.5 Suspending or Restarting DMA Activation

To suspend a DMA activation request, write 0 to the DMAC Event Link Select bits (ICU.DELSRn.DELS[8:0]). To restart the DMA transfer, write the event number to the ICU.DELSRn.DELS[8:0] bit with the settings shown in [section 17.3.7, Activating the DMAC](#).

## 18. Data Transfer Controller (DTC)

### 18.1 Overview

The MCU includes a Data Transfer Controller (DTC) that performs data transfers when activated by an interrupt request. [Table 18.1](#) lists the DTC specifications and [Figure 18.1](#) shows a block diagram.

**Table 18.1 DTC specifications**

| Parameter            | Specifications   |
|----------------------|--|
| Transfer modes       | <ul style="list-style-type: none"> <li>• Normal transfer mode<br/>A single activation leads to a single data transfer.</li> <li>• Repeat transfer mode<br/>A single activation leads to a single data transfer.<br/>The transfer address returns to the start address after the number of data transfers reaches the specified repeat size.<br/>The maximum number of repeat transfers is 256 and the maximum data transfer size is 256 × 32 bits (1024 bytes).</li> <li>• Block transfer mode<br/>A single activation leads to a transfer of a single block.<br/>The maximum block size is 256 × 32 bits = 1024 bytes.</li> </ul> |

| Module-stop function | Module-stop state can be set to reduce power consumption   |

Figure 18.1 DTC block diagram

See 14.1 Overview, in section 14, Interrupt Controller Unit (ICU), for the connections between the DTC and NVIC in the CPU.

## 18.2 Register Descriptions

MRA, MRB, SAR, DAR, CRA, and CRB are all DTC internal registers that cannot be directly accessed from the CPU. Values to be set in these DTC internal registers are placed in the SRAM area as transfer information. When an activation request is generated, the DTC reads the transfer information from the SRAM area and sets it in its internal registers. After the data transfer ends, the internal register contents are written back to the SRAM area as transfer information.

### 18.2.1 DTC Mode Register A (MRA)

Address(es): (Inaccessible directly from the CPU. See [section 18.3.1.](#))

| Bit    | Symbol                  | Bit name                                | Description   | R/W |
|--------|-------------------------|---|---|-----|
| b1, b0 | —                       | Reserved                                | These bits are read as undefined. The write value should be 0.  | —   |
| b3, b2 | <a href="#">SM[1:0]</a> | Transfer Source Address Addressing Mode | b3 b2<br>0 0: Address in the SAR register is fixed (write-back to SAR) is skipped<br>0 1: Address in the SAR register is fixed (write-back to SAR is skipped)<br>1 0: SAR value is incremented after data transfer:<br>+1 when SZ[1:0] = 00b<br>+2 when SZ[1:0] = 01b<br>+4 when SZ[1:0] = 10b.<br>1 1: SAR value is decremented after data transfer:<br>-1 when SZ[1:0] = 00b<br>-2 when SZ[1:0] = 01b<br>-4 when SZ[1:0] = 10b. | —   |
| b5, b4 | <a href="#">SZ[1:0]</a> | DTC Data Transfer Size                  | b5 b4<br>0 0: Byte (8-bit) transfer<br>0 1: Halfword (16-bit) transfer<br>1 0: Word (32-bit) transfer<br>1 1: Setting prohibited.   | —   |
| b7, b6 | <a href="#">MD[1:0]</a> | DTC Transfer Mode Select                | b7 b6<br>0 0: Normal transfer mode<br>0 1: Repeat transfer mode<br>1 0: Block transfer mode<br>1 1: Setting prohibited.   | —   |

The MRA register cannot be accessed directly from the CPU, however the CPU can access the SRAM area (transfer information (n) start address + 03h) and the DTC automatically transfers the MRA transfer information to and from the MRA register. See [section 18.3.1, Allocating Transfer Information and the DTC Vector Table.](#)

### 18.2.2 DTC Mode Register B (MRB)

Address(es): (Inaccessible directly from the CPU. See [section 18.3.1.](#))

| Bit    | Symbol | Bit name | Description  | R/W |
|--------|--------|----------|--|-----|
| b1, b0 | —      | Reserved | These bits are read as undefined. The write value should be 0. | —   |

| Bit    | Symbol  | Bit name                                     | Description   | R/W |
|--------|---------|--|---|-----|
| b3, b2 | DM[1:0] | Transfer Destination Address Addressing Mode | b3 b2<br>0 0: Address in the DAR register is fixed (write-back to DAR is skipped)<br>0 1: Address in the DAR register is fixed (write-back to DAR is skipped)<br>1 0: DAR value is incremented after data transfer:<br>+1 when MRA.SZ[1:0] = 00b<br>+2 when MRA.SZ[1:0] = 01b<br>+4 when MRA.SZ[1:0] = 10b.<br>1 1: DAR value is decremented after data transfer:<br>-1 when MRA.SZ[1:0] = 00b<br>-2 when MRA.SZ[1:0] = 01b<br>-4 when MRA.SZ[1:0] = 10b. | —   |
| b4     | DTS     | DTC Transfer Mode Select                     | 0: Select transfer destination as repeat or block area<br>1: Select transfer source as repeat or block area.  | —   |
| b5     | DISEL   | DTC Interrupt Select                         | 0: Generate an interrupt request to CPU when specified data transfer is complete<br>1: Generate an interrupt request to CPU each time DTC data transfer is performed.   | —   |
| b6     | CHNS    | DTC Chain Transfer Select                    | 0: Select continuous chain transfer<br>1: Select chain transfer to occur only when the transfer counter is changed from 1 to 0 or 1 to CRAH.  | —   |
| b7     | CHNE    | DTC Chain Transfer Enable                    | 0: Chain transfer disabled<br>1: Chain transfer enabled.  | —   |

The MRB register cannot be accessed directly from the CPU, however the CPU can access the SRAM area (transfer information (n) start address + 02h) and the DTC automatically transfers the MRB transfer information to and from the MRB register. See [section 18.3.1, Allocating Transfer Information and the DTC Vector Table](#).

### DTS bit (DTC Transfer Mode Select)

The DTS bit selects either the transfer source or transfer destination as the repeat area or block area in repeat or block transfer mode.

### CHNS bit (DTC Chain Transfer Select)

The CHNS bit selects the chain transfer condition. When CHNE is 0, the CHNS setting is ignored. For details on the conditions for chain transfer, see [Table 18.3, Chain transfer conditions](#).

When the next transfer is a chain transfer, completion of the specified number of transfers is not determined, the activation source flag is not cleared, and an interrupt request to the CPU is not generated.

### CHNE bit (DTC Chain Transfer Enable)

The CHNE bit enables chain transfer. The chain transfer condition is selected in the CHNS bit. For details on chain transfer, see [section 18.4.6, Chain Transfer](#).

## 18.2.3 DTC Transfer Source Register (SAR)

Address(es): (Inaccessible directly from the CPU. See [section 18.3.1](#).)

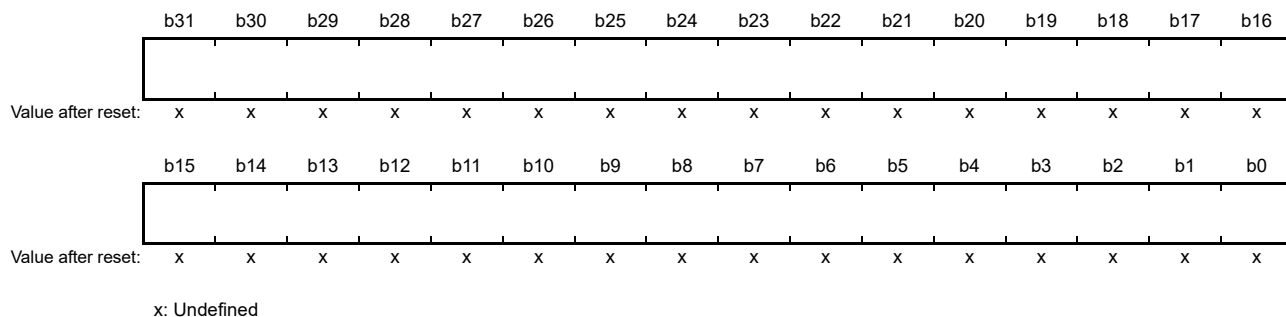

The SAR register sets the transfer source start address and cannot be accessed directly from the CPU. However, the CPU

can access the SRAM area (transfer information (n) start address + 04h) and the DTC automatically transfers the SAR transfer information to and from the SAR register. See [section 18.3.1, Allocating Transfer Information and the DTC Vector Table](#).

Note: Misalignment is prohibited for DTC transfers. Bit [0] must be 0 when MRA.SZ[1:0] = 01b.  
 Bits [1] and [0] must be 0 when MRA.SZ[1:0] = 10b.

### 18.2.4 DTC Transfer Destination Register (DAR)

Address(es): (Inaccessible directly from the CPU. See [section 18.3.1](#).)

The DAR register sets the transfer destination start address and cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 08h) and the DTC automatically transfers the DAR transfer information to and from the DAR register. See [section 18.3.1, Allocating Transfer Information and the DTC Vector Table](#).

Note: Misalignment is prohibited for DTC transfers. Bit [0] must be 0 when MRA.SZ[1:0] = 01b.  
 Bits [1] and [0] must be 0 when MRA.SZ[1:0] = 10b.

### 18.2.5 DTC Transfer Count Register A (CRA)

Address(es): (Inaccessible directly from the CPU. See [section 18.3.1](#).)

- Normal transfer mode

- Repeat transfer mode/block transfer mode

| Symbol | Register name                     | Description                | R/W |
|--------|-----------------------------------|----------------------------|-----|
| CRAL   | Transfer Counter A Lower Register | Specify the transfer count | —   |
| CRAH   | Transfer Counter A Upper Register |                            | —   |

Note: The function depends on the transfer mode.  
 Note: Set CRAH and CRAL to the same value in repeat transfer mode and block transfer mode.

The CRA register cannot be accessed directly from the CPU, however the CPU can access the SRAM area (transfer

information (n) start address + 0Eh) and the DTC automatically transfers the CRA transfer information to and from the CRA register. See [section 18.3.1, Allocating Transfer Information and the DTC Vector Table](#).

(1) Normal transfer mode (MRA.MD[1:0] = 00b)

In normal transfer mode, CRA functions as a 16-bit transfer counter. The transfer count is 1, 65,535, and 65,536 when the set value is 0001h, FFFFh, and 0000h, respectively. The CRA value is decremented (-1) on each data transfer.

(2) Repeat transfer mode (MRA.MD[1:0] = 01b)

In repeat transfer mode, the CRAH register holds the transfer count and the CRAL register functions as an 8-bit transfer counter. The transfer count is 1, 255, and 256 when the set value is 01h, FFh, and 00h, respectively. The CRAL value is decremented (-1) on each data transfer. When it reaches 00h, the CRAH value is transferred to CRAL.

(3) Block transfer mode (MRA.MD[1:0] = 10b)

In block transfer mode, the CRAH register holds the transfer count and the CRAL register functions as an 8-bit block size counter. The transfer count is 1, 255, and 256 when the set value is 01h, FFh, and 00h, respectively. The CRAL value is decremented (-1) at each data transfer. When it reaches 00h, the CRAH value is transferred to CRAL.

### 18.2.6 DTC Transfer Count Register B (CRB)

Address(es): (Inaccessible directly from the CPU. See [section 18.3.1](#).)

The CRB register sets the block transfer count for block transfer mode. The transfer count is 1, 65,535, and 65,536 when the set value is 0001h, FFFFh, and 0000h, respectively. The CRB value is decremented (-1) when the final data of a single block size is transferred. When normal transfer mode or repeat transfer mode is selected, this register is not used and the set value is ignored.

CRB cannot be accessed directly from the CPU, however the CPU can access the SRAM area (transfer information (n) start address + 0Ch) and the DTC automatically transfers the CRB transfer information to and from the CRB register. See [section 18.3.1, Allocating Transfer Information and the DTC Vector Table](#).

### 18.2.7 DTC Control Register (DTCCR)

Address(es): DTC.DTCCR 4000 5400h

| Bit      | Symbol | Bit name                                  | Description   | R/W |
|----------|--------|---|---|-----|
| b2 to b0 | —      | Reserved                                  | These bits are read as 0. The write value should be 0.  | R/W |
| b3       | —      | Reserved                                  | This bit is read as 1. The write value should be 1.   | R/W |
| b4       | RRS    | DTC Transfer Information Read Skip Enable | 0: Transfer information read is not skipped<br>1: Transfer information read is skipped when vector numbers match. | R/W |
| b7 to b5 | —      | Reserved                                  | These bits are read as 0. The write value should be 0.  | R/W |

#### RRS bit (DTC Transfer Information Read Skip Enable)

The RRS bit enables skipping of transfer information reads when vector numbers match. The DTC vector number is compared with the vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, DTC data transfer is performed without reading the transfer information. However, when the previous transfer

is a chain transfer, the transfer information is read regardless of the value in the RRS bit.

When the transfer counter (CRA register) becomes 0 during the previous normal transfer and when the transfer counter (CRB register) becomes 0 during the previous block transfer, the transfer information is read regardless of the RRS bit value.

### 18.2.8 DTC Vector Base Register (DTCVBR)

Address(es): [DTC.DTCVBR 4000 5404h](#)

| Bit       | Bit name                | Description   | R/W |
|-----------|-------------------------|---|-----|
| b31 to b0 | DTC Vector Base Address | Set the DTC vector base address. The lower 10 bits should be 0. | R/W |

The DTCVBR register sets the base address for calculating the DTC vector table address, which can be set in the range of 0000 0000h to FFFF FFFFh (4 GB) in 1-KB units.

### 18.2.9 DTC Module Start Register (DTCST)

Address(es): [DTC.DTCST 4000 540Ch](#)

| Bit      | Symbol                | Bit name         | Description  | R/W |
|----------|-----------------------|------------------|--|-----|
| b0       | <a href="#">DTCST</a> | DTC Module Start | 0: DTC module stopped<br>1: DTC module started.        | R/W |
| b7 to b1 | —                     | Reserved         | These bits are read as 0. The write value should be 0. | R/W |

#### DTCST bit (DTC Module Start)

Set the DTCST bit to 1 to enable the DTC to accept transfer requests. When DTCST is set to 0, transfer requests are no longer accepted. If DTCST is set to 0 during a data transfer, the accepted transfer request is active until processing is complete.

DTCST must be set to 0 before transitioning to any of the following state or mode:

- Module-stop state
- Software Standby mode without Snooze mode transition
- Deep Software Standby mode.

For details on these transitions, see [section 18.10, Module-Stop Function](#), and [section 11, Low Power Modes](#).

### 18.2.10 DTC Status Register (DTCSTS)

Address(es): [DTC.DTCSTS 4000 540Eh](#)

| Bit       | Symbol                    | Bit name                                | Description   | R/W |
|-----------|---------------------------|---|---|-----|
| b7 to b0  | <a href="#">VECN[7:0]</a> | DTC-Activating Vector Number Monitoring | These bits indicate the vector number for the activation source when a DTC transfer is in progress. The value is only valid if a DTC transfer is in progress (ACT flag is 1). | R   |
| b14 to b8 | —                         | Reserved                                | These bits are read as 0. Writing to these bits has no effect.  | R   |
| b15       | <a href="#">ACT</a>       | DTC Active Flag                         | 0: DTC transfer operation is not in progress<br>1: DTC transfer operation is in progress.   | R   |

#### [VECN\[7:0\] bits \(DTC-Activating Vector Number Monitoring\)](#)

While transfer by the DTC is in progress, the VECN[7:0] bits indicate the vector number associated with the activation source for the transfer. The value read from the VECN[7:0] bits is valid if the ACT flag is 1, indicating that a DTC transfer is in progress, and invalid if the ACT flag is 0, indicating that no DTC transfer is in progress.

#### [ACT flag \(DTC Active Flag\)](#)

The ACT flag indicates the state of the DTC transfer operation.

[Setting condition]

- When the DTC is activated by a transfer request.

[Clearing condition]

- When transfer by the DTC, in response to a transfer request, is complete.

## 18.3 Activation Sources

The DTC is activated by an interrupt request. Setting the ICU.IELSRn.DTCE bit to 1 enables activation of the DTC by the associated interrupt. The selector output  $n$  number set in ICU.IELSRn is defined as the interrupt vector number, where  $n = 0$  to 95. For an enabled interrupt, the specific DTC interrupt source associated with each interrupt vector number  $n$  is selected in ICU.IELSRn.IELS[8:0] where  $n = 0$  to 95, as listed in [Table 14.4, Event table](#), in [section 14, Interrupt Controller Unit \(ICU\)](#). For activation by software, see [section 19.2.2, Event Link Software Event Generation Register  \$n\$  \(ELSEGRn\) \( \$n = 0, 1\$ \)](#).

The interrupt vector number is equivalent to the DTC vector table number. After the DTC accepted an activation request, it does not accept another activation request until transfer for that single request is complete, regardless of the priority of the requests. When multiple activation requests are generated during a DMAC or DTC transfer, a highest priority request is accepted on completion of the transfer. When multiple activation requests are generated while the DTC Module Start bit (DTCST.DTCST) is 0, the DTC accepts the highest-priority request when DTCST.DTCST is subsequently set to 1. The smaller interrupt vector number has higher priority.

The DTC performs the following operations at the start of a single data transfer or for a chain transfer, after the last of the consecutive transfers:

- On completion of a specified round of data transfer, the ICU.IELSRn.DTCE bit is set to 0, and an interrupt request is sent to the CPU
- If the MRB.DISEL bit is 1, an interrupt request is sent to the CPU on completion of a data transfer
- For other transfers, the ICU.IELSRn.IR bit of the activation source is set to 0 at the start of the data transfer.

### 18.3.1 Allocating Transfer Information and the DTC Vector Table

The DTC reads the start address of the transfer information associated with each activation source from the vector table and reads the transfer information starting at that address.

The vector table must be located so that the lower 10 bits of the base address (start address) are 0. Use the DTC Vector Base Register (DTCVBR) to set the base address of the DTC vector table. Transfer information is allocated in the SRAM area. In the SRAM area, the start address of the transfer information  $n$  with vector number  $n$  must be  $4n$  added to the base address in the vector table.

Figure 18.2 shows the relationship between the DTC vector table and transfer information. Figure 18.3 shows the allocation of transfer information in the SRAM area.

Figure 18.2 DTC vector table and transfer information

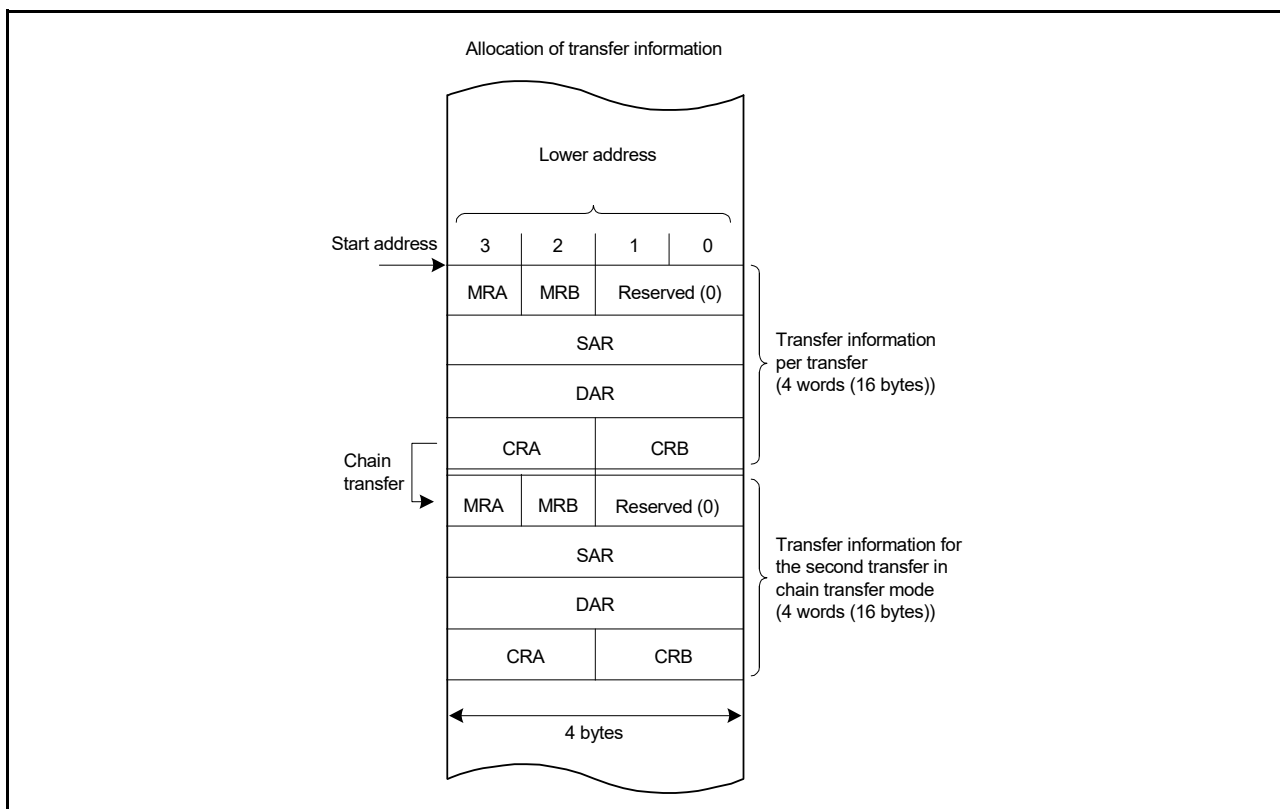

Figure 18.3 Allocation of transfer information in the SRAM area

### 18.4 Operation

The DTC transfers data according to the transfer information. Storage of the transfer information in the SRAM area is required before a DTC operation. When the DTC is activated, it reads the DTC vector associated with the vector number. The DTC then reads the transfer information from the transfer information store address referenced by the DTC vector and transfers the data. After the data transfer, the DTC writes back the transfer information. Storing the transfer information in the SRAM area allows data transfer of any number of channels.

The transfer modes include:

- Normal transfer mode
- Repeat transfer mode
- Block transfer mode.

The DTC specifies a transfer source address in the SAR register and a transfer destination address in the DAR register. The values in these registers are incremented, decremented, or address-fixed independently after the data transfer.

Table 18.2 describes the DTC transfer modes.

Table 18.2 DTC transfer modes

| Transfer mode          | Data size transferred on single transfer request  | Increment or decrement of memory address                  | Settable transfer count |
|------------------------|---|---|-------------------------|
| Normal transfer mode   | 1 byte (8 bits), 1 halfword (16 bits), or 1 word (32 bits)  | Incremented or decremented by 1, 2, or 4 or address fixed | 1 to 65,536             |
| Repeat transfer mode*1 | 1 byte (8 bits), 1 halfword (16 bits), or 1 word (32 bits)  | Incremented or decremented by 1, 2, or 4 or address fixed | 1 to 256*3              |
| Block transfer mode*2  | Block size specified in CRAH (1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), or 1 to 256 words (4 to 1024 bytes)) | Incremented or decremented by 1, 2, or 4 or address fixed | 1 to 65,536             |

- Note 1. Set the transfer source or destination as the repeat area.
- Note 2. Set the transfer source or destination as the block area.
- Note 3. After a data transfer of the specified count, the initial state is restored and operation restarts.

Setting the MRB.CHNE bit to 1 allows multiple transfers or a chain transfer on a single activation source. It also enables a chain transfer when the specified data transfer is complete.

[Figure 18.4](#) shows the operation flow of the DTC. [Table 18.3](#) lists the chain transfer conditions. The combination of control information for the second and subsequent transfers are omitted in this table.

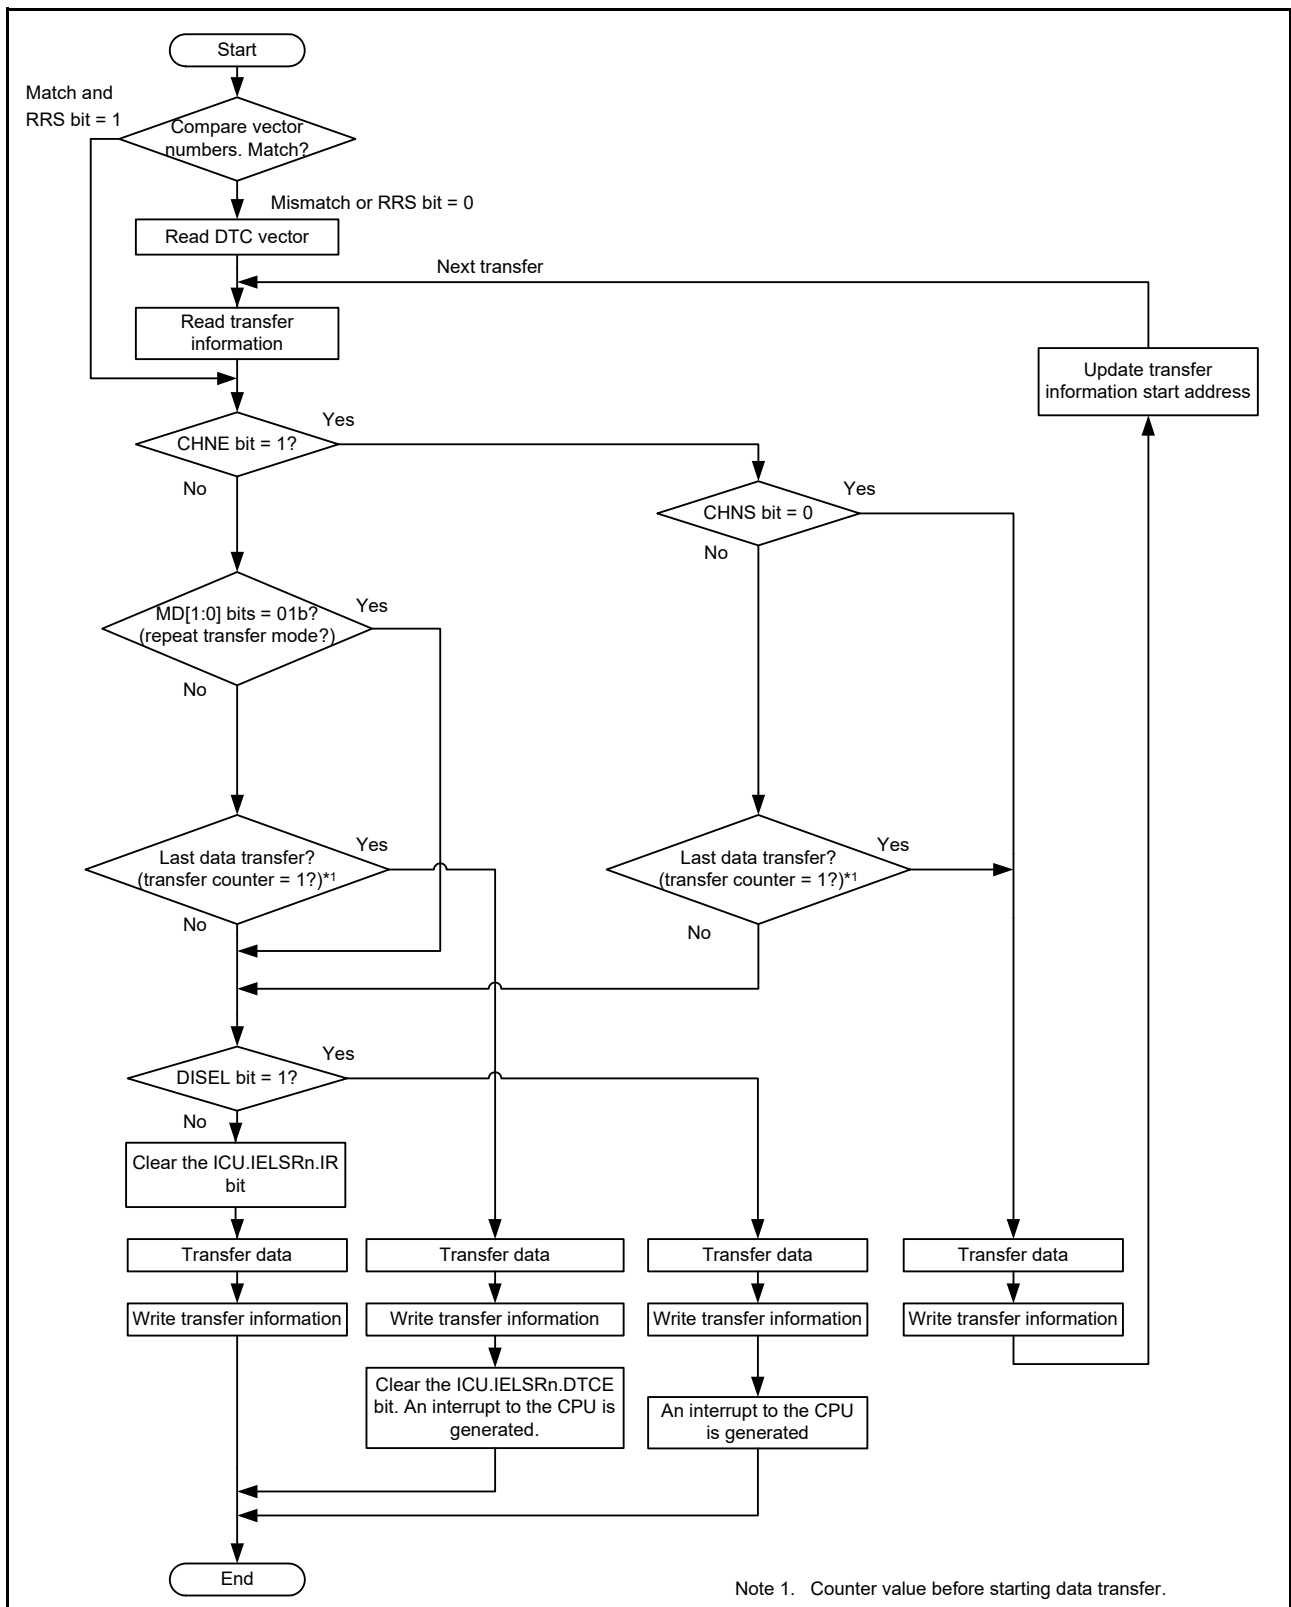

Figure 18.4 DTC operation flow

**Table 18.3 Chain transfer conditions**

| First transfer |          |           |                       | Second transfer*3 |          |           |                       | DTC transfer  |
|----------------|----------|-----------|-----------------------|-------------------|----------|-----------|-----------------------|---|
| CHNE bit       | CHNS bit | DISEL bit | Transfer counter*1,*2 | CHNE bit          | CHNS bit | DISEL bit | Transfer counter*1,*2 |   |
| 0              | —        | 0         | Other than (1 → 0)    | —                 | —        | —         | —                     | Ends after the first transfer                                       |
| 0              | —        | 0         | (1 → 0)               | —                 | —        | —         | —                     | Ends after the first transfer with an interrupt request to the CPU  |
| 0              | —        | 1         | —                     | —                 | —        | —         | —                     |   |
| 1              | 0        | —         | —                     | 0                 | —        | 0         | Other than (1 → 0)    | Ends after the second transfer                                      |
|                |          |           |                       | 0                 | —        | 0         | (1 → 0)               | Ends after the second transfer with an interrupt request to the CPU |
|                |          |           |                       | 0                 | —        | 1         | —                     |   |
| 1              | 1        | 0         | Other than (1 → *)    | —                 | —        | —         | —                     | Ends after the first transfer                                       |
| 1              | 1        | —         | (1 → *)               | 0                 | —        | 0         | Other than (1 → 0)    | Ends after the second transfer                                      |
|                |          |           |                       | 0                 | —        | 0         | (1 → 0)               | Ends after the second transfer with an interrupt request to the CPU |
|                |          |           |                       | 0                 | —        | 1         | —                     |   |
| 1              | 1        | 1         | Other than (1 → *)    | —                 | —        | —         | —                     | Ends after the first transfer with an interrupt request to the CPU  |

Note 1. The transfer counter used depends on the transfer modes as follows:

- Normal transfer mode — CRA register
- Repeat transfer mode — CRAL register
- Block transfer mode — CRB register

Note 2. On completion of a data transfer, the counters operate as follows:

- 1 → 0 in normal and block transfer modes
- 1 → CRAH in repeat transfer mode
- (1 → \*) in the table indicates both of these two operations, depending on the mode.

Note 3. Chain transfer can be selected for the second or subsequent transfers. The conditions for the combination of the second transfer and CHNE bit = 1 is omitted.

#### 18.4.1 Transfer Information Read Skip Function

Reading of vector addresses and transfer information can be skipped by setting the DTCCR.RRS bit. When a DTC activation request is generated, the current DTC vector number is compared to the DTC vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, the DTC data transfer is performed without reading the vector address and transfer information. However, when the previous transfer is a chain transfer, the vector address and transfer information are read. Additionally, when the transfer counter (CRA register) becomes 0 during the previous normal transfer, or when the transfer counter (CRB register) becomes 0 during the previous block transfer, transfer information is read regardless of the RRS bit. [Figure 18.12](#) shows an example of a transfer information read skip.

To update the vector table and transfer information, set the RRS bit to 0, update the vector table and transfer information, and then set the RRS bit to 1. The stored vector number is discarded by setting the RRS bit to 0. The updated DTC vector table and transfer information are read in the next activation process.

#### 18.4.2 Transfer Information Write-Back Skip Function

When the MRA.SM[1:0] bits or the MRB.DM[1:0] bits are set to address fixed, a part of the transfer information is not written back. [Table 18.4](#) lists the transfer information write-back skip conditions and the associated registers. The CRA and CRB registers are written back, and the write-back of the MRA and MRB registers is skipped.

**Table 18.4 Transfer information write-back skip conditions and applicable registers**

| MRA.SM[1:0] bits |    | MRB.DM[1:0] bits |    | SAR register | DAR register |
|------------------|----|------------------|----|--------------|--------------|
| b3               | b2 | b3               | b2 |              |              |
| 0                | 0  | 0                | 0  | Skip         | Skip         |
| 0                | 0  | 0                | 1  |              |              |
| 0                | 1  | 0                | 0  |              |              |
| 0                | 1  | 0                | 1  |              |              |
| 0                | 0  | 1                | 0  | Skip         | Write-back   |
| 0                | 0  | 1                | 1  |              |              |
| 0                | 1  | 1                | 0  |              |              |
| 0                | 1  | 1                | 1  |              |              |
| 1                | 0  | 0                | 0  | Write-back   | Skip         |
| 1                | 0  | 0                | 1  |              |              |
| 1                | 1  | 0                | 0  |              |              |
| 1                | 1  | 0                | 1  |              |              |
| 1                | 0  | 1                | 0  | Write-back   | Write-back   |
| 1                | 0  | 1                | 1  |              |              |
| 1                | 1  | 1                | 0  |              |              |
| 1                | 1  | 1                | 1  |              |              |

### 18.4.3 Normal Transfer Mode

Normal transfer mode allows a 1-byte (8-bit), 1-halfword (16-bit), or 1-word (32-bit) data transfer on a single activation source. The transfer count can be set from 1 to 65536. Transfer source and destination addresses can be independently set to increment, decrement, or remain fixed. This mode enables an interrupt request to the CPU to be generated at the end of a specified-count transfer.

[Table 18.5](#) lists register functions in normal transfer mode, and [Figure 18.5](#) shows the memory map of normal transfer mode.

**Table 18.5 Register functions in normal transfer mode**

| Register | Description                  | Value written back by writing transfer information |
|----------|------------------------------|--|
| SAR      | Transfer source address      | Increment, decrement, or fixed*1                   |
| DAR      | Transfer destination address | Increment, decrement, or fixed*1                   |
| CRA      | Transfer counter A           | CRA - 1  |
| CRB      | Transfer counter B           | Not updated  |

Note 1. Write-back operation is skipped in address-fixed mode.

Figure 18.5 Memory map of normal transfer mode (MRA.SM[1:0] = 10b, MRB.DM[1:0] = 10b, CRA = 0006h)

### 18.4.4 Repeat Transfer Mode

Repeat transfer mode allows a 1-byte (8-bit), 1-halfword (16-bit), or 1-word (32-bit) data transfer on a single activation source. Specify either transfer source or transfer destination for the repeat area in the MRB.DTS bit. The transfer count can be set from 1 to 256. When the specified-count transfer is complete, the initial value of the address register specified in the repeat area is restored, the initial value of the transfer counter is restored, and transfer is repeated. The other address register is incremented or decremented continuously or remains unchanged.

When the transfer counter CRAL decrements to 00h in repeat transfer mode, the CRAL value is updated to the value set in the CRAH register. As a result, the transfer counter does not become 00h, which disables interrupt requests to the CPU when the MRB.DISEL bit is set to 0. An interrupt request to the CPU is generated when the specified data transfer is complete.

Table 18.6 lists the register functions in repeat transfer mode, and Figure 18.6 shows the memory map of repeat transfer mode.

Table 18.6 Register functions in repeat transfer mode

| Register | Description                  | Value written back by writing transfer information |   |
|----------|------------------------------|--|---|
|          |                              | When CRAL is not 1                                 | When CRAL is 1  |
| SAR      | Transfer source address      | Increment, decrement, or fixed*1                   | <ul style="list-style-type: none"> <li>When the MRB.DTS bit is 0<br/>Increment, decrement, or fixed*1</li> <li>When the MRB.DTS bit is 1<br/>SAR register initial value.</li> </ul> |
| DAR      | Transfer destination address | Increment, decrement, or fixed*1                   | <ul style="list-style-type: none"> <li>When the MRB.DTS bit is 0<br/>DAR register initial value</li> <li>When the MRB.DTS bit is 1<br/>Increment, decrement, or fixed.*1</li> </ul> |
| CRAH     | Holds transfer counter       | CRAH   | CRAH  |
| CRAL     | Transfer counter A           | CRAL - 1   | CRAH  |
| CRB      | Transfer counter B           | Not updated  | Not updated   |

Note 1. Write-back is skipped in address-fixed mode.

**Figure 18.6** Memory map of repeat transfer mode when the transfer source is a repeat area (MRA.SM[1:0] = 10b, MRB.DM[1:0] = 10b, CRAH = 04h)

### 18.4.5 Block Transfer Mode

Block transfer mode allows single-block data transfer on a single activation source. Transfer source or transfer destination for the block area must be specified in the MRB.DTS bit. The block size can be set from 1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), or 1 to 256 words (4 to 1024 bytes). When transfer of the specified block completes, the initial values of the block size counter CRAL and the address register (the SAR register when the MRB.DTS bit = 1 or the DAR register when the DTS bit = 0) specified in the block area are restored. The other address register is incremented or decremented continuously or remains unchanged.

The transfer count (block count) can be set from 1 to 65,536. This mode enables an interrupt request to the CPU to be generated at the end of the specified-count block transfer.

Table 18.7 lists register functions in block transfer mode, and Figure 18.7 shows the memory map for block transfer mode.

**Table 18.7** Register functions in block transfer mode

| Register | Description                  | Value written back by writing transfer information  |
|----------|------------------------------|---|
| SAR      | Transfer source address      | <ul style="list-style-type: none"> <li>When MRB.DTS bit is 0<br/>Increment, decrement, or fixed*1</li> <li>When MRB.DTS bit is 1<br/>SAR register initial value.</li> </ul> |
| DAR      | Transfer destination address | <ul style="list-style-type: none"> <li>When MRB.DTS bit is 0<br/>DAR register initial value</li> <li>When MRB.DTS bit is 1<br/>Increment, decrement, or fixed.*1</li> </ul> |
| CRAH     | Holds the block size         | CRAH  |
| CRAL     | Block size counter           | CRAH  |
| CRB      | Block transfer counter       | CRB - 1   |

Note 1. Write-back is skipped in address-fixed mode.

Figure 18.7 Memory map of block transfer mode

### 18.4.6 Chain Transfer

Setting the MRB.CHNE bit to 1 allows chain transfer to be performed continuously on a single activation source. If MRB.CHNE is set to 1 and CHNS to 0, an interrupt request to the CPU is not generated on completion of the specified number of transfer rounds or by setting the MRB.DISEL bit to 1. An interrupt request is sent to the CPU each time DTC data transfer is performed. Data transfer has no effect on the ICU.IELSRn.IR bit of the activation source.

The SAR, DAR, CRA, CRB, MRA, and MRB registers can be set independently of each other to define the data transfer. Figure 18.8 shows a chain transfer operation.

Figure 18.8 Chain transfer operation

Writing 1 to the MRB.CHNE and CHNS bits enables chain transfer to be performed only after completion of the specified data transfer. In repeat transfer mode, chain transfer is performed after completion of the specified data transfer. For details on chain transfer conditions, see [Table 18.3, Chain transfer conditions](#).

### 18.4.7 Operation Timing

Figure 18.9 to Figure 18.12 are timing diagrams that show the minimum number of execution cycles.

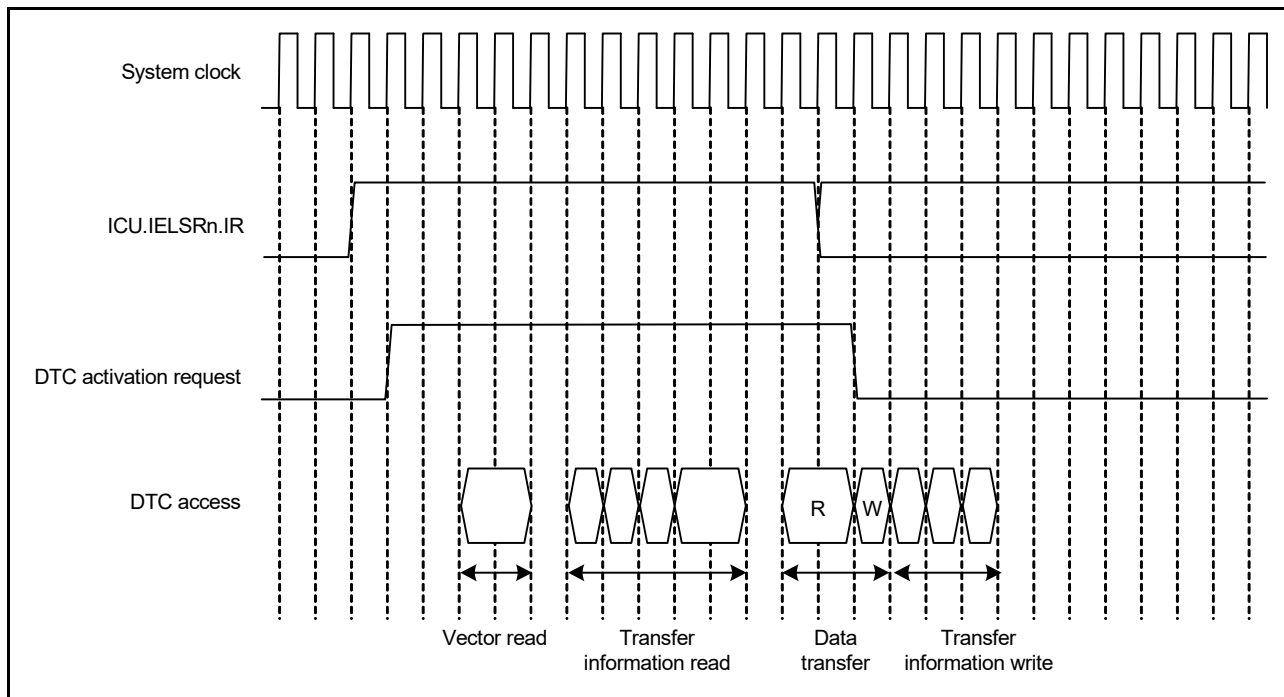

Figure 18.9 Example 1 of DTC operation timing in normal transfer and repeat transfer modes

Figure 18.10 Example 2 of DTC operation timing in block transfer mode when the block size = 4

Figure 18.11 Example 3 of DTC operation timing for chain transfer

Figure 18.12 Example of operation when a transfer information read is skipped, with the vector, transfer information, and transfer destination data on the SRAM, and the transfer source data on the peripheral module

### 18.4.8 Execution Cycles of DTC

Table 18.8 lists the execution cycles of single data transfer of the DTC.

For the order of the execution states, see section 18.4.7, Operation Timing.

**Table 18.8 Execution cycles of DTC**

| Transfer mode       | Vector read      |          | Transfer information read   |          | Transfer information write       |                                  |                     | Data transfer           |                         | Internal operation |          |
|---------------------|------------------|----------|-----------------------------|----------|----------------------------------|----------------------------------|---------------------|-------------------------|-------------------------|--------------------|----------|
|                     |                  |          |                             |          |                                  |                                  |                     | Read                    | Write                   |                    |          |
| Normal              | $C_v + C_s1 + 1$ | $0^{*1}$ | $4 \times (C_i + C_s1) + 1$ | $0^{*1}$ | $3 \times (C_i + C_s1) + 1^{*2}$ | $2 \times (C_i + C_s1) + 1^{*3}$ | $(C_i + C_s1)^{*4}$ | $C_r + C_s2 + 1$        | $C_w + C_s2 + 1$        | 2                  | $0^{*1}$ |
| Repeat              |                  |          |                             |          |                                  |                                  |                     | $C_r + C_s2 + 1$        | $C_w + C_s2 + 1$        |                    |          |
| Block <sup>*5</sup> |                  |          |                             |          |                                  |                                  |                     | $P \times (C_r + C_s2)$ | $P \times (C_w + C_s2)$ |                    |          |

Note 1. When transfer information read is skipped.

Note 2. When neither SAR nor DAR is set to address-fixed mode.

Note 3. When SAR or DAR is set to address-fixed mode.

Note 4. When SAR and DAR are set to address-fixed mode.

Note 5. When the block size is 2 or more. If the block size is 1, the cycle number for normal transfer is applied.

P: Block size (initial settings of CRAH and CRAL)

Cv: Cycles for access to vector transfer information storage destination

Ci: Cycles for access to transfer information storage destination address

Cr: Cycles for access to data read destination

Cw: Cycles for access to data write destination

Cs1: When accessing SRAMHS: 2 cycles.

When accessing elsewhere: 0 cycles.

When a slave bus changes by a read/write data transfer, add 1 more cycle.

Cs2: When accessing SRAMHS and peripheral modules related to system control: 2 cycles.

When accessing elsewhere: 0 cycle.

When a slave bus change by a read/write data transfer, add 1 more cycle.

The unit is system clocks (ICLK) + 1 in the Vector read, Transfer information read, and Data transfer read columns and 2 in the Internal operation column.

Cv, Ci, Cr, and Cw vary depending on the corresponding access destination. For the number of cycles for respective access destinations, see [section 51, SRAM](#), [section 53, Flash Memory](#), and [section 15.2.3, External Bus](#).

The frequency ratio of the system clock and peripheral clock is also taken into consideration.

The DTC response time is the time from when the DTC activation source is detected until DTC transfer starts.

This table does not include the time until DTC data transfer starts after the DTC activation source becomes active.

#### 18.4.9 DTC Bus Mastership Release Timing

The DTC does not release bus mastership during transfer information reads. Before the transfer information is read or written, the bus is arbitrated according to the priority determined by the bus master arbitrator. For bus arbitration, see [section 15, Buses](#).

### 18.5 DTC Setting Procedure

Before using the DTC, set the DTC Vector Base Register (DTCVBR). [Figure 18.13](#) shows the procedure for setting the DTC.

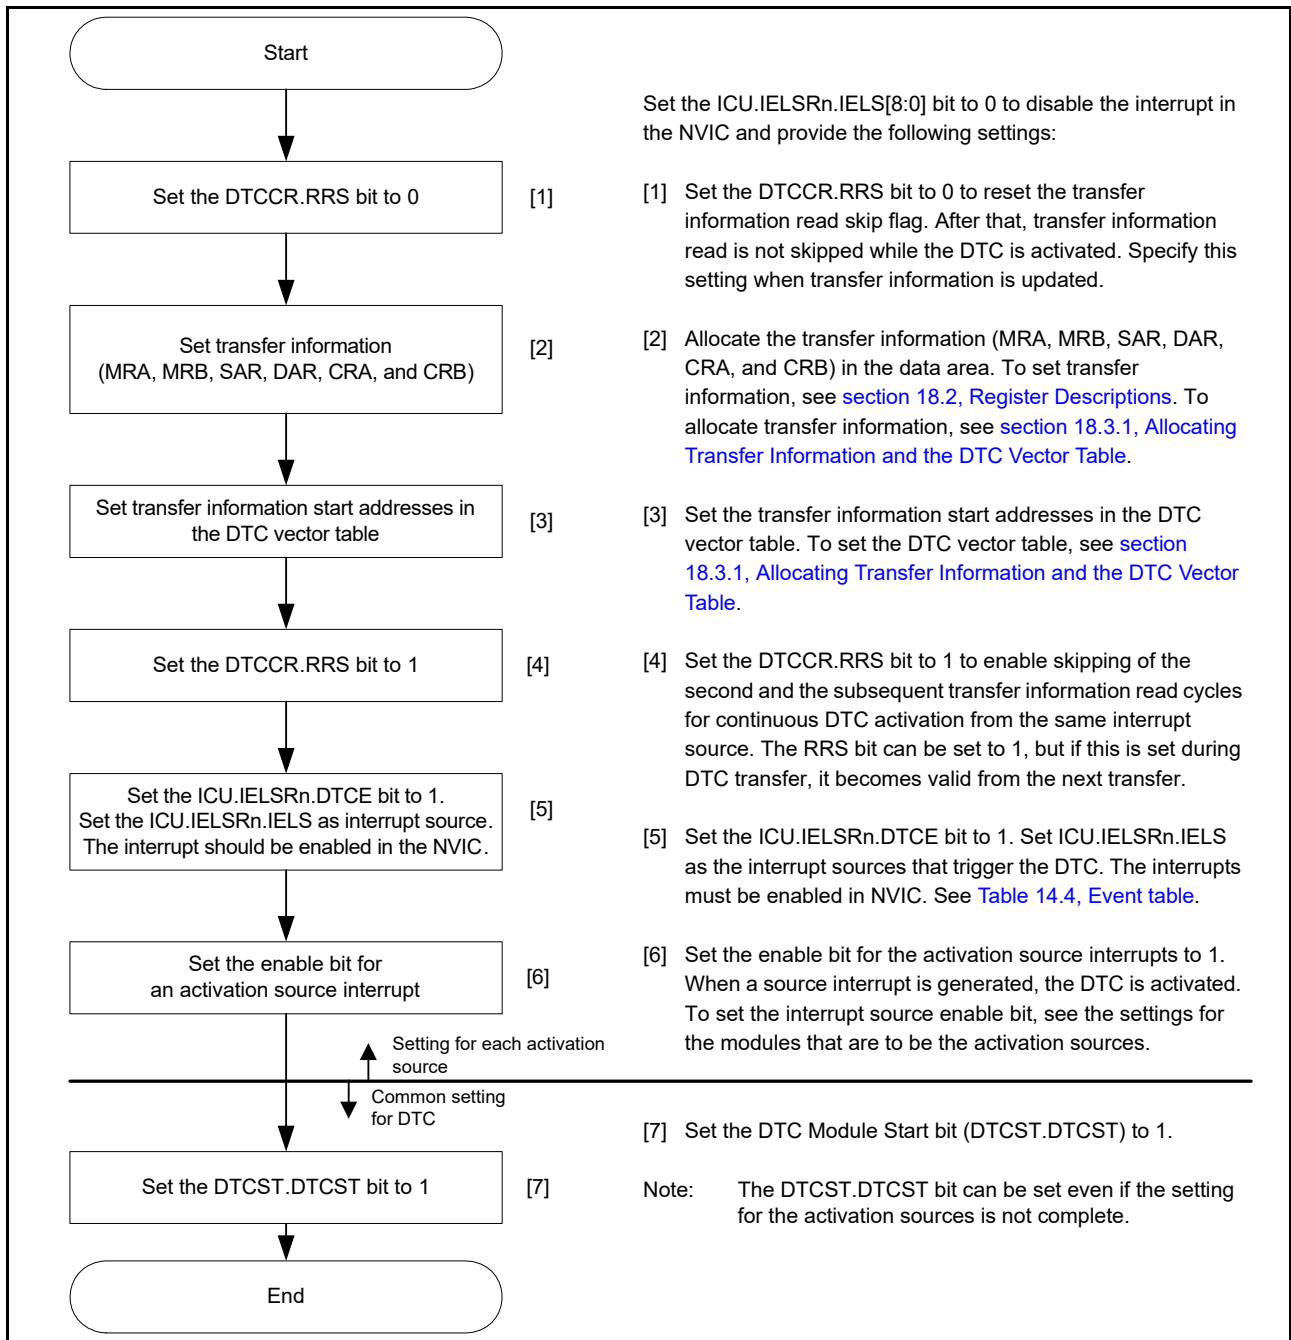

Figure 18.13 DTC setting procedure

## 18.6 Examples of DTC Usage

### 18.6.1 Normal Transfer

This section provides an example of DTC usage and its application when receiving 128 bytes of data from an SCI.

#### (1) Transfer information settings

In the MRA register, select a fixed source address (MRA.SM[1:0] = 00b), normal transfer mode (MRA.MD[1:0] = 00b), and byte-sized transfer (MRA.SZ[1:0] = 00b). In the MRB register, specify incrementation of the destination address (MRB.DM[1:0] = 10b) and single data transfer by a single interrupt (MRB.CHNE = 0 and MRB.DISEL = 0). The MRB.DTS bit can be set to any value. Set the RDR register address of the SCI in the SAR register, the start address of the SRAM area for data storage in the DAR register, and 128 (0080h) in the CRA register. The CRB register can be set to any value.

## (2) DTC vector table settings

The start address of the transfer information for the RXI interrupt is set in the vector table for the DTC.

## (3) ICU settings and DTC module activation

Set the ICU.IELSRn.DTCE bit to 1 and set ICU.IELSRn.IELS as the SCI interrupt. The interrupt must be enabled in the NVIC. Set the DTCST.DTCST bit to 1.

## (4) SCI settings

Enable the RXI interrupt by setting the SCR.RIE bit in the SCI to 1. If a reception error occurs during the SCI receive operation, reception stops. To manage this, use settings that allow the CPU to accept receive error interrupts.

## (5) DTC transfer

Each time a reception of 1 byte by the SCI is complete, an RXI interrupt is generated to activate the DTC. The DTC transfers the received byte from the RDR of the SCI to the SRAM, after which the DAR register is incremented and the CRA register is decremented.

## (6) Interrupt handling

After 128 rounds of data transfer are complete and the value in the CRA register becomes 0, an RXI interrupt request is generated for the CPU. Complete the process in the handling routine for this interrupt.

### 18.6.2 Chain Transfer

This section provides an example of chain transfer by the DTC and describes its use in the output of pulses by the General PWM Timer (GPT). You can use chain transfer to transfer PWM timer compare data and change the period of the PWM timer for GPT.

For the first of the chain transfers, normal transfer mode is specified for transfer to the GPT32m.GTCCRC register (m = EH0 to EH3, E4 to E7, 8 to 13). For the second transfer, normal transfer mode is specified for transfer to the GPT32m.GTCCRE register. For the third transfer, normal transfer mode is specified for transfer to the GPT32m.GTPBR register. This is because clearing of the activation source and generation of an interrupt on completion of the specified number of transfers are restricted to the third of the chain transfers, that is, transfer while MRB.CHNE = 0.

The following example shows how to use the counter overflow interrupt with a GPT32EH0.GTPR register as an activating source for the DTC.

#### (1) First transfer information settings

Set up transfer to the GPT32EH0.GTCCRC register:

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1 and MRB.CHNS = 0).
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT32EH0.GTCCRC register.
6. Set the CRAH and CRAL registers to the size of the data table. The CRB register can be set to any value.

#### (2) Second transfer information settings

Set up transfer to the GPT32EH0.GTCCRE register:

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1 and MRB.CHNS = 0).
4. Set the SAR register to the first address of the data table.

5. Set the DAR register to the address of the GPT32EH0.GTCCRE register.
6. Set the CRAH and CRAL registers to the size of the data table. The CRB register can be set to any value.

### (3) Third transfer information settings

Set up transfer to the GPT32EH0.GTPBR registers:

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up single data transfer per interrupt (MRB.CHNE = 0, MRB.DISEL = 0). The MRB.DTS bit can be set to any value.
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT32EH0.GTPBR register.
6. Set the CRA register to the size of the data table. The CRB register can be set to any value.

### (4) Transfer information assignment

Place the transfer information for use in the transfer to GPT32EH0.GTPBR immediately after the transfer control information for use in the GPT32EH0.GTCCRC and GPT32EH0.GTCCRE registers.

### (5) DTC vector table

In the DTC vector table, set the address where the transfer control information for use in transfer to the GPT32EH0.GTCCRC and GPT32EH0.GTCCRE registers starts.

### (6) ICU settings and DTC module activation

1. Set the ICU.IELSRn.DTCE bit associated with the GPT32EH0 counter overflow interrupt.
2. Set ICU.IELSRn.IELS[8:0] to 182 (B6h) for the GPT32EH0 counter overflow.
3. Set the DTCST.DTCST bit to 1.

### (7) GPT settings

1. Set the GPT32EH0.GTIOR register so that the GTCCRA and GTCCRB registers operate as output compare registers.
2. Set the default PWM timer compare values in the GPT32EH0.GTCCRA and GPT32EH0.GTCCRB registers and the next PWM timer compare values in the GPT32EH0.GTCCRC and GPT32EH0.GTCCRE registers.
3. Set the default PWM timer period values in the GPT32EH0.GTPR register and the next PWM timer period values in the GPT32EH0.GTPBR register.
4. Set 1 to the output bit in PmnPFS.PDR, and set 00011b to the peripheral select bits in PmnPFS.PSEL[4:0].

### (8) GPT activation

Set the GPT32EH0.GTSTR.CSTRT bit to 1 to start the GPT32EH0.GTCNT counter.

### (9) DTC transfer

Each time a GPT32EH0 counter overflow is generated with the GPT32EH0.GTPR register, the next PWM timer compare values are transferred to the GPT32EH0.GTCCRC and GPT32EH0.GTCCRE registers. The setting for the next PWM timer period is transferred to the GPT32EH0.GTPBR register.

### (10) Interrupt handling

After the specified rounds of data transfer are complete, for example when the value in the CRA register for GPT transfer becomes 0, a GPT counter overflow interrupt request is issued for the CPU. Complete the process for this interrupt in the handling routine.

## 18.6.3 Chain Transfer when Counter = 0

The second data transfer is performed only when the transfer counter is set to 0 in the first data transfer, and the first data

transfer information is repeatedly changed in the second transfer. Chain transfer enables transfers to be repeated 256 times or more.

The following procedure shows an example of configuring a 128-KB input buffer, where the input buffer is set so that its lower address starts with 0000h. [Figure 18.14](#) shows a chain transfer when the counter = 0.

1. Set the normal transfer mode to input data for the first data transfer. Set the following:
  - a. Transfer source address = fixed.
  - b. CRA register = 0000h (65,536) times.
  - c. MRB.CHNE bit = 1 (chain transfer is enabled).
  - d. MRB.CHNS bit = 1 (chain transfer is performed only when the transfer counter is 0).
  - e. MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
2. Prepare the upper 8-bit address of the start address at every 65,536 times of the transfer destination address for the first data transfer in different area such as the flash. For example, when setting the input buffer to 20 0000h to 21 FFFFh, prepare 21h and 20h.
3. For the second data transfer:
  - a. Set the repeat transfer mode (with the source as the repeat area) to reset the transfer destination address of the first data transfer.
  - b. Specify the upper 8 bits of the DAR register in the first transfer information area for the transfer destination.
  - c. Set the MRB.CHNE bit = 0 (chain transfer is disabled).
  - d. Set the MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
  - e. When setting the input buffer to 20 0000h to 21 FFFFh, also set the transfer counter to 2.
4. The first data transfer is performed by an interrupt 65,536 times. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the upper 8 bits of the transfer destination address of the first data transfer to 21h. The lower 16 bits of the transfer destination address and the transfer counter of the first data transfer becomes 0000h.
5. In succession, the first data transfer is performed by an interrupt 65,536 times as specified for the first data transfer. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the upper 8 bits of the transfer destination address of the first data transfer to 20h. The lower 16 bits of the transfer destination address and the transfer counter of the first data transfer becomes 0000h.
6. Steps 4 and 5 are repeated indefinitely. Because the second data transfer is in repeat transfer mode, no interrupt request to the CPU is generated.

Figure 18.14 Chain transfer when counter = 0

## 18.7 Interrupt Sources

When the DTC completes data transfer of the specified count or when data transfer with MRB.DISEL set to 1 is complete, a DTC activation source generates an interrupt to the CPU. Interrupts to the CPU are controlled according to the settings in the NVIC and ICU.IELSRn.IELS[8:0]. See [section 14, Interrupt Controller Unit \(ICU\)](#).

The DTC prioritizes activation sources by granting the smaller interrupt vector numbers higher priority. The priority of interrupts to the CPU is determined by the NVIC priority.

## 18.8 Event Link

The DTC can produce an event link request on completion of one transfer request. When the destination for the transfer is an external bus, the event link request is issued after completion of writing to the write buffer rather than after completion of writing to the actual transfer destination.

## 18.9 Snooze Control Interface

To return to Software Standby mode from Snooze mode through the DTC, set SYSTEM.SNZEDCR.DTCZRED or SYSTEM.SNZEDCR.DTCNZRED to 1. See [section 11.8.3, Return to Software Standby Mode](#).

SYSTEM.SNZEDCR.DTCZRED enables or disables a Snooze end request on completion of the last DTC transmission, detected on DTC transmission completion when CRA and CRB are 0.

SYSTEM.SNZEDCR.DTCNZRED enables or disables a Snooze end request on a not last DTC transmission completion (CRA and CRB are not 0), detected on DTC transmission completion when CRA and CRB are not 0.

## 18.10 Module-Stop Function

Before transitioning to the module-stop function, Software Standby mode without a Snooze mode transition, or Deep Software Standby mode, set the DTCST.DTCST bit to 0, then perform the operations described in the following sections. The DTC is available in Snooze mode by setting LPW.SNZCR.SNZDTCEN to 1. See [section 11, Low Power Modes](#).

### (1) Module-stop function

Writing 1 to the MSTPCRA.MSTPA22 bit enables the module-stop function of the DTC. If the DTC transfer is in progress at the time 1 is written to the MSTPCRA.MSTPA22 bit, the transition to the module-stop state proceeds after DTC transfer ends. When the MSTPCRA.MSTPA22 bit is 1, accessing the DTC registers is prohibited. Writing 0 to the MSTPCRA.MSTPA22 bit releases the DTC from the module-stop state.

### (2) Software Standby and Deep Software Standby modes

Use the settings described in [section 11.7.1, Transition to Software Standby Mode](#), or [section 11.9.1, Transition to Deep Software Standby Mode](#).

If DTC transfer operations are in progress when the WFI instruction is executed, the transition to Software Standby mode or Deep Software Standby mode follows the completion of the DTC transfer.

When the snooze control circuit receives a snooze request in Software Standby mode, the MCU transfers to Snooze mode. See [section 11.8.1, Transition to Snooze Mode](#). DTC operation in Snooze mode can be selected in the SYSTEM.SNZCR.SNZDTCEN bit. If DTC operation is enabled in Snooze mode, before transitioning to Software Standby mode, set the DTCST.DTCST bit to 1. To return to Software Standby mode through the DTC, set SYSTEM.SNZEDCR.DTCZRED or SYSTEM.SNZEDCR.DTCNZRED to 1. See [section 11.8.3, Return to Software Standby Mode](#). The DTC activation request from the ICU is stopped during Software Standby mode but not during Snooze mode.

### (3) Notes on the module-stop function

For the WFI instruction and the register setting procedure, see [section 11, Low Power Modes](#).

To perform a DTC transfer after returning from a low power mode without Snooze mode transition, set the DTCST.DTCST bit to 1 again.

To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DTC activation request, specify the CPU as the interrupt request destination as described in [section 14.4.2, Selecting Interrupt Request Destinations](#), then execute a WFI instruction. If DTC operation is enabled in Snooze mode, do not use the module-stop function of the DTC.

## 18.11 Usage Notes

### 18.11.1 Transfer information Start Address

You must set multiples of 4 for the transfer information start addresses in the vector table. Otherwise, such addresses are accessed with their lowest 2 bits regarded as 00b.

## 19. Event Link Controller (ELC)

### 19.1 Overview

The Event Link Controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect them to different modules, allowing direct link between the modules without CPU intervention.

Table 19.1 lists the ELC specifications and Figure 19.1 shows a block diagram.

**Table 19.1 ELC specifications**

| Parameter            | Specifications   |
|----------------------|--|
| Event link function  | 258 types of event signals can be directly connected to modules. The ELC can generate an ELC event signal, and events that activate the DTC. |
| Module-stop function | Module-stop state can be set   |

**Figure 19.1 ELC block diagram**

## 19.2 Register Descriptions

### 19.2.1 Event Link Controller Register (ELCR)

Address(es): [ELC.ELCR 4004 1000h](#)

|       |    |    |    |    |    |    |    |
|-------|----|----|----|----|----|----|----|
| b7    | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| ELCON | —  | —  | —  | —  | —  | —  | —  |

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol                | Bit name              | Description  | R/W |
|----------|-----------------------|-----------------------|--|-----|
| b6 to b0 | —                     | Reserved              | These bits are read as 0. The write value should be 0. | R/W |
| b7       | <a href="#">ELCON</a> | All Event Link Enable | 0: ELC function disabled<br>1: ELC function enabled.   | R/W |

The ELCR register controls the ELC operation.

### 19.2.2 Event Link Software Event Generation Register n (ELSEGRn) (n = 0, 1)

Address(es): [ELC.ELSEGR0 4004 1002h](#), [ELC.ELSEGR1 4004 1004h](#)

|    |    |    |    |    |    |    |     |
|----|----|----|----|----|----|----|-----|
| b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0  |
| WI | WE | —  | —  | —  | —  | —  | SEG |

Value after reset: 1 0 0 0 0 0 0 0

| Bit      | Symbol              | Bit name                      | Description  | R/W |
|----------|---------------------|-------------------------------|--|-----|
| b0       | <a href="#">SEG</a> | Software Event Generation     | 0: Normal operation<br>1: Software event is generated.                         | W   |
| b5 to b1 | —                   | Reserved                      | These bits are read as 0. The write value should be 0.                         | R/W |
| b6       | <a href="#">WE</a>  | SEG Bit Write Enable          | 0: Writes to SEG bit disabled<br>1: Writes to SEG bit enabled.                 | R/W |
| b7       | <a href="#">WI</a>  | ELSEGR Register Write Disable | 0: Writes to ELSEGR register enabled<br>1: Writes to ELSEGR register disabled. | W   |

#### [SEG bit \(Software Event Generation\)](#)

When 1 is written to the SEG bit while the WE bit is 1, a software event is generated. This bit is read as 0. Even when 1 is written to this bit, data is not stored. The WE bit must be set to 1 before writing to this bit.

A software event can trigger a linked DTC event.

#### [WE bit \(SEG Bit Write Enable\)](#)

The SEG bit can only be written to when the WE bit is 1. Clear the WI bit to 0 before writing to this bit.

[Setting condition]

- If 1 is written to this bit while the WI bit is 0, this bit becomes 1.

[Clearing condition]

- If 0 is written to this bit while the WI bit is 0, this bit becomes 0.

#### [WI bit \(ELSEGR Register Write Disable\)](#)

The ELSEGR register can only be written to when the write value to the WI bit is 0. This bit is read as 1. Before setting the WE or SEG bit, the WI bit must be set to 0.

### 19.2.3 Event Link Setting Register n (ELSRn) (n = 0 to 18)

Address(es): [ELC.ELSR0 4004 1010h](#), [ELC.ELSR1 4004 1014h](#), [ELC.ELSR2 4004 1018h](#), [ELC.ELSR3 4004 101Ch](#), [ELC.ELSR4 4004 1020h](#), [ELC.ELSR5 4004 1024h](#), [ELC.ELSR6 4004 1028h](#), [ELC.ELSR7 4004 102Ch](#), [ELC.ELSR8 4004 1030h](#), [ELC.ELSR9 4004 1034h](#), [ELC.ELSR10 4004 1038h](#), [ELC.ELSR11 4004 103Ch](#), [ELC.ELSR12 4004 1040h](#), [ELC.ELSR13 4004 1044h](#), [ELC.ELSR14 4004 1048h](#), [ELC.ELSR15 4004 104Ch](#), [ELC.ELSR16 4004 1050h](#), [ELC.ELSR17 4004 1054h](#), [ELC.ELSR18 4004 1058h](#)

| Bit       | Symbol                   | Bit name          | Description  | R/W |
|-----------|--------------------------|-------------------|--|-----|
| b8 to b0  | <a href="#">ELS[8:0]</a> | Event Link Select | b8 b0<br>00000000: Event output disabled for the associated peripheral module<br>00000001 to 111000101b: Number setting for the event signal to be linked.<br>Other settings are prohibited. | R/W |
| b15 to b9 | —                        | Reserved          | These bits are read as 0. The write value should be 0.   | R/W |

The ELSRn register specifies an event signal to be linked to each peripheral module. [Table 19.2](#) shows the association between the ELSRn registers and the peripheral modules. [Table 19.3](#) shows the association between the event signal names set in the ELSRn register and the signal numbers.

**Table 19.2 Association between the ELSRn registers and peripheral functions**

| Register name | Peripheral function (module) | Event name |
|---------------|------------------------------|------------|
| ELSR0         | GPT (A)                      | ELC_GPTA   |
| ELSR1         | GPT (B)                      | ELC_GPTB   |
| ELSR2         | GPT (C)                      | ELC_GPTC   |
| ELSR3         | GPT (D)                      | ELC_GPTD   |
| ELSR4         | GPT (E)                      | ELC_GPTE   |
| ELSR5         | GPT (F)                      | ELC_GPTF   |
| ELSR6         | GPT (G)                      | ELC_GPTG   |
| ELSR7         | GPT (H)                      | ELC_GPTH   |
| ELSR8         | ADC12A0                      | ELC_AD00   |
| ELSR9         | ADC12B0                      | ELC_AD01   |
| ELSR10        | ADC12A1                      | ELC_AD10   |
| ELSR11        | ADC12B1                      | ELC_AD11   |
| ELSR12        | DAC12 channel 0              | ELC_DA0    |
| ELSR13        | DAC12 channel 1              | ELC_DA1    |
| ELSR14        | PORT 1                       | ELC_PORT1  |
| ELSR15        | PORT 2                       | ELC_PORT2  |
| ELSR16        | PORT 3                       | ELC_PORT3  |
| ELSR17        | PORT 4                       | ELC_PORT4  |
| ELSR18        | CTSU                         | ELC_CTSU   |

**Table 19.3 Association between event signal names set in ELSRn.ELS bits and signal numbers (1 of 6)**

| Event number | Interrupt request source | Name                | Description                 |
|--------------|--------------------------|---------------------|-----------------------------|
| 001h         | Port                     | PORT_IRQ0*1         | External pin interrupt 0    |
| 002h         |                          | PORT_IRQ1*1         | External pin interrupt 1    |
| 003h         |                          | PORT_IRQ2*1         | External pin interrupt 2    |
| 004h         |                          | PORT_IRQ3*1         | External pin interrupt 3    |
| 005h         |                          | PORT_IRQ4*1         | External pin interrupt 4    |
| 006h         |                          | PORT_IRQ5*1         | External pin interrupt 5    |
| 007h         |                          | PORT_IRQ6*1         | External pin interrupt 6    |
| 008h         |                          | PORT_IRQ7*1         | External pin interrupt 7    |
| 009h         |                          | PORT_IRQ8*1         | External pin interrupt 8    |
| 00Ah         |                          | PORT_IRQ9*1         | External pin interrupt 9    |
| 00Bh         |                          | PORT_IRQ10*1        | External pin interrupt 10   |
| 00Ch         |                          | PORT_IRQ11*1        | External pin interrupt 11   |
| 00Dh         |                          | PORT_IRQ12*1        | External pin interrupt 12   |
| 00Eh         |                          | PORT_IRQ13*1        | External pin interrupt 13   |
| 00Fh         |                          | PORT_IRQ14*1        | External pin interrupt 14   |
| 010h         |                          | PORT_IRQ15*1        | External pin interrupt 15   |
| 020h         | DMAC0                    | DMAC0_INT           | DMAC transfer end 0         |

Note 1. Only pulse (edge detection) is supported.

Note 2. ELSR8 to ELSR11, ELSR14 to ELSR17, and ELSR18 can select this event.

Note 3. This event can occur in Snooze mode.

Note 4. This event is not supported in FIFO mode.

## 19.3 Operation

### 19.3.1 Relation between Interrupt Handling and Event Linking

Event number for an event link is the same as that for the associated interrupt source. For information on generating event signals, see the explanation in the chapter for each event source module.

### 19.3.2 Linking Events

When an event occurs and that event is already set as a trigger in the Event Link Setting Register (ELSRn), the associated module is activated. The operation of the module must be set up in advance. Table 19.4 lists the operations of modules when an event occurs.

**Table 19.4 Module operations when event occurs**

| Module    | Operations when event occurs  |
|-----------|---|
| GPT       | <ul style="list-style-type: none"> <li>• Start counting</li> <li>• Stop counting</li> <li>• Clear counting</li> <li>• Up counting</li> <li>• Down counting</li> <li>• Input capture.</li> </ul>   |
| ADC12     | Start A/D conversion  |
| DAC12     | Start D/A conversion  |
| I/O ports | <ul style="list-style-type: none"> <li>• Change pin output based on the EORR (reset) or EOSR (set)</li> <li>• Latch pin state to EIDR</li> <li>• The following ports can be used for the ELC:               <ul style="list-style-type: none"> <li>PORT 1</li> <li>PORT 2</li> <li>PORT 3</li> <li>PORT 4.</li> </ul> </li> </ul> |
| CTSU      | Start measurement operation   |
| DTC       | Start DTC data transfer   |

### 19.3.3 Example Procedure for Linking Events

To link events:

1. Set the operation of the module for which an event is to be linked.
2. Set the appropriate ELSRn register for the module to be linked.
3. Set the ELCR.ELCON bit to 1 to enable linkage of all events.
4. Configure the module from which an event is output and activate the module. The link between the two modules is now active.
5. To stop event linkage of modules individually, set 00000000b in the ELSRn.ELS[8:0] bits associated with the modules. To stop linkage of all events, set the ELCR.ELCON bit to 0.

If the event link output from the RTC is to be used, set the ELC after the RTC is set, for example, for initialization and time settings. Unintended events can be generated if the RTC settings are made after the ELC settings.

## 19.4 Usage Notes

### 19.4.1 Linking DMAC or DTC Transfer End Signals as Events

When linking the DMAC or DTC transfer end signals as events, do not set the same peripheral module as the DMAC or DTC transfer destination and event link destination. If set, the peripheral module might be started before DMAC or DTC transfer to the peripheral module is complete.

### 19.4.2 Setting Clocks

To link events, you must enable the ELC and the related modules. The modules cannot operate if the related modules are in the module-stop state or in the specific low power mode in which the module is stopped (Software Standby mode or Deep Software Standby mode). Some modules can perform in Snooze mode. For more information, see [Table 19.3](#) and [section 11, Low Power Modes](#).

### 19.4.3 Settings for the Module-Stop Function

The Module Stop Control Register C (MSTPCRC) can enable or disable ELC operation. The ELC is initially stopped after reset. Releasing the module-stop state enables access to the registers. The ELCON bit must be set to 0 before disabling ELC operation using the Module Stop Control Register. For more information, see [Table 19.3](#) and [section 11, Low Power Modes](#).

### 19.4.4 ELC Delay Time

In [Figure 19.2](#), module A uses ELC and accesses module B through the ELC. There is a delay time in the ELC module between module A and module B. See [Table 19.5](#).

**Table 19.5 ELC delay time**

| Clock domain      | Clock frequency   | ELC delay time           |
|-------------------|-------------------|--------------------------|
| clock_A = clock_B | clock_A = clock_B | 0 cycle                  |
| clock_A ≠ clock_B | clock_A = clock_B | 1 cycle to 2 cycles      |
|                   | clock_A > clock_B | 1 cycle to 2 cycles of B |
|                   | clock_A < clock_B | 1 cycle to 2 cycles of A |

**Figure 19.2 ELC delay time**

## 20. I/O Ports

### 20.1 Overview

The I/O port pins operate as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, analog I/O, port group function for the ELC, or bus control pins. All pins operate as input pins immediately after a reset, and pin functions are switched by register settings. The I/O ports and peripheral modules for each pin are specified in the associated registers.

Figure 20.1 shows a connection diagram for the I/O port registers. The configuration of the I/O ports differs depending on the package. Table 20.1 lists the I/O port specifications by package, and Table 20.2 lists the port functions.

Figure 20.1 Connection diagram for I/O port registers

Note: Figure 20.1 shows a basic port configuration. The configuration differs depending on the ports.

**Table 20.1 I/O port specifications**

| Port  | Package                        |                | Package                    |                |
|-------|--------------------------------|----------------|----------------------------|----------------|
|       | 144 pins, 145 pins             | Number of pins | 100 pins                   | Number of pins |
| PORT0 | P000 to P009, P014, P015       | 12             | P000 to P008, P014, P015   | 11             |

|                    | PDR15 | PDR14 | PDR13 | PDR12 | PDR11 | PDR10 | PDR09 | PDR08 | PDR07 | PDR06 | PDR05 | PDR04 | PDR03 | PDR02 | PDR01 | PDR00 |
| Value after reset: | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     |

| Bit        | Symbol | Bit name        | Description   | R/W |
|------------|--------|-----------------|---|-----|
| b15 to b0  | PDRn   | Pmn Direction   | 0: Input (functions as an input pin)<br>1: Output (functions as an output pin). | R/W |
| b31 to b16 | PODRn  | Pmn Output Data | 0: Low output<br>1: High output.  | R/W |

m = 0 to 8

n = 00 to 15

The Port Control Register 1 (PCNTR1/PODR/PDR) is a 32-bit and 16-bit read/write register that controls port direction and port output data.

The PCNTR1 specifies the port direction and the output data, and is accessed in 32-bit units. The PDRn (bits [15:0] in PCNTR1) and PODRn (bits [31:16] in PCNTR1) respectively, are accessed in 16-bit units.

The PDRn bits select the input or output direction for individual pins on the associated port when the pins are configured as general I/O pins. Each pin on port m is associated with a PORTm.PCNTR1.PDRn bit. The I/O direction can be specified in 1-bit units. Bits associated with non-existent pins are reserved. The write value should always be 0. P200 is input only, so PORT2.PCNTR1.PDR00 is reserved. The PDRn bit in the PORTm.PCNTR1 register serves the same function as the PDR bit in the PFS.PmnPFS register.

The PODRn bits hold data to be output from the general I/O pins. Bits associated with non-existent pins are reserved. The write value should be 0. P200 is input only, so PORT2.PCNTR1.PODR00 is reserved. Writes to P200 have no effect. The PODRn bit in the PORTm.PCNTR1 register serves the same function as the PODR bit in the PFS.PmnPFS register.

## 20.2.2 Port Control Register 2 (PCNTR2/EIDR/PIDR)

Address(es): PORT0.PCNTR2 4004 0004h, PORT1.PCNTR2 4004 0024h, PORT2.PCNTR2 4004 0044h, PORT3.PCNTR2 4004 0064h, PORT4.PCNTR2 4004 0084h, PORT5.PCNTR2 4004 00A4h, PORT6.PCNTR2 4004 00C4h, PORT7.PCNTR2 4004 00E4h, PORT8.PCNTR2 4004 0104h

PORT0.EIDR 4004 0004h, PORT1.EIDR 4004 0024h, PORT2.EIDR 4004 0044h, PORT3.EIDR 4004 0064h, PORT4.EIDR 4004 0084h, PORT5.EIDR 4004 00A4h, PORT6.EIDR 4004 00C4h, PORT7.EIDR 4004 00E4h, PORT8.EIDR 4004 0104h

PORT0.PIDR 4004 0006h, PORT1.PIDR 4004 0026h, PORT2.PIDR 4004 0046h, PORT3.PIDR 4004 0066h, PORT4.PIDR 4004 0086h, PORT5.PIDR 4004 00A6h, PORT6.PIDR 4004 00C6h, PORT7.PIDR 4004 00E6h, PORT8.PIDR 4004 0106h

|                    |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |
|--------------------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
|                    | b31    | b30    | b29    | b28    | b27    | b26    | b25    | b24    | b23    | b22    | b21    | b20    | b19    | b18    | b17    | b16    |
|                    | EIDR15 | EIDR14 | EIDR13 | EIDR12 | EIDR11 | EIDR10 | EIDR09 | EIDR08 | EIDR07 | EIDR06 | EIDR05 | EIDR04 | EIDR03 | EIDR02 | EIDR01 | EIDR00 |
| Value after reset: | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 0      |
|                    | b15    | b14    | b13    | b12    | b11    | b10    | b9     | b8     | b7     | b6     | b5     | b4     | b3     | b2     | b1     | b0     |
|                    | PIDR15 | PIDR14 | PIDR13 | PIDR12 | PIDR11 | PIDR10 | PIDR09 | PIDR08 | PIDR07 | PIDR06 | PIDR05 | PIDR04 | PIDR03 | PIDR02 | PIDR01 | PIDR00 |
| Value after reset: | x      | x      | x      | x      | x      | x      | x      | x      | x      | x      | x      | x      | x      | x      | x      | x      |

x: Undefined

| Bit        | Symbol | Bit name                | Description   | R/W |
|------------|--------|-------------------------|---|-----|
| b15 to b0  | PIDRn  | Pmn State               | 0: Low level<br>1: High level.                              | R   |
| b31 to b16 | EIDRn  | Port Event Input Data*1 | When an ELC_PORTx occurs:<br>0: Low input<br>1: High input. | R   |

m = 0 to 8

n = 00 to 15

x = 1 to 4

Note 1. Supported for PORT1 to PORT4.

The Port Control Register 2 (PCNTR2/EIDR/PIDR) allows read access to the Pmn state and port event input data using 32-bit or 16-bit access.

The PCNTR2 specifies the Pmn state and port event input data, and is accessed in 32-bit units. The PIDRn (bits [15:0] in PCNTR2) and EIDRn (bits [31:16] in PCNTR2) respectively, are accessed in 16-bit units. Bits associated with non-existent pins are reserved. Reserved bits are read as undefined.

The PIDRn bits reflect individual pin states of the port, regardless of the values set in PmnPFS.PMR and PORTm.PCNTR1.PDRn. The PIDRn bit in the PORTm.PCNTR2 register serves the same function as the PIDR bit in the PFS.PmnPFS register.

A pin state cannot be reflected in PIDRn when one of the following functions is enabled:

- Main clock oscillator (MOSC)
- CS area controller (CSC)
- Analog function (ASEL = 1)
- Capacitive Touch Sensing Unit (CTSU)
- USB 2.0 Full-Speed (USBFS) module.

The EIDRn bits latch a pin state when an ELC\_PORTx signal occurs. Pin states can only be input to EIDRn when PmnPFS.PMR and PORTm.PCNTR1.PDRn are 0. When the PmnPFS.ASEL bit is set to 1, the associated pin state is not reflected in EIDRn.

### 20.2.3 Port Control Register 3 (PCNTR3/PORR/POSR)

Address(es): PORT0.PCNTR3 4004 0008h, PORT1.PCNTR3 4004 0028h, PORT2.PCNTR3 4004 0048h, PORT3.PCNTR3 4004 0068h, PORT4.PCNTR3 4004 0088h, PORT5.PCNTR3 4004 00A8h, PORT6.PCNTR3 4004 00C8h, PORT7.PCNTR3 4004 00E8h, PORT8.PCNTR3 4004 0108h

m = 0 to 8

n = 00 to 15

The Port Control Register 3 (PCNTR3/PORR/POSR) is a 32-bit and 16-bit write register that controls the setting or resetting of the port output data.

The PCNTR3 controls the setting or resetting of the port output data, and is accessed in 32-bit units. The POSRn (bits [15:0] in PCNTR3) and PORRn (bits [31:16] in PCNTR3) respectively, are accessed in 16-bit units.

POSR changes PODR when set by a software write. For example, for P100, when PORT1.PCNTR3.POSR00 is 1, PORT1.PCNTR1.PODR00 outputs 1. Bits associated with non-existent pins are reserved. The write value should always be 0. P200 is input only, so PORT2.PCNTR3.POSR00 is reserved.

PORR changes PODR when reset by a software write. For example, for P100, when PORT1.PCNTR3.PORR00 is 1, PORT1.PCNTR1.PODR00 outputs 0. Bits associated with non-existent pins are reserved. The write value should always be 0. P200 is input only, so PORT2.PCNTR3.PORR00 is reserved.

Note: When EORRn or EOSRn is set, writing is prohibited to PODRn, PORRn, and POSRn.

Note: PORRn and POSRn should not be set at the same time.

## 20.2.4 Port Control Register 4 (PCNTR4/EORR/EOSR)

| Bit        | Symbol | Bit name               | Description  | R/W |
|------------|--------|------------------------|--|-----|
| b15 to b0  | EOSRn  | Pmn Event Output Set   | When an ELC_PORTx occurs:<br>0: No effect on output<br>1: High output. | R/W |
| b31 to b16 | EORRn  | Pmn Event Output Reset | When an ELC_PORTx occurs:<br>0: No effect on output<br>1: Low output.  | R/W |

m = 1 to 4

n = 00 to 15

x = 1 to 4

The Port Control Register 4 (PCNTR4/EORR/EOSR) is a 32-bit and 16-bit read/write register that controls the setting or resetting of the port output data by an event input from the ELC.

The PCNTR4 controls the setting or resetting of the port output data by an event input from the ELC, and is accessed in 32-bit units. The EOSRn (bits [15:0] in PCNTR4) and EORRn (bits [31:16] in PCNTR4) respectively, are accessed in 16-bit units.

EOSR changes PODR when set because an ELC\_PORTx signal occurs. For example, for P100, if PORT1.PCNTR4.EOSR00 is set to 1 when the ELC\_PORTx occurs, PORT1.PCNTR1.PODR00 outputs 1. Bits associated with non-existent pins are reserved. The write value must always be 0. P200 is input only, so PORT2.PCNTR4.EOSR00 is reserved.

EORR changes PODR when reset because an ELC\_PORTx signal occurs. For example, for P100, if PORT1.PCNTR4.EORR00 is set to 1 when the ELC\_PORTx occurs, PORT1.PCNTR1.PODR00 outputs 0. Bits associated with non-existent pins are reserved. The write value must always be 0. P200 is input only, so PORT2.PCNTR4.EORR00 is reserved.

Note: When EORRn or EOSRn is set, writing is prohibited to PODRn, PORRn, and POSRn.

Note: EORRn and EOSRn should not be set at the same time.

## 20.2.5 Port mn Pin Function Select Register (PmnPFS/PmnPFS\_HA/PmnPFS\_BY) (m = 0 to 8; n = 00 to 15)

| b28 to b24 | PSEL[4:0] | Peripheral Select | These bits select the peripheral function. For individual pin functions, see the associated tables in this chapter. | R/W |
| b31 to b29 | —         | Reserved          | These bits are read as 0. The write value should be 0.  | R/W |

Note: P010PFS to P013PFS, P507PFS, P509PFS, P510PFS, P606PFS, P607PFS, P706PFS, and P707PFS for 32-bit, 16-bit, and 8-bit access are not available.

Note 1. Supported for PORT1 to PORT4.

Note 2. The initial value of P000 to P007, P108, P109, P110, P201 and P300 is not 0000\_0000h.

P000 to P007 is 0000\_8000h, P108 is 0001\_0410h, P109 is 0001\_0400h, P110 is 0001\_0010h, P201 is 0000\_0010h, and P300 is 0001\_0010h.

The Port mn Pin Function Select register (PmnPFS/PmnPFS\_HA/PmnPFS\_BY) is a 32-bit, 16-bit, and 8-bit read/write control register that selects the port mn pin function, and is accessed in 32-bit units. PmnPFS\_HA (bits [15:0] in PmnPFS) is accessed in 16-bit units. PmnPFS\_BY (bits [7:0]) is accessed in 8-bit units.

The PDR/PIDR/PODR bits serve the same function as the PCNTR. When these bits are read, the PCNTR value is read.

The PCR bit enables or disables an input pull-up resistor on the individual port pins. When a pin is in the input state with the associated bit in PmnPFS.PCR set to 1, the pull-up resistor connected to the pin is enabled. When a pin is set as an external bus pin, a general port output pin, or a peripheral function output pin, the pull-up resistor for the pin is disabled regardless of the PCR setting. The pull-up resistor is also disabled in the reset state. Bits associated with non-existent pins are reserved. The write value should be 0.

The NCODR bit specifies the output type for the port pins. Bits associated with non-existent pins are reserved. The write value should be 0.

The DSCR bit switches the drive capacity of the port. If the drive capacity of a pin is fixed, the associated bit is a read/write bit, but the drive capacity cannot be changed. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

The EOR and EOF bits select the edge detection method for the port group input signal. These bits support rising, falling, or both edge detections. When the EOR and EOF bits are set to 01b, 10b, or 11b, the input enable of the I/O cell is asserted. Following that, the event pulse is input from the external pin, and the GPIO outputs the event pulse to the ELC. Bits associated with non-existent pins are reserved. The write value should be 0.

The ISEL bit specifies IRQ input pins. This setting can be used in combination with the peripheral functions, although an IRQn (external pin interrupt) of the same number must only be enabled for one pin.

The ASEL bit specifies analog pins. When a pin is set as an analog pin by this bit:

1. Specify it as a general I/O port with the Port Mode Control bit (PmnPFS.PMR).
2. Disable the pull-up resistor with the Pull-up Control bit (PmnPFS.PCR).
3. Specify the input in the Port Direction bit (PmnPFS.PDR). The pin state cannot be read at this point. The PmnPFS register is protected by the Write-Protect Register (PWPR). Release write-protect before modifying the register.

The ISEL bit for an unspecified IRQn is reserved. The ASEL bit for an unspecified analog input/output pin is reserved.

The PMR bit specifies the port pin function. Bits associated with non-existent pins are reserved. The write value should be 0.

The PSEL[4:0] bits assign the peripheral function.

For details on the peripheral settings for each product, see [section 20.6, Peripheral Select Settings for each Product](#).

## 20.2.6 Write-Protect Register (PWPR)

Address(es): [PMISC.PWPR 4004 0D03h](#)

| b7   | b6    | b5 | b4 | b3 | b2 | b1 | b0 |
|------|-------|----|----|----|----|----|----|
| B0WI | PFSWE | —  | —  | —  | —  | —  | —  |

Value after reset: 1 0 0 0 0 0 0 0

| Bit      | Symbol                | Bit name                     | Description  | R/W |
|----------|-----------------------|------------------------------|--|-----|
| b5 to b0 | —                     | Reserved                     | These bits are read as 0. The write value should be 0.   | R/W |
| b6       | <a href="#">PFSWE</a> | PmnPFS Register Write Enable | 0: Writing to the PmnPFS register is disabled<br>1: Writing to the PmnPFS register is enabled. | R/W |
| b7       | <a href="#">B0WI</a>  | PFSWE Bit Write Disable      | 0: Writing to the PFSWE bit is enabled<br>1: Writing to the PFSWE bit is disabled.             | R/W |

### [PFSWE bit \(PmnPFS Register Write Enable\)](#)

Writing to the PmnPFS register is enabled only when the PFSWE bit is set to 1. You must first write 0 to the B0WI bit before setting PFSWE to 1.

### [B0WI bit \(PFSWE Bit Write Disable\)](#)

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

## 20.2.7 Ethernet Control Register (PFENET)

Address(es): [PMISC.PFENET 4004 0D00h](#)

| b7 | b6 | b5 | b4       | b3 | b2 | b1 | b0 |
|----|----|----|----------|----|----|----|----|
| —  | —  | —  | PHYMODE0 | —  | —  | —  | —  |

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol                   | Bit name                  | Description  | R/W |
|----------|--------------------------|---------------------------|--|-----|
| b3 to b0 | —                        | Reserved                  | These bits are read as 0. The write value should be 0.             | R/W |
| b4       | <a href="#">PHYMODE0</a> | Ethernet Mode Setting ch0 | 0: RMII mode (ETHERC channel 0)<br>1: MII mode (ETHERC channel 0). | R/W |
| b7 to b5 | —                        | Reserved                  | These bits are read as 0. The write value should be 0.             | R/W |

### [PHYMODE0 bit \(Ethernet Mode Setting ch0\)](#)

The PHYMODE0 bit specifies the PHY mode of ETHERC channel 0. Select the same mode as that specified in the pin function select bits (PmnPFS.PSEL[4:0]). When the signals for the RMII mode are specified in the PmnPFS.PSEL[4:0] bits, set the PHYMODE bit to 0 (RMII mode). When the signals for the MII mode are specified in the PmnPFS.PSEL[4:0] bits, set the PHYMODE bit to 1 (MII mode).

## 20.3 Operation

### 20.3.1 General I/O Ports

All pins except P000 to P007, P108 to P110, and P300 operate as general I/O ports after reset. General I/O ports are organized as 16 bits per port and can be accessed by port with the Port Control Registers (PCNTRn, where n = 1 to 4), or by individual pins with the Port mn Pin Function Select register. For details on these registers, see [section 20, Register Descriptions](#).

Each port has the following bits:

- Port Direction bit (PDR<sub>n</sub>), which selects input or output direction
- Port Output Data bit (PODR<sub>n</sub>), which holds data for output
- Port Input Data bit (PIDR<sub>n</sub>), which indicates the pin state
- Event Input Data bit (EIDR<sub>n</sub>), which indicates the pin state when an ELC\_PORT1, 2, 3, or 4 signal occurs
- Port Output Set bit (POSR<sub>n</sub>), which indicates the output value when a software write occurs
- Port Output Reset bit (PORR<sub>n</sub>), which indicates the output value when a software write occurs
- Event Output Set bit (EOSR<sub>n</sub>), which indicates the output value when an ELC\_PORT1, 2, 3 or 4 signal occurs
- Event Output Reset bit (EORR<sub>n</sub>), which indicates the output value when an ELC\_PORT1, 2, 3 or 4 signal occurs.

### 20.3.2 Port Function Select

The following port functions are available for configuring each pin:

- I/O configuration: Complementary or open-drain output, pull-up control, and drive strength
- General I/O port: Port direction, output data setting, and reading input data
- Alternate function: Configured function mapping to the pin.

Each pin is associated with a Port *mn* Pin Function Select register (PmnPFS), which includes the associated PODR, PIDR, and PDR bits. In addition, the PmnPFS register includes:

- PCR: Pull-up resistor control bit that turns the input pull-up MOS on or off
- NCODR: N-channel open-drain control bit that selects the output type for each pin
- DSCR: Drive capacity control bit that selects the drive capacity
- EOR: Event on rising bit used to detect rising edges on the port input
- EOF: Event on falling bit used to detect falling edges on the port input
- ISEL: IRQ input enable bit to specify an IRQ input pin
- ASEL: Analog input enable bit to specify an analog pin
- PMR: Port mode control bit to specify the pin function of each port
- PSEL[4:0]: Port function select bits to select the associated peripheral function.

These configurations can be made by a single-register access to the Port *mn* Pin Function Select register. For details, see [section 20, Port \*mn\* Pin Function Select Register \(PmnPFS/PmnPFS\\_HA/PmnPFS\\_BY\) \(m = 0 to 8; n = 00 to 15\)](#).

### 20.3.3 Port Group Function for the ELC

In the MCU, PORT1 to PORT4 are assigned for the port group function.

#### 20.3.3.1 Behavior when ELC\_PORT1, 2, 3, or 4 is input from the ELC

The MCU supports the two functions described in this section when an ELC\_PORT1, 2, 3, or 4 signal comes from the ELC.

##### (1) Input to EIDR

For the GPI function (PDR = 0 and PMR = 0 in the PmnPFS register), when an ELC\_PORT1, 2, 3, or 4 signal comes from the ELC, the input enable of the I/O cell is asserted, and data from the external pins are read into the EIDR bit.

For the GPO function (PDR = 1) or the peripheral mode (PMR = 1), 0 is input into the EIDR bit from the external pins.

**Figure 20.2** Event ports input data

## (2) Output from PODR by EOSR/EORR

When an ELC\_PORT1, 2, 3, or 4 signal occurs, the data is output from the PODR to the external pin based on the EOSR/EORR bit settings as follows:

- If EOSR is set to 1, when ELC\_PORT1, 2, 3, or 4 signal occurs, the PODR register outputs 1 to the external pin. Otherwise, when EOSR = 0, the PODR value is kept.
- If EORR is set to 1, when ELC\_PORT1, 2, 3, or 4 signal occurs, the PODR register outputs 0 to the external pin. Otherwise, when EORR = 0, the PODR value is kept.

See [Figure 20.3](#).

**Figure 20.3** Event ports output data

### 20.3.3.2 Behavior when an event pulse is output to the ELC

To output the event pulse from the external pins to the ELC, set the EOR/EOF bits in the PmnPFS register. For details, see [section 20.2.5, Port mn Pin Function Select Register \(PmnPFS/PmnPFS\\_HA/PmnPFS\\_BY\) \(m = 0 to 8; n = 00 to 15\)](#). When the EOR/EOF bits are set, the input enable of the I/O cell is asserted.

Data from the external pin is the input. For example, for PORT1, when the data is input from P100 to P115, the data of those 16 pins is organized by OR logic. This data is formed into a one-shot pulse that goes to the ELC. The operation of PORT2 to PORT4 is the same. See [Figure 20.4](#).

Figure 20.4 Generation of event pulse

### 20.4 Handling of Unused Pins

Table 20.3 shows how to handle unused pins.

Table 20.3 Handling of unused pins

| Pin name      | Handling when unused   |
|---------------|--|
| MD            | Use as a mode pin  |
| RES           | Connect to VCC through a resistor (pulling up)   |
| USB_DP        | Keep pin open  |
| USB_DM        | Keep pin open  |
| P200/NMI      | Connect to VCC through a resistor (pulling up)   |
| EXTAL         | When the main clock oscillator is not used, set the MOSCCR.MOSTP bit to 1 (general port P212).<br>When this pin is not used as port P212, configure it in the same way as ports 1 to 8.  |
| XTAL          | When the main clock oscillator is not used, set the MOSCCR.MOSTP bit to 1 (general port P213).<br>When the external clock is input to the EXTAL pin, the XTAL pin functions as P213.<br>When this pin is not used as port P213, configure it in the same way as ports 1 to 8.                                  |
| XCIN          | Connect to VSS through a resistor (pulling down)   |
| XCOUT         | Keep pin open  |
| P000 to P009  | <ul style="list-style-type: none"> <li>• If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to AVCC0 (pulled up) through a resistor or to AVSS0 (pulled down) through a resistor*1</li> <li>• If the direction is set to output (PCNTR1.PDRn = 1), release the pin*1.</li> </ul>   |
| P1x to P8x    | <ul style="list-style-type: none"> <li>• If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to VCC (pulled up) through a resistor or to VSS (pulled down) through a resistor*1,*2</li> <li>• If the direction is set to output (PCNTR1.PDRn = 1), release the pin*1,*3.</li> </ul> |
| VREFH0, VREFH | Connect to AVCC0   |
| VREFL0, VREFL | Connect to AVSS0   |
| VBATT         | Connect to VCC or VSS  |

Note 1. Clear the PmnPFS.PMR, PmnPFS.ISEL, PmnPFS.PCR, and PmnPFS.ASEL bits to 0.

Note 2. P108, P110, and P300 are recommended for pull up VCC (pulled up) through a resistor, because these pins are input pull-up enabled from the initial value (PmnPFS.PCR=1).

Note 3. P109 is recommended for setting the direction to output (PCNTR1.PDRn = 1), because this pin is output from the initial value.

## 20.5 Usage Notes

### 20.5.1 Procedure for Specifying the Pin Functions

To specify the I/O pin functions:

1. Clear the B0WI bit in the PWPR register. This enables writing to the PFSWE bit in the PWPR register.
2. Set 1 to the PFSWE bit in the PWPR register. This enables writing to the PmnPFS register.
3. Clear the Port Mode Control bit in the PMR for the target pin to select the general I/O port.
4. Specify the I/O function for the pin through the PSEL[4:0] bit settings in the PmnPFS register.
5. Set the PMR bit to 1 as required to switch to the selected I/O function for the pin.
6. Clear the PFSWE bit in the PWPR register. This disables writing to the PmnPFS register.
7. Set 1 to the B0WI bit in the PWPR register. This disables writing to the PFSWE bit in the PWPR register.

### 20.5.2 Procedure for Using Port Group Input

To use the port group input (PORT1 to PORT4):

1. Set the ELSRx.ELS[8:0] bits to 0000 0000b to ignore unexpected pulses. For more information, see [section 19, Event Link Controller \(ELC\)](#).
2. Set the EOF/EOR bit of the PmnPFS register to specify the rising, falling, or both edge detections.
3. Execute a dummy read or wait for a short time, for example 100 ns. Ignoring of unexpected pulses depends on the initial value of the external pin.
4. Set the ELSRx.ELS[8:0] bits to enable the event signals.

### 20.5.3 Port Output Data Register (PODR) Summary

This register outputs data as follows:

1. Output 0 if PCNTR4.EORRn is set to 1 when an ELC\_PORT1, 2, 3, or 4 signal occurs.
2. Output 1 if PCNTR4.EOSRn is set to 1 when an ELC\_PORT1, 2, 3, or 4 signal occurs.
3. Output 0 if PCNTR3.PORRn is set to 1.
4. Output 1 if PCNTR3.POSRn is set to 1.
5. Output 0 or 1 because PCNTR1.PODRn is set.
6. Output 0 or 1 because PmnPFS.PODRn is set.

Numbers in this list correspond to the priority for writing to the PODR. For example, if **1.** and **3.** from the list occur at the same time, the higher priority event **1.** is executed.

### 20.5.4 Notes on Using Analog Functions

To use an analog function, set the Port Mode Control bit (PMR) and Port Direction bit (PDR) to 0 so that the pin acts as a general input port. Next, set the Analog Input Enable bit (ASEL) in the Port mn Pin Function Select register (PmnPFS.ASEL) to 1.

### 20.5.5 I/O Buffer Specification

P402, P403, and P404 can be used as the RTC input, AGT input, and other peripheral functions.

[Table 20.4](#) lists the P402, P403, P404 specifications.

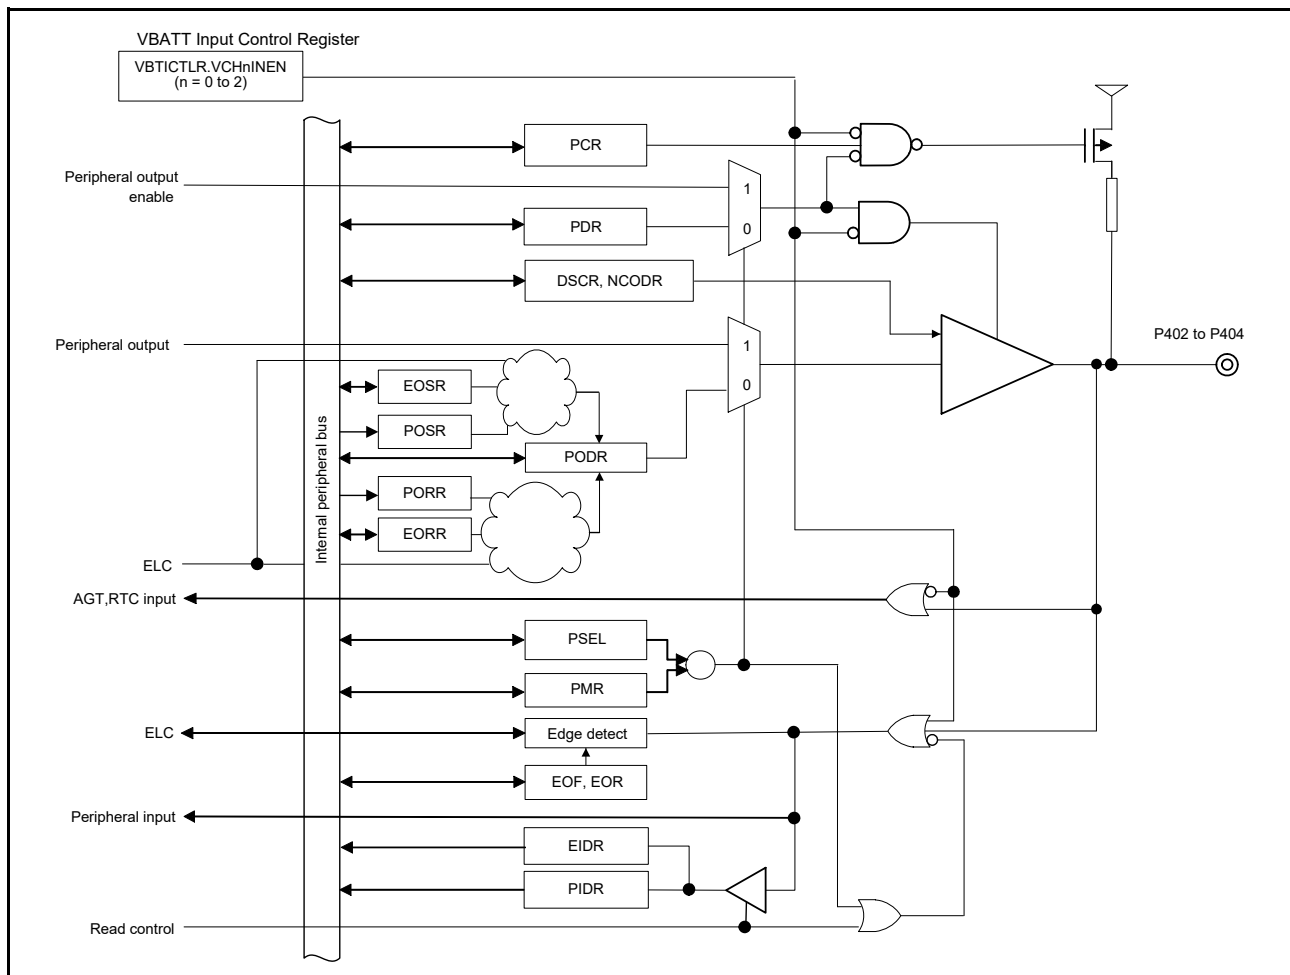

**Table 20.4 P402, P403, P404 specifications**

| I/O port | Functions                         |        |                  |                                  |  |
|----------|-----------------------------------|--------|------------------|----------------------------------|--|
|          | RTC and AGT                       |        |                  | Other peripheral                 |  |
|          | RTC and AGT input enable register | RTC    | AGT              | Other peripheral enable register | CAC, GPT, CAN, SCI, SSIE, ETHERC (MII), ETHERC (RMII), SDHI, Interrupt, and PDC                  |
| P402     | VBTICTLR.VCH0INEN                 | RTCIC0 | AGTIO0<br>AGTIO1 | P402PFS.PSEL and PMR             | For details, see <a href="#">Table 20.13</a><br>Register settings for I/O pin functions on PORT4 |
| P403     | VBTICTLR.VCH1INEN                 | RTCIC1 | AGTIO0<br>AGTIO1 | P403PFS.PSEL and PMR             |  |
| P404     | VBTICTLR.VCH2INEN                 | RTCIC2 | —                | P404PFS.PSEL and PMR             |  |

These RTC and AGT inputs are controlled by the VBTICTLR register, which has the highest priority for selecting the RTC and AGT input functions. See [Figure 20.5](#).

The VBTICTLR register is not initialized on reset. Therefore, when not using the RTC or AGT inputs, the associated bit of the VBTICTLR register must be set to 0 after reset.

For more information on the VBTICTLR register, see [section 12.2.2, VBATT Input Control Register \(VBTICTLR\)](#).

**Figure 20.5 P402, P403, P404 diagram**

## 20.6 Peripheral Select Settings for each Product

This section describes the pin function select configuration by the PmnPFS register. Some pin names have added \_A, \_B, and \_C suffixes. When assigning IIC, SPI, SSIE, ETHERC, and SDHI functionality, select the functional pins having the same suffix. The other pins can be selected regardless of the suffix. Assigning the same function to two or more pins simultaneously is prohibited.

## 20.7 Notes on the PmnPFS Register Setting

(1) In the Port mn Pin Function Select register (PmnPFS), the PSEL bits must be set when the PMR bit of the target pin is 0. If the PSEL bits are set when the PMR bit is 1, unexpected edges might be input for the input function or unexpected pulses might be output to the external pin for the output function.

(2) Only the allowed values (functions) should be specified in the PSEL bits of PmnPFS. If a value that is not allowed for the register is specified, the correct operation is not guaranteed.

(3) A single function should not be assigned to multiple pins by the PmnPFS register.

(4) PORT0 and PORT5 have the analog functions such as A/D converter and D/A converter. When these pins are used as an analog function, to avoid loss of resolution, the PMR and PDR bits should be set to 0. After that, the ASEL bit should be set to 1.

**Table 20.5 Register settings for I/O pin functions (PORT0)**

| PSEL[4:0] settings         | Function               | Pin              |                  |                  |       |                  |                  |                  |       |

—: Setting prohibited

Note 1. Renesas recommends using pins that have a letter appended to their names, for instance “\_A” or “\_B”, to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.

Note 2. There are two types of output buffer, middle drive and high drive. Renesas recommends using the same drive buffer for output skew spec ( $t_{GTISK}$ ).

Note 1. Renesas recommends using pins that have a letter appended to their names, for instance “\_A” or “\_B”, to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.

Note 2. There are two types of output buffer, middle drive and high drive. Renesas recommends using the same drive buffer for output skew spec ( $t_{GTISK}$ ).

Note 1. Renesas recommends using pins that have a letter appended to their names, for instance “\_A” or “\_B”, to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.

Note 2. There are two types of output buffer, middle drive and high drive. Renesas recommends using the same drive buffer for output skew spec ( $t_{GTISK}$ ).

Note 1. To use this pin function, set the associated pin as a general input (set the PmnPFS.PDR and PmnPFS.PMR bits to 0).

Note 2. Renesas recommends using pins that have a letter appended to their names, for instance “\_A” or “\_B”, to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.

Note 3. There are two types of output buffer, middle drive and high drive. Renesas recommends using the same drive buffer for output skew spec ( $t_{GTSK}$ ).

Note 1. Renesas recommends using pins that have a letter appended to their names, for instance “\_A” or “\_B”, to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.

Note 2. There are two types of output buffer, middle drive and high drive. Renesas recommends using the same drive buffer for output skew spec ( $t_{GTISK}$ ).

Note 1. Renesas recommends using pins that have a letter appended to their names, for instance “\_A” or “\_B”, to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.

Note 2. There are two types of output buffer, middle drive and high drive. Renesas recommends using the same drive buffer for output skew spec ( $t_{GTISK}$ ).

## 21. Key Interrupt Function (KINT)

### 21.1 Overview

A key interrupt (KEY\_INTKR) can be generated by setting the Key Return Mode Register (KRM) and inputting a rising or falling edge on the key interrupt input pins, KR00 to KR07.

Table 21.1 shows the pin assignment for key interrupt detection, Table 21.2 shows the function configuration, and Figure 21.1 shows a block diagram.

**Table 21.1 Assignment of key interrupt detection pins**

| Key Interrupt Mode Control n (n = 0 to 7) | Description                         |
|---|-------------------------------------|
| KRM0                                      | Controls KR00 signal in 1-bit units |
| KRM1                                      | Controls KR01 signal in 1-bit units |
| KRM2                                      | Controls KR02 signal in 1-bit units |
| KRM3                                      | Controls KR03 signal in 1-bit units |
| KRM4                                      | Controls KR04 signal in 1-bit units |
| KRM5                                      | Controls KR05 signal in 1-bit units |
| KRM6                                      | Controls KR06 signal in 1-bit units |
| KRM7                                      | Controls KR07 signal in 1-bit units |

**Table 21.2 Configuration of key interrupt function**

| Parameter         | Configuration   |
|-------------------|---|
| Input             | KR00 to KR07  |
| Control registers | Key Return Control Register (KRCTL)<br>Key Return Mode Register (KRM)<br>Key Return Flag Register (KRF) |

**Figure 21.1 Key interrupt block diagram**

Note: In Figure 21.1, all key return factors are merged by an OR gate, and the key interrupt (KEY\_INTKR) is the output of the AND gate to mask the merged key return factor by the KEY\_INTKR mask signal. When using KRFn (KRMD = 1), the KEY\_INTKR mask signal is used as the output mask that is asserted by clearing KRFn.

## 21.2 Register Descriptions

### 21.2.1 Key Return Control Register (KRCTL)

Address(es): [KINT.KRCTL 4008 0000h](#)

|      |    |    |    |    |    |    |      |
|------|----|----|----|----|----|----|------|
| b7   | b6 | b5 | b4 | b3 | b2 | b1 | b0   |
| KRMD | —  | —  | —  | —  | —  | —  | KREG |

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol               | Bit name                                    | Description  | R/W |
|----------|----------------------|---|--|-----|
| b0       | <a href="#">KREG</a> | Detection Edge Selection (KR00 to KR07)     | 0: Falling edge<br>1: Rising edge.                               | R/W |
| b6 to b1 | —                    | Reserved                                    | These bits are read as 0. The write value should be 0.           | R/W |
| b7       | <a href="#">KRMD</a> | Usage of Key Interrupt Flags (KRF0 to KRF7) | 0: Do not use key interrupt flags<br>1: Use key interrupt flags. | R/W |

The KRCTL register controls the usage of the key interrupt flags, KRF0 to KRF7, and sets the detection edge.

### 21.2.2 Key Return Flag Register (KRF)

Address(es): [KINT.KRF 4008 0004h](#)

|      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|
| b7   | b6   | b5   | b4   | b3   | b2   | b1   | b0   |
| KRF7 | KRF6 | KRF5 | KRF4 | KRF3 | KRF2 | KRF1 | KRF0 |

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol | Bit name             | Description  | R/W |
|----------|--------|----------------------|--|-----|
| b7 to b0 | KRFn   | Key Interrupt Flag n | 0: No key interrupt detected<br>1: Key interrupt detected. | R/W |

n = 0 to 7

Note: When KRMD = 0, setting the KRFn bit to 1 is prohibited.  
When setting the KRFn bit to 1, the KRFn value does not change. To clear the KRFn bit, confirm the target bit is 1 before writing 0 to the bit, then write 1 to the other bits.

The KRF register controls the key interrupt flags, KRF0 to KRF7.

### 21.2.3 Key Return Mode Register (KRM)

Address(es): [KINT.KRM 4008 0008h](#)

|      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|
| b7   | b6   | b5   | b4   | b3   | b2   | b1   | b0   |
| KRM7 | KRM6 | KRM5 | KRM4 | KRM3 | KRM2 | KRM1 | KRM0 |

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol | Bit name                     | Description  | R/W |
|----------|--------|------------------------------|--|-----|
| b7 to b0 | KRMn   | Key Interrupt Mode Control n | 0: No key interrupt signal detected<br>1: Key interrupt signal detected. | R/W |

n = 0 to 7

Note: The on-chip pull-up resistors can be applied by setting the pull-up function for the associated key interrupt input pin. For more information, see [section 20, I/O Ports](#).  
 Key interrupts can be assigned in the PmnPFS.PSEL bits. For more information, see [section 20, I/O Ports](#).  
 An interrupt is generated when the target bit in the KRM register is set while a low level (KREG = 0) or a high level (KREG = 1) is being input to the key interrupt input pin. To ignore this interrupt, set the KRM register after disabling the interrupt handling.

The KRM register sets the key interrupt mode.

### 21.3 Operation

#### 21.3.1 Operation When Not Using Key Interrupt Flag (KRMD = 0)

A key interrupt (KEY\_INTKR) is generated when the valid edge specified in the KREG bit is input to a key interrupt pin, KR00 to KR07. To identify the channel to which the valid edge is input, read the port register and check the port level after the key interrupt (KEY\_INTKR) is generated.

The KEY\_INTKR signal changes based on the input level of the key interrupt input pin, KR00 to KR07.

**Figure 21.2** Operation of KEY\_INTKR signal when a key interrupt is input to a single channel

Figure 21.3 shows the operation when a valid edge is input to multiple key interrupt input pins. The KEY\_INTKR signal is set while a low level is being input to one pin (when KREG = 0). Therefore, even if a falling edge is input to another pin in this period, a key interrupt (KEY\_INTKR) is not generated again. See [1] in Figure 21.3.

**Figure 21.3** Operation of KEY\_INTKR signal when key interrupts are input to multiple channels

#### 21.3.2 Operation When Using the Key Interrupt Flags (KRMD = 1)

A key interrupt (KEY\_INTKR) is generated when the valid edge specified in the KREG bit is input to a key interrupt pin, KR00 to KR07. To identify the channels to which the valid edge is input, read the Key Return Flag Register (KRF) after the key interrupt (KEY\_INTKR) is generated. If the KRMD bit is set to 1, clear the KEY\_INTKR signal by clearing the associated bit in the KRF register.

As [Figure 21.4](#) shows, only one interrupt is generated each time a falling edge is input to one channel, that is, when  $KREG = 0$ , regardless of whether the  $KRFn$  bit is cleared before or after a rising edge is input.

**Figure 21.4 Basic operation of KEY\_INTKR signal when key interrupt flag is used**

The operation when a valid edge is input to multiple key interrupt input pins is shown in [Figure 21.5](#). A falling edge is also input to the KR01 and KR05 pins after a falling edge is input to the KR00 pin (when  $KREG = 0$ ). The  $KRF1$  bit is set when the  $KRF0$  bit is cleared. A key interrupt is generated 1 PCLKB clock cycle, after the  $KRF0$  bit is cleared. See [1] in [Figure 21.5](#).

Also, after a falling edge is input to the KR05 pin, the  $KRF5$  bit is set. The  $KRF1$  bit is cleared at time [2] in the figure. A key interrupt is generated 1 PCLKB clock cycle, after the  $KRF1$  bit is cleared. See [3] in the figure. It is therefore possible to generate a key interrupt when a valid edge is input to multiple channels.

Figure 21.5 Operation of KEY\_INTKR signal when key interrupts are input to multiple channels

### 21.4 Usage Notes

- If KEY\_INTKR is used as the Snooze request, the KRMD bit must be set to 0.
- If KEY\_INTKR is used as the interrupt source for returning to Normal mode from Snooze mode and Software Standby mode, the KRMD bit must be set to 1.
- When the Key Interrupt function (KINT) is assigned to a pin, this pin input is always enabled in Software Standby mode, and if the pin level changes, the associated KRFn flag can be set. Therefore, a key interrupt might occur on canceling Software Standby mode.

To ignore changes to the key interrupt pin during a software standby, clear the associated KRM bit before entering Software Standby mode. After canceling Software Standby mode, you must clear KRFn before the associated KRM bit can be set.

## 22. Port Output Enable for GPT (POEG)

### 22.1 Overview

Use the Port Output Enable for GPT (POEG) function to place the General PWM Timer (GPT) output pins in the output-disable state in one of the following ways:

- Input level detection of the GTETR<sub>Gn</sub> (n = A, B, C, D) pins
- Output-disable request from the GPT
- Comparator interrupt request detection
- Oscillation stop detection of the clock generation circuit
- Register settings.

The GTETR<sub>Gn</sub> (n = A, B, C, D) pins can also be used as GPT external trigger input pins.

Table 22.1 lists the POEG specifications, Figure 22.1 shows a block diagram, and Table 22.2 lists the input pins.

**Table 22.1 POEG specifications**

| Parameter  | Specifications  |
|--|---|
| Output-disable control through input level detection   | The GPT output pins can be disabled when a GTETR <sub>Gn</sub> rising edge or high level is sampled after polarity and filter selection   |
| Output-disable request from the GPT  | <ul style="list-style-type: none"> <li>• When the GTIOCA pin and the GTIOCB pin are driven to an active level simultaneously, the GPT generates an output-disable request to the POEG. Through reception of these requests, the POEG can control whether the GTIOCA and GTIOCB pins are output-disabled.</li> <li>• GPT output pins can be set to be disabled when the GPT output pins detect a dead time error.</li> </ul> |
| Output-disable control through comparator (ACMPHS) interrupt detection   | The GPT output pins can be disabled when an interrupt request is generated by a change in the output results of any of the comparators  |
| Output-disable control through oscillation stop detection  | The GPT output pins can be disabled when oscillation of the clock generation circuit stops  |
| Output-disable control by software (registers)   | The GPT output pins can be disabled by modifying the register settings  |
| Interrupts   | <ul style="list-style-type: none"> <li>• Allows output-disable control by the input level detection</li> <li>• Allows output-disable requests from the GPT or ACMPHS.</li> </ul>  |
| External trigger output to the GPT (count start, count stop, count clear, up-count, down-count, or input capture function) | The GTETR <sub>Gn</sub> signals can be output to the GPT after polarity and filter selection  |
| Noise filtering  | <ul style="list-style-type: none"> <li>• Three times sampling for every PCLKB/1, PCLKB/8, PCLKB/32, or PCLKB/128 can be set for any of the input pins GTETR<sub>Gn</sub></li> <li>• Positive or negative polarity can be selected for any of the input pins, GTETR<sub>Gn</sub></li> <li>• Signal state after polarity and filter selection can be monitored.</li> </ul>  |

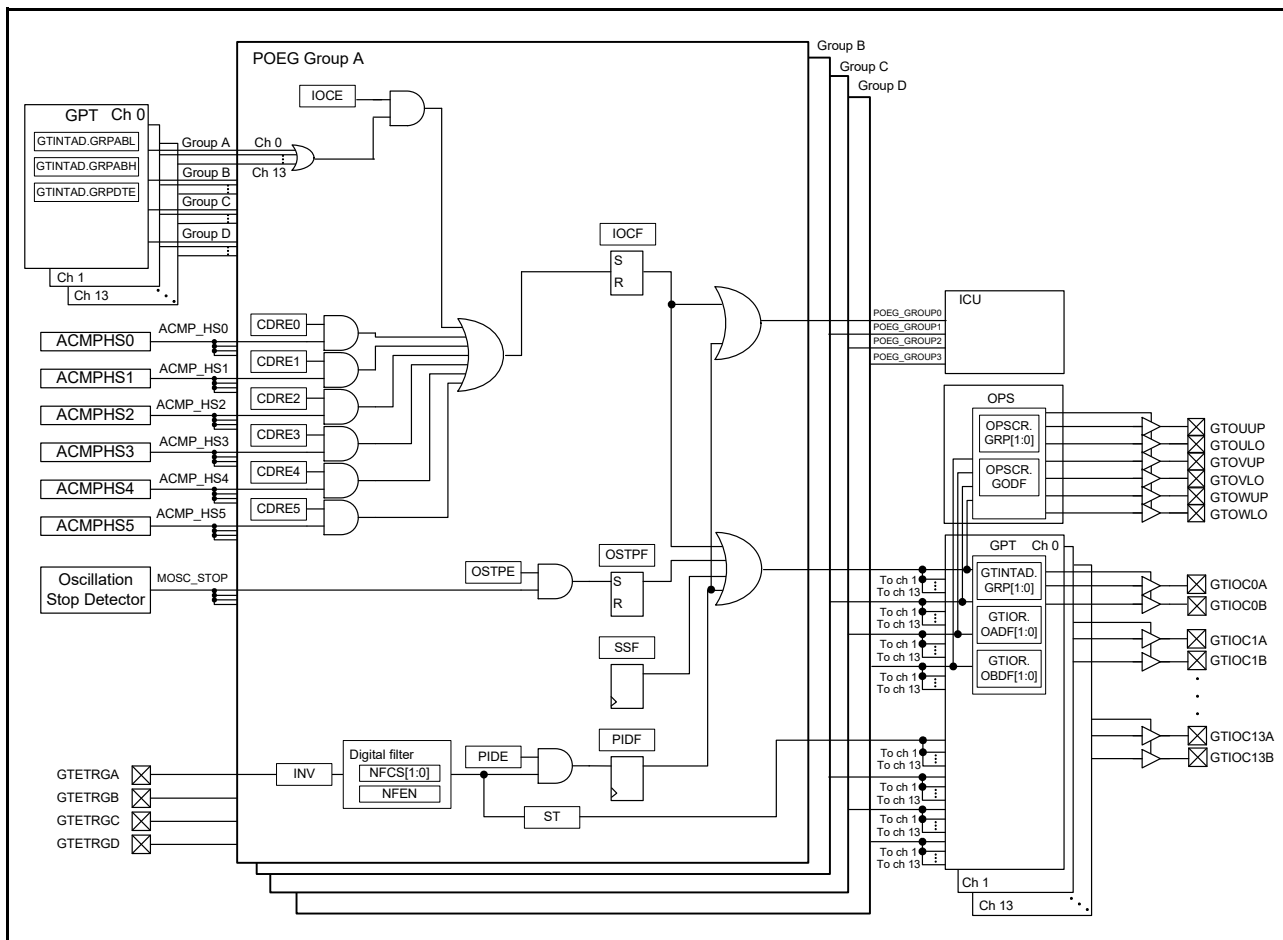

Figure 22.1 POEG block diagram

Table 22.2 POEG input pins

| Pin name | I/O   | Description   |
|----------|-------|---|
| GTETRGA  | Input | GPT output pin output-disable request signal and GPT external trigger input pin A |
| GTETRGB  | Input | GPT output pin output-disable request signal and GPT external trigger input pin B |
| GTETRGC  | Input | GPT output pin output-disable request signal and GPT external trigger input pin C |
| GTETRGD  | Input | GPT output pin output-disable request signal and GPT external trigger input pin D |

| b31, b30 | NFCS[1:0] | Noise Filter Clock Select | b1 b0<br>0 0: GTETR <sub>Gn</sub> pin input level sampled three times every PCLKB<br>0 1: GTETR <sub>Gn</sub> pin input level sampled three times every PCLKB/8<br>1 0: GTETR <sub>Gn</sub> pin input level sampled three times every PCLKB/32<br>1 1: GTETR <sub>Gn</sub> pin input level sampled three times every PCLKB/128. | R/W |

Note 1. Only 0 can be written to clear the flag.

Note 2. Can be modified only once after a reset.

The POEGGA to POEGGD registers control the output-disable state of the GPT pins, interrupts, and the external trigger input to the GPT. In the descriptions, POEGG<sub>n</sub> represents all of the POEGGA to POEGGD registers.

## 22.3 Output-Disable Control Operation

If any of the following conditions is satisfied, the GTIOC<sub>x</sub>A, GTIOC<sub>x</sub>B, and the 3-phase PWM output for BLDC motor control pins can be set to output-disable:

- Input level or edge detection of the GTETR<sub>Gn</sub> pins  
When POEGG<sub>n</sub>.PIDE is 1, the POEGG<sub>n</sub>.PIDF flag is set to 1.
- Output-disable request from the GPT  
When POEGG<sub>n</sub>.IOCE is 1, the POEGG<sub>n</sub>.IOCF flag is set to 1 if the disable request is enabled in the GTINTAD register. The GTINTAD.GRPDTE, GTINTAD.GRPABH, and GTINTAD.GRPABL settings apply to the group selected in the GPT registers GTINTAD.GRP[1:0] and OPSCR.GRP[1:0].
- Comparator (ACMPHS) interrupt request detection  
Comparator interrupt detection is activated when any of the POEGG<sub>n</sub>.CDRE[5:0] registers is 1. When the associated comparator interrupt is generated, the GPT output pins are disabled. POEGG<sub>n</sub>.IOCF indicates the detection status.
- Oscillation stop detection for the clock generation circuit  
When POEGG<sub>n</sub>.OSTPE is 1, the POEGG<sub>n</sub>.OSTPF flag is set to 1.
- SSF bit setting  
When POEGG<sub>n</sub>.SSF is set to 1, the PWM output is disabled.

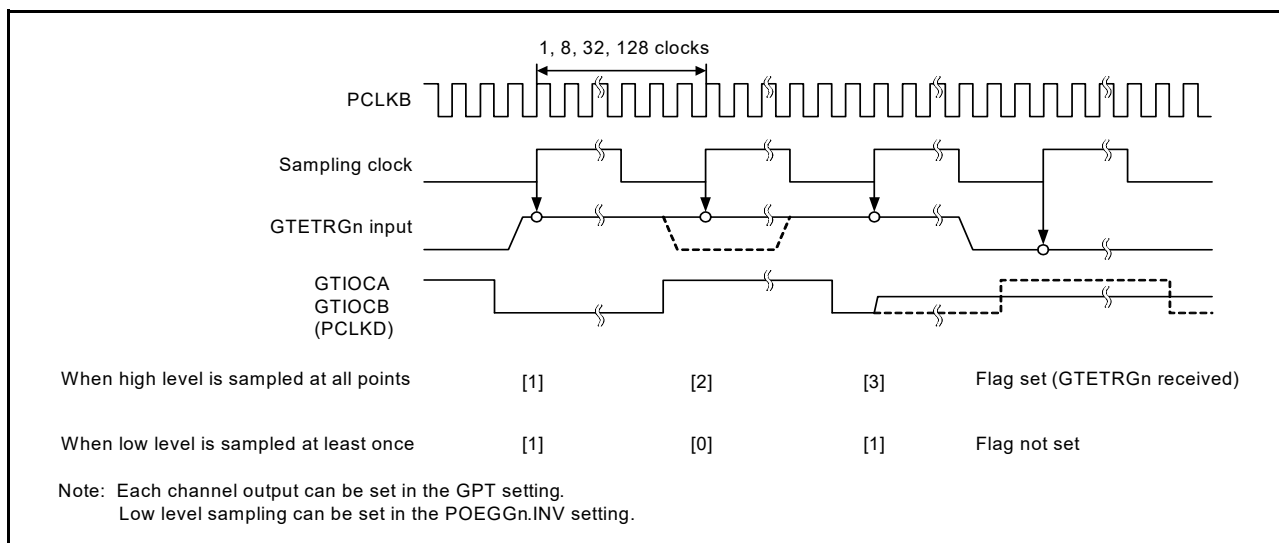

The output-disable state is controlled in the GPT. The output-disable of the GTIOC<sub>x</sub>A and GTIOC<sub>x</sub>B pins is set in the GTINTAD.GRP[1:0], GTIOR.OADF[1:0], and GTIOR.OBDF[1:0] bits in GPT<sub>x</sub>. The output-disable of the 3-phase PWM output for the BLDC motor control pins is set in the OPSCR.GRP[1:0] bits and OPSCR.GODF bit in GPT\_ OPS.

### 22.3.1 Pin Input Level Detection Operation

If the input conditions set in POEGG<sub>n</sub>.PIDE, POEGG<sub>n</sub>.NFCS[1:0], POEGG<sub>n</sub>.NFEN, and POEGG<sub>n</sub>.INV occur on the GTETR<sub>Gn</sub> pins, the GPT output pins are output-disabled.

#### 22.3.1.1 Digital filter

Figure 22.2 shows high level detection by the digital filter. When a high level associated with the POEGG<sub>n</sub>.INV polarity setting is detected three times consecutively with the sampling clock selected in POEGG<sub>n</sub>.NFCS[1:0] and POEGG<sub>n</sub>.NFEN, the detected level is recognized as high, and the GPT output pins are output-disabled. If even one low level is detected during this interval, the detected level is not recognized as high. In addition, in an interval where the sampling clock is not being output, changes of the levels on the GTETR<sub>Gn</sub> pins are ignored.

**Figure 22.2** Example of digital filter operation

### 22.3.2 Output-Disable Requests from the GPT

For details on this operation, see the description of GTIOC Pin Output Negate Control in [section 23, General PWM Timer \(GPT\)](#).

### 22.3.3 Comparator Interrupt Detection

If POEGn.CDRE[5:0] is 1 when the associated comparator interrupt request is generated, the GPT output pins are output-disabled for each group. The status flag is POEGn.IOCF, which is shared with GPT output-disable detection.

### 22.3.4 Output-Disable Control Using Detection of Stopped Oscillation

When the oscillation stop detection function in the clock generation circuit detects stopped oscillation while POEGn.OSTPE is 1, the GPT output pins are output-disabled for each group.

### 22.3.5 Output-Disable Control Using Registers

The GPT output pins can be directly controlled by writing to the Software Stop flag, POEGn.SSF.

### 22.3.6 Release from Output-Disable

To release the GPT output pins placed in the output-disable state, either return them to their initial state with a reset or clear all of the following flags:

- POEGn.PIDF
- POEGn.IOCF
- POEGn.OSTPF
- POEGn.SSF.

Writing 0 to the POEGn.PIDF flag is ignored (the flag is not cleared) if the external input pins, GTETRn, are not disabled and the POEGn.ST bit is not set to 0.

Writing 0 to the POEGn.IOCF flag is valid (the flag is cleared) only if all of the GTST.DTEF, GTST.OABHF, and GTST.OABLF flags in the GPT are set to 0.

Writing 0 to the POEGn.OSTPF flag is ignored (the flag is not cleared) if the OSTDSR.OSTDF flag in the clock generation circuit is not set to 0. In addition, when the flag set and release occur at the same time, the flag set takes precedence.

[Figure 22.3](#) shows the release timing for output-disable. The output-disable is released at the beginning of the next count cycle of the GPT after the flag is cleared.

Figure 22.3 Output-disable release timing for the GPT pin outputs

### 22.4 Interrupt Sources

The POEG generates an interrupt request when triggered by these sources:

- Output-disable control by the input level detection
- Output-disable request from the GPT
- Comparator interrupt request detection.

Table 22.3 lists the conditions for interrupt requests.

Table 22.3 Interrupt sources and conditions

| Interrupt source       | Symbol      | Associated flag | Trigger conditions   |
|------------------------|-------------|-----------------|--|
| POEG group A interrupt | POEG_GROUP0 | POEGGA.IOCF     | An output-disable request from a GPT disable request occurred  |
|                        |             |                 | An output-disable request from a comparator interrupt occurred |
|                        |             | POEGGA.PIDF     | An output-disable request from the GTETRGA pin occurred        |
| POEG group B interrupt | POEG_GROUP1 | POEGGB.IOCF     | An output-disable request from a GPT disable request occurred  |
|                        |             |                 | An output-disable request from a comparator interrupt occurred |
|                        |             | POEGGB.PIDF     | An output-disable request from the GTETRGB pin occurred        |
| POEG group C interrupt | POEG_GROUP2 | POEGGC.IOCF     | An output-disable request from a GPT disable request occurred  |
|                        |             |                 | An output-disable request from a comparator interrupt occurred |
|                        |             | POEGGC.PIDF     | An output-disable request from the GTETRGC pin occurred        |
| POEG group D interrupt | POEG_GROUP3 | POEGGD.IOCF     | An output-disable request from a GPT disable request occurred  |
|                        |             |                 | An output-disable request from a comparator interrupt occurred |
|                        |             | POEGGD.PIDF     | An output-disable request from the GTETRGD pin occurred        |

## 22.5 External Trigger Output to the GPT

The POEG outputs the GTETR<sub>Gn</sub> signals as the GPT operation trigger signal for the following:

- Count start
- Count stop
- Count clear
- Up-count
- Down-count
- Input capture.

For the POEG<sub>Gn</sub>.INV polarity setting signal, when the same level is input three times continuously with the sampling clock selected in POEG<sub>Gn</sub>.NFCS[1:0] and POEG<sub>Gn</sub>.NFEN, that value is output. Set the control registers the same as for the input level detection operation described in [section 22.3.1, Pin Input Level Detection Operation](#). The state after filtering can be monitored in POEG<sub>Gn</sub>.ST.

Figure 22.4 shows the output timing of an external trigger to the GPT.

Figure 22.4 Output timing of external trigger to GPT

## 22.6 Usage Notes

### 22.6.1 Transition to Software Standby Mode

When using the POEG, do not invoke Software Standby mode. In this mode, the POEG stops and therefore output-disable of the pins cannot be controlled.

### 22.6.2 Specifying Pins Associated with the GPT

The POEG controls output-disable only when a pin is associated with the GPT in the PmnPFS.PMR and PmnPFS.PSEL settings. When the pin is specified as a general I/O pin, the POEG does not perform output-disable control.

## 23. General PWM Timer (GPT)

### 23.1 Overview

The General PWM Timer (GPT) is a 32-bit timer with four GPT32EH channels, four GPT32E channels, and six GPT32 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. The GPT can also be used as a general-purpose timer.

Table 23.1 lists the GPT specifications, Table 23.2 shows the GPT functions, Figure 23.1 shows a block diagram, Figure 23.2 shows the correspondence between the GPT channels and module names, and Table 23.3 lists the I/O pins.

**Table 23.1 GPT specifications**

| Parameter | Specifications  |
|-----------|---|
| Functions | <ul style="list-style-type: none"> <li>• 32 bits × 14 channels</li> <li>• Up-counting or down-counting (saw waves) or up/down-counting (triangle waves) for each counter</li> <li>• Clock sources independently selectable for each channel</li> <li>• Two I/O pins per channel</li> <li>• Two output compare/input capture registers per channel</li> <li>• For the two output compare/input capture registers of each channel, four registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use</li> <li>• In output compare operation, buffer switching can be at crests or troughs, enabling the generation of laterally asymmetric PWM waveforms</li> <li>• Registers for setting up frame cycles in each channel with capability for generating interrupts at overflow or underflow</li> <li>• Generation of dead times in PWM operation</li> <li>• Synchronous starting, stopping, and clearing counters for arbitrary channels</li> <li>• Starting, stopping, and clearing up/down counters in response to a maximum of eight ELC events</li> <li>• Starting, stopping, and clearing up/down counters in response to input level comparison</li> <li>• Starting, stopping, and clearing up/down counters in response to a maximum of four external triggers</li> <li>• Output pin disable function by dead time error and detected short-circuits between output pins</li> <li>• A/D converter start triggers can be generated</li> <li>• PWM waveform for controlling brushless DC motors can be generated</li> <li>• Compare match A to F event, overflow/underflow event, and input UVW edge event can be output to the ELC</li> <li>• Enables the noise filter for input capture and input UVW</li> <li>• Bus clock: PCLKA</li> <li>• Core clock: PCLKD</li> <li>• Frequency ratio: PCLKA:PCLKD = 1:N (N = 1/2/4/8/16/32/64).</li> </ul> |

**Table 23.2 GPT functions (2 of 2)**

| Parameter                           | GPT32EH, GPT32E  | GPT32  |           |
|-------------------------------------|--|--|-----------|
| External trigger input pin*1        | GTETRGA<br>GTETRGB<br>GTETRGC<br>GTETRGD   | GTETRGA<br>GTETRGB<br>GTETRGC<br>GTETRGD   |           |
| Counter clear sources               | GTPR register compare match, input capture, input pin status, ELC event input, and GTETR Gn (n = A, B, C, D) pin input   | GTPR register compare match, input capture, input pin status, ELC event input, and GTETR Gn (n = A, B, C, D) pin input   |           |
| Compare match output                | Low output   | Available  | Available |
|                                     | High output  | Available  | Available |
|                                     | Toggle output  | Available  | Available |
| Input capture function              | Available  | Available  |           |
| Automatic addition of dead time     | Available  | Available<br>(no dead time buffer)   |           |
| PWM mode                            | Available  | Available  |           |
| Phase count function                | Available  | Available  |           |
| Buffer operation                    | Double buffer  | Double buffer  |           |
| One-shot operation                  | Available  | Available  |           |
| DTC activation                      | All the interrupt sources  | All the interrupt sources  |           |
| A/D converter start trigger         | Compare match of GTADTRA or GTADTRB  | -  |           |
| Brushless DC motor control function | Available  | Available  |           |
| Interrupt sources                   | 10 sources <ul style="list-style-type: none"> <li>• GTCCRA compare match/input capture (GPTn_CCMPA)</li> <li>• GTCCRB compare match/input capture (GPTn_CCMPB)</li> <li>• GTCCRC compare match (GPTn_CMPC)</li> <li>• GTCCRD compare match (GPTn_CMPD)</li> <li>• GTCCRE compare match (GPTn_CMPCE)</li> <li>• GTCCRF compare match (GPTn_CMPF)</li> <li>• GTADTRA compare match (GPTn_ADTRGA)</li> <li>• GTADTRB compare match (GPTn_ADTRGB)</li> <li>• GTCNT overflow (GTPR compare match) (GPTn_OVF)</li> <li>• GTCNT underflow (GPTn_UDF)</li> </ul> | 8 sources <ul style="list-style-type: none"> <li>• GTCCRA compare match/input capture (GPTn_CCMPA)</li> <li>• GTCCRB compare match/input capture (GPTn_CCMPB)</li> <li>• GTCCRC compare match (GPTn_CMPC)</li> <li>• GTCCRD compare match (GPTn_CMPD)</li> <li>• GTCCRE compare match (GPTn_CMPE)</li> <li>• GTCCRF compare match (GPTn_CMPF)</li> <li>• GTCNT overflow (GTPR compare match) (GPTn_OVF)</li> <li>• GTCNT underflow (GPTn_UDF)</li> </ul> |           |
| Interrupt skipping function         | Skips GTCNT overflows (GTPR compare match) (GPTn_OVF)/ GTCNT underflow (GPTn_UDF) interrupts (with interlocking function for other interrupts or A/D conversion requests).   | -  |           |
| Event linking (ELC) function        | Available  | Available  |           |
| Noise filtering function            | Available  | Available  |           |

Note 1. GTRETRGn connects to GPT through the POEG module. Therefore, to use the GPT function, supply the POEG clock by clearing the MSTPD14 bit.

Figure 23.2 shows an example using multiple GPTs.

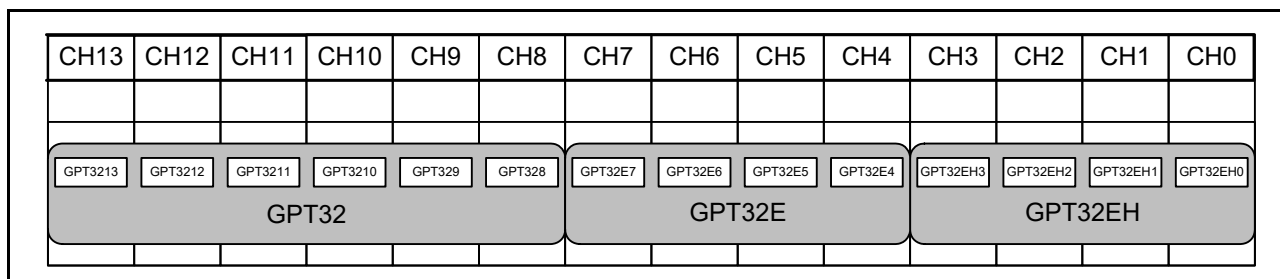

Figure 23.2 Correspondence between GPT channels and module names

Table 23.3 GPT I/O pins (1 of 2)

| Channel  | Pin name | I/O   | Function   |
|----------|----------|-------|--|
| Shared   | GTETRGA  | Input | External trigger input pin A (after noise filtering)                     |
|          | GTETRGB  | Input | External trigger input pin B (after noise filtering)                     |
|          | GTETRGC  | Input | External trigger input pin C (after noise filtering)                     |
|          | GTETRGD  | Input | External trigger input pin D (after noise filtering)                     |
| GPT32EH0 | GTIOC0A  | I/O   | GTCCRA register input capture input/output compare output/PWM output pin |
|          | GTIOC0B  | I/O   | GTCCRB register input capture input/output compare output/PWM output pin |
| GPT32EH1 | GTIOC1A  | I/O   | GTCCRA register input capture input/output compare output/PWM output pin |
|          | GTIOC1B  | I/O   | GTCCRB register input capture input/output compare output/PWM output pin |
| GPT32EH2 | GTIOC2A  | I/O   | GTCCRA register input capture input/output compare output/PWM output pin |
|          | GTIOC2B  | I/O   | GTCCRB register input capture input/output compare output/PWM output pin |
| GPT32EH3 | GTIOC3A  | I/O   | GTCCRA register input capture input/output compare output/PWM output pin |
|          | GTIOC3B  | I/O   | GTCCRB register input capture input/output compare output/PWM output pin |
| GPT32E4  | GTIOC4A  | I/O   | GTCCRA register input capture input/output compare output/PWM output pin |
|          | GTIOC4B  | I/O   | GTCCRB register input capture input/output compare output/PWM output pin |
| GPT32E5  | GTIOC5A  | I/O   | GTCCRA register input capture input/output compare output/PWM output pin |
|          | GTIOC5B  | I/O   | GTCCRB register input capture input/output compare output/PWM output pin |
| GPT32E6  | GTIOC6A  | I/O   | GTCCRA register input capture input/output compare output/PWM output pin |
|          | GTIOC6B  | I/O   | GTCCRB register input capture input/output compare output/PWM output pin |
| GPT32E7  | GTIOC7A  | I/O   | GTCCRA register input capture input/output compare output/PWM output pin |
|          | GTIOC7B  | I/O   | GTCCRB register input capture input/output compare output/PWM output pin |
| GPT328   | GTIOC8A  | I/O   | GTCCRA register input capture input/output compare output/PWM output pin |
|          | GTIOC8B  | I/O   | GTCCRB register input capture input/output compare output/PWM output pin |
| GPT329   | GTIOC9A  | I/O   | GTCCRA register input capture input/output compare output/PWM output pin |
|          | GTIOC9B  | I/O   | GTCCRB register input capture input/output compare output/PWM output pin |
| GPT3210  | GTIOC10A | I/O   | GTCCRA register input capture input/output compare output/PWM output pin |
|          | GTIOC10B | I/O   | GTCCRB register input capture input/output compare output/PWM output pin |
| GPT3211  | GTIOC11A | I/O   | GTCCRA register input capture input/output compare output/PWM output pin |
|          | GTIOC11B | I/O   | GTCCRB register input capture input/output compare output/PWM output pin |
| GPT3212  | GTIOC12A | I/O   | GTCCRA register input capture input/output compare output/PWM output pin |
|          | GTIOC12B | I/O   | GTCCRB register input capture input/output compare output/PWM output pin |
| GPT3213  | GTIOC13A | I/O   | GTCCRA register input capture input/output compare output/PWM output pin |
|          | GTIOC13B | I/O   | GTCCRB register input capture input/output compare output/PWM output pin |

**Table 23.3 GPT I/O pins (2 of 2)**

| Channel | Pin name | I/O    | Function   |
|---------|----------|--------|--|
| GPT_OPS | GTIU     | Input  | Hall sensor input pin U                                      |
|         | GTIV     | Input  | Hall sensor input pin V                                      |
|         | GTIW     | Input  | Hall sensor input pin W                                      |
|         | GTOUUP   | Output | 3-phase PWM output for BLDC motor control (positive U-phase) |
|         | GTOULO   | Output | 3-phase PWM output for BLDC motor control (negative U-phase) |
|         | GTOVUP   | Output | 3-phase PWM output for BLDC motor control (positive V-phase) |
|         | GTOVLO   | Output | 3-phase PWM output for BLDC motor control (negative V-phase) |
|         | GTOWUP   | Output | 3-phase PWM output for BLDC motor control (positive W-phase) |
|         | GTOWLO   | Output | 3-phase PWM output for BLDC motor control (negative W-phase) |

## 23.2 Register Descriptions

Table 23.4 lists the registers in the GPT.

**Table 23.4 GPT registers (1 of 2)**

| Module symbol  | Register name   | Register symbol | Reset value            | Address (m = 0 to 13)  | Access size | GPT32EH/<br>GPT32E | GPT32 |
|--|---|-----------------|------------------------|------------------------|-------------|--------------------|-------|
| GPT32EHm<br>(m = 0 to 3)<br>GPT32Em<br>(m = 4 to 7)<br>GPT32m<br>(m = 8 to 13) | General PWM Timer Write Protection Register   | GTWP            | 0000_0000h             | 4007 8000h + 0100h × m | 32          | ✓                  | ✓     |
|  | General PWM Timer Software Start Register   | GTSTR           | 0000_0000h             | 4007 8004h + 0100h × m | 32          | ✓                  | ✓     |
|  | General PWM Timer Software Stop Register  | GTSTP           | FFFF_FFFFh             | 4007 8008h + 0100h × m | 32          | ✓                  | ✓     |
|  | General PWM Timer Software Clear Register   | GTCLR           | 0000_0000h             | 4007 800Ch + 0100h × m | 32          | ✓                  | ✓     |
|  | General PWM Timer Start Source Select Register  | GTSSR           | 0000_0000h             | 4007 8010h + 0100h × m | 32          | ✓                  | ✓     |
|  | General PWM Timer Stop Source Select Register   | GTPSR           | 0000_0000h             | 4007 8014h + 0100h × m | 32          | ✓                  | ✓     |
|  | General PWM Timer Clear Source Select Register  | GTCSR           | 0000_0000h             | 4007 8018h + 0100h × m | 32          | ✓                  | ✓     |
|  | General PWM Timer Up Count Source Select Register                                     | GTUPSR          | 0000_0000h             | 4007 801Ch + 0100h × m | 32          | ✓                  | ✓     |
|  | General PWM Timer Down Count Source Select Register                                   | GTDNSR          | 0000_0000h             | 4007 8020h + 0100h × m | 32          | ✓                  | ✓     |
|  | General PWM Timer Input Capture Source Select Register A                              | GTICASR         | 0000_0000h             | 4007 8024h + 0100h × m | 32          | ✓                  | ✓     |
|  | General PWM Timer Input Capture Source Select Register B                              | GTICBSR         | 0000_0000h             | 4007 8028h + 0100h × m | 32          | ✓                  | ✓     |
|  | General PWM Timer Control Register  | GTCR            | 0000_0000h             | 4007 802Ch + 0100h × m | 32          | ✓                  | ✓     |
|  | General PWM Timer Count Direction and Duty Setting Register                           | GTUDDTYC        | 0000_0001h             | 4007 8030h + 0100h × m | 32          | ✓                  | ✓     |
|  | General PWM Timer I/O Control Register  | GTIOR           | 0000_0000h             | 4007 8034h + 0100h × m | 32          | ✓                  | ✓     |
|  | General PWM Timer Interrupt Output Setting Register                                   | GTINTAD         | 0000_0000h             | 4007 8038h + 0100h × m | 32          | ✓                  | (✓)*1 |
|  | General PWM Timer Status Register   | GTST            | 0000_8000h             | 4007 803Ch + 0100h × m | 32          | ✓                  | (✓)*1 |
| General PWM Timer Buffer Enable Register                                       | GTBER   | 0000_0000h      | 4007 8040h + 0100h × m | 32                     | ✓           | (✓)*1              |       |
| GPT32EHm<br>(m = 0 to 3)<br>GPT32Em<br>(m = 4 to 7)                            | General PWM Timer Interrupt and A/D Converter Start Request Skipping Setting Register | GTITC           | 0000_0000h             | 4007 8044h + 0100h × m | 32          | ✓                  | -     |

Table 23.4 GPT registers (2 of 2)

| Module symbol  | Register name   | Register symbol | Reset value | Address (m = 0 to 13)  | Access size | GPT32EH/<br>GPT32E | GPT32 |
|--|---|-----------------|-------------|------------------------|-------------|--------------------|-------|
| GPT32EHm<br>(m = 0 to 3)<br>GPT32Em<br>(m = 4 to 7)<br>GPT32m<br>(m = 8 to 13) | General PWM Timer Counter   | GTCNT           | 0000_0000h  | 4007 8048h + 0100h × m | 32          | ✓                  | ✓     |

Note 1. Some functions are reduced from GPT32EH/GPT32E.

### 23.2.1 General PWM Timer Write-Protection Register (GTWP)

Address(es): GPT32EHm.GTWP 4007 8000h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTWP 4007 8000h + 0100h × m (m = 4 to 7)  
 GPT32m.GTWP 4007 8000h + 0100h × m (m = 8 to 13)

| Bit        | Symbol     | Bit name               | Description  | R/W |
|------------|------------|------------------------|--|-----|
| b0         | WP         | Register Write Disable | 0: Write to the register enabled<br>1: Write to the register disabled.                           | R/W |
| b7 to b1   | —          | Reserved               | These bits are read as 0. The write value should be 0.   | R/W |
| b15 to b8  | PRKEY[7:0] | GTWP Key Code          | When A5h is written to these bits, writing to the WP bit is permitted. These bits are read as 0. | R/W |
| b31 to b16 | —          | Reserved               | These bits are read as 0. The write value should be 0.   | R/W |

To prevent accidental changes, the GTWP register enables or disables writing to following registers:

GTSSR, GTPSR, GTCSSR, GTUPSR, GTDNSR, GTICASSR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTITC, GTCNT, GTCORA, GTCORB, GTCORC, GTCORD, GTCORE, GTCORF, GTPR, GTPBR, GTPDBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTDVD, GTDBU, GTDBD, GTSOS, GTSOTR.

### 23.2.2 General PWM Timer Software Start Register (GTSTR)

Address(es): GPT32EHm.GTSTR 4007 8004h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTSTR 4007 8004h + 0100h × m (m = 4 to 7)  
 GPT32m.GTSTR 4007 8004h + 0100h × m (m = 8 to 13)

The GTSTR starts the GTCNT counter operation for each channel n, where n = 0 to 13.

The GTSTR bit number represents the channel number. The GTSTR register is shared by all of the channels. The GTCNT counter starts for the channel associated with the GTSTR bit where 1 is written. Writing 0 has no effect on the status of the GTCNT counter and the value of GTSTR register. For the association between the GTSTR bit number and a channel number, see [Figure 23.2](#).

#### CSTRTn bit (Channel n GTCNT Count Start) (n = 0 to 13)

The CSTRTn bit starts channel n of the GTCNT counter operation. Writing to the GTSTR.CSTRTn bit (n = 0 to 13) has no effect unless the GPTm.GTSSR.CSTRT bit is set to 1 (for GPT32EH, m = EH0 to EH3, for GPT32E, m = E4 to E7, for GPT32, m = 8 to 13).

Read data shows the counter status of each channel (GTCR.CST bit). Zero means the counter is stopped and 1 means the

counter is running.

### 23.2.3 General PWM Timer Software Stop Register (GTSTP)

Address(es): GPT32EHm.GTSTP 4007 8008h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTSTP 4007 8008h + 0100h × m (m = 4 to 7)  
 GPT32m.GTSTP 4007 8008h + 0100h × m (m = 8 to 13)

|                    |     |     |             |             |             |             |            |            |            |            |            |            |            |            |            |            |
|--------------------|-----|-----|-------------|-------------|-------------|-------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
|                    | b31 | b30 | b29         | b28         | b27         | b26         | b25        | b24        | b23        | b22        | b21        | b20        | b19        | b18        | b17        | b16        |
|                    | —   | —   | —           | —           | —           | —           | —          | —          | —          | —          | —          | —          | —          | —          | —          | —          |
| Value after reset: | 1   | 1   | 1           | 1           | 1           | 1           | 1          | 1          | 1          | 1          | 1          | 1          | 1          | 1          | 1          | 1          |
|                    | b15 | b14 | b13         | b12         | b11         | b10         | b9         | b8         | b7         | b6         | b5         | b4         | b3         | b2         | b1         | b0         |
|                    | —   | —   | CSTOP<br>13 | CSTOP<br>12 | CSTOP<br>11 | CSTOP<br>10 | CSTOP<br>9 | CSTOP<br>8 | CSTOP<br>7 | CSTOP<br>6 | CSTOP<br>5 | CSTOP<br>4 | CSTOP<br>3 | CSTOP<br>2 | CSTOP<br>1 | CSTOP<br>0 |
| Value after reset: | 1   | 1   | 1           | 1           | 1           | 1           | 1          | 1          | 1          | 1          | 1          | 1          | 1          | 1          | 1          | 1          |

The GTSTP register stops the GTCNT counter operation for each channel n, where n = 0 to 13.

The GTSTP bit number represents the channel number. The GTSTP register is shared by all of the channels. The GTCNT counter stops for the channel associated with the GTSTP bit in which 1 is written. Writing 0 has no effect on the status of GTCNT counter and the value of GTSTP register. For the association between the GTSTP bit number and a channel number, see [Figure 23.2](#).

#### CSTOPn bit (channel n GTCNT Count Stop) (n = 0 to 13)

The CSTOPn bit stops channel n of the GTCNT counter operation. Writing to the GTSTP.CSTOPn bit (n = 0 to 13) has no effect unless the GPTm.GTPSR.CSTOP bit is set to 1 (for GPT32EH, m = EH0 to EH3, for GPT32E, m = E4 to E7, for GPT32, m = 8 to 13).

Read data shows the counter status of each channel (invert of the GTCR.CST bit). Zero means the counter is running and 1 means the counter stops.

### 23.2.4 General PWM Timer Software Clear Register (GTCLR)

Address(es): GPT32EHm.GTCLR 4007 800Ch + 0100h × m (m = 0 to 3)  
 GPT32Em.GTCLR 4007 800Ch + 0100h × m (m = 4 to 7)  
 GPT32m.GTCLR 4007 800Ch + 0100h × m (m = 8 to 13)

|                    |     |     |            |            |            |            |           |           |           |           |           |           |           |           |           |           |
|--------------------|-----|-----|------------|------------|------------|------------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
|                    | b31 | b30 | b29        | b28        | b27        | b26        | b25       | b24       | b23       | b22       | b21       | b20       | b19       | b18       | b17       | b16       |
|                    | —   | —   | —          | —          | —          | —          | —         | —         | —         | —         | —         | —         | —         | —         | —         | —         |
| Value after reset: | 0   | 0   | 0          | 0          | 0          | 0          | 0         | 0         | 0         | 0         | 0         | 0         | 0         | 0         | 0         | 0         |
|                    | b15 | b14 | b13        | b12        | b11        | b10        | b9        | b8        | b7        | b6        | b5        | b4        | b3        | b2        | b1        | b0        |
|                    | —   | —   | CCLR<br>13 | CCLR<br>12 | CCLR<br>11 | CCLR<br>10 | CCLR<br>9 | CCLR<br>8 | CCLR<br>7 | CCLR<br>6 | CCLR<br>5 | CCLR<br>4 | CCLR<br>3 | CCLR<br>2 | CCLR<br>1 | CCLR<br>0 |
| Value after reset: | 0   | 0   | 0          | 0          | 0          | 0          | 0         | 0         | 0         | 0         | 0         | 0         | 0         | 0         | 0         | 0         |

The GTCLR is a write-only register that clears the GTCNT counter operation for each channel n, where n = 0 to 13.

The GTCLR bit number represents the channel number. The GTCLR register is shared by all of the channels. The GTCNT counter is cleared for the channel associated with the GTCLR bit number where 1 is written. Writing 0 has no effect on the status of the GTCNT counter. For the association between the GTCLR bit number and a channel number, see [Figure 23.2](#).

#### CCLRn bit (Channel n GTCNT Count Clear) (n = 0 to 13)

Channel n of the GTCNT counter value is cleared on writing 1 to the CCLRn bit. This bit is read as 0.

### 23.2.5 General PWM Timer Start Source Select Register (GTSSR)

Address(es): GPT32EHm.GTSSR 4007 8010h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTSSR 4007 8010h + 0100h × m (m = 4 to 7)  
 GPT32m.GTSSR 4007 8010h + 0100h × m (m = 8 to 13)

|                    |             |             |             |             |             |             |             |              |              |              |              |              |              |              |              |

The GTSSR sets the source to start the GTCNT counter.

#### **SSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Start Enable)**

The SSGTRGAR bit enables or disables GTCNT counter start on the rising edge of GTETRGA pin input.

#### **SSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Start Enable)**

The SSGTRGAF bit enables or disables GTCNT counter start on the falling edge of GTETRGA pin input.

#### **SSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Start Enable)**

The SSGTRGBR bit enables or disables GTCNT counter start on the rising edge of GTETRGB pin input.

#### **SSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Start Enable)**

The SSGTRGBF bit enables or disables GTCNT counter start on the falling edge of GTETRGB pin input.

#### **SSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Start Enable)**

The SSGTRGCR bit enables or disables GTCNT counter start on the rising edge of GTETRGC pin input.

**SSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Start Enable)**

The SSGTRGCF bit enables or disables GTCNT counter start on the falling edge of GTETRGC pin input.

**SSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Start Enable)**

The SSGTRGDR bit enables or disables GTCNT counter start on the rising edge of GTETRGD pin input.

**SSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Start Enable)**

The SSGTRGDF bit enables or disables GTCNT counter start on the falling edge of GTETRGD pin input.

**SSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Start Enable)**

The SSCARBL bit enables or disables GTCNT counter start on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

**SSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Start Enable)**

The SSCARBH bit enables or disables GTCNT counter start on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

**SSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Start Enable)**

The SSCAFBL bit enables or disables GTCNT counter start on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

**SSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Start Enable)**

The SSCAFBH bit enables or disables GTCNT counter start on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

**SSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Start Enable)**

The SSCBRAL bit enables or disables GTCNT counter start on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

**SSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Start Enable)**

The SSCBRAH bit enables or disables GTCNT counter start on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

**SSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Start Enable)**

The SSCBFAL bit enables or disables GTCNT counter start on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

**SSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Start Enable)**

The SSCBFAH bit enables or disables GTCNT counter start on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

**SSELCm bit (ELC\_GPTm Event Source Counter Start Enable) (m = A to H)**

The SSELCm bit enables or disables GTCNT counter start at the ELC\_GPTm event input.

**CSTRT bit (Software Source Counter Start Enable)**

The CSTRT bit enables or disables GTCNT counter start by the GTSTR register.

| b30 to b24 | —       | Reserved   | These bits are read as 0. The write value should be 0.   | R/W |
| b31        | CSTOP   | Software Source Counter Stop Enable  | 0: Counter stop disabled by the GTSTP register<br>1: Counter stop enabled by the GTSTP register.   | R/W |

The GTPSR sets the source to stop the GTCNT counter.

#### **PSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Stop Enable)**

The PSGTRGAR bit enables or disables GTCNT counter stop on the rising edge of GTETRGA pin input.

#### **PSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Stop Enable)**

The PSGTRGAF bit enables or disables GTCNT counter stop on the falling edge of GTETRGA pin input.

#### **PSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Stop Enable)**

The PSGTRGBR bit enables or disables GTCNT counter stop on the rising edge of GTETRGB pin input.

#### **PSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Stop Enable)**

The PSGTRGBF bit enables or disables GTCNT counter stop on the falling edge of GTETRGB pin input.

#### **PSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Stop Enable)**

The PSGTRGCR bit enables or disables GTCNT counter stop on the rising edge of GTETRGC pin input.

**PSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Stop Enable)**

The PSGTRGCF bit enables or disables GTCNT counter stop on the falling edge of GTETRGC pin input.

**PSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Stop Enable)**

The PSGTRGDR bit enables or disables GTCNT counter stop on the rising edge of GTETRGD pin input.

**PSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Stop Enable)**

The PSGTRGDF bit enables or disables GTCNT counter stop on the falling edge of GTETRGD pin input.

**PSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Stop Enable)**

The PSCARBL bit enables or disables GTCNT counter stop on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

**PSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Stop Enable)**

The PSCARBH bit enables or disables GTCNT counter stop on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

**PSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Stop Enable)**

The PSCAFBL bit enables or disables GTCNT counter stop on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

**PSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Stop Enable)**

The PSCAFBH bit enables or disables GTCNT counter stop on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

**PSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Stop Enable)**

The PSCBRAL bit enables or disables GTCNT counter stop on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

**PSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Stop Enable)**

The PSCBRAH bit enables or disables GTCNT counter stop on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

**PSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Stop Enable)**

The PSCBFAL bit enables or disables GTCNT counter stop on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

**PSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Stop Enable)**

The PSCBFAH bit enables or disables GTCNT counter stop on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

**PSELCm bit (ELC\_GPTm Event Source Counter Stop Enable) (m = A to H)**

The PSELCm bit enables or disables GTCNT counter stop at the ELC\_GPTm event input.

**CSTOP bit (Software Source Counter Stop Enable)**

The CSTOP bit enables or disables GTCNT counter stop by the GTSTP register.

## 23.2.7 General PWM Timer Clear Source Select Register (GTCSR)

Address(es): GPT32EHm.GTCSR 4007 8018h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTCSR 4007 8018h + 0100h × m (m = 4 to 7)  
 GPT32m.GTCSR 4007 8018h + 0100h × m (m = 8 to 13)

The GTCNT sets the source to clear the GTCNT counter.

#### **CSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Clear Enable)**

The CSGTRGAR bit enables or disables GTCNT counter clear on the rising edge of GTETRGA pin input.

#### **CSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Clear Enable)**

The CSGTRGAF bit enables or disables GTCNT counter clear on the falling edge of GTETRGA pin input.

#### **CSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Clear Enable)**

The CSGTRGBR bit enables or disables GTCNT counter clear on the rising edge of GTETRGB pin input.

#### **CSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Clear Enable)**

The CSGTRGBF bit enables or disables GTCNT counter clear on the falling edge of GTETRGB pin input.

#### **CSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Clear Enable)**

The CSGTRGCR bit enables or disables GTCNT counter clear on the rising edge of GTETRGC pin input.

**CSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Clear Enable)**

The CSGTRGCF bit enables or disables GTCNT counter clear on the falling edge of GTETRGC pin input.

**CSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Clear Enable)**

The CSGTRGDR bit enables or disables GTCNT counter clear on the rising edge of GTETRGD pin input.

**CSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Clear Enable)**

The CSGTRGDF bit enables or disables GTCNT counter clear on the falling edge of GTETRGD pin input.

**CSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Clear Enable)**

The CSCARBL bit enables or disables GTCNT counter clear on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

**CSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Clear Enable)**

The CSCARBH bit enables or disables GTCNT counter clear on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

**CSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Clear Enable)**

The CSCAFBL bit enables or disables GTCNT counter clear on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

**CSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Clear Enable)**

The CSCAFBH bit enables or disables GTCNT counter clear on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

**CSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Clear Enable)**

The CSCBRAL bit enables or disables GTCNT counter clear on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

**CSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Clear Enable)**

The CSCBRAH bit enables or disables GTCNT counter clear on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

**CSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Clear Enable)**

The CSCBFAL bit enables or disables GTCNT counter clear on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

**CSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Clear Enable)**

The CSCBFAH bit enables or disables GTCNT counter clear on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

**CSELCm bit (ELC\_GPTm Event Source Counter Clear Enable) (m = A to H)**

The CSELCm bit enables or disables GTCNT counter clear at the ELC\_GPTm event input.

**CCLR bit (Software Source Counter Clear Enable)**

The CCLR bit enables or disables GTCNT counter clear by the GTCLR register.

| b31 to b24 | —       | Reserved   | These bits are read as 0. The write value should be 0.   | R/W |

The GTUPSR register sets the source to count up the GTCNT counter.

When at least 1 bit in the GTUPSR register is set to 1, the GTCNT counter is counted up by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

#### **USGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Up Enable)**

The USGTRGAR bit enables or disables GTCNT counter count up on the rising edge of GTETRGA pin input.

#### **USGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Up Enable)**

The USGTRGAF bit enables or disables GTCNT counter count up on the falling edge of GTETRGA pin input.

#### **USGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Up Enable)**

The USGTRGBR bit enables or disables GTCNT counter count up on the rising edge of GTETRGB pin input.

#### **USGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Up Enable)**

The USGTRGBF bit enables or disables GTCNT counter count up on the falling edge of GTETRGB pin input.

#### **USGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Up Enable)**

The USGTRGCR bit enables or disables GTCNT counter count up on the rising edge of GTETRGC pin input.

**USGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Up Enable)**

The USGTRGCF bit enables or disables GTCNT counter count up on the falling edge of GTETRGC pin input.

**USGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Up Enable)**

The USGTRGDR bit enables or disables GTCNT counter count up on the rising edge of GTETRGD pin input.

**USGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Up Enable)**

The USGTRGDF bit enables or disables GTCNT counter count up on the falling edge of GTETRGD pin input.

**USCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Count Up Enable)**

The USCARBL bit enables or disables GTCNT counter count up on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

**USCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Count Up Enable)**

The USCARBH bit enables or disables GTCNT counter count up on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

**USCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Count Up Enable)**

The USCAFBL bit enables or disables GTCNT counter count up on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

**USCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Count Up Enable)**

The USCAFBH bit enables or disables GTCNT counter count up on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

**USCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Count Up Enable)**

The USCBRAL bit enables or disables GTCNT counter count up on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

**USCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Count Up Enable)**

The USCBRAH bit enables or disables GTCNT counter count up on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

**USCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Count Up Enable)**

The USCBFAL bit enables or disables GTCNT counter count up on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

**USCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Count Up Enable)**

The USCBFAH bit enables or disables GTCNT counter count up on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

**USELCm bit (ELC\_GPTm Event Source Counter Count Up Enable) (m = A to H)**

The USELCm bit enables or disables GTCNT counter count up at the ELC\_GPTm event input.

The GTDNSR register sets the source to count down the GTCNT counter.

When at least 1 bit in the GTDNSR register is set to 1, the GTCNT counter is counted up by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

#### **DSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Down Enable)**

The DSGTRGAR bit enables or disables GTCNT counter count down on the rising edge of GTETRGA pin input.

#### **DSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Down Enable)**

The DSGTRGAF bit enables or disables GTCNT counter count down on the falling edge of GTETRGA pin input.

#### **DSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Down Enable)**

The DSGTRGBR bit enables or disables GTCNT counter count down on the rising edge of GTETRGB pin input.

#### **DSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Down Enable)**

The DSGTRGBF bit enables or disables GTCNT counter count down on the falling edge of GTETRGB pin input.

#### **DSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Down Enable)**

The DSGTRGCR bit enables or disables GTCNT counter count down on the rising edge of GTETRGC pin input.

**DSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Down Enable)**

The DSGTRGCF bit enables or disables GTCNT counter count down on the falling edge of GTETRGC pin input.

**DSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Down Enable)**

The DSGTRGDR bit enables or disables GTCNT counter count down on the rising edge of GTETRGD pin input.

**DSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Down Enable)**

The DSGTRGDF bit enables or disables GTCNT counter count down on the falling edge of GTETRGD pin input.

**DSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Count Down Enable)**

The DSCARBL bit enables or disables GTCNT counter count down on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

**DSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Count Down Enable)**

The DSCARBH bit enables or disables GTCNT counter count down on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

**DSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Count Down Enable)**

The DSCAFBL bit enables or disables GTCNT counter count down on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

**DSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Count Down Enable)**

The DSCAFBH bit enables or disables GTCNT counter count down on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

**DSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Count Down Enable)**

The DSCBRAL bit enables or disables GTCNT counter count down on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

**DSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Count Down Enable)**

The DSCBRAH bit enables or disables GTCNT counter count down on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

**DSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Count Down Enable)**

The DSCBFAL bit enables or disables GTCNT counter count down on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

**DSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Count Down Enable)**

The DSCBFAH bit enables or disables GTCNT counter count down on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

**DSELCm bit (ELC\_GPTm Event Source Counter Count Down Enable) (m = A to H)**

The DSELCm bit enables or disables GTCNT counter count down at the ELC\_GPTm event input.

| b31 to b24 | —       | Reserved  | These bits are read as 0. The write value should be 0.   | R/W |

The GTICASR register sets the source of input capture for GTCCRA.

#### ASGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGAR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGA pin input.

**ASGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRA Input Capture Enable)**

The ASGTRGAF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGA pin input.

**ASGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRA Input Capture Enable)**

The ASGTRGBR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGB pin input.

**ASGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRA Input Capture Enable)**

The ASGTRGBF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGB pin input.

**ASGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRA Input Capture Enable)**

The ASGTRGCR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGC pin input.

**ASGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRA Input Capture Enable)**

The ASGTRGCF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGC pin input.

**ASGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRA Input Capture Enable)**

The ASGTRGDR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGD pin input.

**ASGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRA Input Capture Enable)**

The ASGTRGDF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGD pin input.

**ASCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source GTCCRA Input Capture Enable)**

The ASCARBL bit enables or disables input capture for GTCCRA on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

**ASCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source GTCCRA Input Capture Enable)**

The ASCARBH bit enables or disables input capture for GTCCRA on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

**ASCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source GTCCRA Input Capture Enable)**

The ASCAFBL bit enables or disables input capture for GTCCRA on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

**ASCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source GTCCRA Input Capture Enable)**

The ASCAFBH bit enables or disables input capture for GTCCRA on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

**ASCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source GTCCRA Input Capture Enable)**

The ASCBRAL bit enables or disables input capture for GTCCRA on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

**ASCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source GTCCRA Input Capture Enable)**

The ASCBRAH bit enables or disables input capture for GTCCRA on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

**ASCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source GTCCRA Input Capture Enable)**

The ASCBFAL bit enables or disables input capture for GTCCRA on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

**ASCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source GTCCRA Input Capture Enable)**

The ASCBFAH bit enables or disables input capture for GTCCRA on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

**ASELCm bit (ELC\_GPTm Event Source Counter GTCCRA Input Capture Enable) (m = A to H)**

The ASELCm bit enables or disables input capture for GTCCRA at the ELC\_GPTm event input.

**23.2.11 General PWM Timer Input Capture Source Select Register B (GTICBSR)**

Address(es): GPT32EHm.GTICBSR 4007 8028h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTICBSR 4007 8028h + 0100h × m (m = 4 to 7)  
 GPT32m.GTICBSR 4007 8028h + 0100h × m (m = 8 to 13)

| b23        | BSELCH | ELC_GPTH Event Source<br>GTCCRB Input Capture Enable | 0: GTCCRB input capture disabled at ELC_GPTH event input<br>1: GTCCRB input capture enabled at ELC_GPTH event input. | R/W |
| b31 to b24 | —      | Reserved   | These bits are read as 0. The write value should be 0.   | R/W |

The GTICBSR register sets the source of input capture for GTCCRB.

#### **BSGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRB Input Capture Enable)**

The BSGTRGAR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGA pin input.

#### **BSGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRB Input Capture Enable)**

The BSGTRGAF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGA pin input.

#### **BSGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRB Input Capture Enable)**

The BSGTRGBR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGB pin input.

#### **BSGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRB Input Capture Enable)**

The BSGTRGBF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGB pin input.

#### **BSGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRB Input Capture Enable)**

The BSGTRGCR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGC pin input.

#### **BSGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRB Input Capture Enable)**

The BSGTRGCF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGC pin input.

#### **BSGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRB Input Capture Enable)**

The BSGTRGDR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGD pin input.

#### **BSGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRB Input Capture Enable)**

The BSGTRGDF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGD pin input.

#### **BSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source GTCCRB Input Capture Enable)**

The BSCARBL bit enables or disables input capture for GTCCRB on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

#### **BSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source GTCCRB Input Capture Enable)**

The BSCARBH bit enables or disables input capture for GTCCRB on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

#### **BSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source GTCCRB Input Capture Enable)**

The BSCAFBL bit enables or disables input capture for GTCCRB on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

#### **BSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source GTCCRB Input Capture Enable)**

The BSCAFBH bit enables or disables input capture for GTCCRB on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

#### **BSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source GTCCRB Input Capture Enable)**

The BSCBRAL bit enables or disables input capture for GTCCRB on the rising edge of GTIOCB pin input, when

GTIOCA input is 0.

**BSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source GTCCRB Input Capture Enable)**

The BSCBRAH bit enables or disables input capture for GTCCRB on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

**BSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source GTCCRB Input Capture Enable)**

The BSCBFAL bit enables or disables input capture for GTCCRB on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

**BSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source GTCCRB Input Capture Enable)**

The BSCBFAH bit enables or disables input capture for GTCCRB on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

**BSELCm bit (ELC\_GPTm Event Source Counter GTCCRB Input Capture Enable) (m = A to H)**

The BSELCm bit enables or disables input capture for GTCCRB at the ELC\_GPTm event input.

**23.2.12 General PWM Timer Control Register (GTCR)**

Address(es): GPT32EHm.GTCR 4007 802Ch + 0100h × m (m = 0 to 3)  
 GPT32Em.GTCR 4007 802Ch + 0100h × m (m = 4 to 7)  
 GPT32m.GTCR 4007 802Ch + 0100h × m (m = 8 to 13)

The GTCR register controls GTCNT.

**CST bit (Count Start)**

The CST bit controls the GTCNT counter start and stop.

[Setting conditions]

- The GTSTR value in which the channel number associated with the bit number is set to 1 with the GTSSR.CSTRT bit at 1
- The ELC event input or the GTIOCA/GTIOCB/GTETRGN port input event enabled by GTSSR as the counter start source, occurs
- 1 is written by software directly.

[Clearing conditions]

- GTSTP value in which the channel number associated with the bit number is set to 1 with the GTSSR.CSTOP bit at 1.
- The ELC event input or the GTIOCA/GTIOCB/GTETRGN port input event enabled by GTSSR as the counter stop source, occurs
- 0 is written by software directly.

**MD[2:0] bits (Mode Select)**

The MD[2:0] bits select the GPT operating mode. The MD[2:0] bits must be set while the GTCNT operation is stopped.

**TPCS[2:0] bits (Timer Prescaler Select)**

The TPCS[2:0] bits select the clock for GTCNT. A clock prescaler can be selected independently for each channel. The TPCS[2:0] bits must be set while the GTCNT operation is stopped.

**23.2.13 General PWM Timer Count Direction and Duty Setting Register (GTUDDTYC)**

Address(es): GPT32EHm.GTUDDTYC 4007 8030h + 0100h × m (m = 0 to 3)

x: Don't care

The GTUDDTYC register sets the direction in which GTCNT counts (up-counting or down-counting) and sets the duty of the GTIOCA/GTIOCB pin output.

Count direction:

- In saw-wave mode

When the UD value is set to 0 during up-counting, the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value is set to 1 during down-counting, the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).

When the UD value changes from 1 to 0 with the UDF bit being 0 and while counting is stopped, the counter starts up-counting and the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes GTPR value). When the UD value changes from 0 to 1 with the UDF bit being 0 and while counting stops, the counter starts down-counting and the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).

When the UDF bit is set to 1 while counting stops, the UD bit value is reflected in the count direction when counting starts.

Count direction:

- In triangle-wave mode

When the UD value changes during counting, the count direction does not change. When the UD value changes while the UDF bit is 0 and counting stops, the change is not reflected in the count direction when counting starts.

When the UDF bit is set to 1 while counting stops, the UD value is reflected in the count direction when counting starts.

### UD bit (Count Direction Setting)

The UD bit sets the count direction (up-counting or down-counting.) for GTCNT.

**UDF bit (Forcible Count Direction Setting)**

The UDF bit forcibly sets the count direction when GTCNT starts operation as the UD value. Only write 0 to this bit during counter operation. When 1 is written to UDF while counting stops, return UDF to 0 before counting starts.

Output duty

- In saw-wave mode

When the OADTY/OBDTY value changes during up-counting, the duty is reflected at an overflow (GTCNT = GTPR). When the OADTY/OBDTY value changes during down-counting, the duty is reflected at an underflow (GTCNT = 0).

When the OADTY/OBDTY value changes to 1 with the OADTYF/OBDTYF bit being 0 and while counting stops, the output duty is not reflected at the starting counter operation. When the count direction is up, the output duty is reflected at an overflow (GTCNT = GTPR). When the count direction is down, the output duty is reflected at an underflow (GTCNT = 0).

When the OADTY/OBDTY value changes to 0 with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at the starting counter operation.

Output duty

- In triangle-wave mode

When the OADTY/OBDTY value changes during counting, the duty is reflected at an underflow. When the OADTY/OBDTY value changes to 1 with the OADTYF/OBDTYF bit being 0 and while counting stops, the output duty is not reflected at the starting counter operation. The output duty is reflected at an underflow.

When the OADTY/OBDTY value changes to 0 with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at the starting counter operation.

**OmDTY[1:0] bits (GTIOCm Output Duty Setting) (m = A, B)**

The OmDTY[1:0] bits set the output duty of the GTIOCm pin to either 0%, 100%, or compare match control.

**OmDTYF bit (Forcible GTIOCm Output Duty Setting) (m = A, B)**

The OmDTYF bit forcibly sets the output duty cycle to the OmDTY setting. Set this bit to 0 during counter operation. When OmDTYF bit is set to 1 while counting stops, return OmDTYF to 0 until the first period ends after the counter starts.

**OmDTYR bit (GTIOCm Output Value Selecting after Releasing 0%/100% Duty Setting) (m = A, B)**

The OmDTYR bits select the value that is the object of output retained or toggled at cycle end, when the control changes from 0%/100% duty setting to compare match for GTIOCm pin and GTIOR.GTIOm[3:2] are set to 00b (output retained at cycle end) or GTIOR.GTIOm[3:2] are set to 11b (output toggled at cycle end).

While the duty 0%/100% setting operation is running, the compare match operation continues inside the GPT32. When the OmDTYR bit is set to 1, the GTIOCm pin is in the output state selected by the GTIOR.GTIOm [3:2] bits at the end of the cycle in this compare match operation.

The GTIOR register sets the functions of the GTIOCA and GTIOCB pins.

#### GTIOA[4:0] bits (GTIOCA Pin Function Select)

The GTIOA[4:0] bits select the GTIOCA pin function. For details, see [Table 23.5](#).

#### OADFLT bit (GTIOCA Pin Output Value Setting at the Count Stop)

The OADFLT bit selects whether the GTIOCA pin outputs high or low when counting stops.

#### OAHLD bit (GTIOCA Pin Output Setting at the Start/Stop Count)

The OAHLD bit specifies whether the GTIOCA pin output level is retained or the level at the start/stop of counting depends on the register setting.

When the OAHLD bit is set to 0:

- The value specified in bit [4] of the GTIOA[4:0] bits is output when counting starts
- The value specified in the OADFLT bit is output when counting stops
- If the OADFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OAHLD bit is set to 1:

- The output is retained when counting starts or stops.

#### OAE bit (GTIOCA Pin Output Enable)

The OAE bit disables or enables the GTIOCA pin output.

When GTCCRA register is used as the input capture register (at least one bit in the GTICASR register is set to 1), the GTIOCA pin does not output regardless of the OAE bit value.

#### OADF[1:0] bits (GTIOCA Pin Disable Value Setting)

The OADF[1:0] bits select the output value of GTIOCA pin when an output disable request occurs.

#### NFAEN bit (Noise Filter A Enable)

The NFAEN bit disables or enables the noise filter for input from the GTIOCA pin. Because changing the value of the bit might lead to internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

#### NFCSA[1:0] bits (Noise Filter A Sampling Clock Select)

The NFCSA[1:0] bits set the sampling interval for the noise filter of the GTIOCA pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

#### GTIOB[4:0] bits (GTIOCB Pin Function Select)

The GTIOB[4:0] bits select the GTIOCB pin function. For details, see [Table 23.5](#).

#### OBDFLT bit (GTIOCB Pin Output Value Setting at the Count Stop)

The OBDFLT bit sets whether the GTIOCB pin outputs high or low when counting stops.

#### OBHLD bit (GTIOCB Pin Output Setting at the Start/Stop Count)

The OBHLD bit specifies whether the GTIOCB pin output level is retained or the level at the start/stop of counting depends on the register setting.

When the OBHLD bit is set to 0:

- The value specified in bit [4] of the GTIOB[4:0] bits is output when counting starts
- The value specified in the OBDFLT bit is output when counting stops
- If the OBDFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OBHLD bit is set to 1:

- The output is retained when counting starts or stops.

#### OBE bit (GTIOCB Pin Output Enable)

The OBE bit disables or enables the GTIOCB pin output.

When GTCCRB register is used as the input capture register (at least one bit in GTICBSR register is set to 1), the GTIOCB pin does not output regardless of the OBE bit value.

#### OBDF[1:0] bits (GTIOCB Pin Disable Value Setting)

The OBDF[1:0] bits select the output value of GTIOCB pin when an output disable request occurs.

#### NFBEN bit (Noise Filter B Enable)

The NFBEN bit disables or enables the noise filter for input from the GTIOCB pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

#### NFCSB[1:0] bits (Noise Filter B Sampling Clock Select)

The NFCSB[1:0] bits set the sampling interval for the noise filter of the GTIOCB pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

**Table 23.5 Settings of GTIOA[4:0] and GTIOB[4:0] bits (1 of 2)**

| GTIOA/GTIOB[4:0] bits |    |    |    |    | Function                    |                              |  |
|-----------------------|----|----|----|----|-----------------------------|------------------------------|--|
| b4                    | b3 | b2 | b1 | b0 | b4                          | b3, b2                       | b1, b0   |
| 0                     | 0  | 0  | 0  | 0  | Initial output is low       | Output retained at cycle end | Output retained at GTCCRA/GTCCRB compare match |
| 0                     | 0  | 0  | 0  | 1  |                             |                              | Low output at GTCCRA/GTCCRB compare match      |
| 0                     | 0  | 0  | 1  | 0  |                             |                              | High output at GTCCRA/GTCCRB compare match     |
| 0                     | 0  | 0  | 1  | 1  |                             |                              | Output toggled at GTCCRA/GTCCRB compare match  |
| 0                     | 0  | 1  | 0  | 0  | Low output at cycle end     | Low output at cycle end      | Output retained at GTCCRA/GTCCRB compare match |
| 0                     | 0  | 1  | 0  | 1  |                             |                              | Low output at GTCCRA/GTCCRB compare match      |
| 0                     | 0  | 1  | 1  | 0  |                             |                              | High output at GTCCRA/GTCCRB compare match     |
| 0                     | 0  | 1  | 1  | 1  |                             |                              | Output toggled at GTCCRA/GTCCRB compare match  |

| 1                     | 0  | 1  | 0  | 1  |                            |                            | Low output at GTCCRA/GTCCRB compare match      |
| 1                     | 0  | 1  | 1  | 0  |                            |                            | High output at GTCCRA/GTCCRB compare match     |
| 1                     | 0  | 1  | 1  | 1  |                            |                            | Output toggled at GTCCRA/GTCCRB compare match  |
| 1                     | 1  | 0  | 0  | 0  | Output high at cycle end   | Output high at cycle end   | Output retained at GTCCRA/GTCCRB compare match |
| 1                     | 1  | 0  | 0  | 1  |                            |                            | Low output at GTCCRA/GTCCRB compare match      |
| 1                     | 1  | 0  | 1  | 0  |                            |                            | High output at GTCCRA/GTCCRB compare match     |
| 1                     | 1  | 0  | 1  | 1  |                            |                            | Output toggled at GTCCRA/GTCCRB compare match  |
| 1                     | 1  | 1  | 0  | 0  | Toggle output at cycle end | Toggle output at cycle end | Output retained at GTCCRA/GTCCRB compare match |
| 1                     | 1  | 1  | 0  | 1  |                            |                            | Low output at GTCCRA/GTCCRB compare match      |
| 1                     | 1  | 1  | 1  | 0  |                            |                            | High output at GTCCRA/GTCCRB compare match     |
| 1                     | 1  | 1  | 1  | 1  |                            |                            | Output toggled at GTCCRA/GTCCRB compare match  |

- Note 1. The cycle end means an overflow (GTCNT changes from GTPR to 0 in up-counting) or underflow (GTCNT changes from 0 to GTPR in down-counting). The GTCNT counter is cleared for saw waves and for the trough (GTCNT changes from 0 to 1) for triangle waves.
- Note 2. When the timing of a cycle end and the timing of a GTCCRA/GTCCRB compare match are the same in a compare-match operation, the b3 and b2 settings are given priority in saw-wave PWM mode, and the b1 and b0 settings are given priority in any other mode.
- Note 3. In event count operation where at least one bit in GTUPSR or GTDNSR is set to 1, the setting of b3 and b2 is ignored.

## 23.2.15 General PWM Timer Interrupt Output Setting Register (GTINTAD)

Address(es): GPT32EHm.GTINTAD 4007 8038h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTINTAD 4007 8038h + 0100h × m (m = 4 to 7)  
 GPT32m.GTINTAD 4007 8038h + 0100h × m (m = 8 to 13)

| b30        | GRPABL   | Same Time Output Level Low Disable Request Enable                        | 0: Same time output level low disable request disabled<br>1: Same time output level low disable request enabled.   | R/W |

| Bit | Symbol | Bit name | Description   | R/W |
|-----|--------|----------|---|-----|
| b31 | —      | Reserved | This bit is read as 0. The write value should be 0. | R/W |

The GTINTAD enables or disables interrupt requests, A/D converter start requests, and output disable requests.

#### **ADTRAUEN bit (GTADTRA Compare Match (Up-Counting) A/D Converter Start Request Enable)**

The ADTRAUEN bit enables or disables A/D converter start requests generated by GTADTRA compare matches during GTCNT up-counting. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

#### **ADTRADEN bit (GTADTRA Compare Match (Down-Counting) A/D Converter Start Request Enable)**

The ADTRADEN bit enables or disables A/D converter start requests generated by GTADTRA compare matches during GTCNT down-counting. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

#### **ADTRBUEN bit (GTADTRB Compare Match (Up-Counting) A/D Converter Start Request Enable)**

The ADTRBUEN bit enables or disables A/D converter start requests generated by GTADTRB compare matches during GTCNT up-counting. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

#### **ADTRBDEN bit (GTADTRB Compare Match (Down-Counting) A/D Converter Start Request Enable)**

The ADTRBDEN bit enables or disables A/D converter start requests generated by GTADTRB compare matches during GTCNT down-counting. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

#### **GRP[1:0] bits (Output Disable Source Select)**

The GRP[1:0] bits select GTIOCA pin and GTIOCB pin output disable source. The output disable request to POEG outputs to the group that is selected with GRP[1:0] bits when dead time error, same time output level high, or same time output level low occurs based on the output disable request enable bit.

GTST.ODF shows the request of output disable source group that is selected with the GRP[1:0] bits. Set the GRP[1:0] bits when both GTIOR.OAE and GTIOR.OBE are 0.

#### **GRPDTE bit (Dead Time Error Output Disable Request Enable)**

The GRPDTE bit enables or disables dead time error output disable request. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

#### **GRPABH bit (Same Time Output Level High Disable Request Enable)**

The GRPABH bit enables or disables output disable request when the GTIOCA and GTIOCB pins output 1 at the same time.

#### **GRPABL bit (Same Time Output Level Low Disable Request Enable)**

The GRPABL bit enables or disables output disable request when the GTIOCA and GTIOCB pins output 0 at the same time.

## 23.2.16 General PWM Timer Status Register (GTST)

Note 1. Only 0 can be written to this bit. Do not write 1.

The GTST register indicates the status of the GPT.

#### TCFA flag (Input Capture/Compare Match Flag A)

TCFA is the status flag for the input capture or compare match of GTCCRA.

[Setting conditions]

- GTCNT = GTCCRA when the GTCCRA register functions as a compare match register
- GTCNT counter value is transferred to GTCCRA by the input capture signal when the GTCCRA register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

#### TCFB flag (Input Capture/Compare Match Flag B)

TCFB is the status flag for the input capture or compare match of GTCCRB.

[Setting conditions]

- GTCNT = GTCCRB when the GTCCRB register functions as a compare match register
- GTCNT counter value is transferred to GTCCRB by the input capture signal when the GTCCRB register function as an input capture register.

[Clearing condition]

- 0 is written to this flag.

#### TCFC flag (Input Compare Match Flag C)

TCFC is the status flag for the compare match of GTCCRC.

[Setting condition]

- GTCNT = GTCCRC

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)

- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (GTCCRC performs buffer operation).

#### TCFD flag (Input Compare Match Flag D)

TCFD is the status flag for the compare match of GTCCRD.

[Setting condition]

- GTCNT = GTCCRD

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (GTCCRD performs buffer operation).

#### TCFE flag (Input Compare Match Flag E)

TCFE is the status flag for the compare match of GTCCRE.

[Setting condition]

- GTCNT = GTCCRE

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (GTCCRE performs buffer operation).

#### TCFF flag (Input Compare Match Flag F)

TCFF is the status flag for the compare match of GTCCRF.

[Setting condition]

- GTCNT = GTCCRF

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (GTCCRF performs buffer operation).

#### TCFPO flag (Overflow Flag)

The TCFPO flag indicates when an overflow or a crest has occurred.

[Setting conditions]

- In saw-wave mode, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from GTPR to GTPR-1) has occurred
- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

### TCFPU flag (Underflow Flag)

The TCFPU flag indicates when an underflow or a trough has occurred.

[Setting conditions]

- In saw-wave mode, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred
- In triangle-wave mode, a trough (GTCNT changes from 0 to 1) has occurred
- In counting by hardware sources, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

### ITCNT[2:0] bits (GPTn\_OVF/GPTn\_UDF Interrupt Skipping Count Counter)

When the GPTn\_OVF/GPTn\_UDF (n = 0 to 7) interrupt skipping function is used (the GTITC.IVTC[1:0] bits are set to a value other than 00b), the counter in the ITCNT[2:0] bits increments by 1 every time the GPTn\_OVF/GPTn\_UDF interrupt source that is selected in GTITC.IVTC[1:0] is generated.

Only GPT32EH and GPT32E have these bits. GPT32 does not have these bits.

[Clearing conditions]

- The GPTn\_OVF/GPTn\_UDF interrupt skipping function is not used (GTITC.IVTT[2:0] is 000b when GTITC.IVTC[1:0] is 00b)
- The GPTn\_OVF/GPTn\_UDF interrupt skipping count matches the specified count (ITCNT[2:0] matches the skipping count specified in GTITC.IVTT[2:0]).

### TUCF flag (Count Direction Flag)

The TUCF flag indicates the count direction of GTCNT. In event count operation, this flag is set to 1 in up-counting and to 0 in down-counting.

### ADTRAUF flag (GTADTRA Compare Match (Up-Counting) A/D Converter Start Request Flag)

ADTRAUF is the status flag for the compare match of GTADTRA at up-counting.

[Setting condition]

- GTCNT = GTADTRA at up-counting.

[Clearing condition]

- 0 is written to this flag.

### ADTRADF flag (GTADTRA Compare Match (Down-Counting) A/D Converter Start Request Flag)

ADTRADF is the status flag for the compare match of GTADTRA at down-counting.

[Setting condition]

- GTCNT = GTADTRA at down-counting.

[Clearing condition]

- 0 is written to this flag.

### ADTRBUF flag (GTADTRB Compare Match (Up-Counting) A/D Converter Start Request Flag)

ADTRBUF is the status flag for the compare match of GTADTRB at up-counting.

[Setting condition]

- GTCNT = GTADTRB at up-counting.

[Clearing condition]

- 0 is written to this flag.

#### **ADTRBDF flag (GTADTRB Compare Match (Down-Counting) A/D Converter Start Request Flag)**

ADTRBDF is the status flag for the compare match of GTADTRB at down-counting.

[Setting condition]

- $GTCNT = GTADTRB$  at down-counting.

[Clearing condition]

- 0 is written to this bit.

#### **ODF flag (Output Disable Flag)**

The ODF flag shows the request of the output disable source group that is selected in the GRP[1:0] bits. When output is disabled, an output disable control is not released within the same cycle in which an output disable request is negated. It is released in the next cycle.

#### **DTEF flag (Dead Time Error Flag)**

The DTEF flag indicates that the timer output toggle point after the automatic addition of dead time has exceeded the timer cycle.

DTEF returns to 0 when the timer output toggle point after the automatic addition of dead time is within the timer cycle. DTEF is read-only. Writing 0 to clear the flag is not allowed.

[Setting condition]

- The timer output toggle point after the automatic addition of dead time has exceeded the timer cycle.  
For triangle wave in up-counting:  $GTCCRA - GTDVU \leq 0$   
For triangle wave in down-counting:  $GTCCRA - GTDVD < 0$   
For saw-wave one-shot pulse mode in up-counting:  
 $GTCCRA - GTDVU < 0$  or  $GTCCRA + GTDVD > GTPR$   
For saw-wave one-shot pulse mode in down-counting:  
 $GTCCRA + GTDVU > GTPR$  or  $GTCCRA - GTDVD < 0$

[Clearing condition]

- The timer output toggle point after the automatic addition of dead time is within the timer cycle.  
Only GPT32EH and GPT32E have this flag. GPT32 does not have this flag.  
GPT32 has the automatic dead time setting function but it does not generate dead time error.

#### **OABHF flag (Same Time Output Level High Flag)**

The OABHF flag indicates that the GTIOCA and the GTIOCB pins output 1 at the same time.

When the GTIOCA or GTIOCB pin outputs 0, OABHF returns to 0. OABHF is read-only. Writing 0 to clear the flag is not allowed. When an interrupt by the OABHF flag is enabled ( $GTINTAD.GRPABH = 1$ ), the OABHF flag is output to the POEG as an output disable request.

[Setting condition]

- GTIOCA and GTIOCB pins output 1 at the same time when both the OAE and OBE bits are set to 1.

[Clearing conditions]

- GTIOCA pin output value is different from GTIOCB pin output value when both the OAE and OBE bits are set to 1
- GTIOCA and GTIOCB pins output 0 at the same time when both the OAE and OBE bits are set to 1
- Either the OAE bit or OBE bit is set to 0.

#### **OABLF flag (Same Time Output Level Low Flag)**

The OABLF flag indicates that the GTIOCA and GTIOCB pins output 0 at the same time.

When the GTIOCA pin or GTIOCB pin outputs 1, OABLF returns to 0. OABLF is read-only. Writing 0 to clear the flag is not allowed. When an interrupt by the OABLF flag is enabled ( $GTINTAD.GRPABL = 1$ ), the OABLF flag is output to

the POEG as an output disable request.

[Setting condition]

- The GTIOCA and GTIOCB pins output 0 at the same time when both the OAE and OBE bits are set to 1.

[Clearing conditions]

- The GTIOCA pin output value is different from GTIOCB pin output value when both the OAE and OBE bits are set to 1
- The GTIOCA and GTIOCB pins output 1 at the same time when both the OAE and OBE bits are set to 1
- Either the OAE bit or OBE bit is set to 0.

The compare-target signals to generate the OABHF/OABLF flag are the compare match outputs (PWM outputs) signals before they are masked by the output disable function. When the output disable state is active, a compare match is performed continuously in the GPT and the OABHF/OABLF flag is updated in association with the result of the compared value.

### 23.2.17 General PWM Timer Buffer Enable Register (GTBER)

Address(es): GPT32EHm.GTBER 4007 8040h + 0100h × m (m = 0 to 3)

The GTBER register provides settings for the buffer operation and must be set while the GTCNT operation is stopped.

#### BD[0] bit (GTCCR Buffer Operation Disable)

The BD[0] bit disables buffer operation using GTCCRA, GTCCRC, and GTCCRD combined and the buffer operation using GTCCRB, GTCCRE, and GTCCRF combined.

When GTDTCR.TDE is 1 and when BD [0] is set to 0, GTCCRB does not perform buffer operation and the GTCCRB register is automatically set to a compare match value for a negative-phase waveform with dead time.

#### BD[1] bit (GTPR Buffer Operation Disable)

The BD[1] bit disables buffer operation using GTPR, GTPBR, and GTPDBR combined.

#### BD[2] bit (GTADTR Buffer Operation Disable)

The BD[2] bit disables buffer operation using GTADTRA, GTADTBRA, and GTADTDBRA combined and buffer operation using GTADTRB, GTADTB RB, and GTADTDB RB combined. In event count operation, this bit is not

available and the GTADTR buffer operation is not performed. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

#### **BD[3] bit (GTDV Buffer Operation Disable)**

The BD[3] bit disables buffer operation using GTDVU and GTDBU combined and buffer operation using GTDVD and GTDBD combined.

When the GTDTCR.TDFER bit is set to 1, even if BD[3] is set to 0, buffer operation is not performed and the GTDVD value is set as a value of GTDVU automatically. In event count operation, this bit is not available and the GTDV buffer operation is not performed. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

#### **CCRA[1:0] bits (GTCCRA Buffer Operation)**

The CCRA[1:0] bits set buffer operation using GTCCRA, GTCCRC, and GTCCRD combined. When buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.\*1

#### **CCRB[1:0] bits (GTCCRB Buffer Operation)**

The CCRB[1:0] bits set buffer operation using GTCCRB, GTCCRE, and GTCCRF combined. When buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.\*1

#### **PR[1:0] bits (GTPR Buffer Operation)**

The PR[1:0] bits set buffer operation using GTPR, GTPBR, and GTPDBR combined. GPT32 does not have the PR[1] bit. Only single buffer operation setting by PR[0] bit is available for GPT32.

#### **CCRSWT bit (GTCCRA and GTCCRB Forcible Buffer Operation)**

Writing 1 to the CCRSWT bit forces a buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0 after 1 is written. This bit is read as 0 and is only valid when counting is stopped with a specified compare match operation.

#### **ADTTA[1:0] bits (GTADTRA Buffer Transfer Timing Select)**

The ADTTA[1:0] bits set the transfer timing for buffer operation of GTADTRA, GTADTBRA, and GTADTDBRA. These bits are not available in event count operation. Only GPT32EH and GPT32E have these bits. GPT32 does not have these bits.

#### **ADTDA bit (GTADTRA Double Buffer Operation)**

The ADTDA bit sets buffer operation using GTADTRA, GTADTBRA, and GTADTDBRA combined. This bit is not available in event count operation. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

#### **ADTTB[1:0] bits (GTADTRB Buffer Transfer Timing Select)**

The ADTTB[1:0] bits set the transfer timing for buffer operation of GTADTRB, GTADTBRB, and GTADTDBRB. These bits are not available in event count operation. Only GPT32EH and GPT32E have these bits. GPT32 does not have these bits.

#### **ADTDB bit (GTADTRB Double Buffer Operation)**

The ADTDB bit sets buffer operation using GTADTRB, GTADTBRB, and GTADTDBRB combined. This bit is not available in event count operation. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

Note 1. The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough).

## 23.2.18 General PWM Timer Interrupt and A/D Converter Start Request Skipping Setting Register (GTITC)

Address(es): GPT32EHm.GTITC 4007 8044h + 0100h × m (m = 0 to 3)  
GPT32Em.GTITC 4007 8044h + 0100h × m (m = 4 to 7)

The GTITC register sets the skipping function for the GTCNT counter overflow (GTPR compare match) interrupt (GPTn\_OVF) and underflow interrupt (GPTn\_UDF). It also specifies whether to link other interrupts and A/D converter start requests with the GPTn\_OVF/GPTn\_UDF interrupt skipping function. The output disable request to POEG cannot be linked with the GPTn\_OVF/GPTn\_UDF interrupt skipping function. This register is not available in event count operation. Only GPT32EH and GPT32E have this register. GPT32 does not have this register and it is read as 0.

#### **ITLA bit (GTCCRA Compare Match/Input Capture Interrupt Link)**

The ITLA bit specifies whether to link the GTCCRA compare match/input capture interrupt (GTCIA) with the GPTn\_OVF/GPTn\_UDF interrupt skipping function.

#### **ITLB bit (GTCCRB Compare Match/Input Capture Interrupt Link)**

The ITLB bit specifies whether to link the GTCCRB compare match/input capture interrupt (GTCIB) with the GPTn\_OVF/GPTn\_UDF interrupt skipping function.

#### **ITLC bit (GTCCRC Compare Match Interrupt Link)**

The ITLC bit specifies whether to link the GTCCRC compare match interrupt (GTCIC) with the GPTn\_OVF/GPTn\_UDF interrupt skipping function.

#### **ITLD bit (GTCCRD Compare Match Interrupt Link)**

The ITLD bit specifies whether to link the GTCCRD compare match interrupt (GTCID) with the GPTn\_OVF/GPTn\_UDF interrupt skipping function.

#### **ITLE bit (GTCCRE Compare Match Interrupt Link)**

The ITLE bit specifies whether to link the GTCCRE compare match interrupt (GTCIE) with the GPTn\_OVF/GPTn\_UDF interrupt skipping function.

#### **ITLF bit (GTCCRF Compare Match Interrupt Link)**

The ITLF bit specifies whether to link the GTCCRF compare match interrupt (GTCIF) with the GPTn\_OVF/GPTn\_UDF interrupt skipping function.

#### **IVTC[1:0] bits (GPTn\_OVF/GPTn\_UDF Interrupt Skipping Function Select)**

The IVTC[1:0] bits set the skipping function for the GTPR compare match (GTCNT overflow) interrupt (GPTn\_OVF) and GTCNT counter underflow interrupt (GPTn\_UDF).

#### **IVTT[2:0] bits (GPTn\_OVF/GPTn\_UDF Interrupt Skipping Count Select)**

The IVTT[2:0] bits set the skipping count for the GTPR compare match (GTCNT overflow) interrupt (GPTn\_OVF) and GTCNT counter underflow interrupt (GPTn\_UDF). When modifying the IVTT[2:0] bits, first set the IVTC[1:0] bits to 00b.

#### **ADTAL bit (GTADTRA A/D Converter Start Request Link)**

The ADTAL bit specifies whether to link the GTADTRA A/D converter start request with GPTn\_OVF/GPTn\_UDF interrupt skipping function.

**ADTBL bit (GTADTRB A/D Converter Start Request Link)**

The ADTBL bit specifies whether to link the GTADTRB A/D converter start request with GPTn\_OVF/GPTn\_UDF interrupt skipping function.

**23.2.19 General PWM Timer Counter (GTCNT)**

Address(es): GPT32EHm.GTCNT 4007 8048h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTCNT 4007 8048h + 0100h × m (m = 4 to 7)  
 GPT32m.GTCNT 4007 8048h + 0100h × m (m = 8 to 13)

GTCNT is a 32-bit read/write counter and can only be written to after counting stops. GTCNT must be accessed in 32-bit units. Access in 8-bit/16-bit units is prohibited. GTCNT must be set within the range of  $0 \leq \text{GTCNT} \leq \text{GTPR}$ .

**23.2.20 General PWM Timer Compare Capture Register n (GTCCRn) (n = A to F)**

Address(es): GPT32EHm.GTCCRA 4007 804Ch + 0100h × m (m = 0 to 3)  
 GPT32Em.GTCCRA 4007 804Ch + 0100h × m (m = 4 to 7)  
 GPT32m.GTCCRA 4007 804Ch + 0100h × m (m = 8 to 13)  
 GPT32EHm.GTCCRB 4007 8050h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTCCRB 4007 8050h + 0100h × m (m = 4 to 7)  
 GPT32m.GTCCRB 4007 8050h + 0100h × m (m = 8 to 13)  
 GPT32EHm.GTCCRC 4007 8054h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTCCRC 4007 8054h + 0100h × m (m = 4 to 7)  
 GPT32m.GTCCRC 4007 8054h + 0100h × m (m = 8 to 13)  
 GPT32EHm.GTCCRE 4007 8058h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTCCRE 4007 8058h + 0100h × m (m = 4 to 7)  
 GPT32m.GTCCRE 4007 8058h + 0100h × m (m = 8 to 13)  
 GPT32EHm.GTCCRD 4007 805Ch + 0100h × m (m = 0 to 3)  
 GPT32Em.GTCCRD 4007 805Ch + 0100h × m (m = 4 to 7)  
 GPT32EHm.GTCCRF 4007 8060h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTCCRF 4007 8060h + 0100h × m (m = 4 to 7)

GTCCRn registers are read/write registers.

GTCCRA and GTCCRB are registers used for both output compare and input capture.

GTCCRC and GTCCRE are compare match registers that can also function as buffer registers for GTCCRA and GTCCRB.

GTCCRD and GTCCRF are compare match registers that can also function as buffer registers for GTCCRC and GTCCRE (double-buffer registers for GTCCRA and GTCCRB).

### 23.2.21 General PWM Timer Cycle Setting Register (GTPR)

Address(es): GPT32EHm.GTPR 4007 8064h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTPR 4007 8064h + 0100h × m (m = 4 to 7)  
 GPT32m.GTPR 4007 8064h + 0100h × m (m = 8 to 13)

GTPR is a read/write register that sets the maximum count value of GTCNT. For saw waves, the value of (GTPR + 1) is the cycle. For triangle waves, the value of (GTPR value × 2) is the cycle.

### 23.2.22 General PWM Timer Cycle Setting Buffer Register (GTPBR)

Address(es): GPT32EHm.GTPBR 4007 8068h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTPBR 4007 8068h + 0100h × m (m = 4 to 7)  
 GPT32m.GTPBR 4007 8068h + 0100h × m (m = 8 to 13)

GTPBR is a read/write register that functions as a buffer register for GTPR.

### 23.2.23 General PWM Timer Cycle Setting Double-Buffer Register (GTPDBR)

Address(es): GPT32EHm.GTPDBR 4007 806Ch + 0100h × m (m = 0 to 3)  
 GPT32Em.GTPDBR 4007 806Ch + 0100h × m (m = 4 to 7)

GTPDBR is a 32-bit read/write register that functions as a buffer register for GTPBR (double-buffer register for GTPR). Only GPT32EH and GPT32E have this register. GPT32 does not have this register. This register is read with the value after reset.

### 23.2.24 A/D Converter Start Request Timing Register n (GTADTRn) (n = A, B)

Address(es): GPT32EHm.GTADTRA 4007 8070h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTADTRA 4007 8070h + 0100h × m (m = 4 to 7)

GPT32EHm.GTADTRB 4007 807Ch + 0100h × m (m = 0 to 3)  
 GPT32Em.GTADTRB 4007 807Ch + 0100h × m (m = 4 to 7)

The GTADTRn registers are 32-bit read/write registers that set the timing of A/D converter start request generation. When the GTADTRn value matches the GTCNT counter value, an A/D converter start request is generated. GTADTRn must be accessed in 32-bit units. Access in 8-bit/16-bit units is prohibited. Only GPT32EH and GPT32E have this register. GPT32 does not have this register. This register is read with the value after reset.

### 23.2.25 A/D Converter Start Request Timing Buffer Register n (GTADTBRn) (n = A, B)

Address(es): GPT32EHm.GTADTBRA 4007 8074h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTADTBRA 4007 8074h + 0100h × m (m = 4 to 7)

GPT32EHm.GTADTBRB 4007 8080h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTADTBRB 4007 8080h + 0100h × m (m = 4 to 7)

The GTADTBRn registers are 32-bit read/write registers that function as buffer registers for GTADTRn. GTADTBRn must be accessed in 32-bit units. Access in 8-bit/16-bit units is prohibited. Only GPT32EH and GPT32E have this register. GPT32 does not have this register. This register is read with the value after reset.

### 23.2.26 A/D Converter Start Request Timing Double-Buffer Register n (GTADTDBRn) (n = A, B)

Address(es): GPT32EHm.GTADTDBRA 4007 8078h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTADTDBRA 4007 8078h + 0100h × m (m = 4 to 7)  
 GPT32EHm.GTADTDBRB 4007 8084h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTADTDBRB 4007 8084h + 0100h × m (m = 4 to 7)

The GTADTDBRn registers are 32-bit read/write registers that function as buffer registers for GTADTBRn (double-buffer registers for GTADTR). GTADTDBRn must be accessed in 32-bit units. Access in 8-bit/16-bit units is prohibited. Only GPT32EH and GPT32E have this register. GPT32 does not have this register. This register is read with the value after reset.

### 23.2.27 General PWM Timer Dead Time Control Register (GTDTCR)

Address(es): GPT32EHm.GTDTCR 4007 8088h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTDTCR 4007 8088h + 0100h × m (m = 4 to 7)  
 GPT32m.GTDTCR 4007 8088h + 0100h × m (m = 8 to 13)

• GPT32EH, GPT32E

• GPT32

| Bit      | Symbol | Bit name                        | Description  | R/W |
|----------|--------|---------------------------------|--|-----|
| b0       | TDE    | Negative-Phase Waveform Setting | 0: GTCCRB is set without using GTDVU and GTDVD<br>1: GTDVU and GTDVD set the compare match value for negative-phase waveform with automatic dead time in GTCCRB. | R/W |
| b3 to b1 | —      | Reserved                        | These bits are read as 0. The write value should be 0.   | R/W |
| b4       | TDBUE  | GTDVU Buffer Operation Enable   | 0: GTDVU buffer operation disabled<br>1: GTDVU buffer operation enabled.   | R/W |

| Bit       | Symbol | Bit name                      | Description   | R/W |
|-----------|--------|-------------------------------|---|-----|
| b5        | TDBDE  | GTDVD Buffer Operation Enable | 0: GTDVD buffer operation disabled<br>1: GTDVD buffer operation enabled.                              | R/W |
| b7, b6    | —      | Reserved                      | These bits are read as 0. The write value should be 0.  | R/W |
| b8        | TDFER  | GTDVD Setting                 | 0: GTDVU and GTDVD are set separately<br>1: The value written to GTDVU to GTDVD is automatically set. | R/W |
| b31 to b9 | —      | Reserved                      | These bits are read as 0. The write value should be 0.  | R/W |

The GTDTCR register enables automatic setting of a compare match value for negative-phase waveform with dead time. GPT32EH, GPT32E and GPT32 have dead time control function. GPT32 does not have the dead time buffer function and only GTDVU register is used for setting dead time value.

#### TDE bit (Negative-Phase Waveform Setting)

The TDE bit specifies whether to use GTDVU and GTDVD. When GTDVU and GTDVD are used, the compare match value for a negative-phase waveform with dead time obtained by the compare match value of a positive-phase waveform (GTCCRA) and the dead time value (GTDVU and GTDVD), is automatically set in GTCCRB. The TDE bit setting is ignored in saw-wave PWM mode, and automatic setting does not take place.

The GTCCRB value is automatically set and has the following upper and lower limit values. If the obtained GTCCRB value is not within the upper or lower limit, the following limit value is set in GTCCRB and the GTST.DTEF flag is set to 1. However, in triangle waves, when the obtained GTCCRB value exceeds the upper limit value, the GTST.DTEF flag is set to 0.

- Triangle waves:  
Upper limit value:  $GTPR - 1$   
Lower limit value: 1 in up-counting, 0 in down-counting
- Saw-wave one-shot pulse mode:  
Upper limit value:  $GTPR$   
Lower limit value: 0.

#### TDBUE bit (GTDVU Buffer Operation Enable)

The TDBUE bit enables buffer operation with GTDVU and GTDBU combined. The buffer transfer timing is the trough for triangle waves, and an overflow or underflow for saw waves.

Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

#### TDBDE bit (GTDVD Buffer Operation Enable)

The TDBDE bit enables buffer operation with GTDVD and GTDBD combined. The buffer transfer timing is the trough for triangle waves, and an overflow or underflow for saw waves. When this bit and the TDFER bit are set to 1 simultaneously, the TDFER bit setting is given priority.

Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

#### TDFER bit (GTDVD Setting)

The TDFER bit selects whether the value written to GTDVU is also set to GTDVD automatically.

Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

### 23.2.28 General PWM Timer Dead Time Value Register n (GTDVn) (n = U, D)

Address(es): GPT32EHm.GTDVU 4007 808Ch + 0100h x m (m = 0 to 3)  
 GPT32Em.GTDVU 4007 808Ch + 0100h x m (m = 4 to 7)  
 GPT32m.GTDVU 4007 808Ch + 0100h x m (m = 8 to 13)  
 GPT32EHm.GTDVD 4007 8090h + 0100h x m (m = 0 to 3)  
 GPT32Em.GTDVD 4007 8090h + 0100h x m (m = 4 to 7)

GTDVn is a 32-bit read/write register that sets the dead time for generating PWM waveforms with dead time. GTDVU is used for up-counting and GTDVD is used for down-counting.

Setting a GTDVn value greater than or equal to GTPR is prohibited. Setting a dead time value that exceeds the cycle is prohibited. The compare match value set by the automatic dead time setting function for a negative waveform can be confirmed by reading from GTCCRB.

When GTDVn is used, writing to GTCCRB is not allowed. When this register is set to 0, waveforms without dead time are output. GTDVn must be accessed in 32-bit units. Access in 8-bit/16-bit units is prohibited. The way to rewrite GTDVn differs by GPT channel number.

#### GPT32EH0 to GPT32EH3 and GPT32E4 to GPT32E7

When GTDVn buffer operation is enabled, GTDBn can be written at anytime. GTDBn is transferred to GTDVn at the cycle end. When GTDVn buffer operation is disabled, stop the GPT using the CST bit in the GTCR register before changing GTDVn to a new value.

#### GPT328 to GPT3213

While the GPT is running, changing the GTDVU values is prohibited. To change GTDVU to a new value, stop the GPT with the CST bit in the GTCR register.

Only GPT32EH and GPT32E have the GTDVD register. GPT32 does not have the GTDVD register. This register is read with the value after reset.

### 23.2.29 General PWM Timer Dead Time Buffer Register n (GTDBn) (n = U, D)

Address(es): GPT32EHm.GTDBU 4007 8094h + 0100h x m (m = 0 to 3)  
 GPT32Em.GTDBU 4007 8094h + 0100h x m (m = 4 to 7)  
 GPT32EHm.GTDBD 4007 8098h + 0100h x m (m = 0 to 3)  
 GPT32Em.GTDBD 4007 8098h + 0100h x m (m = 4 to 7)

GTDBn is a 32-bit read/write register that functions as a buffer register for GTDVn.

Only GPT32EH and GPT32E have this register. GPT32 does not have this register. This register is read with the value after reset.

### 23.2.30 General PWM Timer Output Protection Function Status Register (GTSOS)

Address(es): GPT32EHm.GTSOS 4007 809Ch + 0100h × m (m = 0 to 3)  
 GPT32Em.GTSOS 4007 809Ch + 0100h × m (m = 4 to 7)

| Bit       | Symbol   | Bit name                          | Description  | R/W |
|-----------|----------|-----------------------------------|--|-----|
| b1, b0    | SOS[1:0] | Output Protection Function Status | b1 b0<br>0 0: Normal operation<br>0 1: Protected state (set GTCCRA = 0 during transfer at trough or crest)<br>1 0: Protected state (set GTCCRA ≥ GTPR during transfer at trough)<br>1 1: Protected state (set GTCCRA ≥ GTPR during transfer at crest). | R   |
| b31 to b2 | —        | Reserved                          | These bits are read as 0. Writing to these bits is ignored.  | R   |

GTSOS is a status register that indicates the status of the output protection function. The output protection function is enabled only when the dead time is automatically set (GTDTCR.TDE bit = 1) in triangle-wave mode.

Only GPT32EH and GPT32E have this register. GPT32 does not have this register. This register is read as 0000\_0000h.

#### SOS[1:0] bits (Output Protection Function Status)

The SOS[1:0] bits indicate the status of the output protection function in triangle-wave PWM mode.

### 23.2.31 General PWM Timer Output Protection Function Temporary Release Register (GTSOTR)

Address(es): GPT32EHm.GTSOTR 4007 80A0h + 0100h × m (m = 0 to 3)  
 GPT32Em.GTSOTR 4007 80A0h + 0100h × m (m = 4 to 7)

| Bit       | Symbol | Bit name                                     | Description   | R/W |
|-----------|--------|--|---|-----|
| b0        | SOTR   | Output Protection Function Temporary Release | 0: Protected state is not released<br>1: Protected state is released. | R/W |
| b31 to b1 | —      | Reserved                                     | These bits are read as 0. The write value should be 0.                | R/W |

The GTSOTR register temporarily releases the protected state of GTIOCB pin output when output protection is set. The protected state can be released only when GTSOS.SOS[1:0] bits = 10b (protected state in which GTCCRA ≥ GTPR has occurred during transfer at trough). The protected state cannot be released in any other case.

Only GPT32EH and GPT32E have this register. GPT32 does not have this register. This register is read as 0000\_0000h.

### SOTR bit (Output Protection Function Temporary Release)

The SOTR bit specifies whether to temporarily release the protected state of GTIOCB pin output in an output protected state. When the SOTR bit is set to 1, the output protection function is canceled from the first trough. When the SOTR bit is set to 0, output protection resumes from the first trough.

## 23.2.32 Output Phase Switching Control Register (OPSCR)

Address(es): GPT\_OPS.OPSCR 4007 8FF0h

|  |     |      |     |     |      |          |     |     |     |       |     |     |     |     |     |

| b28, b27  | —        | Reserved                          | These bits are read as 0. The write value should be 0.   | R/W |

| Bit      | Symbol    | Bit name                                    | Description  | R/W |
|----------|-----------|---|--|-----|
| b29      | NFEN      | External Input Noise Filter Enable          | 0: Do not use a noise filter on the external input<br>1: Use a noise filter on the external input.                                       | R/W |
| b31, b30 | NFCS[1:0] | External Input Noise Filter Clock Selection | Noise filter sampling clock setting of the external input:<br>b31 b30<br>0 0: PCLKD/1<br>0 1: PCLKD/4<br>1 0: PCLKD/16<br>1 1: PCLKD/64. | R/W |

Note 1. When OPSCR.GODF = 1 and the signal value selected by the OPSCR.GRP[1:0] bit is high, the OPSCR.EN bit is set to 0.

The OPSCR register sets the output of the signal waveform required for brushless DC motor control.

#### UF, VF, WF bits (Input Phase Soft Setting)

The UF, VF, and WF bits set the input phase from the software settings. When OPSCR.FB bit is 1, these bits are valid. The set value of the UF/VF/WF bits take the place of the U/V/W external inputs.

#### U, V, W bits (Input Phase Monitor)

When OPSCR.FB bit is 0, external inputs that are synchronized by PCLKD are monitored by these bits. When OPSCR.FB bit is 1, the OPSCR.U, OPSCR.V, and OPSCR.W bits can read the OPSCR.UF, OPSCR.VF, and OPSCR.WF bits.

#### EN bit (Enable-Phase Output Control)

The EN bit controls the output enable signal output phase (positive phase/reverse phase).

When OPSCR.EN bit = 1, the signal waveform is output.

When OPSCR.EN bit = 0, first set OPSCR.FB, OPSCR.UF/VF/WF (software setting is selected), OPSCR.P/N, OPSCR.INV, OPSCR.RV, OPSCR.ALIGN, OPSCR.GRP, OPSCR.GODF, OPSCR.NFEN, and OPSCR.NFCS. Then, set the EN bit to 1. Also, when OPSCR.GODF = 1 and the signal value selected by the OPSCR.GRP bit is high, the OPSCR.EN bit is set to 0.

#### FB bit (External Feedback Signal Enable)

The FB bit selects the input phase from the software settings (OPSCR.UF, VF, WF) and external input such as a Hall element.

#### P bit (Positive-Phase Output (P) Control)

The P bit selects the level signal output or PWM signal output for the positive-phase output (GTOUUP pin, GTOVUP pin, GTOWUP pin).

#### N bit (Negative-Phase Output (N) Control)

The N bit selects the level signal output or PWM signal output for the negative-phase output (GTOULO pin, GTOVLO pin, GTOWLO pin).

#### INV bit (Invert-Phase Output Control)

The INV bit selects either positive logic (active-high) output or negative logic (active-low) output for the output phase.

#### ALIGN bit (Input Phase Alignment)

The ALIGN bit selects the PCLKD or PWM for the sampling of the input phase (input phase is specified in the OPSCR.FB bit).

When OPSCR.ALIGN bit = 0, input phase is aligned to PCLKD.

Note: When PWM output is selected (OPSCR.P/N = 1) and the PCLKD input phase is aligned, the PWM pulse might be short-pulsed.

Note: When OPSCR.ALIGN bit = 1, input phase is aligned with PWM output.

**GRP[1:0] bits (Output Disabled Source Selection)**

The GRP[1:0] bits select the output disable source (A to D).

**GODF bit (Group Output Disable Function)**

When the GODF bit = 1 and the signal value selected by the OPSCR.GRP bit is high, the OPSCR.EN bit is set to 0. When the GODF bit = 0, the bit is ignored.

**NFEN bit (External Input Noise Filter Enable)**

The NFEN bit selects the noise filter for external input.

When OPSCR.NFEN = 0, a noise filter is not used for the external input.

Note: When this bit is switched because of an unintentional internal edge, set the OPSCR.EN bit to 0.

**NFCS[1:0] bits (External Input Noise Filter Clock Selection)**

The NFCS[1:0] bits select the clock for the external input noise filter. When the OPSCR.NFEN bit = 1, noise filter sampling clock setting for external input is enabled.

1. Set the NFCS[1:0].
2. Wait for 2 cycles.
3. Set the OPSCR.EN bit to 1.

## 23.3 Operation

### 23.3.1 Basic Operation

Each channel has a 32-bit timer that performs a periodic count operation using the count clock and hardware sources. The count function provides both up-counting and down-counting. The GTPR controls the count cycle. When the GTCNT counter value matches the value in GTCCRA or GTCCRB, the output from the associated pin GTIOCA or GTIOCB can be changed. GTCCRA or GTCCRB can be used as an input capture register with hardware resources.

GTCCRC and GTCCRD can function as buffer registers for GTCCRA. GTCCRE and GTCCRF can function as buffer registers for GTCCRB.

#### 23.3.1.1 Counter operation

##### (1) Counter start and stop

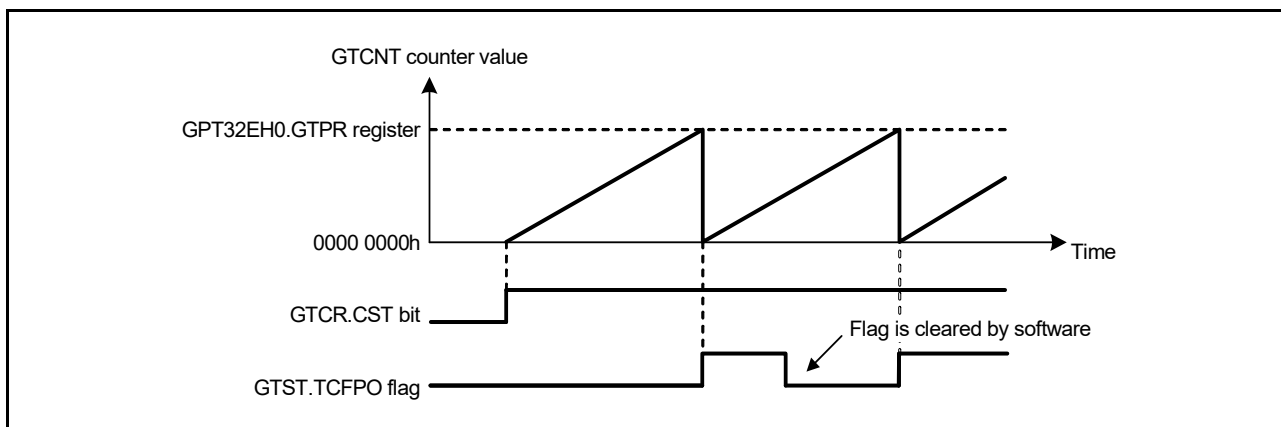

The counter for each channel starts the count operation when GTCR.CST is set to 1. The GTCR.CST bit value is changed by the following sources:

- Writing to GTCR register
- Writing 1 to the bit in GTSTR associated with the GPT channel number when the GTSSR.CSTRT bit is set to 1
- Writing 1 to the bit in GTSTP associated with the GPT channel number when the GTPSR.CSTOP bit is set to 1
- The hardware source selected in the GTSSR register
- The hardware source selected in the GTPSR register.

##### (2) Periodic count operation in up-counting by count clock

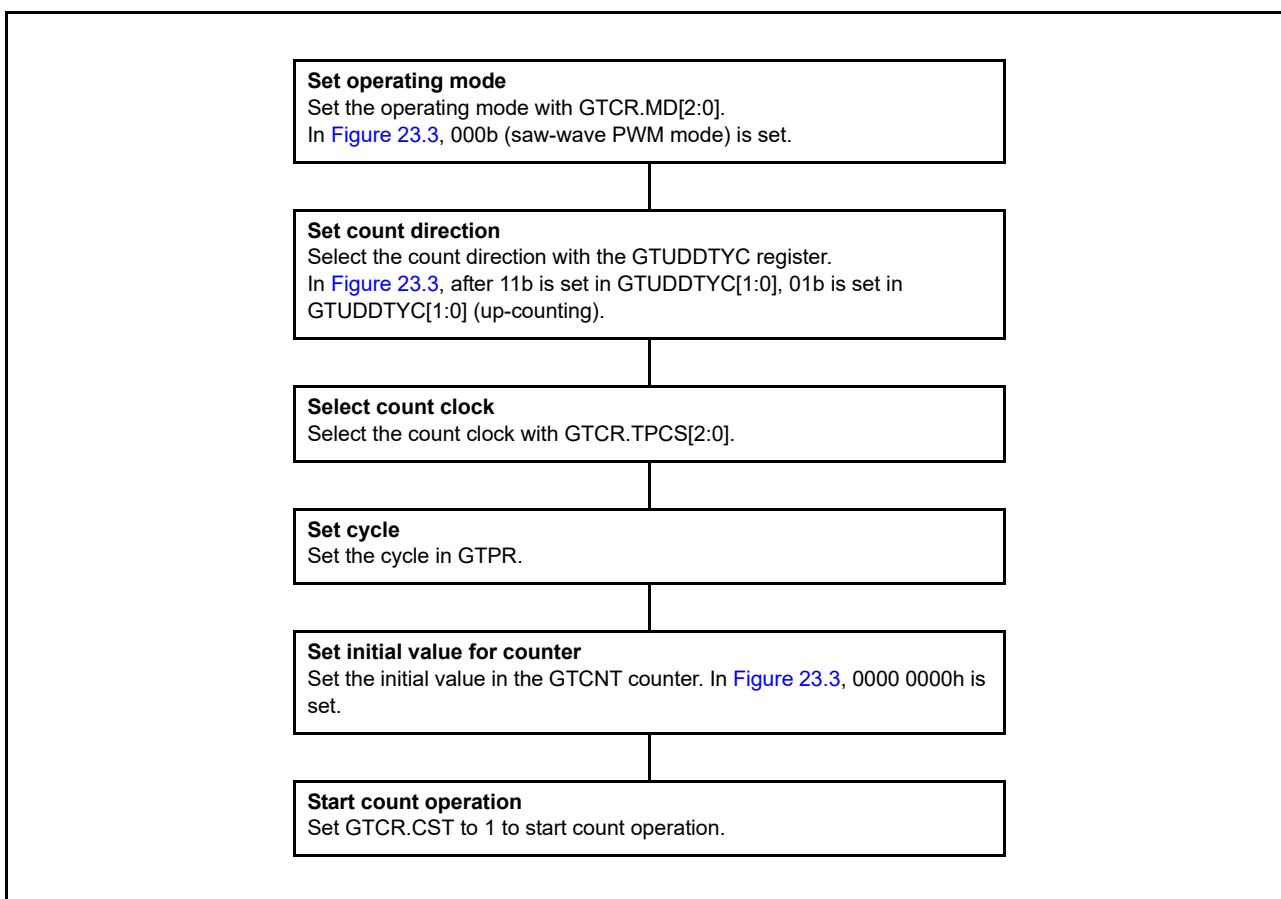

The GTCNT counter in each channel starts up-counting when the associated GTCR.CST bit is set to 1 with the GTUPSR and GTDNSR registers set to 0000 0000h. When the GTCNT value changes from the GTPR value to 0 (overflow), the GTST.TCFPO flag is set to 1. When GTCNT overflows, up-counting resumes from 0000 0000h.

Figure 23.3 shows an example of a periodic count operation in up-counting.

**Figure 23.3** Example of periodic count operation in up-counting by the count clock

Figure 23.4 shows an example for setting periodic count operation in up-counting.

**Figure 23.4** Example setting for a periodic count operation in up-counting by the count clock

(3) Periodic count operation in down-counting by count clock

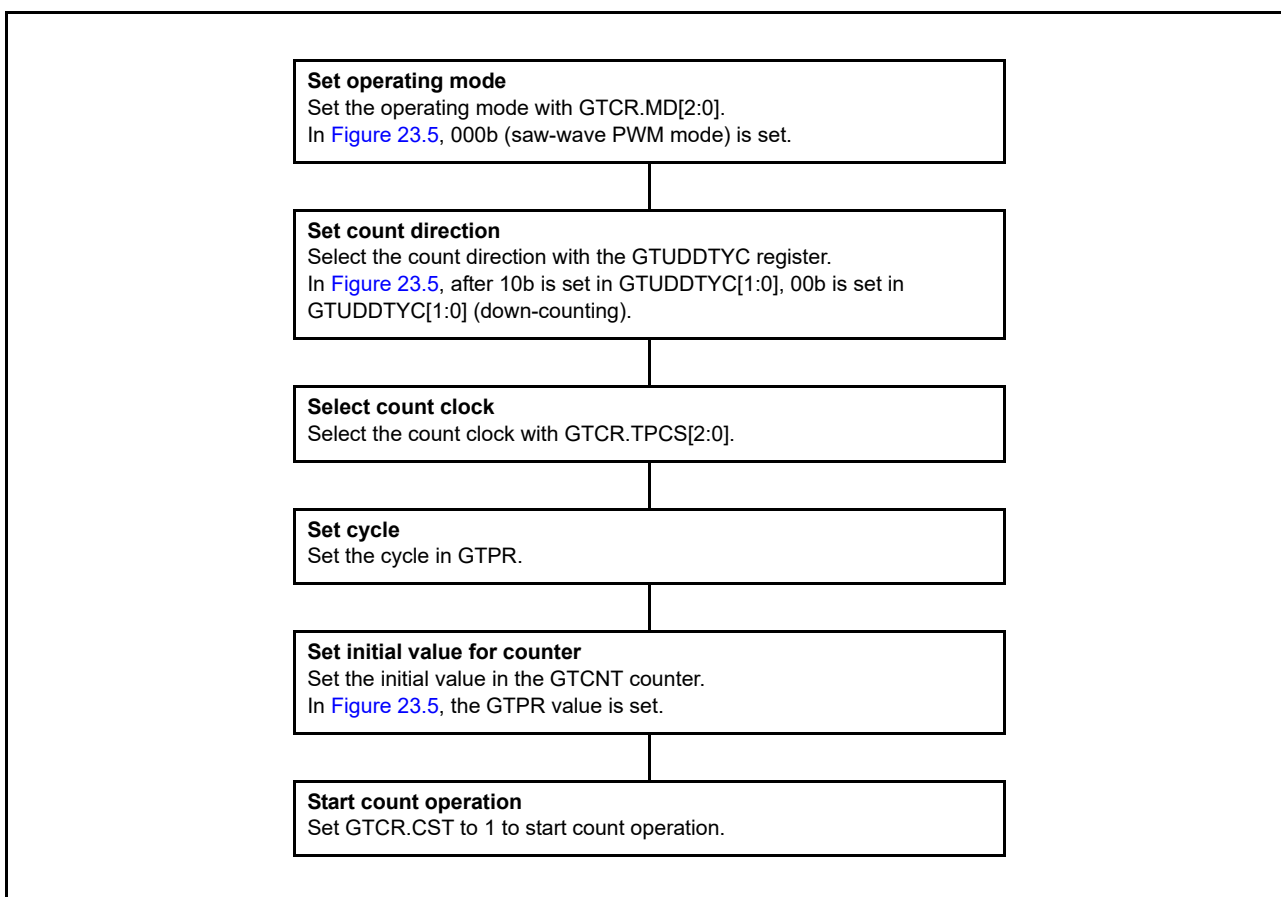

The GTCNT counter in each channel can perform down-counting by setting GTUDDTYC.UD with the GTUPSR and GTDNSR registers set to 0000 0000h. When GTCNT changes from 0 to the GTPR value (underflow), GTST.TCFPU is set to 1. When the GTCNT counter underflows, down-counting resumes from the GTPR value.

Figure 23.5 shows an example of periodic count operation in down-counting by the count clock.

**Figure 23.5** Example of periodic count operation in down-counting by the count clock

Figure 23.6 shows an example setting for periodic count operation in down-counting by the count clock.

**Figure 23.6** Example setting for periodic count operation in down-counting by count clock

**(4) Event count operation in up-counting using hardware sources**

The GTCNT counter in each channel can perform up-counting using hardware sources as set in GTUPSR.

When GTUPSR is set to enable, the count clock selected in GTCR.TPCS[2:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The overflow behavior for up-counting using hardware sources is the same as for up-counting by the count clock.

When GTCR.CST bit is set to 1 to count up using hardware sources, the count operation is enabled. When GTCR.CST is set to 1, the counter cannot count up for 1 clock cycle as specified in GTCR.TPCS[2:0] because the count operation is

synchronized by the count clock selected in GTCR.TPCS[2:0]. Set GTCR.TPCS[2:0] to 000b to count up with a 1 PCLKD delay after GTCR.CST is set to 1.

Figure 23.7 shows an example of a periodic count operation in up-counting by a hardware source (rising edge of the GTETRGA pin).

Figure 23.7 Example of periodic count operation in up-counting using hardware sources

Figure 23.8 shows an example setting for periodic count operation in up-counting by a hardware source.

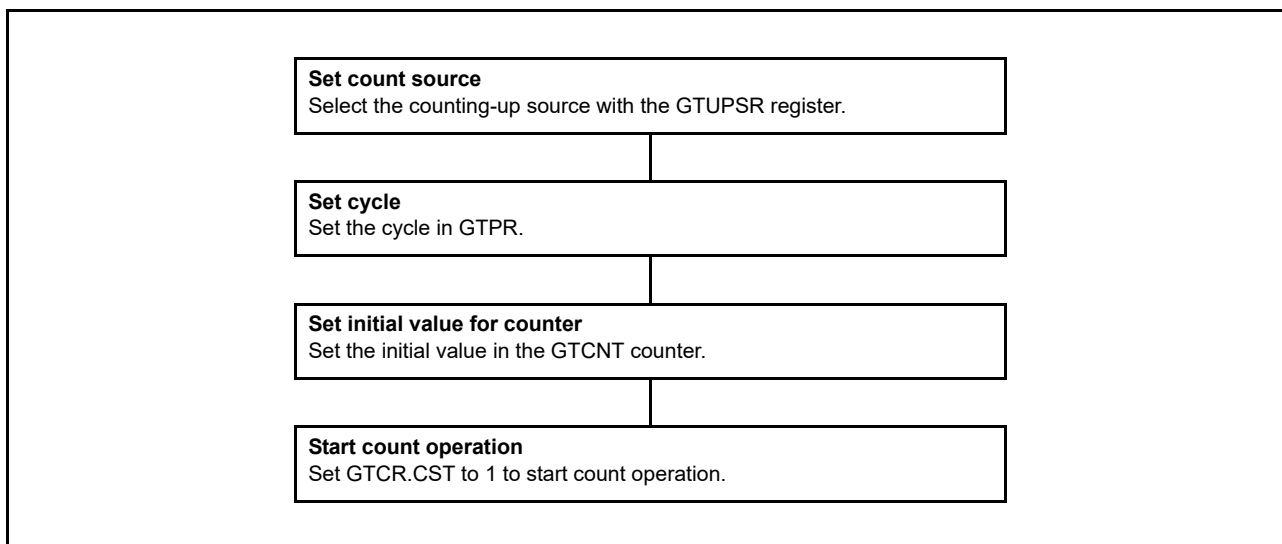

Figure 23.8 Example setting for an event count operation in up-counting using hardware sources

(5) Event count operation in down-counting using hardware sources

The GTCNT counter in each channel can perform down-counting using hardware sources set in the GTDNSR register.

When GTDNSR is set to enable, the count clock selected in GTCR.TPCS[2:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, GTCNT counter value does not change. The underflow behavior for down-counting using hardware sources is the same as for down-counting by the count clock.

When GTCR.CST bit is set to 1 to count down using hardware sources, the count operation is enabled. When GTCR.CST is set to 1, the counter cannot count down for 1 clock cycle as specified in GTCR.TPCS[2:0] because the count operation is synchronized with the count clock selected by GTCR.TPCS[2:0]. Set GTCR.TPCS[2:0] to 000b to count down with a 1 PCLKD delay after GTCR.CST is set to 1.

Figure 23.9 shows an example of a periodic count operation in down-counting by a hardware source (rising edge of the GTETRGA pin).

**Figure 23.9** Example of event count operation in down-counting using hardware sources

Figure 23.10 shows an example setting for a periodic count operation in down-counting using a hardware source.

**Figure 23.10** Example setting for an event count operation in down-counting using hardware sources

## (6) Counter clear operation

The counter of each channel is cleared by the following sources:

- Writing 0 to GTCNT register
- Writing 1 to the bit in GTCLR associated with the GPT channel number when the GTCSR.CCLR bit is set to 1
- The hardware source selected in GTCSR register.

Writing to the GTCNT register is prohibited during count operation. The GTCNT counter can be cleared both by writing 1 to the GTCLR and by the clear request of hardware sources, whether GTCNT is counting (GTCR.CST = 1) or not (GTCR.CST = 0).

For saw waves selected by setting GTCR.MD[2:0] and the count direction flag showing down-counting (GTST.TUCF = 0), the GTCNT register is set to the value of the GTPR register when writing 1 to the GTCLR register or when clearing by hardware sources is performed. When not in saw wave mode and down-counting, the GTCNT register is set to 0 when writing 1 to the GTCLR register and when clearing by hardware sources is performed.

In event count operation when at least 1 bit in GTUPSR or GTDNSR is set to 1, after clear sources occur, both writing to the GTCLR register and clearing by hardware sources are performed immediately, synchronized with PCLKD. If other settings are used, clear is synchronized with the counter clock selected in GTCR.TPCS[2:0].

### 23.3.1.2 Waveform output by compare match

Compare match means that the GTCNT counter value matches the value of GTCCRA or GTCCRB. When a compare match occurs, the compare match flag is generated synchronously with the count clock, including the event count. At the same time the GPT can output low, high, or toggle output from the associated GTIOCA or GTIOCB output pin. In addition, the GTIOCA or GTIOCB pin output can be low, high, or toggled at the cycle end, which is determined by GTPR.

The cycle end is:

- For saw waves in up-counting — when GTCNT changes from the GTPR value to 0 (overflow)
- For saw waves in down-counting — when GTCNT changes from 0 to the GTPR value (underflow)
- For saw waves — when the GTCNT counter is cleared
- For triangle waves — when the GTCNT changes from 0 to 1 (trough).

#### (1) Low output and high output

Figure 23.11 shows an example of low output and high output operation by a compare match of GTCCRA and GTCCRB.

In this example, the GPT32EH0.GTCNT counter performs up-counting, and settings are made so that high is output from the GTIOC0A pin by a GPT32EH0.GTCCRA compare match, and low is output from the GTIOC0B pin by a GPT32EH0.GTCCRB compare match. The pin level does not change when the specified level and pin level match.

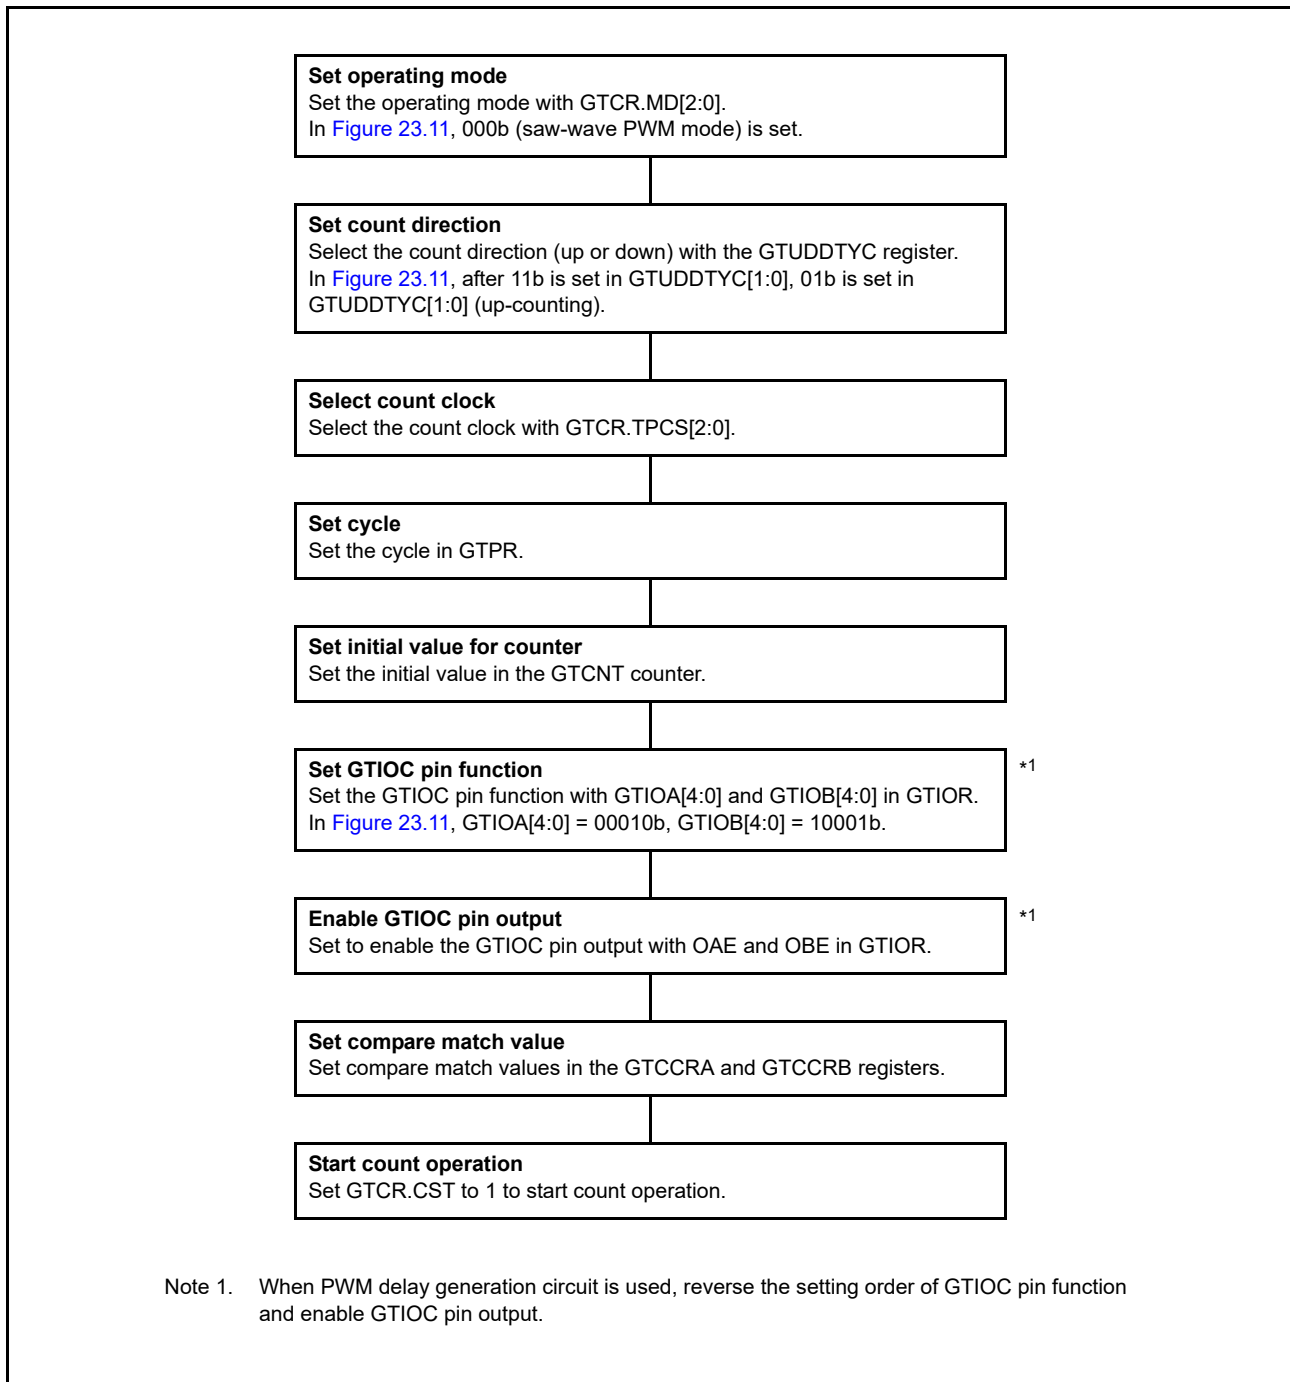

Figure 23.11 Example of low output and high output operation

Figure 23.12 shows an example setting for low output and high output operation.

**Figure 23.12 Example setting for low output and high output operation**

## (2) Toggled output

Figure 23.13 and Figure 23.14 show examples of toggled output operation by compare matches of GTCCRA and GTCCRB. In Figure 23.13, the GPT32EH0.GTCNT counter performs up-counting, and settings are made so that the GTIOC0A pin output by a GPT32EH0.GTCCRA compare match and GTIOC0B pin output by a GPT32EH0.GTCCRB compare match are toggled.

In Figure 23.14, the GPT32EH0.GTCNT counter performs up-counting, and settings are made so that the GTIOC0A output is toggled by a compare match of GPT32EH0.GTCCRA and the GTIOC0B output is toggled at the cycle end.

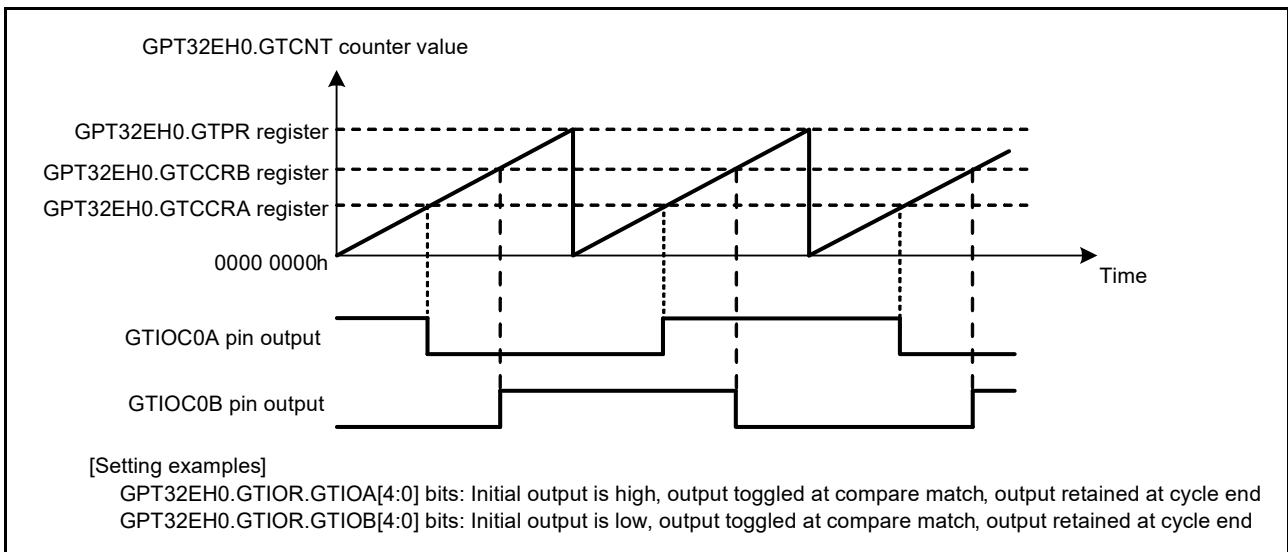

Figure 23.13 Example of toggled output operation (1)

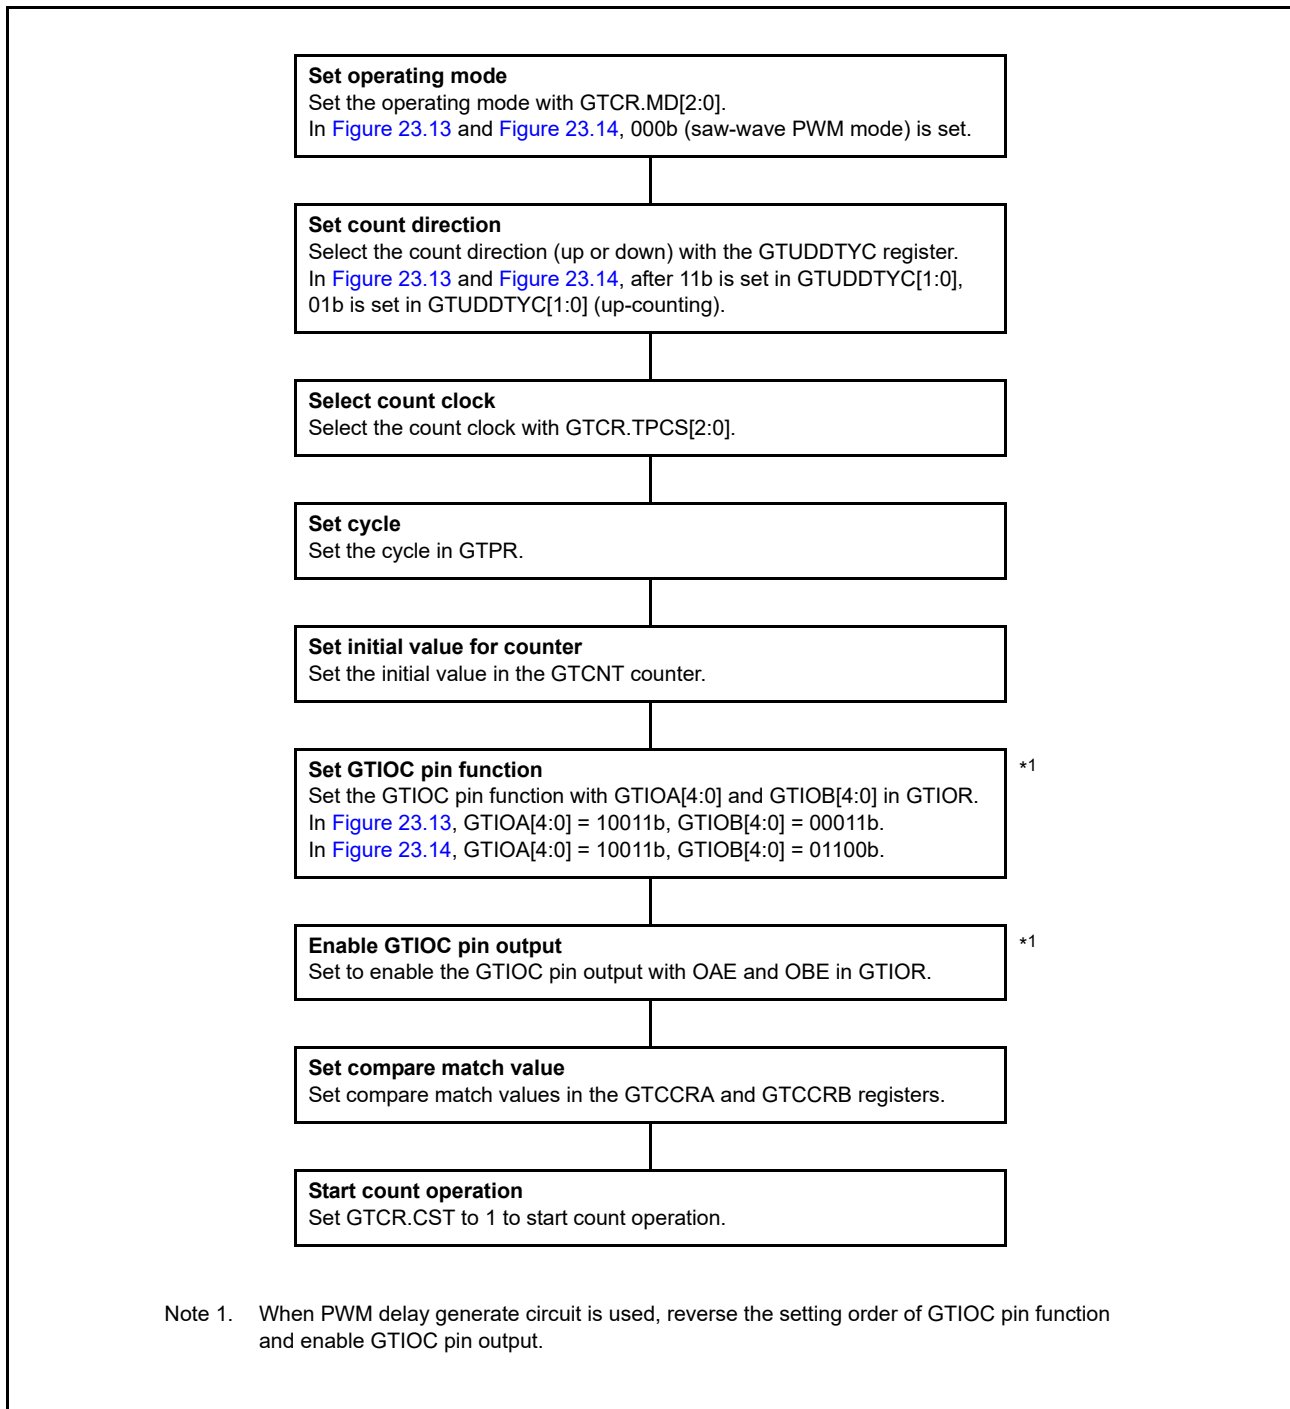

Figure 23.14 Example of toggled output operation (2)

Figure 23.15 shows an example setting for toggled output operation.

**Figure 23.15** Example setting for toggled output operation

### 23.3.1.3 Input capture function

The GTCNT counter value can be transferred to either GTCCRA or GTCCRB on detection of the hardware source that is set in GTICASR and GTICBSR.

Figure 23.16 shows an example of the input capture function.

In this example, the GPT32EH0.GTCNT counter performs up-counting by the count clock, and settings are made so that an input capture is performed to GTICCRA at both edges of the GTIOC0A input pin and to GTICCRB on the rising edge of the GTIOC0B input pin.

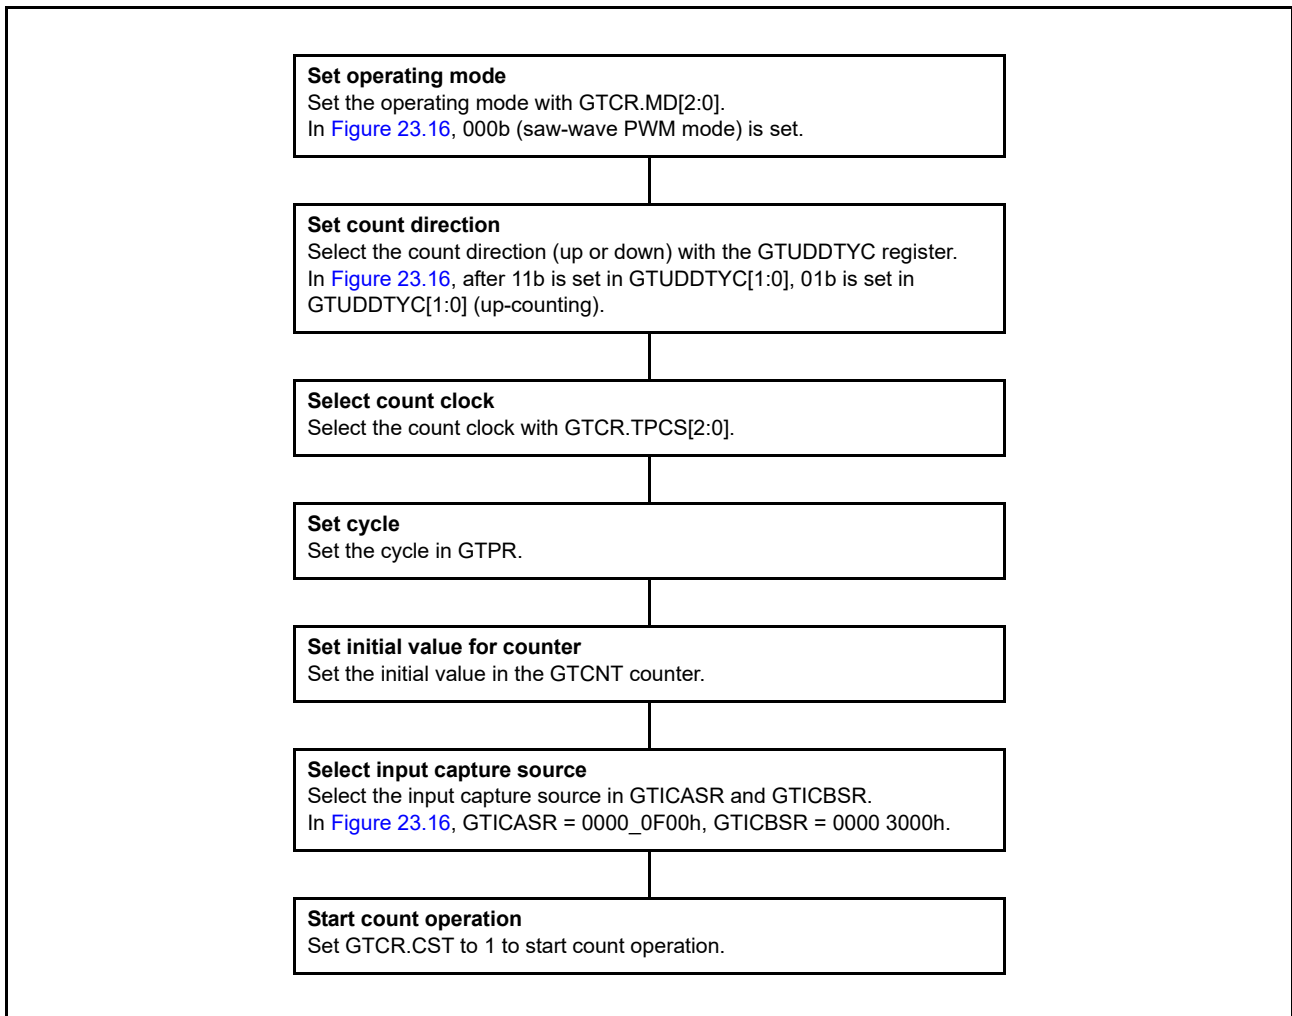

Figure 23.16 Example of input capture operation

Figure 23.17 shows an example setting for an input capture operation with count operation by the count clock.

**Figure 23.17** Example setting for input capture operation

### 23.3.2 Buffer Operation

The following buffer operations can be set with GTBER:

- GTPR, GTPBR, and GTPDBR
- GTCCRA, GTCCRC, and GTCCRD
- GTCCRB, GTCCRE, and GTCCRF
- GTADTRA, GTADTBRA, and GTADTDBRA
- GTADTRB, GTADTBRB, and GTADTDBRB.

The following buffer operations can be set with GTDTCR:

- GTDVU and GTDBU
- GTDVU and GTDBD.

#### 23.3.2.1 GTPR register buffer operation

GTPBR can function as a buffer register for GTPR, and GTPDBR can function as a buffer register for GTPBR (double-buffer register for GTPR). The buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count, and at a trough in triangle-wave mode.

In saw-wave mode or in event count, the buffer transfer is performed when the following counter clear operations occur during counting:

- Clear by hardware sources (the clear source is selected in GTCSR[23:0])
- Clear by software (when GTCSR.CCLR bit is 1 and GTCLRn bit is set to 1, n = channel number).

To set GTPR to function as double buffer, set GTBER.PR[1:0] to 10b or 11b. To set GTPR to not function as a buffer, set GTBER.PR[1:0] to 00b.

Figure 23.18 to Figure 23.20 show examples of GTPR buffer operation, and Figure 23.21 shows an example setting for GTPR buffer operation.

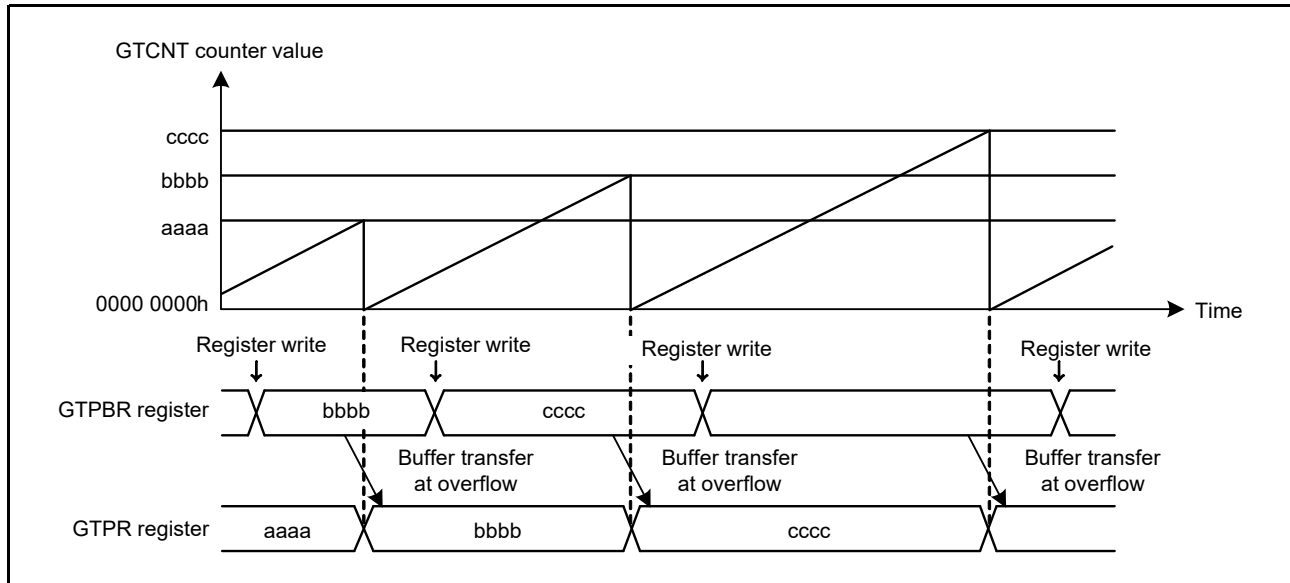

Figure 23.18 Example of GTPR buffer operation with saw waves in up-counting

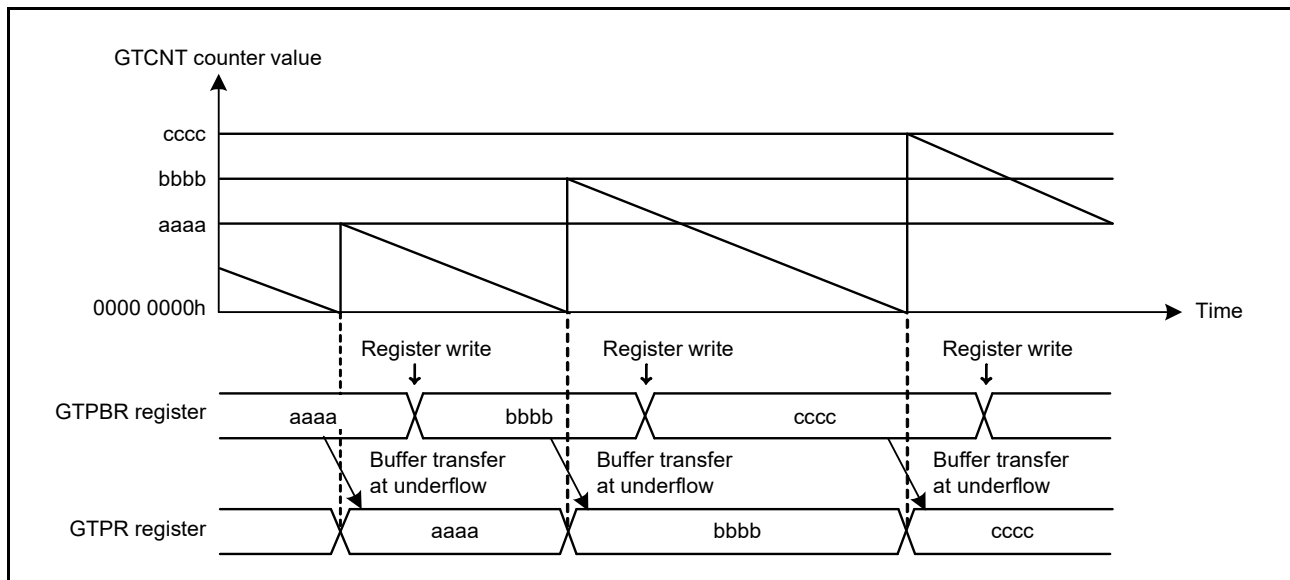

Figure 23.19 Example of GTPR buffer operation with saw waves in down-counting

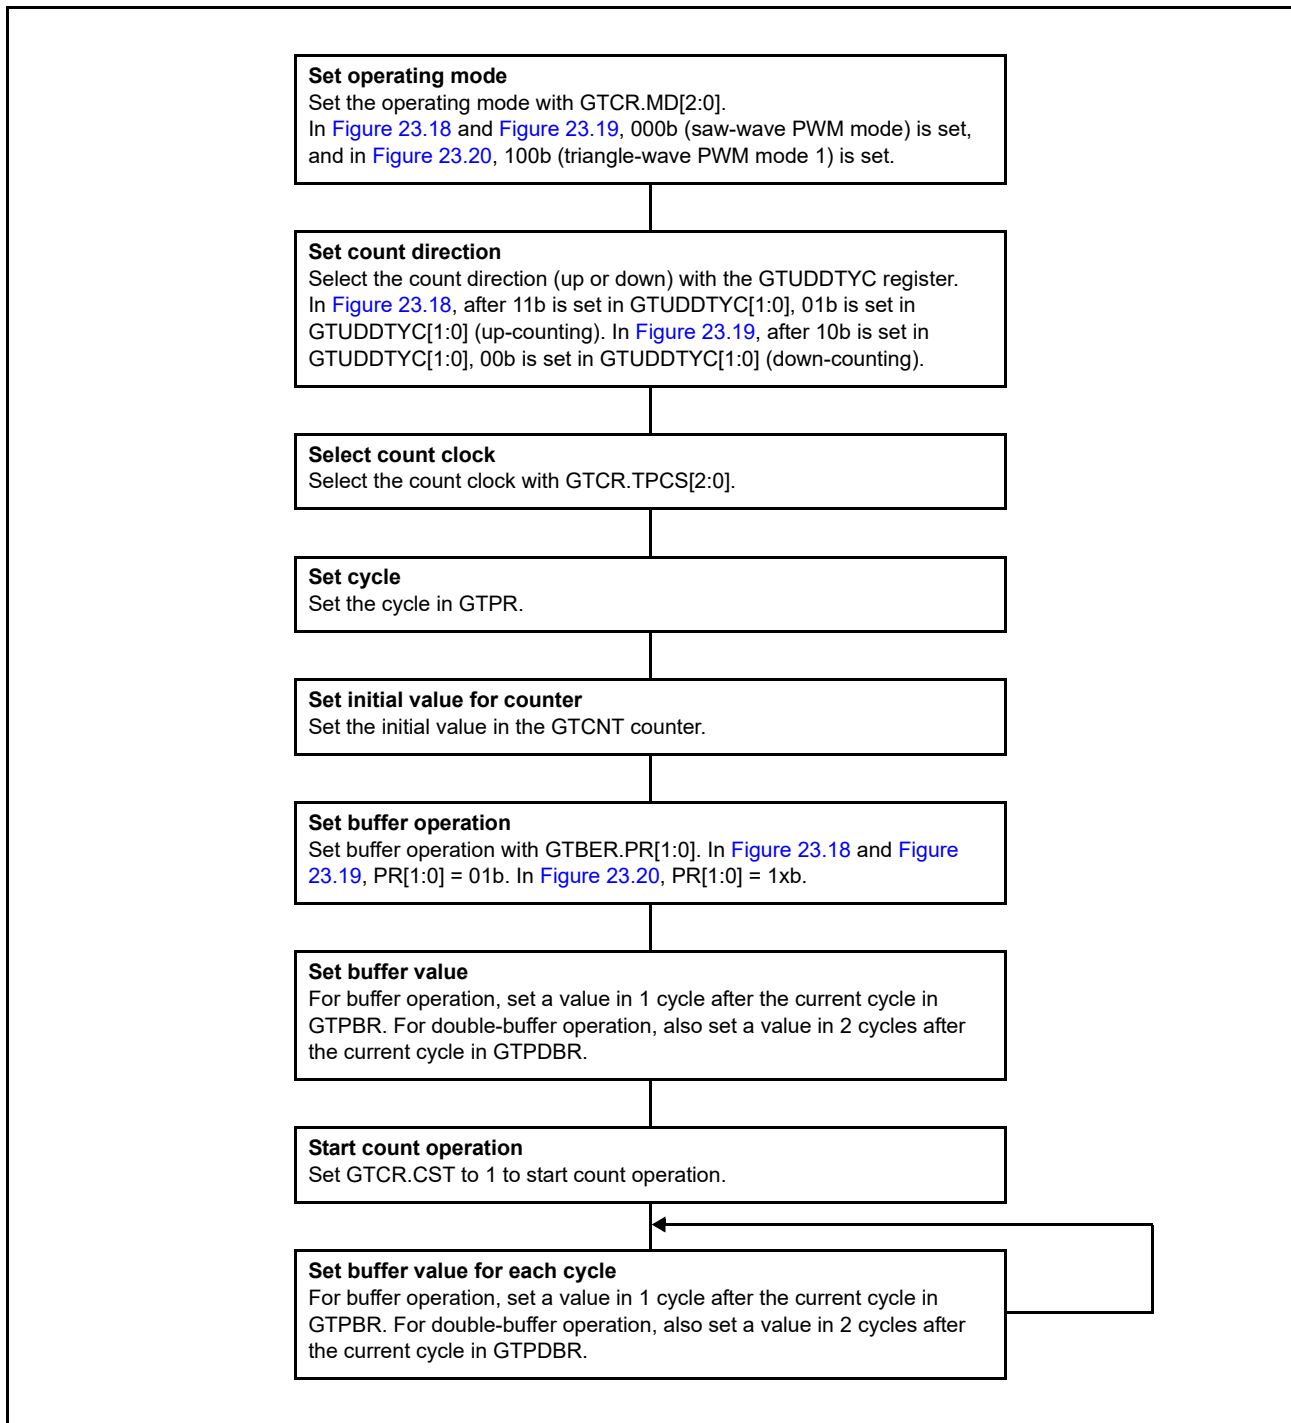

Figure 23.20 Example of GTPR double buffer operation with triangle waves

**Figure 23.21** Example setting for GTPR buffer operation

### 23.3.2.2 Buffer operation for GTCCRA and GTCCRB

GTCCRC can function as the GTCCRA buffer register and GTCCRD can function as the GTCCRC buffer register (double-buffer register for GTCCRA). Similarly, GTCCRE can function as the GTCCRB buffer register and GTCCRF can function as the GTCCRE buffer register (double-buffer register for GTCCRB).

To set GTCCRA or GTCCRB to function as a double buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 10b or 11b. For single-buffer operation, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 01b. To set GTCCRA or GTCCRB to not function as a buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 00b.

(1) When GTCCRA or GTCCRB functions as an output compare register

Buffer transfer occurs in the following situations:

- Buffer transfer by overflow or underflow  
Buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count operation. In triangle-wave mode, buffer transfer is performed at a trough (triangle-wave PWM mode 1) or a crest and trough (triangle-wave PWM mode 2).
- Buffer transfer by counter clear  
In saw-wave mode or in event count operation, during counting, buffer transfer (which is the same as an overflow during up-counting or an underflow during down-counting) is performed by the counter clear sources the same as shown in section 23.3.2.1, GTPR register buffer operation. In triangle-wave mode, buffer transfer is not performed by the counter clear.
- Forcible buffer transfer  
When GTBER.CCRSWT bit is set to 1 while the count operation is stopped, the GTCCRA and the GTCCRB register buffer transfer is performed forcibly in saw-wave mode, in event count operation and in triangle-wave mode. Additionally, buffer transfer from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B are performed in saw-wave 1 shot pulse mode or triangle-wave PWM mode 3.

Figure 23.22 to Figure 23.24 show examples of GTCCRA and GTCCRB buffer operation and Figure 23.25 shows an example setting for GTCCRA and GTCCRB buffer operation.

Figure 23.22 Example of GTCCRA and GTCCRB buffer operation with output compare, saw waves in up-counting, high output at GTCCRA compare match, and low output at cycle end

**Figure 23.23** Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at trough, output toggled at GTCCRA compare match, and output retained at cycle end

**Figure 23.24** Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at both troughs and crests, output toggled at GTCCRB compare match, and output retained at cycle end

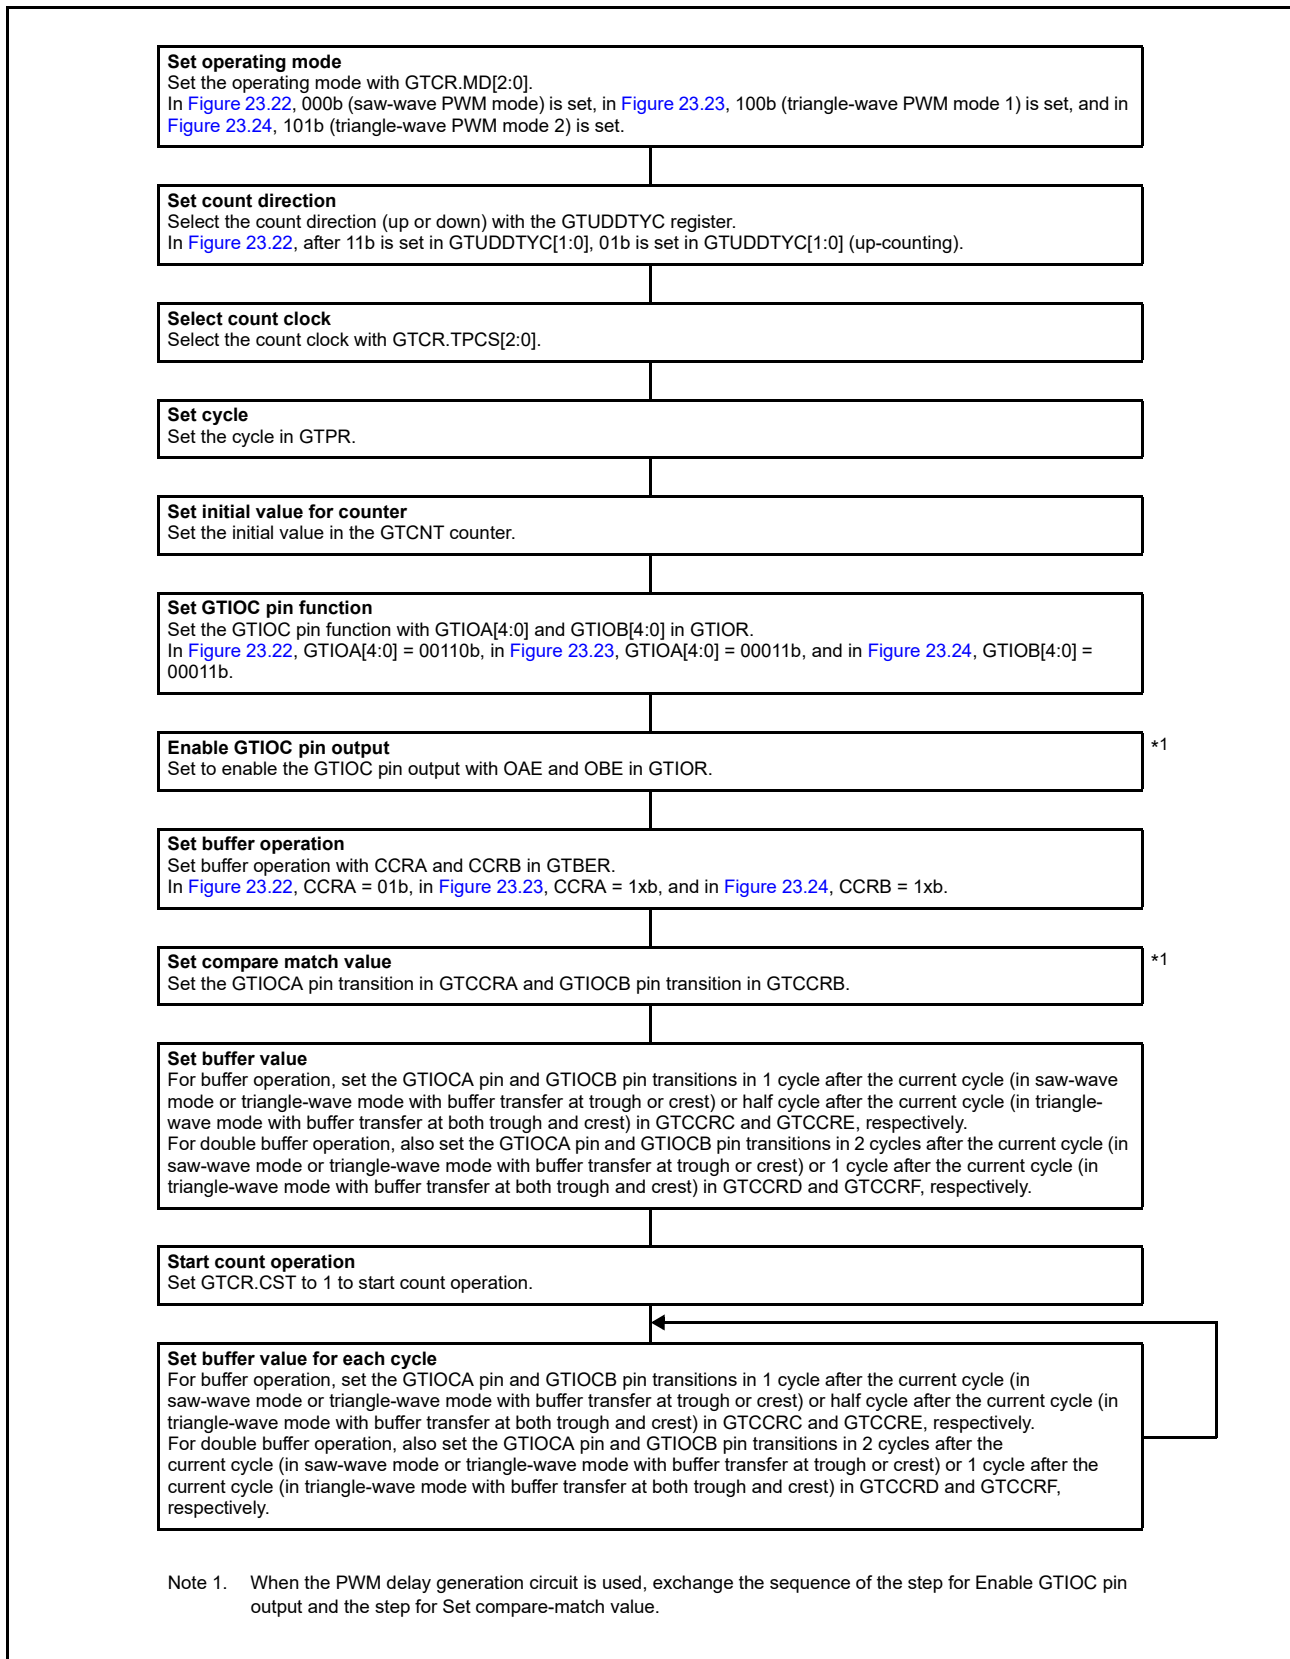

Figure 23.25 Example setting for GTCRA and GTCCRB buffer operation with output compare

(2) When GTCCRA or GTCCRB functions as an Input Capture Register

When an input capture is generated, the GTCNT counter value is transferred to GTCCRA and GTCCRB and the stored GTCCRA and GTCCRB register values are transferred to the buffer registers. In input capture operation, the buffer transfer is not performed by the counter clear.

Figure 23.26 and Figure 23.27 show examples of GTCCRA and GTCCRB buffer operation and Figure 23.28 shows an example setting for GTCCRA and GTCCRB buffer operation.

Figure 23.26 Example of GTCCRA and GTCCRB buffer operation with input capture at both edges of GTIOC0A input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOC0A input

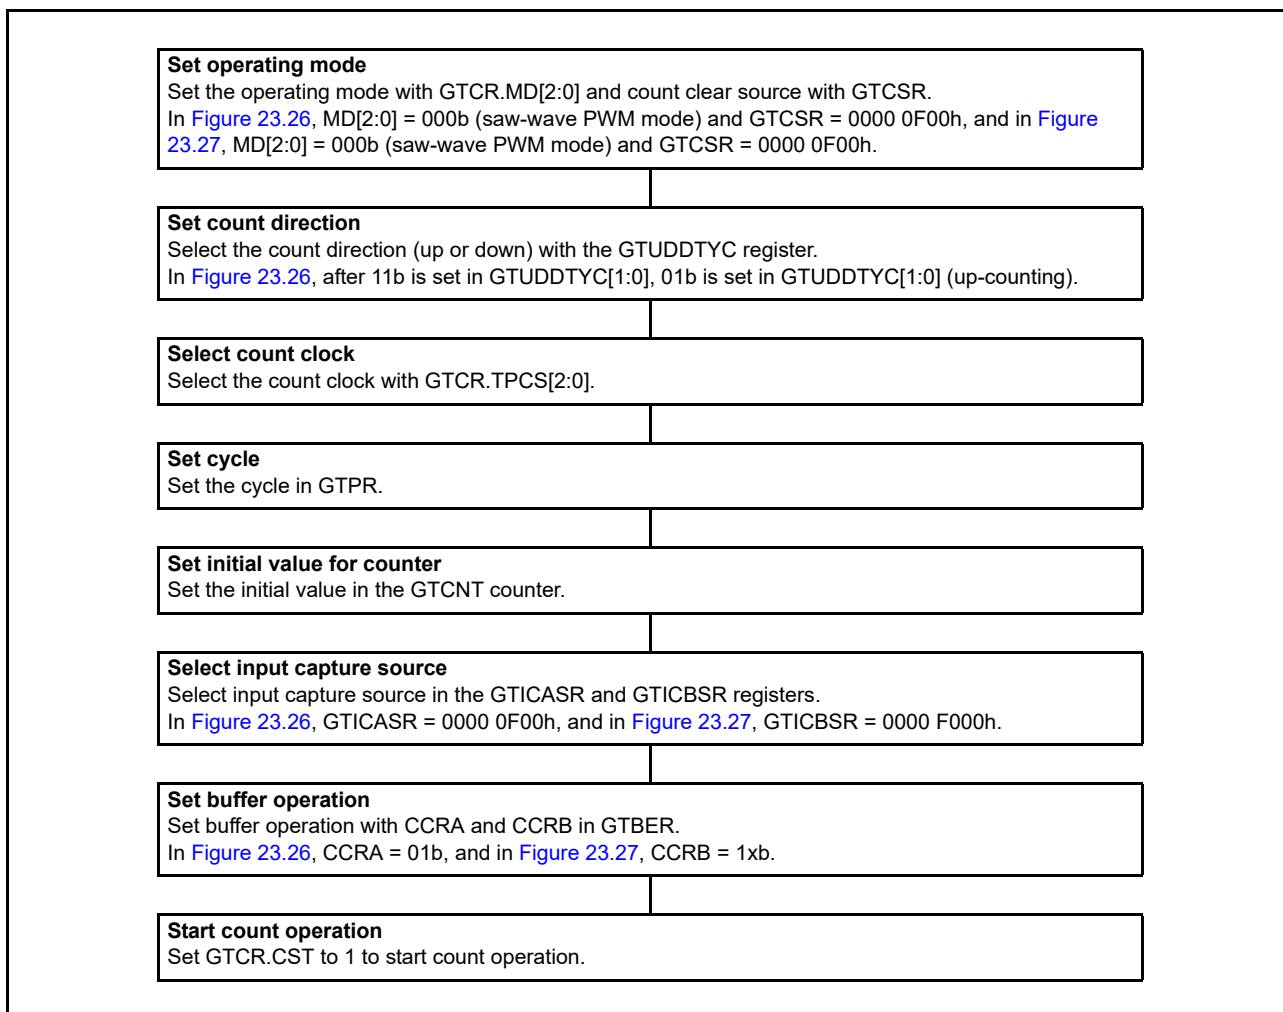

Figure 23.27 Example of GTCCRA and GTCCRB double buffer operation with input capture at both edges of GTIOC0B input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOC0B input

**Figure 23.28** Example setting for GTCCRA and GTCCRB buffer operation with input capture

### 23.3.2.3 Buffer operation for GTADTRA and GTADTRB

GTADTBRA can function as the GTADTRA buffer register and GTADTDBRA can function as the GTADTBRA buffer register (double-buffer register for GTADTRA). Similarly, GTADTBRB can function as the GTADTRB buffer register and GTADTDBRB can function as the GTADTBRB buffer register (double-buffer register for GTADTRB).

To set GTADTRA or GTADTRB to function as a double buffer, set GTBER.ADTDA or GTBER.ADTDB to 1. For single buffer operation, set GTBER.ADTDA or GTBER.ADTDB to 0. To set GTADTRA or GTADTRB to not function as a buffer, set GTBER.ADTTA[1:0] or GTBER.ADTTB[1:0] to 00b.

The buffer transfer timing can be set with the GTBER.ADTTA[1:0] bits. For saw waves, overflows (during up-counting) or underflows (during down-counting) can be selected. For triangle waves, crests are selected when GTBER.ADTTA[1:0] = 01b, troughs are selected when GTBER.ADTTA[1:0] = 10b, and both crests and troughs are selected when GTBER.ADTTA[1:0] = 11b.

Figure 23.29 to Figure 23.31 show examples of GTADTRA and GTADTRB buffer operation and Figure 23.32 shows an example setting for GTDTRA and GTADTRB buffer operation.

**Figure 23.29** Example of GTADTRA and GTADTRB buffer operation with saw waves in up-counting and A/D converter start request interrupt generated by up-counting

**Figure 23.30** Example of GTADTRA and GTADTRB double buffer operation with triangle waves, buffer transfer at troughs, and A/D converter start request interrupt generated by down-counting

**Figure 23.31** Example of GTADTRA and GTADTRB double buffer operation with triangle waves, buffer transfer at both troughs and crests, and A/D converter start request interrupt generated by both up- and down-counting

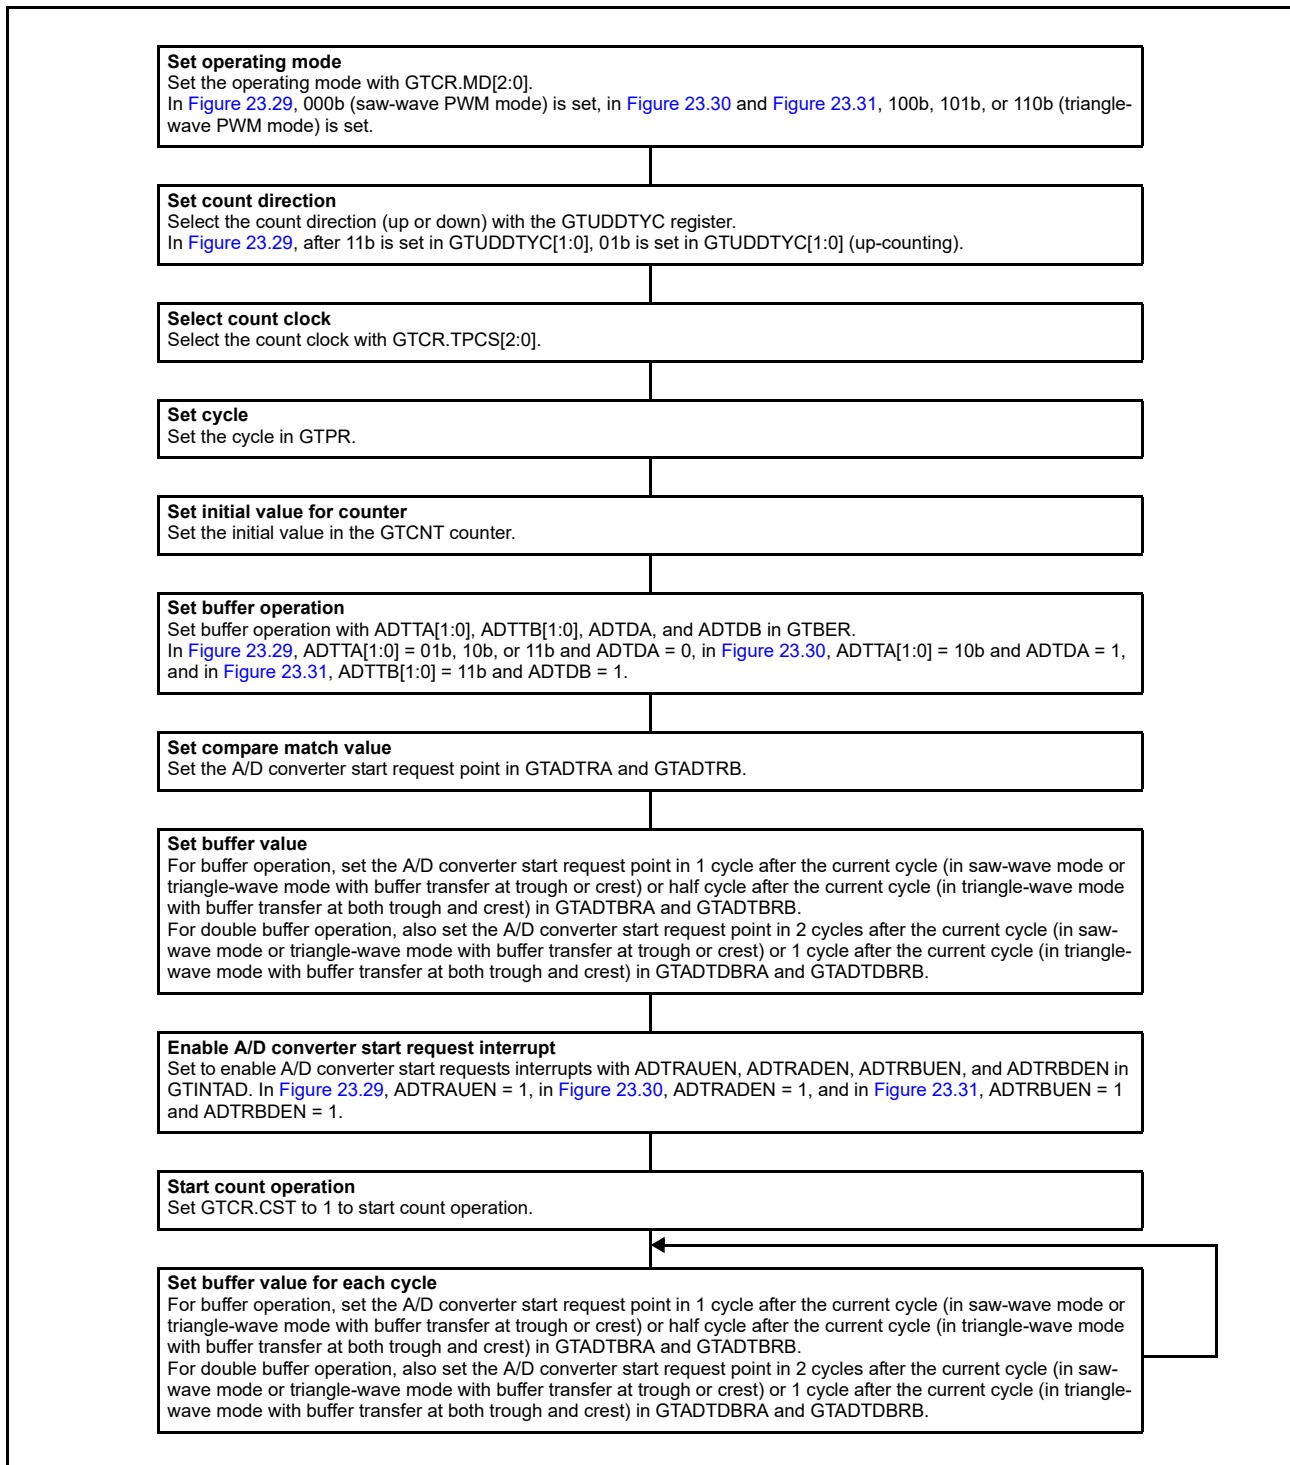

Figure 23.32 Example setting for GTADTRA and GTADTRB buffer operation

### 23.3.3 PWM Output Operating Mode

The GPT can output PWM waveforms to the GTIOCA or GTIOCB pin by a compare match between the GTCNT counter and GTCCRA or GTCCRB. By setting GTDTCR, GTDVU, and GTDVD, the compare match value for a negative-phase waveform with dead time can be automatically set to GTCCRB.

#### 23.3.3.1 Saw-wave PWM mode

In saw-wave PWM mode, GTCNT performs saw-wave (half-wave) operation by setting the cycle in GTPR. A PWM

waveform is output to the GTIOCA or GTIOCB pin when a GTCCRA or GTCCRB compare match occurs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

Figure 23.33 shows an example of saw-wave PWM mode operation, and Figure 23.34 shows an example setting for saw-wave PWM mode.

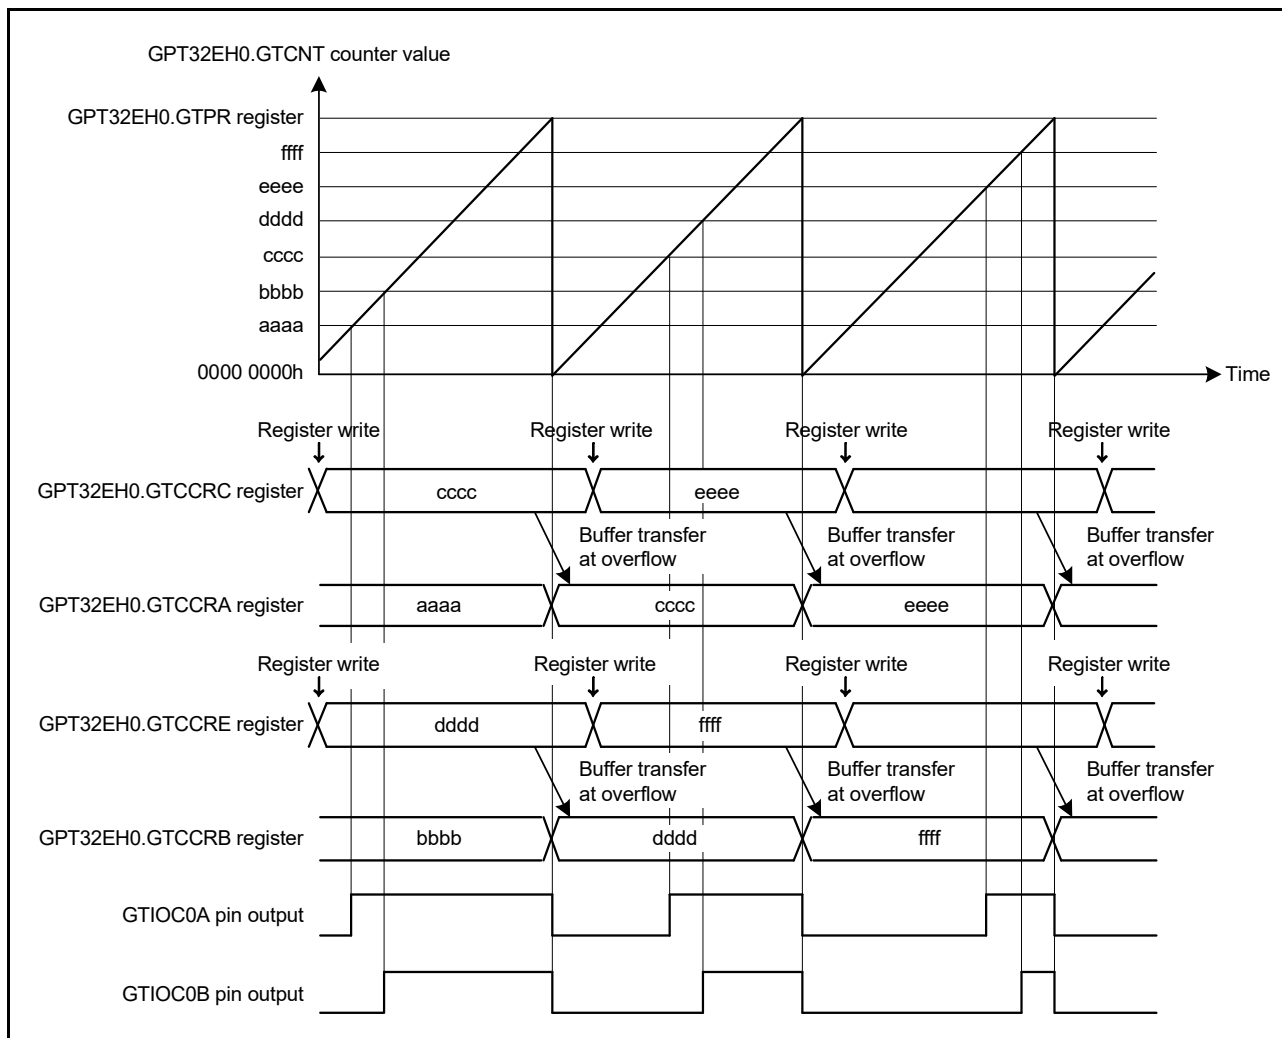

Figure 23.33 Example of saw-wave PWM mode operation with up-counting, buffer operation, high output at GTCCRA/GTCCRB compare match, and low output at cycle end

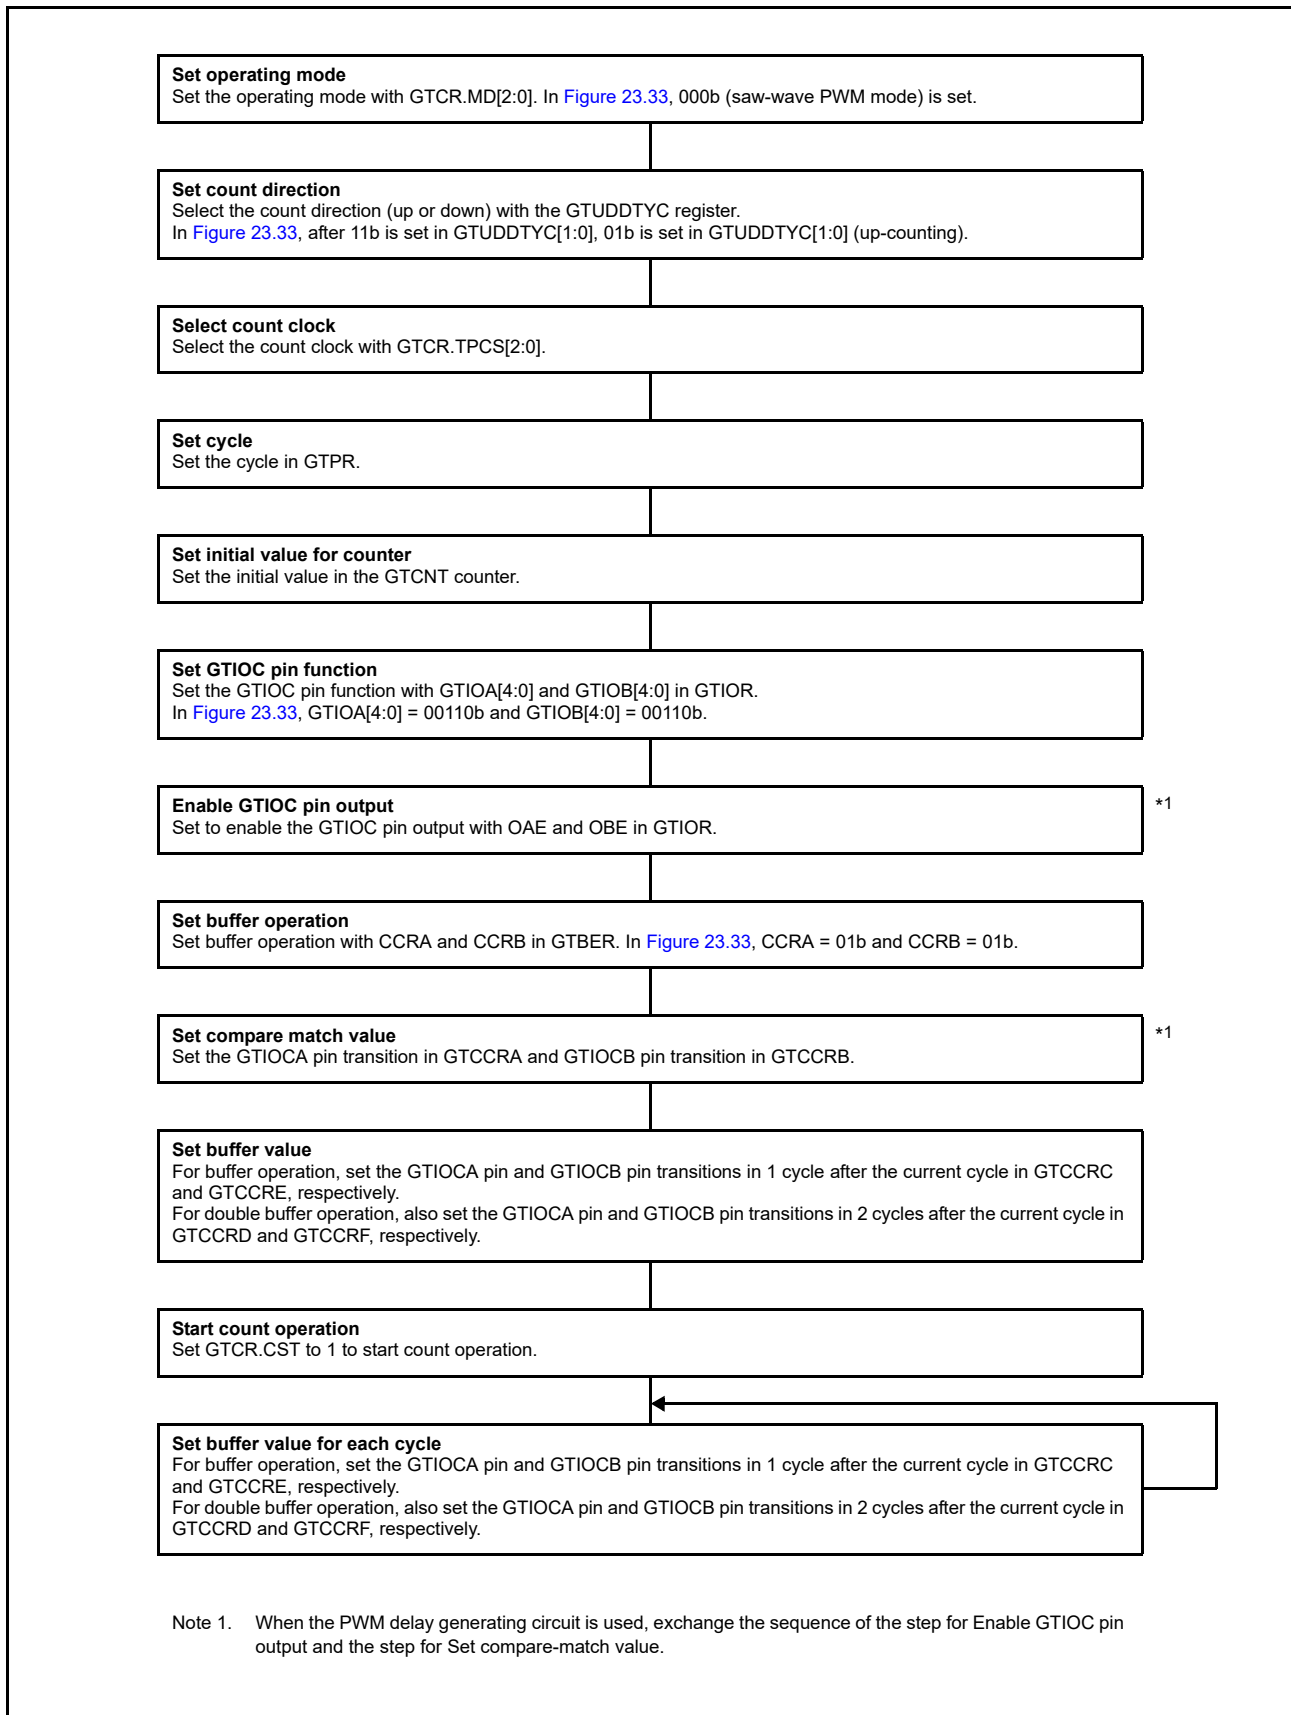

Figure 23.34 Example setting for saw-wave PWM mode

### 23.3.3.2 Saw-wave one-shot pulse mode

The saw-wave one-shot pulse mode is a mode in which the cycle is set in GTPR. The GTCNT counter performs saw-wave (half-wave) operation and a PWM waveform is output to the GTIOCA or GTIOCB pin at a compare match of GTCCRA or GTCCRB with buffer operation fixed.

Buffer operation in saw-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from:

- GTCCRC to GTCCRA at the cycle end
- GTCCRE to GTCCRB at the cycle end
- GTCCRD to temporary register A at the cycle end
- GTCCRF to temporary register B at the cycle end
- Temporary register A to GTCCRA at a GTCCRA compare match
- Temporary register B to GTCCRB at a GTCCRB compare match.

The pin output value can be selected from low output, high output, or toggle output separately for a compare match and the cycle end according to the GTIOR setting. When the GTBER.CCRSWT bit is set to 1 while the count operation is stopped, the buffer is transferred forcibly from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B. By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

[Figure 23.35](#) shows an example of saw-wave one-shot pulse mode operation, and [Figure 23.36](#) shows an example setting for saw-wave one-shot pulse mode.

**Figure 23.35** Example of saw-wave one-shot pulse mode operation with up-counting, low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

Figure 23.36 Example setting for saw-wave one-shot pulse mode

### 23.3.3.3 Triangle-wave PWM mode 1 (32-bit transfer at trough)

The triangle-wave PWM mode 1 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOC0A or GTIOC0B pin when a GTCCRA or GTCCRB compare match occurs. Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 23.37 shows an example of a triangle-wave PWM mode 1 operation, and Figure 23.38 shows an example setting for a triangle-wave PWM mode 1.

**Figure 23.37** Example of triangle-wave PWM mode 1 operation with buffer operation, low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB register compare match, and output retained at cycle end

Figure 23.38 Example setting for triangle-wave PWM mode 1

### 23.3.3.4 Triangle-wave PWM mode 2 (32-bit transfer at crest and trough)

Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2 the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCA or GTIOCB pin when a GTCCRA or GTCCRB compare match occurs. The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 23.39 shows an example of triangle-wave PWM mode 2 operation, and Figure 23.40 shows an example setting for triangle-wave PWM mode 2.

**Figure 23.39** Example of triangle-wave PWM mode 2 operation with buffer operation, low output from the GTIOCA pin and high output from the GTIOCB pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

Figure 23.40 Example setting for triangle-wave PWM mode 2

### 23.3.3.5 Triangle-wave PWM mode 3 (64-bit transfer at trough)

The triangle-wave PWM mode 3 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCA or GTIOCB pin at a compare match of GTCCRA or GTCCRB with buffer operation fixed. Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from:

- GTCCRC to GTCCRA at the trough
- GTCCRE to GTCCRB at the trough
- GTCCRD to temporary register A at the trough
- GTCCRF to temporary register B at the trough
- Temporary register A to GTCCRA at the crest
- Temporary register B to GTCCRB at the crest.

The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting. By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

[Figure 23.41](#) shows an example of triangle-wave PWM mode 3 operation, and [Figure 23.42](#) shows an example setting for triangle-wave PWM mode 3.

**Figure 23.41** Example of triangle-wave PWM mode 3 operation with low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

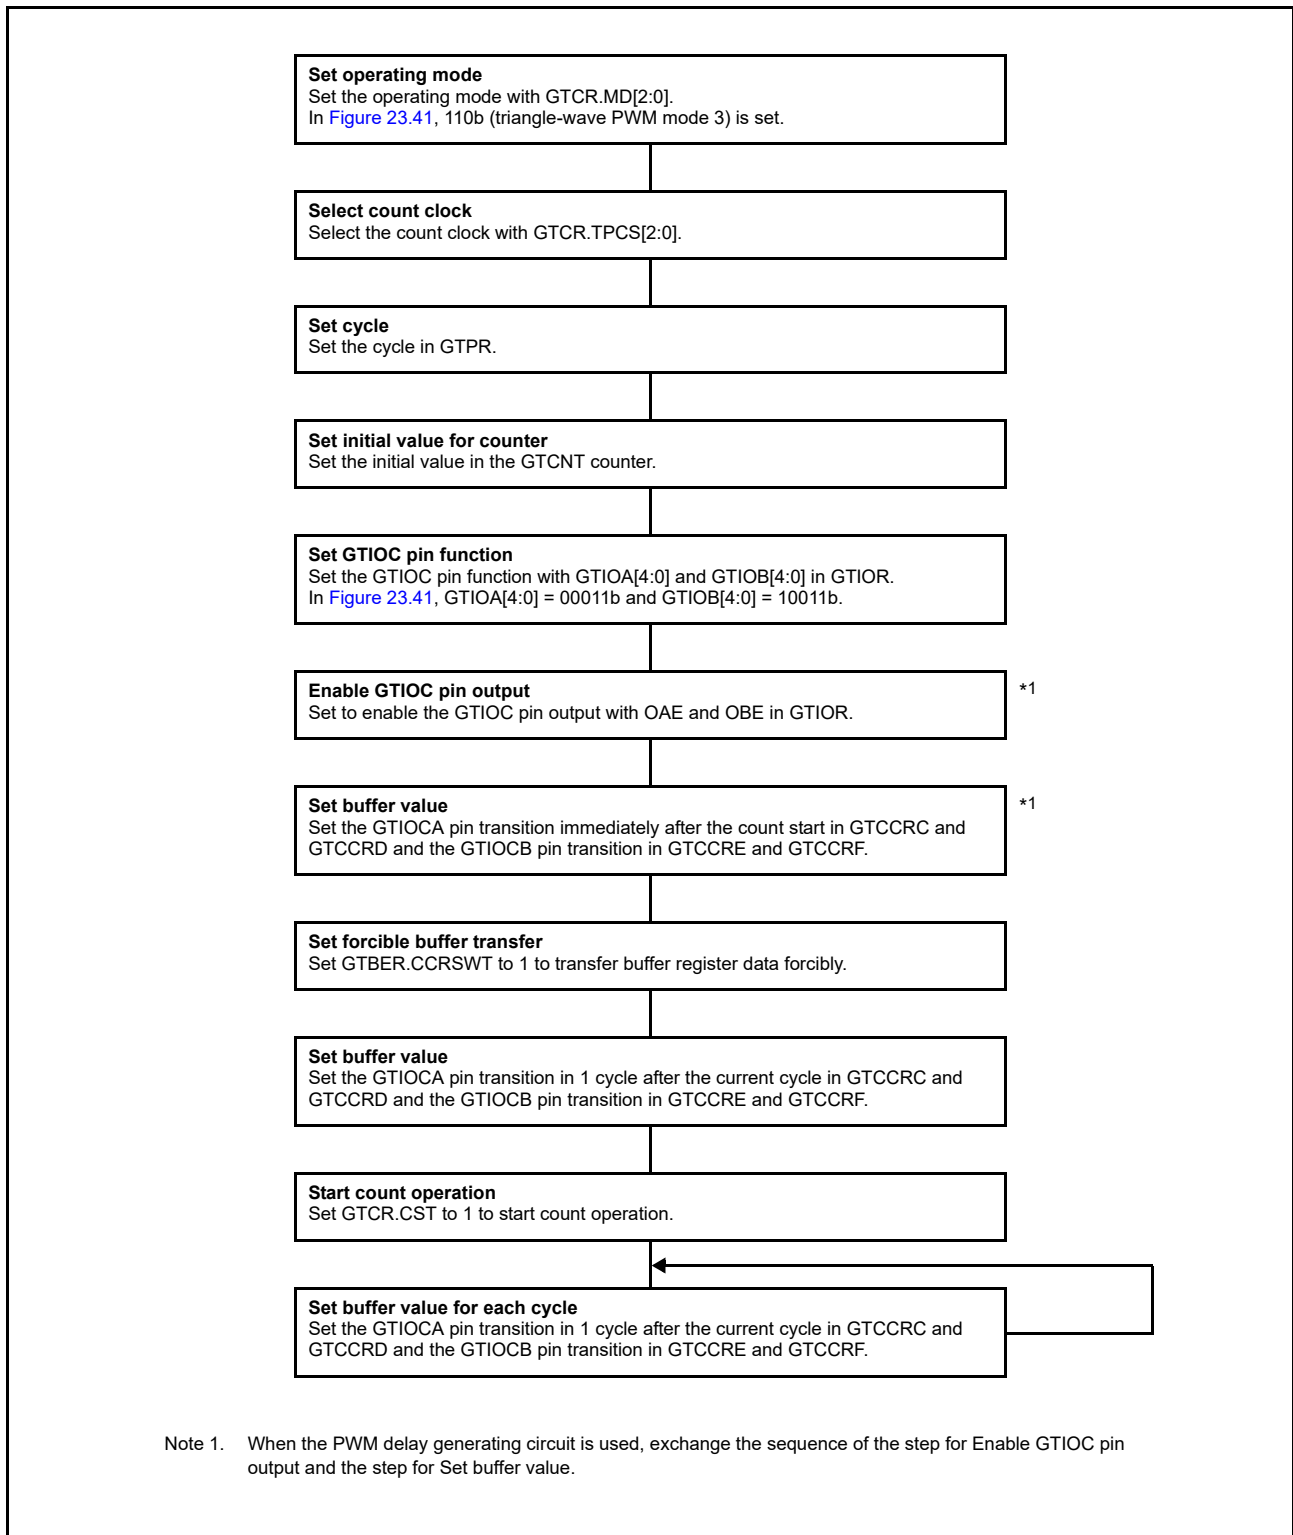

Figure 23.42 Example setting for triangle-wave PWM mode 3

### 23.3.4 Automatic Dead Time Setting Function

By setting GTDTCR, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (GTCCRA value) and specified dead time values (GTDVU and GTDVD values) can automatically be set to GTCCRB. The automatic dead time setting function can be used in saw-wave one-shot pulse mode and all the triangle PWM modes.

Dead time can be separately set for the first half and second half of a waveform. Dead time for the transition in the first half of a negative waveform is set in GTDVU and that in the second half is set in GTDVD. The same dead time can also be set for the first and second halves by setting the GTDTCR.TDFER bit to 1.

GTDBU can be used as a buffer register of GTDVU, and GTDBD can be used as a buffer register of GTDVD. Buffer transfer is performed at a GTCNT overflow (during up-counting) or an underflow (during down-counting), or at a GTCNT counter clear for saw waves and at the trough for triangle waves.

The compare match value set by automatic dead time setting function can be confirmed by reading from GTCCRB. Writing to GTCCRB is prohibited when the automatic dead time setting function is used.

Dead time setting beyond the cycle is prohibited. When a dead time error occurs, the compare match values for positive and negative waveforms are adjusted to generate the waveforms with the dead time as shown in Table 23.6. The adjusted value for the negative waveform is set for GTCCRB automatically. The adjusted value for the positive waveform is used as internal signal and not set for GTCCRA.

In saw-wave one-shot pulse mode, when the adjusted value is beyond the cycle or the adjusted waveform toggle points are in disorder, the complementarity of the waveforms is not guaranteed.

In triangle-wave mode, when the dead time is beyond the cycle by setting the value  $GTCCR = 0$  or  $GTCCRA \geq GTPR$  for GTCCRA, the output protection function keeps the level of output. For details, see section 23.8.4, [Output Protection Function for GTIOC Pin Output](#). When the GTCCRA is  $GTCCRA \geq GTPR + GTDVm$ ,  $GTPR-1$  is set for GTCCRB as the upper limit value. The automatic dead time value setting to GTCCRB is performed at the next clock cycle count when registers used for calculating the automatic dead time value are updated.

The way to rewrite GTDVm differs by GPT channel number.

**Table 23.6 Compare match value after adjusting for dead time error**

| PWM output operating mode    | Count direction | First half/<br>Second half | Condition of dead time error | Compare match value after adjusting |                   |
|------------------------------|-----------------|----------------------------|------------------------------|-------------------------------------|-------------------|
|                              |                 |                            |                              | Positive waveform                   | Negative waveform |
| Saw-wave one-shot pulse mode | Up              | First half                 | $GTCCRA - GTDVU < 0$         | GTDVU                               | 0                 |
|                              |                 | Second half                | $GTCCRA + GTDVD > GTPR$      | $GTPR - GTDVD$                      | GTPR              |
|                              | Down            | First half                 | $GTCCRA + GTDVU > GTPR$      | $GTPR - GTDVU$                      | GTPR              |
|                              |                 | Second half                | $GTCCRA - GTDVD < 0$         | GTDVD                               | 0                 |
| Triangle-wave PWM mode 1/2/3 | Up              | First half                 | $GTCCRA - GTDVU \leq 0$      | $GTDVU + 1$                         | 1                 |
|                              | Down            | Second half                | $GTCCRA - GTDVD < 0$         | GTDVD                               | 0                 |

#### GPT32EH0 to GPT32EH3 and GPT32E4 to GPT32E7

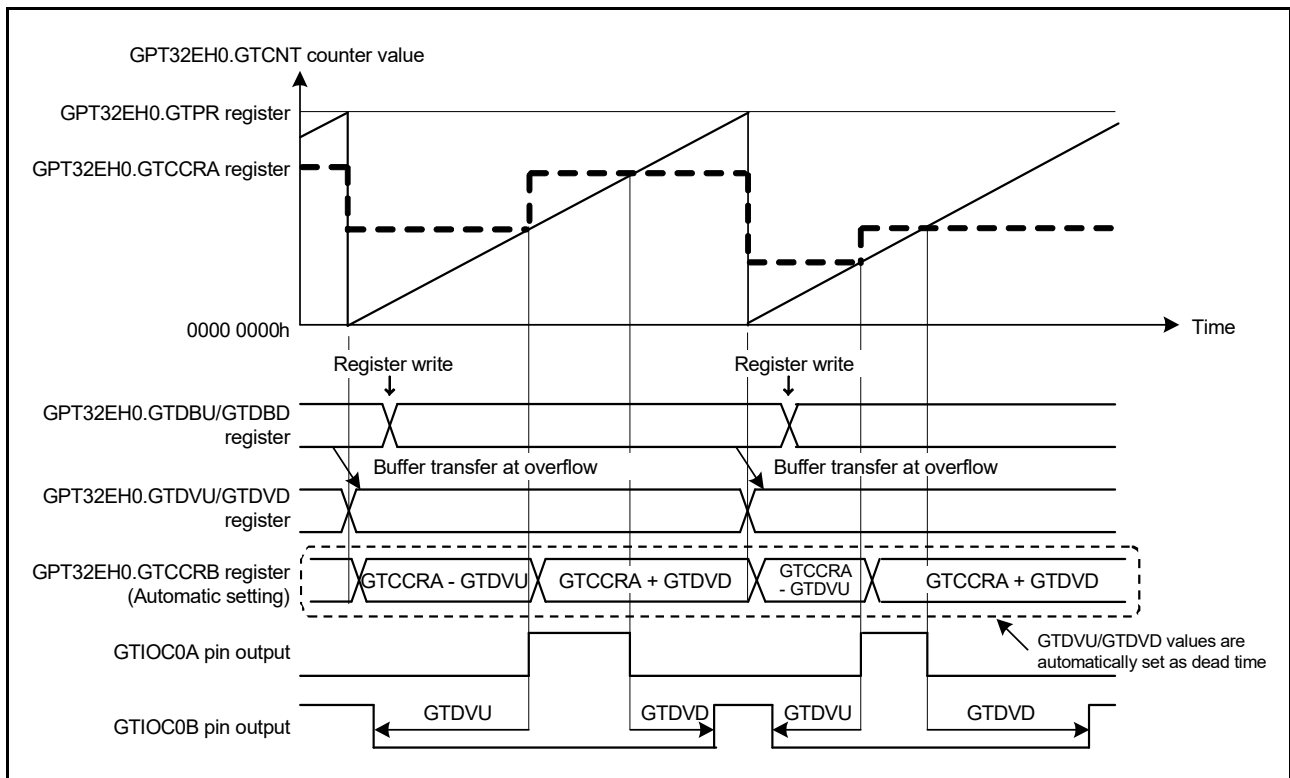

When GTDVn buffer operation is enabled, GTDBn can be written at anytime. GTDBn is transferred to GTDVn at the cycle end.

When GTDVn buffer operation is disabled, stop the GPT using the CST bit in the GTCR register before changing GTDVn to a new value.

#### GPT328 to GPT3213

While GPT is running, changing the GTDVU values is prohibited. To change GTDVU to a new value, first stop the GPT using the CST bit in the GTCR register.

Figure 23.43 to Figure 23.46 show examples of automatic dead time setting function operation for GPT32EH and GPT32E. Figure 23.47 and Figure 23.48 show the setting examples.

**Figure 23.43** Example of automatic dead time setting function operation with saw-wave one-shot pulse mode, up-counting, GTDVU and GTDVID set to buffer operation, and active-high

**Figure 23.44** Example of automatic dead time setting function operation with saw-wave one-shot pulse mode, down-counting, GTDVU and GTDVID set to buffer operation, and active-high

Figure 23.47 Example setting for automatic dead time setting function with saw-wave one-shot pulse mode, and triangle-wave PWM mode 3

**Figure 23.48 Example setting for automatic dead time setting function with triangle-wave PWM mode 1 or 2**

### 23.3.5 Count Direction Changing Function

The count direction of the GTCNT counter can be changed by modifying the UD bit in GTUDDTYC.

In saw-wave mode, if the UD bit in GTUDDTYC is modified during count operation, the count direction is changed at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.UD bit is modified while the count operation is stopped and the GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit modification is not reflected at the start of counting and the count direction is changed at an overflow or an underflow. If the UDF bit is set to 1 while the count operation is stopped, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

In triangle-wave mode, the count direction does not change when the UD bit in GTUDDTYC is modified during the count operation. Similarly, when the GTUDDTYC.UD bit is modified while the count operation is stopped and GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit value is not reflected to the count operation. If the GTUDDTYC.UDF bit is set to 1 while the count operation is stopped, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

If the count direction changes during a saw-wave count operation, the GTPR value after the start of up-counting is reflected in the count cycle during up-counting and the GTPR value before the start of down-counting is reflected during down-counting.

Figure 23.49 shows an example of count direction changing function operation.

Figure 23.49 Example of count direction changing function operation during buffer operation

### 23.3.6 Function of Output Duty 0% and 100%

The output duty of the GTIOCA pin and the GTIOCB pin are set to 0% or 100% by changing the GTUDDTYC.OADTY bit or GTUDDTYC.OBDTY bit.

In saw-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an overflow or an underflow. If the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is set to 1 while the count operation is stopped, the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit value at that time is reflected at the start of counting.

In triangle-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected at an underflow.

If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an underflow. If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 1, the output duty modification is reflected at the start of counting.

In performing 0%/100% duty operation, GPT internally continues to:

- Perform compare match operation
- Set compare match flag
- Output interrupt
- Perform buffer operation.

When the control is changed from 0% or 100% duty setting to compare match, the output value of GTIOCA pin at cycle end is decided by GTIOR.GTIOA[3:2] and GTUDDTYC.OADTYR. The output value of GTIOCB pin at cycle end is decided by GTIOR.GTIOB[3:2] and GTUDDTYC.OBDTYR.

When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 01b, the output pins output low at cycle end. When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 10b, the output pins output high at cycle end.

GTUDDTYC.OADTYR selects the value that is the object of output retained/toggled at cycle end, when GTIOR.GTIOm[3:2] are set to 00b (output retained at cycle end) or when GTIOR.GTIOm[3:2] are set to 11b (output toggled at cycle end). Table 23.7 shows the values of GTIOCA/GTIOCB pin output at cycle end.

**Table 23.7 Output values after releasing 0% or 100% duty setting (m = A, B)**

| GTIOR.GTIOm[3:2]                     | Compare match value at cycle end masked by 0% or 100% duty setting | GTUDDTYC.OmDTYR in duty 0% setting |   | GTUDDTYC.OmDTYR in duty 100% setting |   |
|--------------------------------------|--|------------------------------------|---|--------------------------------------|---|
|                                      |  | 0                                  | 1 | 0                                    | 1 |
| 00<br>(output retained at cycle end) | 0  | 0                                  | 0 | 1                                    | 0 |
|                                      | 1  | 0                                  | 1 | 1                                    | 1 |
| 01<br>(low output at cycle end)      | -  | 0                                  | 0 | 0                                    | 0 |
| 10<br>(high output at cycle end)     | -  | 1                                  | 1 | 1                                    | 1 |
| 11<br>(output toggled at cycle end)  | 0  | 1                                  | 1 | 0                                    | 1 |
|                                      | 1  | 1                                  | 0 | 0                                    | 0 |

Figure 23.50 shows an example of output duty 0% and 100% functions.

Figure 23.50 Example of output duty 0% and 100% functions

### 23.3.7 Hardware Count Start/Count Stop and Clear Operation

The GTCNT counter can be started, stopped, or cleared by the following hardware sources:

- External trigger input
- ELC event input
- GTIOCA/GTIOCB pin input.

#### 23.3.7.1 Hardware start operation

The GTCNT counter can be started by selecting a hardware source using GTSSR.

Figure 23.51 shows an example of a count start operation by a hardware source. Figure 23.52 shows the setting example.

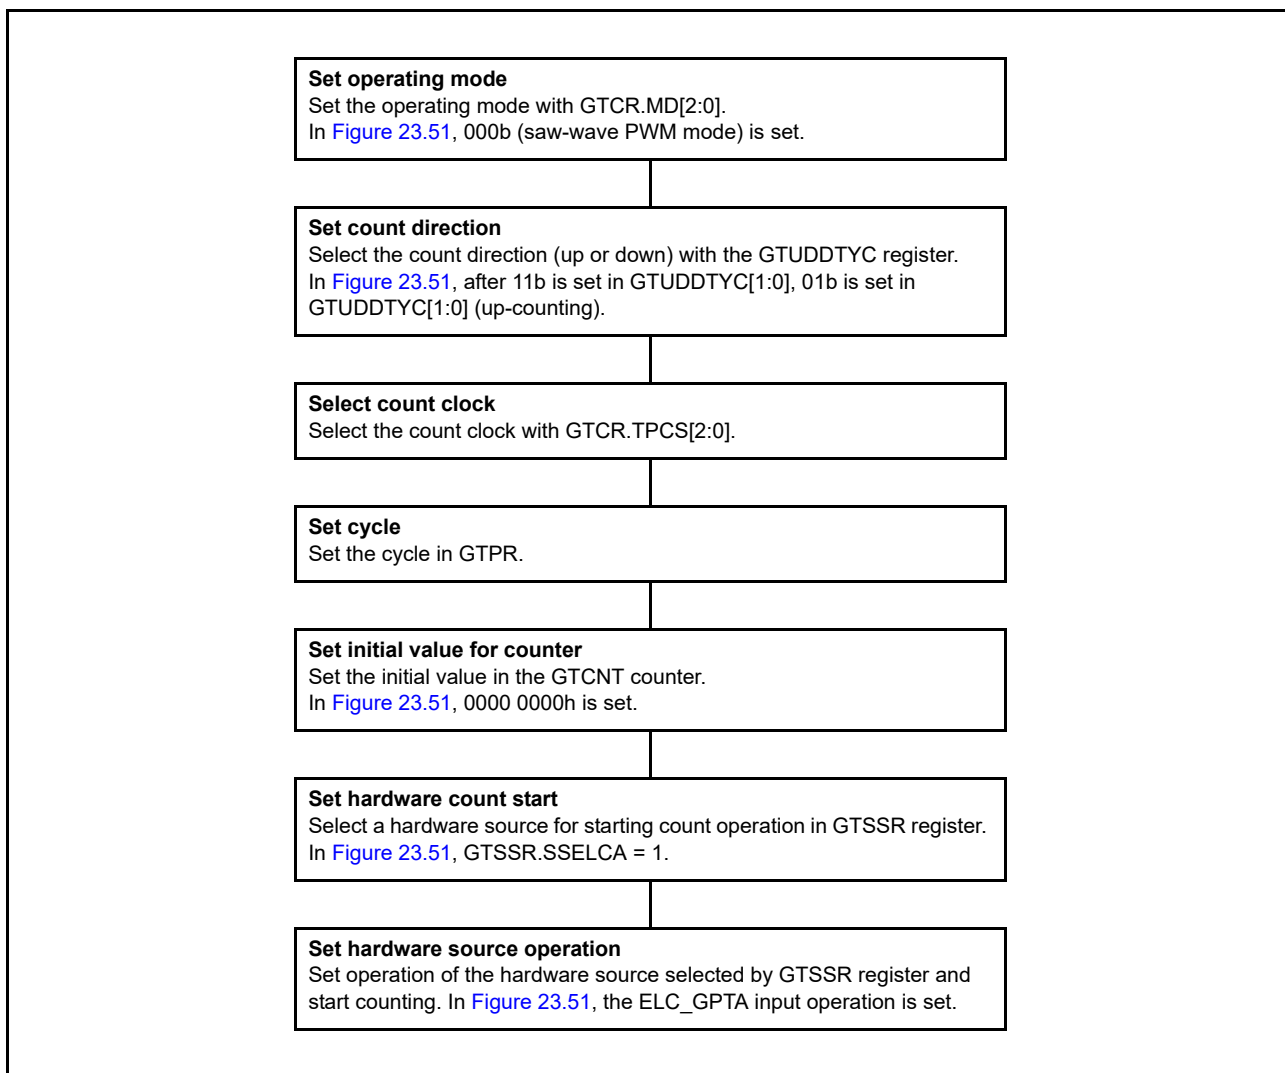

Figure 23.51 Example of count start operation by hardware source, started at the input of the signal from ELC\_GPTA

**Figure 23.52** Example setting for count start operation by a hardware source

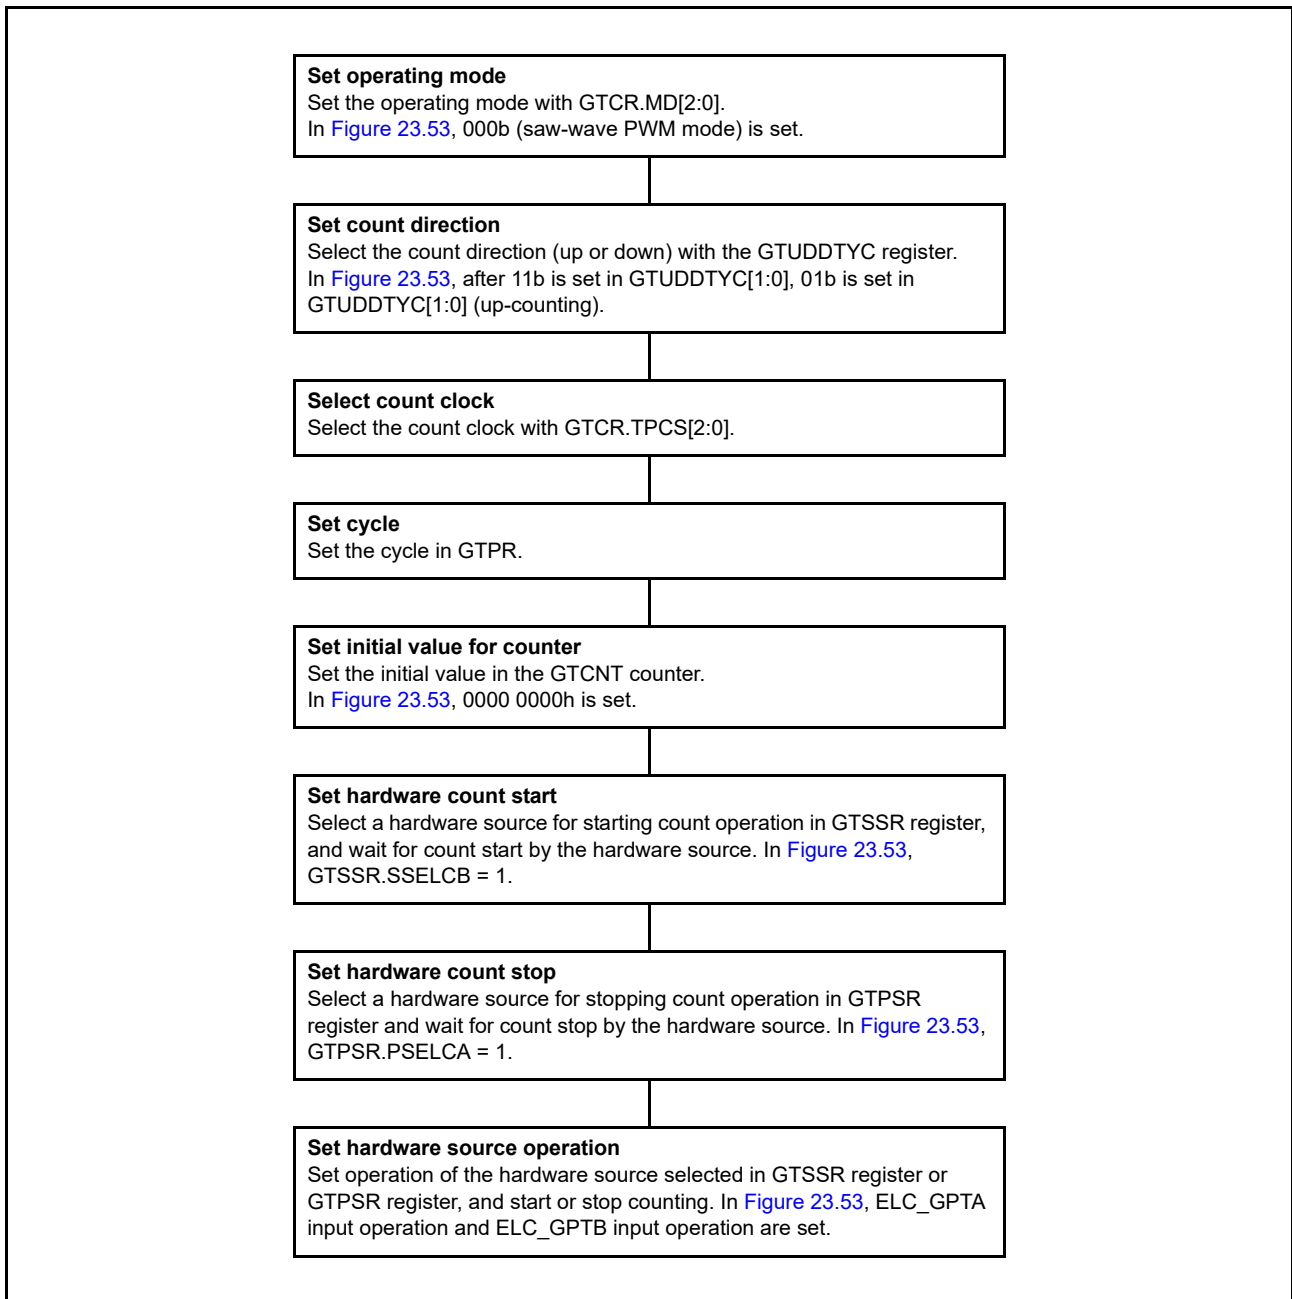

### 23.3.7.2 Hardware stop operation

The GTCNT counter can be stopped by selecting a hardware source using GTPSR.

Figure 23.53 shows an example of a count stop operation by a hardware source. Figure 23.54 shows the setting example. In this example, the count operation stops and restarts at the edge of the ELC event input.

**Figure 23.53** Example of count stop operation by a hardware source started by software, stopped at ELC\_GPTA input, and restarted at ELC\_GPTB input

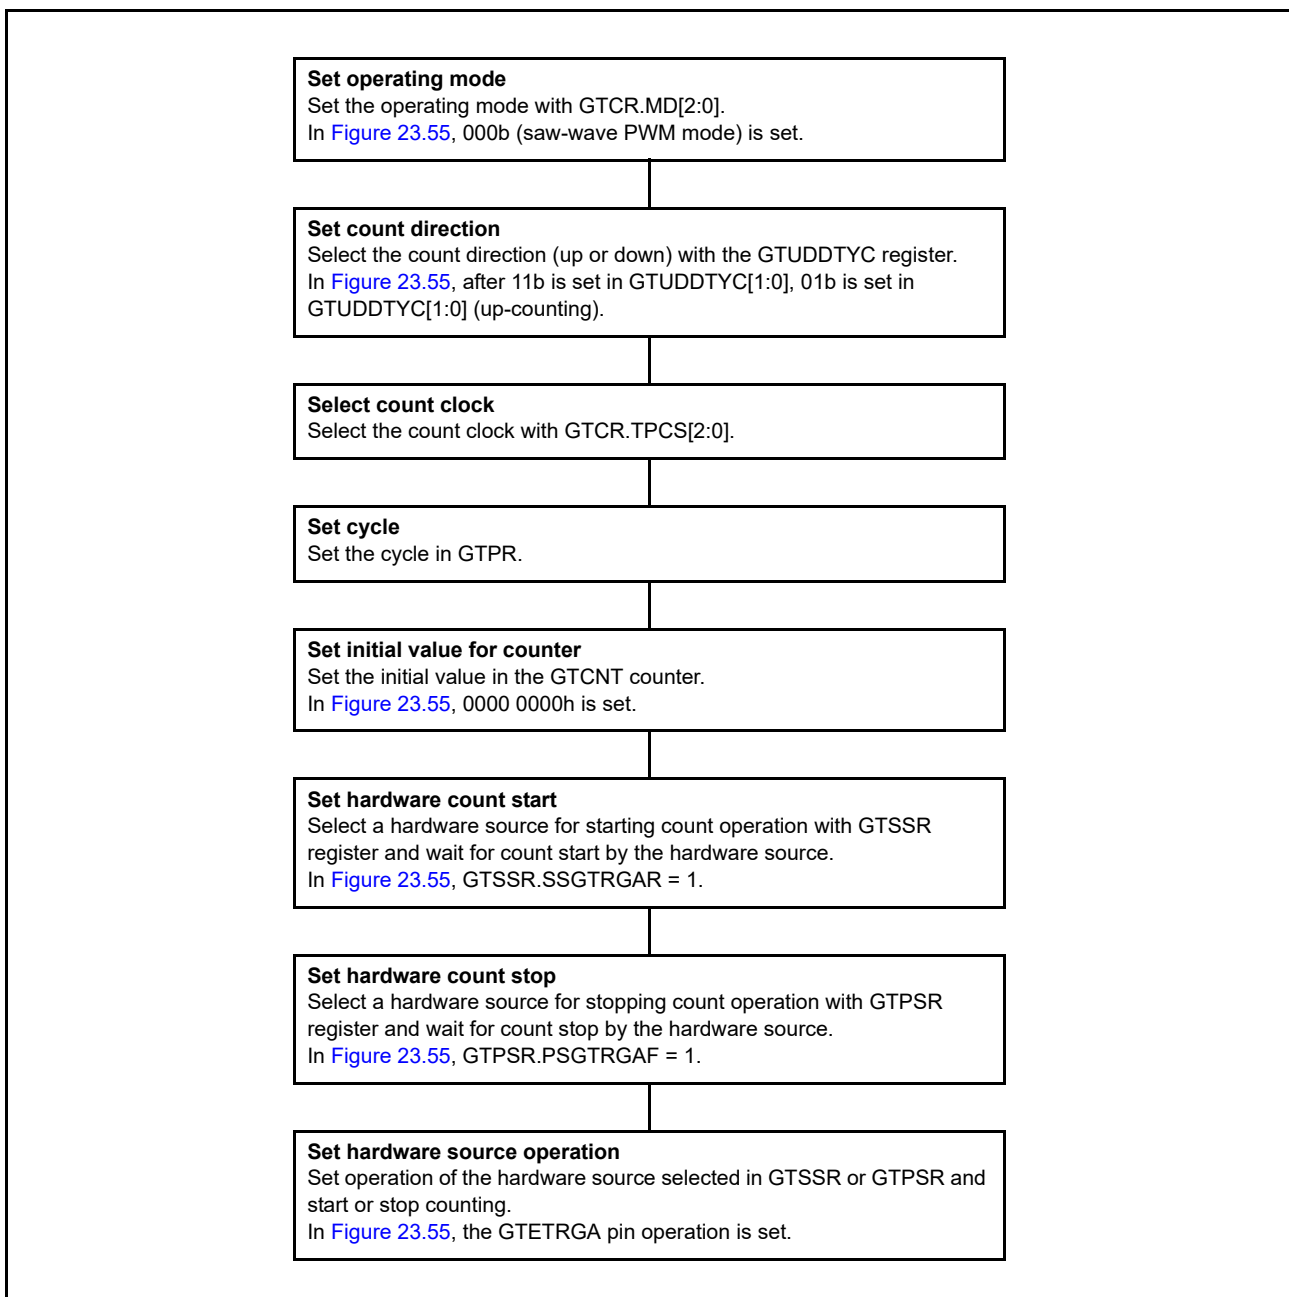

**Figure 23.54 Example setting for count stop operation by a hardware source**

Figure 23.55 shows an example of a count start/stop operation by a hardware source. Figure 23.56 shows the setting example. In this example, the counter operates during the high-level periods of the external trigger input GTETRGA.

**Figure 23.55** Example of count start/stop operation by hardware source, started on the rising edge of GTETRGA pin input and stopped on the falling edge of GTETRGA pin input

**Figure 23.56** Example setting for count start/stop operation by a hardware source

### 23.3.7.3 Hardware clear operation

The GTCNT counter can be cleared by selecting a hardware source using GTCSR. The GPTn\_OVF/GPTn\_UDF (n = 0 to 13) interrupt (overflow/underflow interrupt) is not generated when the GTCNT counter is cleared by a hardware source or by software.

Figure 23.57 and Figure 23.58 show examples of the GTCNT counter clearing operation by a hardware source. Figure 23.59 shows the setting example. In this example, the GTCNT counter starts at the edge of the ELC\_GPTA input, and the counter stops/clears at the edge of the ELC\_GPTB input.

Figure 23.57 Examples of count clearing operation by hardware source with saw wave up-counting, started at ELC\_GPTA input, and stopped/cleared at ELC\_GPTB input

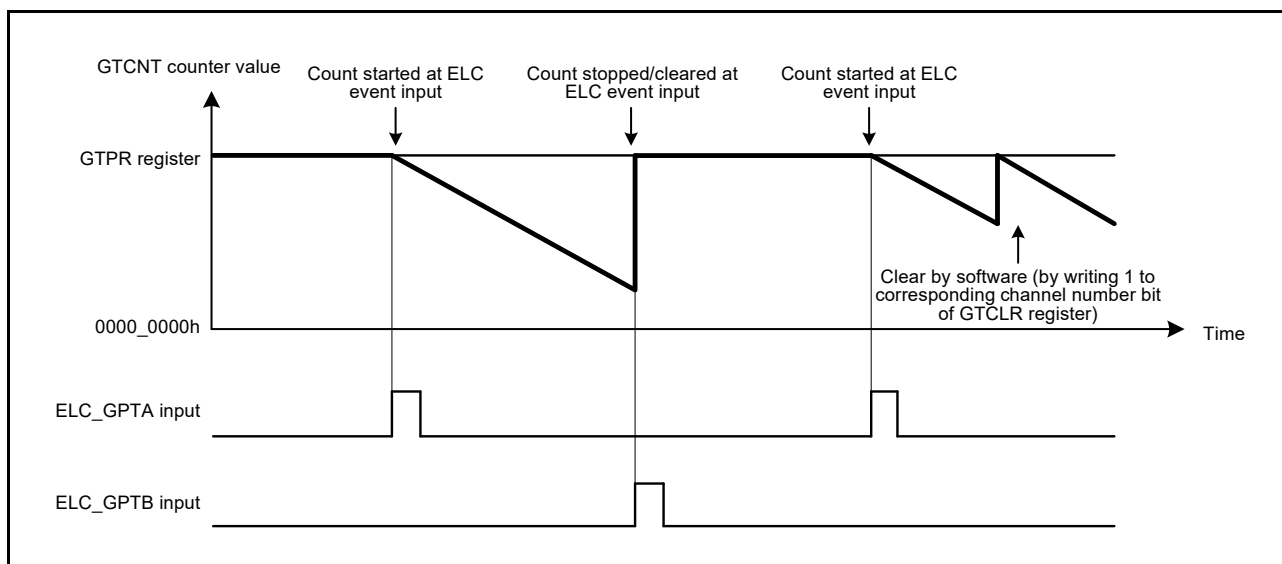

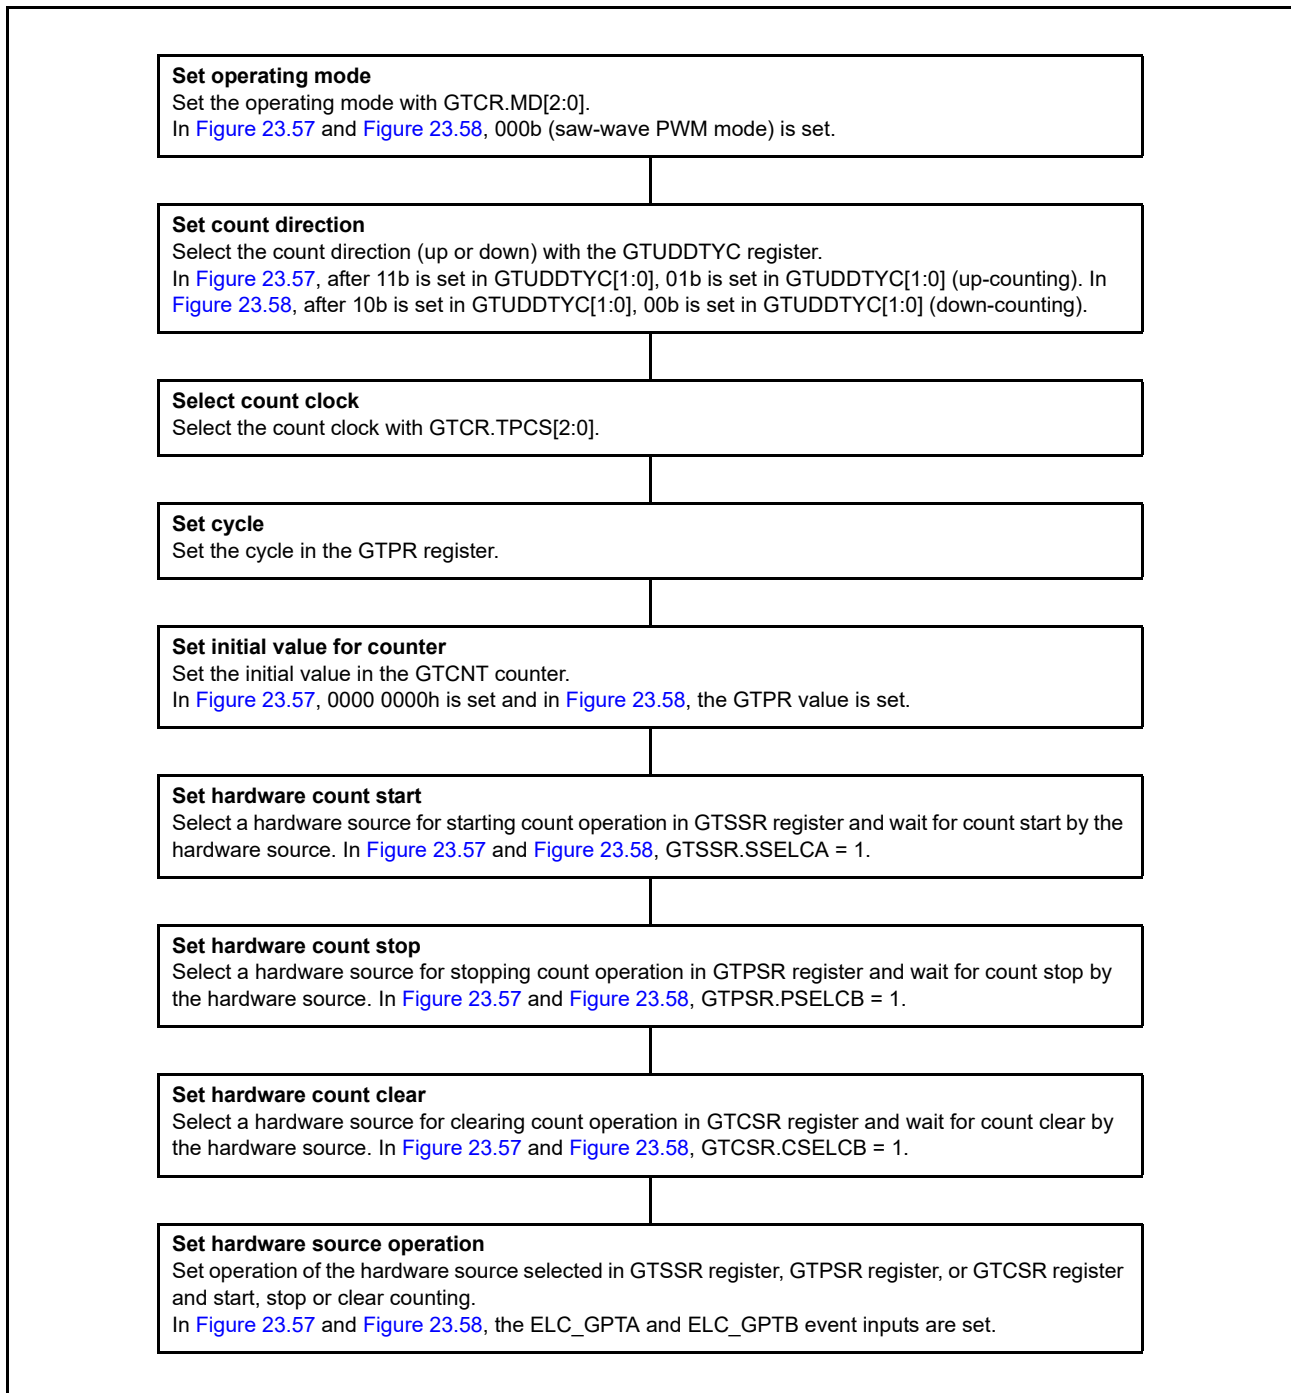

Figure 23.58 Examples of count clearing operation by hardware source with saw wave down-counting, started at ELC\_GPTA input, and stopped/cleared at ELC\_GPTB input

**Figure 23.59 Example setting for count clearing operation by a hardware source**

The GPTn\_OVF/GPTn\_UDF (n = 0 to 13) interrupt (overflow/underflow interrupt) is not generated when the counter is cleared by a hardware source or by software.

[Figure 23.60](#) shows the relationship between the counter clearing by a hardware source and the GPTn\_OVF (n = 0 to 13) interrupt.

**Figure 23.60** Relationship between counter clearing by hardware source and GPTn\_OVF (n = 0 to 13) interrupt

### 23.3.8 Synchronized Operation

Synchronized operation on channels such as a synchronized start, stop, and clear operation can be performed.

#### 23.3.8.1 Synchronized operation by software

The GTCNT counters can be started, stopped, and cleared on multiple channels by setting the associated GTSTR, GTSTP, or GTCLR bits simultaneously to 1.

Count start with a phase difference is possible by setting the initial value in the GTCNT counter and setting the associated GTSTR bits simultaneously to 1.

[Figure 23.61](#) shows an example of a simultaneous start, stop, and clear by software. [Figure 23.62](#) shows an example of phase start operation by software.

**Figure 23.61** Example of a simultaneous start, stop, and clear by software, with the same count cycle (GTPR register value)

**Figure 23.62** Example of software phase start with the same count cycle (GTPR register value)

### 23.3.8.2 Synchronized operation by hardware

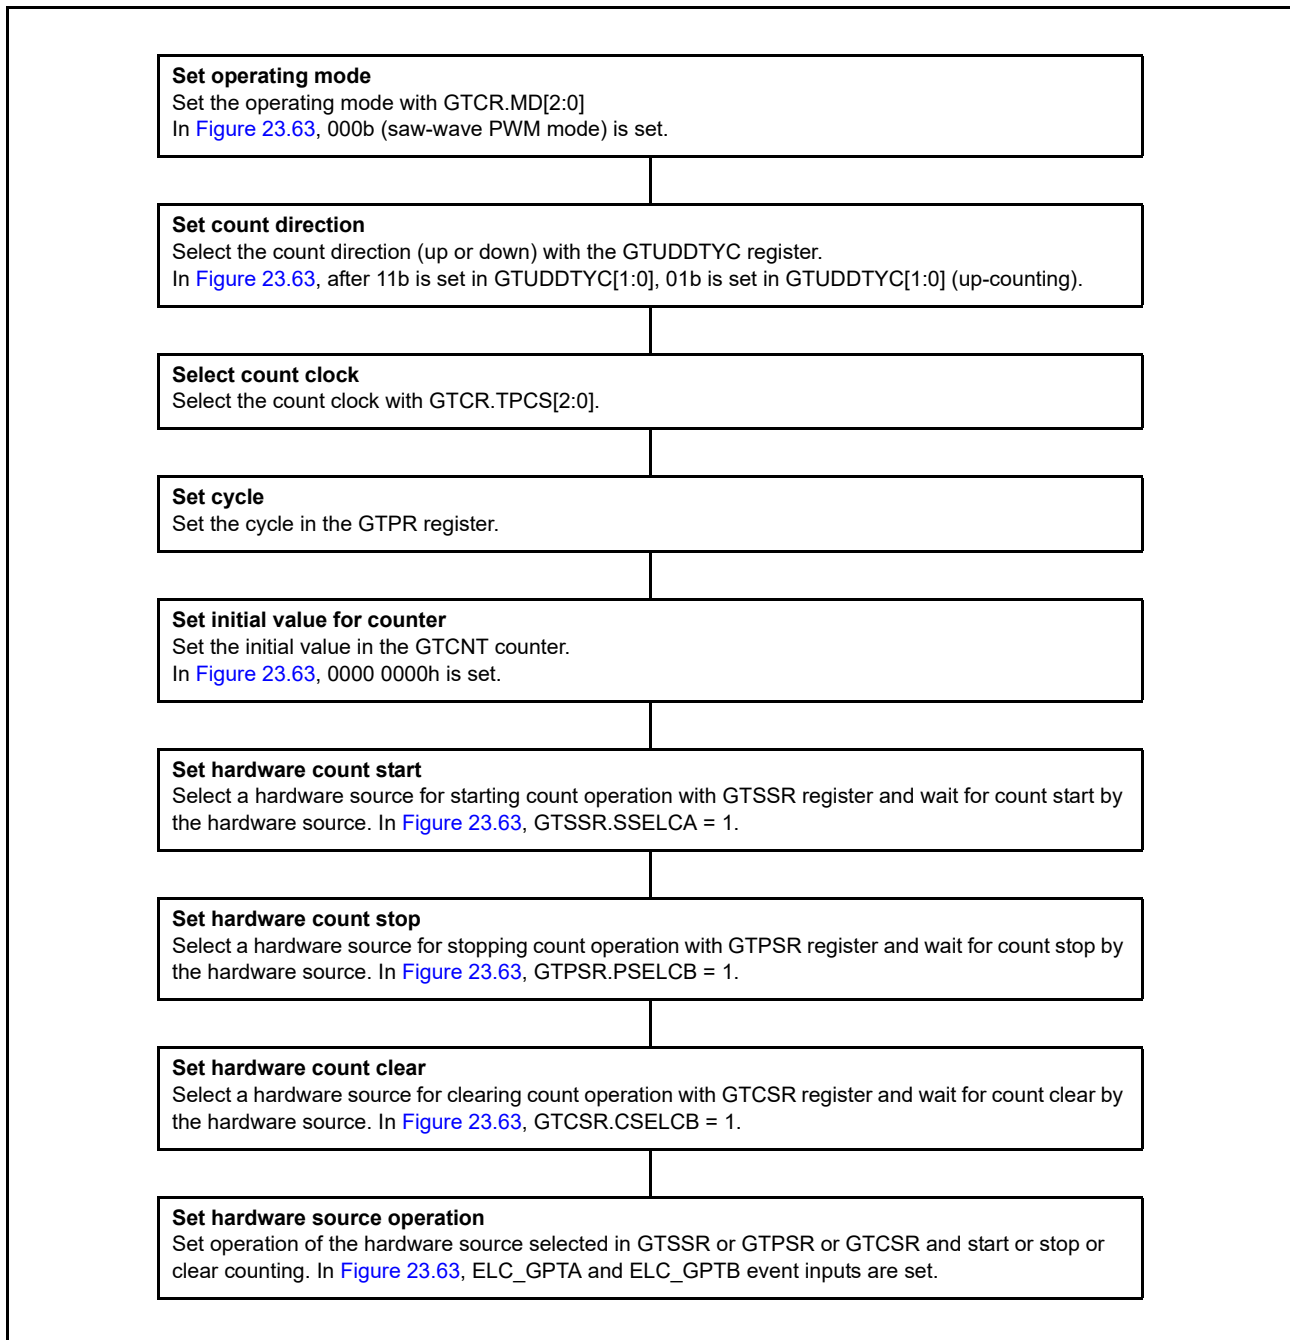

The GTCNT counters can be started simultaneously by the following hardware sources:

- External trigger input
- ELC event input.

Figure 23.63 shows an example of a simultaneous start, stop, and clear operation by a hardware source. Figure 23.64 shows the setting example.

**Figure 23.63** Example of a simultaneous start, stop, and clear by hardware source with the same count cycle (GTPR register value)

**Figure 23.64** Example setting for simultaneous start by a hardware source

### 23.3.9 PWM Output Operation Examples

#### (1) Synchronized PWM output

The GPT outputs 28 phases of linked PWM waveforms for a maximum of 14 channels by multiple GPTs.

Figure 23.65 shows an example in which four channels perform synchronized operation in saw-wave PWM mode and eight phases of PWM waveforms are output. The GTIOCA is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCB is set so that it outputs low as the initial value, high at a GTCCRB compare match, and low at the cycle end.

**Figure 23.65 Example of synchronized PWM output**

**(2) 3-phase saw-wave complementary PWM output**

Figure 23.66 shows an example in which three channels perform synchronized operation in saw-wave PWM mode and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, low at a GTCCRB compare match, and high at the cycle end.

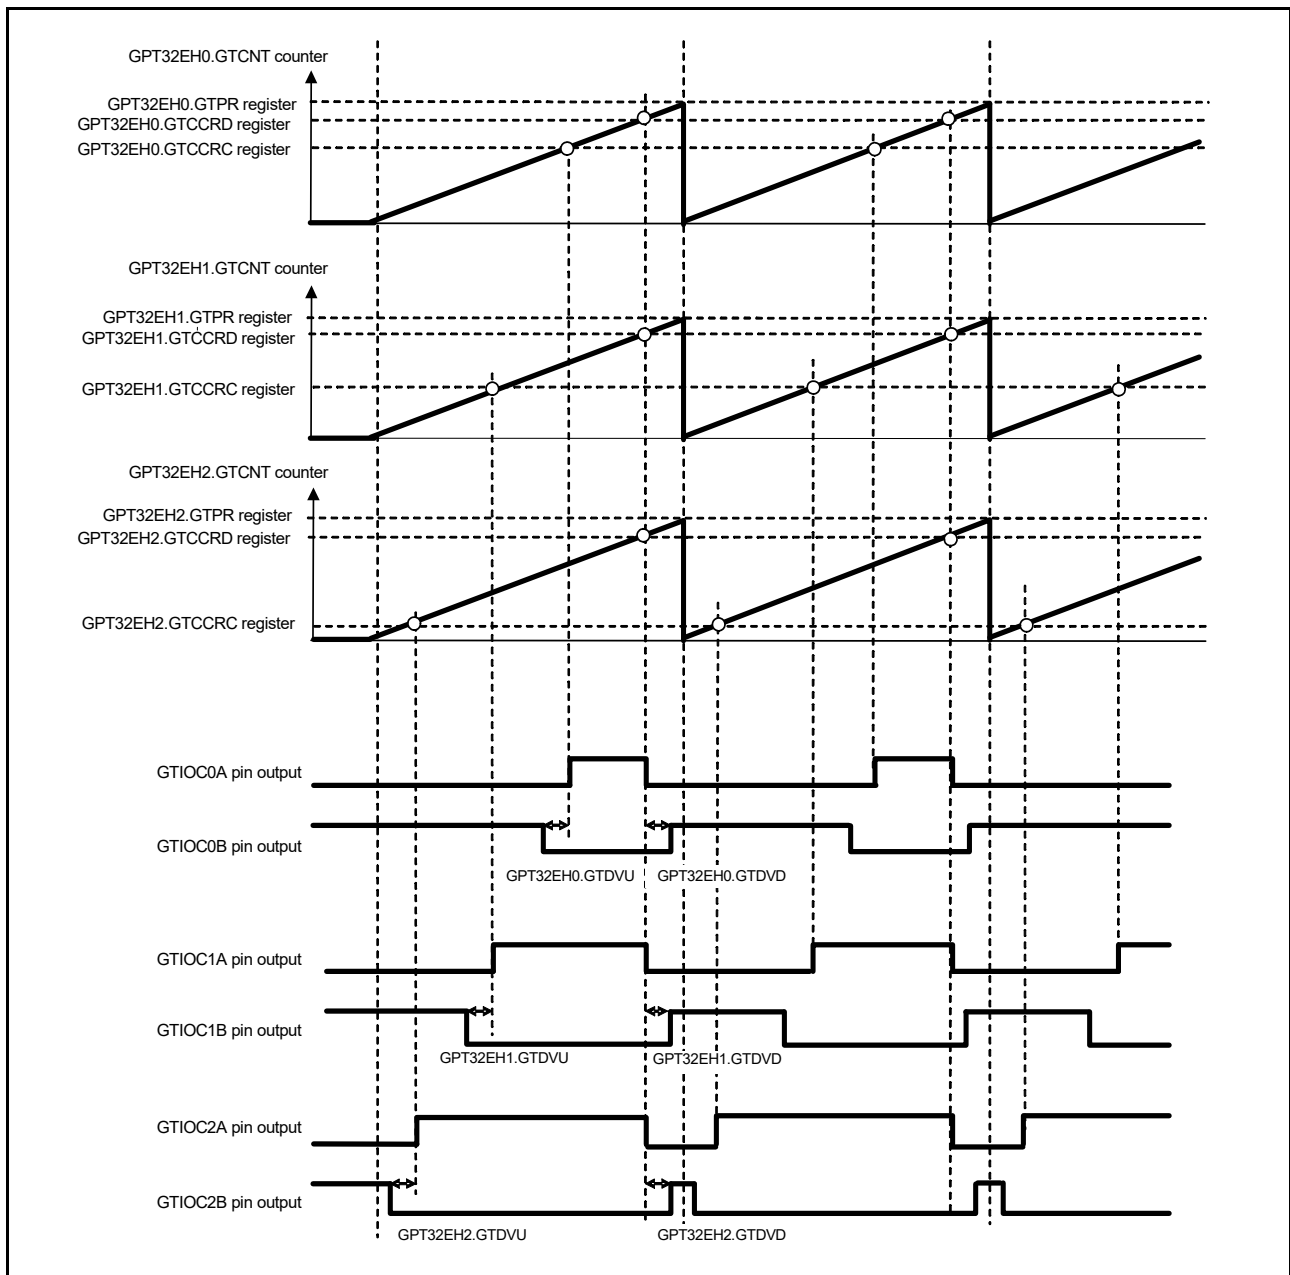

**Figure 23.66** Example of 3-phase saw-wave complementary PWM output

### (3) 3-phase saw-wave complementary PWM output with automatic dead time setting

Figure 23.67 shows an example in which three channels perform synchronized operation in saw-wave one-shot pulse mode with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

**Figure 23.67** Example of 3-phase saw-wave complementary PWM output with automatic dead time setting

(4) 3-phase triangle-wave complementary PWM output

Figure 23.68 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

**Figure 23.68 Example of 3-phase triangle-wave complementary PWM output**

(5) 3-phase triangle-wave complementary PWM output with automatic dead time setting

Figure 23.69 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

**Figure 23.69** Example of 3-phase triangle-wave complementary PWM output with automatic dead time setting

(6) 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting

Figure 23.70 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 3 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCA is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCB is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

**Figure 23.70** Example of 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting

### 23.3.10 Phase Counting Function

The phase difference between the GTIOCA and GTIOCB pin inputs is detected and the associated GTCNT counts up or counts down. The detectable phase difference is available in any combination with the relationship between the edge and the level of GTIOCA and GTIOCB pin inputs being set in the GTUPSR and GTDNSR registers. For details on count operation, see [section 23.3.1.1, Counter operation](#).

[Figure 23.71](#) to [Figure 23.80](#) show phase counting modes 1 to 5. [Table 23.8](#) to [Table 23.17](#) show conditions of up-counting or down-counting and lists settings for the GTUPSR and GTDNSR registers.

### 23.3.11 Output Phase Switching (GPT\_OPS)

GPT\_OPS provides a function for easy control of brushless DC motor operation using the Output Phase Switching Control Register (OPSCR).

GPT\_OPS outputs a PWM signal to be used for chopper control or level signal for each phase (U-positive phase/negative phase, V-positive phase/negative phase, W-positive phase/negative phase) of the 6-phase motor control. This function uses a soft setting value (OPSCR.UF, VF, WF) set by software or external signals detected by the Hall element, a PWM waveform of GPT32EH0.GTIOCA.

Figure 23.81 shows the GPT\_OPS control flow conceptual diagram.

**Figure 23.83 Example of 6-phase PWM output operation with chopper control**

Figure 23.84 shows an example of output disable control (6-phase PWM output operation).

**Figure 23.84** Example of group output disable control operation

### 23.3.11.1 Input selection and synchronization of external input signal

In the GPT\_ OPS control flow conceptual diagram shown in [Figure 23.81](#), (1) is a selection of input phase from software settings and external input by the OPSCR.FB bit.

When OPSCR.FB bit = 0, select the external input. Enable the input signal after synchronization with the GPT core clock (PCLKD). After carrying out noise filtering (optional), set the external input to the input phase of PWM (PWM of GPT32EH0.GTIOCA) using falling edge sampling with OPSCR.ALIGN bit = 1.

When OPSCR.FB bit = 1, select the soft setting (OPSCR.UF, VF, WF) with the value of the input phase of PWM (PWM of GPT32EH0.GTIOCA) using falling edge sampling with OPSCR.ALIGN bit = 1.

When OPSCR.ALIGN bit = 0, GPT\_ OPS operates with the input phase of PCLKD synchronization with either OPSCR.FB bit = 0 or OPSCR.FB bit = 1. However, in some situations, the PWM pulse width of the output U/V/W phases (PWM output mode) of switch timing (just before or just after) is shortened.

[Table 23.18](#) shows the input selection process and setting of associated OPSCR bits.

**Table 23.18** Input selection processing method

| OPSCR register |           | Selection of input phase sampling method<br>(U/V/W-phase)                                    | Synchronization input/output selection<br>process (GPT_OPS internal node name)                  |
|----------------|-----------|--|---|
| FB bit         | ALIGN bit |  |   |
| 0              | 1         | External Input at PWM Falling Edge Sampling<br>(PCLKD synchronization + falling edge sample) | Input Phase<br>Input U-Phase (gtu_sync)<br>Input V-Phase (gtv_sync)<br>Input W-Phase (gtw_sync) |
|                | 0         | External Input at PCLKD Synchronization Output<br>(PCLKD synchronization + through mode)     |   |
| 1              | 1         | Software Settings at PWM Falling Edge Sampling<br>(OPSCR.UF, VF, WF of falling edge sample)  |   |
|                | 0         | Software Setting Value Selection<br>(= OPSCR.UF/VF/WF value) (= PCLKD<br>synchronization)    |   |

### 23.3.11.2 Input sampling

The OPSCR.U, V, W bits indicate the PCLKD sampling results of the input selected by the OPSCR.FB bit.

When OPSCR.FB bit = 0 and after synchronization with the GPT core clock (PCLKD) and noise filtering (optional), OPSCR.U, V, W bits indicate the sampling results of the external input. When OPSCR.FB bit = 1, OPSCR.U, V, W bits have the value (OPSCR.UF, VF, WF) of the soft setting.

### 23.3.11.3 Input phase decode

In the GPT\_OPS control flow conceptual diagram shown in [Figure 23.81](#), (2) enables the 6-phase signals by decoding the input phase selected by the OPSCR.FB bit. The 6-phase enable signal is used for internal processing of GPT\_OPS.

[Table 23.19](#) shows the decode table of input phase.

**Table 23.19** Decode table of input phase

| Input phase (U/V/W)<br>(GPT_OPS internal node name) |               |               | 6-phase enable {U/V/W (Up/Lo)} by decoding input phase<br>(GPT_OPS internal node name) |              |              |              |              |              |
|---|---------------|---------------|--|--------------|--------------|--------------|--------------|--------------|
| Input U-phase                                       | Input V-phase | Input W-phase | U-phase (Up)   | U-phase (Lo) | V-phase (Up) | V-phase (Lo) | W-phase (Up) | W-phase (Lo) |
| (gtu_sync)  | (gtv_sync)    | (gtw_sync)    | (gtuup_en)   | (gtulo_en)   | (gtvup_en)   | (gtvlo_en)   | (gtwup_en)   | (gtwlo_en)   |
| 1   | 0             | 1             | 1  | 0            | 0            | 1            | 0            | 0            |
| 1   | 0             | 0             | 1  | 0            | 0            | 0            | 0            | 1            |
| 1   | 1             | 0             | 0  | 0            | 1            | 0            | 0            | 1            |

### 23.3.11.4 Output selection control

In the GPT\_OPS control flow conceptual diagram in [Figure 23.81](#), (3) represents the selection of the output waveform by setting the OPSCR register bit.

For output selection, the following bits are relevant:

- The OPSCR.EN bit controls whether to output the 6-phase output, or to stop
- The OPSCR.P and OPSCR.N bits can select from the level signal or PWM signal (chopper output) for the output phase
- The polarity of the output phase can be set to positive logic or negative logic by the OPSCR.INV bit.

[Table 23.20](#) and [Table 23.21](#) show the output selection control method using the OPSCR register bit.

Table 23.20 Output selection control method (positive phase)

| Enable-phase output control | Positive-phase output (P) control | Invert-phase output control | Output port name (positive phase = up)<br>(output selection internal node allocation) |  |
|-----------------------------|-----------------------------------|-----------------------------|---|--|
| OPSCR.EN bit                | OPSCR.P bit                       | OPSCR.INV bit               | GTOUUP<br>GTOVUP<br>GTOWUP  | Mode   |
| 0                           | x                                 | x                           | 0   | Output Stop<br>(External pin: Hi-Z)<br>GPT_OPS => 0 output |
| 1                           | 0                                 | 0                           | Level signal<br>(gtuup_en)<br>(gtvup_en)<br>(gtwup_en)                                | Level Output Mode<br>(Positive phase)<br>(Positive logic)  |
| 1                           | 0                                 | 1                           | Level signal<br>(~gtuup_en)<br>(~gtvup_en)<br>(~gtwup_en)                             | Level Output Mode<br>(Positive phase)<br>(Negative logic)  |
| 1                           | 1                                 | 0                           | PWM signal<br>(PWM & gtuup_en)<br>(PWM & gtvup_en)<br>(PWM & gtwup_en)                | PWM Output Mode<br>(Positive phase)<br>(Positive logic)    |
| 1                           | 1                                 | 1                           | PWM signal<br>(~(PWM & gtuup_en))<br>(~(PWM & gtvup_en))<br>(~(PWM & gtwup_en))       | PWM Output Mode<br>(Positive phase)<br>(Negative logic)    |

Table 23.21 Output selection control method (negative phase)

| Enable-phase output control | Negative-phase output (N) control | Invert-phase output control | Output port name (negative phase = Lo)<br>(output selection internal node allocation) |  |
|-----------------------------|-----------------------------------|-----------------------------|---|--|
| OPSCR.EN bit                | OPSCR.N bit                       | OPSCR.INV bit               | GTOULO<br>GTOVLO<br>GTOWLO  | Mode   |

| 1                           | 0                                 | 0                           | Level signal<br>(gtulo_en)<br>(gtvlo_en)<br>(gtwlo_en)                                | Level Output Mode<br>(Negative phase)<br>(Positive logic)  |
| 1                           | 0                                 | 1                           | Level signal<br>(~gtulo_en)<br>(~gtvlo_en)<br>(~gtwlo_en)                             | Level Output Mode<br>(Negative phase)<br>(Negative logic)  |
| 1                           | 1                                 | 0                           | PWM signal<br>(PWM & gtulo_en)<br>(PWM & gtvlo_en)<br>(PWM & gtwlo_en)                | PWM Output Mode<br>(Negative phase)<br>(Positive logic)    |
| 1                           | 1                                 | 1                           | PWM signal<br>(~(PWM & gtulo_en))<br>(~(PWM & gtvlo_en))<br>(~(PWM & gtwlo_en))       | PWM Output Mode<br>(Negative phase)<br>(Negative logic)    |

### 23.3.11.5 Output selection control (group output disable function)

When OPSCR.GODF = 1 and the signal value selected by the OPSCR.GRP bit is high (output disable request), the GPT\_OPS output pins are changed to Hi-Z asynchronously and the OPSCR.EN bit is set to 0 by the output disable request signal synchronized with PCLKD. For the return, set the OPSCR.EN to 1 after clearing the output disable request with software.

The timing of OPSCR.EN bit cleared to 0 is 3 PCLKD cycles after generating the output disable request. To perform output disable control reliably, allow at least 4 PCLKD cycles after generating the output disable request (by clearing the output disable request flag in POEG) until the output disable request is terminated. For an example of the operation of group output disable control, see [Figure 23.84](#).

#### 23.3.11.6 Event Link Controller (ELC) output

In the GPT\_OPS control flow conceptual diagram shown in [Figure 23.81](#), (5) outputs the Hall sensor input signal edge to the ELC.

The Hall sensor input edge signal is the logical OR of the rising and falling edge signals of each U-phase/V-phase/W-phase input sampled at PCLKD. That is, if the high period of each of the U-phase/V-phase/W-phase input is short in duration, the Hall sensor edge input signal is not output at that time.

When OPSCR.FB bit is 0, the Hall sensor input edge signal is the logical OR of the edge signals of the external input phase sampled at PCLKD.

When OPSCR.FB bit is 1, the Hall sensor input edge signal is the logical OR of the edge of the soft setting (OPSCR.UF, VF, WF) sampled at PCLKD.

See [Figure 23.82](#) to [Figure 23.84](#) for examples of the output signal to the ELC.

## 23.3.11.7 GPT\_OPS start operation setting flow

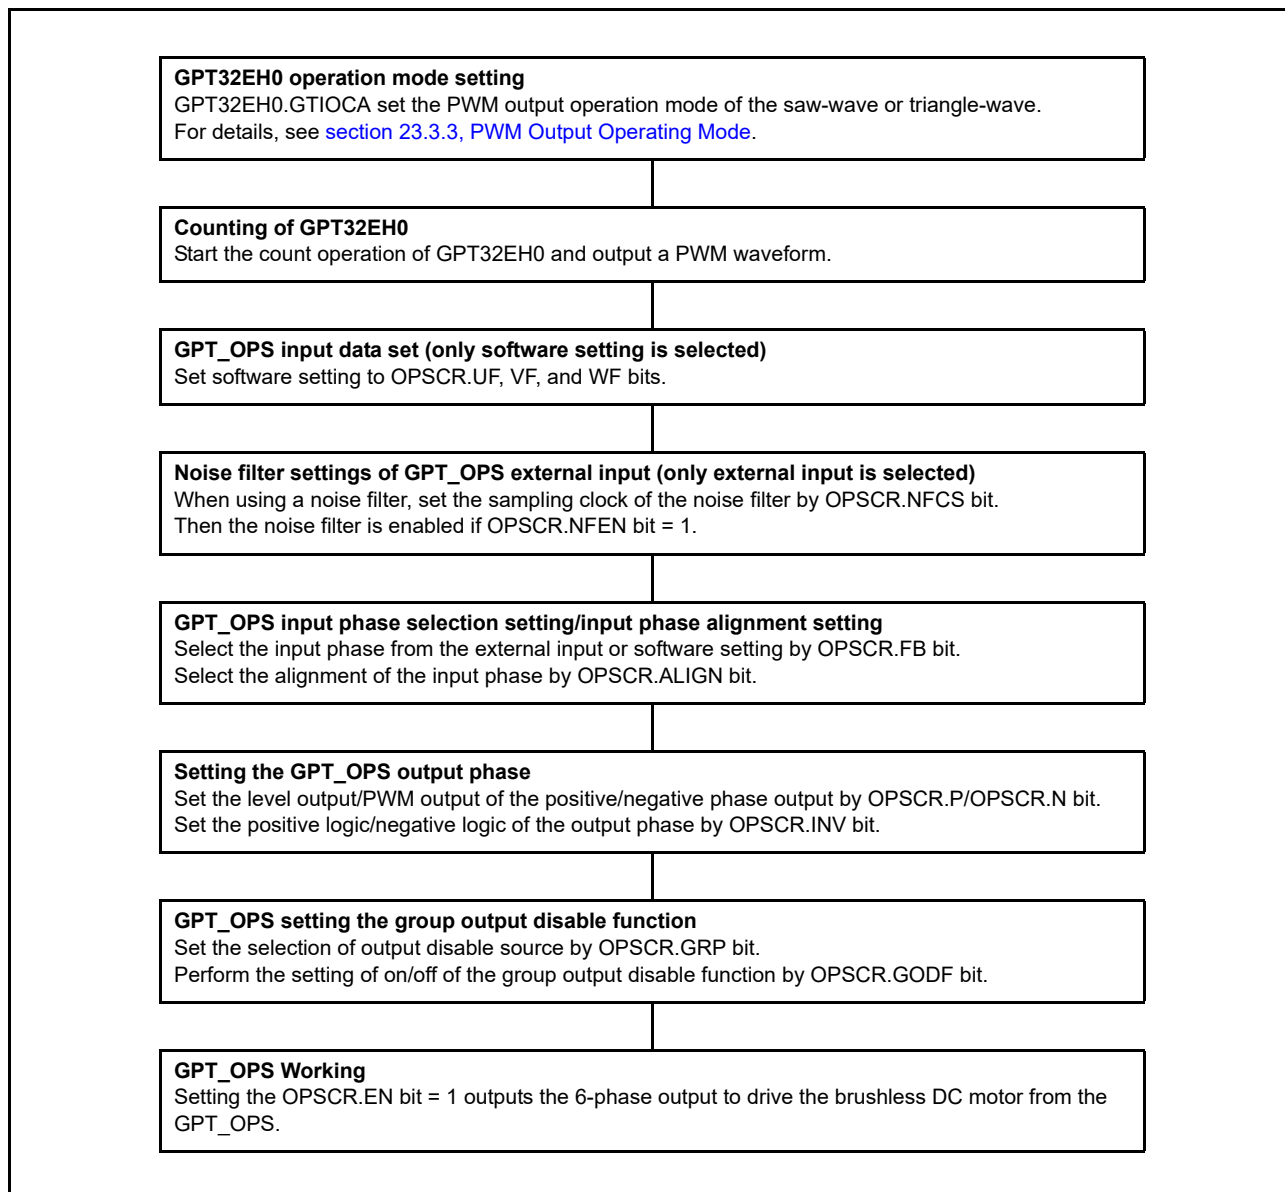

Figure 23.85 Example setting of GPT\_OPS start operation

## 23.4 Interrupt Sources

## 23.4.1 Overview

The GPT provides the following interrupt sources:

- GTCCR input capture/compare match
- GTADTR compare match
- GTCNT counter overflow (GTPR compare match)/underflow.

Each interrupt source has its own status flag. When an interrupt source signal is generated, the associated status flag in GTST is set to 1. The associated status flag in GTST can be cleared by writing 0. If flag set and flag clear occur at the same time, flag clear takes priority over flag set. These flags are automatically updated by the internal state. [Table 23.22](#) lists the GPT interrupt sources.

Table 23.22 Interrupt sources (1 of 4)

| Channel | Name        | Interrupt source                                      | Interrupt flag     | DMAC/DTC activation |
|---------|-------------|---|--------------------|---------------------|
| 0       | GPT0_CCMPA  | GPT32EH0.GTCCRA input capture/compare match           | TCFA               | Possible            |
|         | GPT0_CCMPB  | GPT32EH0.GTCCRB input capture/compare match           | TCFB               | Possible            |
|         | GPT0_CMPC   | GPT32EH0.GTCCRC compare match                         | TCFC               | Possible            |
|         | GPT0_CMPD   | GPT32EH0.GTCCRD compare match                         | TCFD               | Possible            |
|         | GPT0_CMPE   | GPT32EH0.GTCCRE compare match                         | TCFE               | Possible            |
|         | GPT0_CMPF   | GPT32EH0.GTCCRF compare match                         | TCFF               | Possible            |

|         | GPT11_OVF   | GPT3211.GTCNT overflow (GPT3211.GTPR compare match) | TCFPO          | Possible            |
|         | GPT11_UDF   | GPT3211.GTCNT underflow                             | TCFPU          | Possible            |
| 12      | GPT12_CCMPA | GPT3212.GTCCRA input capture/compare match          | TCFA           | Possible            |
|         | GPT12_CCMPB | GPT3212.GTCCRB input capture/compare match          | TCFB           | Possible            |
|         | GPT12_CMPC  | GPT3212.GTCCRC compare match                        | TCFC           | Possible            |
|         | GPT12_CMPD  | GPT3212.GTCCRD compare match                        | TCFD           | Possible            |
|         | GPT12_CMPE  | GPT3212.GTCCRE compare match                        | TCFE           | Possible            |
|         | GPT12_CMPF  | GPT3212.GTCCRF compare match                        | TCFF           | Possible            |
|         | GPT12_OVF   | GPT3212.GTCNT overflow (GPT3212.GTPR compare match) | TCFPO          | Possible            |
|         | GPT12_UDF   | GPT3212.GTCNT underflow                             | TCFPU          | Possible            |
| 13      | GPT13_CCMPA | GPT3213.GTCCRA input capture/compare match          | TCFA           | Possible            |
|         | GPT13_CCMPB | GPT3213.GTCCRB input capture/compare match          | TCFB           | Possible            |
|         | GPT13_CMPC  | GPT3213.GTCCRC compare match                        | TCFC           | Possible            |
|         | GPT13_CMPD  | GPT3213.GTCCRD compare match                        | TCFD           | Possible            |
|         | GPT13_CMPE  | GPT3213.GTCCRE compare match                        | TCFE           | Possible            |
|         | GPT13_CMPF  | GPT3213.GTCCRF compare match                        | TCFF           | Possible            |
|         | GPT13_OVF   | GPT3213.GTCNT overflow (GPT3213.GTPR compare match) | TCFPO          | Possible            |
|         | GPT13_UDF   | GPT3213.GTCNT underflow                             | TCFPU          | Possible            |

**(1) GPTn\_ADTRGA interrupt (n = 0 to 7)**

When the GTCNT counter value matches with the GTADTRA register, an interrupt request is generated under the following conditions:

- In up-counting, the interrupt enable bit (ADTRAUEN) in the GTINTAD register is 1
- In down-counting, the interrupt enable bit (ADTRADEN) in the GTINTAD register is 1.

In event count operation, this interrupt request is not generated.

**(2) GPTn\_ADTRGB interrupt (n = 0 to 7)**

When the GTCNT counter value matches with the GTADTRB register, an interrupt request is generated under the following conditions:

- In up-counting, the interrupt enable bit (ADTRBUEN) in the GTINTAD register is 1
- In down-counting, the interrupt enable bit (ADTRBDEN) in the GTINTAD register is 1.

In event count operation, this interrupt request is not generated.

### (3) GPTn\_CCMPA interrupt (n = 0 to 13)

An interrupt request is generated under the following conditions:

- When the GTCCRA register functions as a compare match register, the GTCNT counter value matches with the GTCCRA register.
- When the GTCCRA register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRA register.

### (4) GPTn\_CCMPB interrupt (n = 0 to 13)

An interrupt request is generated under the following conditions:

- When the GTCCRB register functions as a compare match register, the GTCNT counter value matches with the GTCCRB register
- When the GTCCRB register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRB register.

### (5) GPTn\_CMPC interrupt (n = 0 to 13)

An interrupt request is generated under the following condition:

- When the GTCCRC register functions as a compare match register, the GTCNT counter value matches with the GTCCRC register.

A compare match is not performed and an interrupt is not requested under the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRC register).

### (6) GPTn\_CMPD interrupt (n = 0 to 13)

An interrupt request is generated under the following condition:

- When the GTCCRD register functions as a compare match register, the GTCNT counter value matches with the GTCCRD register.

A compare match is not performed and an interrupt is not requested under the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (buffer operation with the GTCCRD register).

### (7) GPTn\_CMPE interrupt (n = 0 to 13)

An interrupt request is generated under the following condition.

- When the GTCCRE register functions as a compare match register, the GTCNT counter value matches with the GTCCRE register.

A compare match is not performed and an interrupt is not requested under the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRE register).

### (8) GPTn\_CMPF interrupt (n = 0 to 13)

An interrupt request is generated under the following condition:

- When the GTCCRF register functions as a compare match register, the GTCNT counter value matches with the GTCCRF register.

A compare match is not performed and an interrupt is not requested under the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (buffer operation with the GTCCRF register).

#### (9) GPTn\_OVF interrupt (n = 0 to 13)

An interrupt request is generated under the following conditions:

- In saw-wave mode, interrupt requests are enabled at overflows (when the GTCNT counter value changes from GTPR to 0 during up-counting)
- In triangle-wave mode, interrupt requests are enabled at crests (GTCNT changes from GTPR to GTPR-1)
- In counting by hardware sources, overflow (GTCNT changes from GTPR to 0 in up count) has occurred.

#### (10) GPTn\_UDF interrupt (n = 0 to 13)

An interrupt request is generated under the following conditions:

- In saw-wave mode, interrupt requests are enabled at underflows (when the GTCNT counter value changes from 0 to GTPR during down-counting)
- In triangle-wave mode, interrupt requests are enabled at troughs (GTCNT changes from 0 to 1)
- In counting by hardware sources, underflow (GTCNT changes from 0 to GTPR in down count) has occurred.

**Table 23.23** Interrupt signals, interrupt permission bits, and interrupt status flags

| Interrupt signal | Interrupt permission bit                         | Interrupt status flag                    |
|------------------|--|--|
| GPTn_UDF         | __ *1  | GTST[7] (TCFPU)                          |

| GPTn_CMPC        |  | GTST[2] (TCFC)                           |
| GPTn_CCMPB       |  | GTST[1] (TCFB)                           |
| GPTn_CCMPA       |  | GTST[0] (TCFA)                           |

Note 1. Interrupt is always permitted.

### 23.4.2 DMAC/DTC Activation

The DMAC and DTC can be activated by the interrupt in each channel. For details, see [section 14, Interrupt Controller Unit \(ICU\)](#), and [section 18, Data Transfer Controller \(DTC\)](#).

### 23.4.3 Interrupt and A/D Conversion Request Skipping Function

By setting the GTITC register, the GTCNT counter overflow (GTPR compare match) interrupt (GPTn\_OVF) and underflow interrupt (GPTn\_UDF) can be skipped. Other interrupts and A/D converter start request signals can be skipped in coordination with the GPTn\_OVF/GPTn\_UDF skipping function.

The interrupt request skipping function only depends on the setting of GTITC register and is independent of the setting of interrupt permission bits in the GTINTAD register.

When both troughs and crests are counted and skipped in triangle-wave mode, if the number of times of skipping is odd, GPTn\_OVF/GPTn\_UDF interrupt requests cannot be generated at troughs only or at crests only depending on the

skipping counter start timing. To count both troughs and crests and generate the GPTn\_OVF/GPTn\_UDF interrupts at troughs only or crests only in triangle-wave mode, you must set an even number of skips.

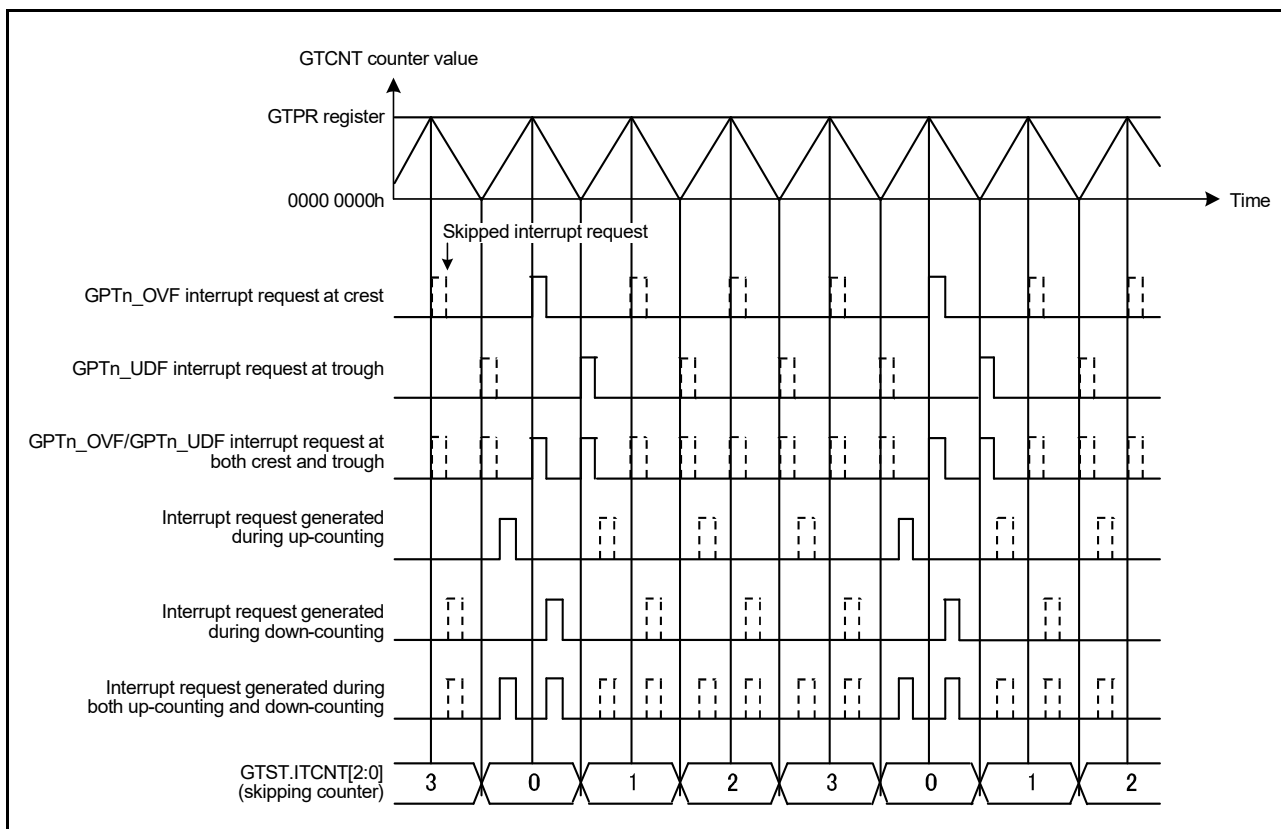

Similarly, in saw-wave mode, when both overflows and underflows are counted and skipped with the count direction changed, GPTn\_OVF interrupt requests cannot be generated on either overflows or underflows only. To count both overflows and underflows with the count direction changed and generate the GPTn\_OVF/GPTn\_UDF interrupts on either overflows or underflows only in saw wave mode, you must first check the skipping state.

Before changing the skipping count, you must release the skipping count setting (GTITC.IVTC[1:0] bits = 00b).

Figure 23.86 to Figure 23.91 show examples of skipping function operation.

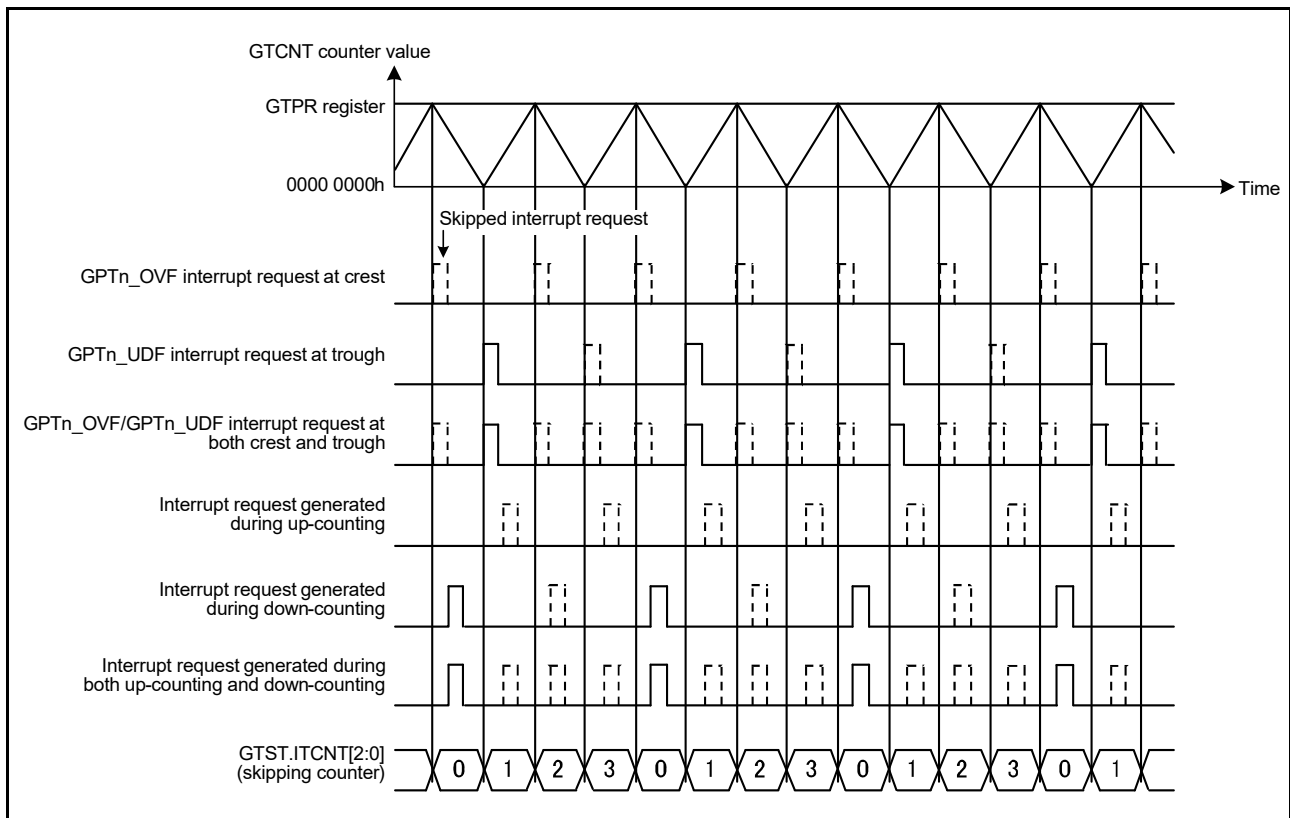

**Figure 23.86 Example of interrupt skipping function operation with triangle waves, counting and skipping crests, and skipping count = 2**

**Figure 23.87** Example of interrupt skipping function operation with triangle waves, counting and skipping troughs, and skipping count = 3

**Figure 23.88** Example of interrupt skipping function operation with triangle waves, counting and skipping both troughs and crests, and skipping count = 4

**Figure 23.89** Example of interrupt skipping function operation with triangle waves, counting and skipping both troughs and crests, skipping count = 3, and skipping started at up-counting

**Figure 23.90** Example of interrupt skipping function operation with triangle waves, counting and skipping both troughs and crests, skipping count = 3, and skipping started at down-counting

**Figure 23.91** Example of interrupt skipping function operation with saw waves, operation with count direction changed, counting and skipping both overflows and underflows, and skipping count = 4

### 23.5 A/D Converter Start Request

An A/D converter start request can be issued at a compare match between the GTCNT counter and GTADTRA or GTADTRB, and up-counting only, down-counting only, or both up-counting and down-counting can be specified.

In event count operation performing, A/D converter start requests interrupt cannot be generated. An A/D converter start request does not direct output to the A/D converter module but results in output to ELC as event signals.

GTADTRA and GTADTRB each have two buffer registers. Buffer operation with GTADTRA combined with GTADTBRA and GTADTDBRA, and buffer operation with GTADTRB combined with GTADTBRB and GTADTDBRB can be performed.

[Figure 23.92](#) shows an example of A/D converter start request operation, and [Figure 23.93](#) shows an example setting for A/D converter start request operation.

**Figure 23.92** Example of A/D converter start request timing operation with triangle waves, double buffer operation, buffer transfer at both troughs and crests, A/D converter start request interrupt by GTADTRA at both up-counting and down-counting, and A/D converter start request interrupt by GTADTRB at down-counting

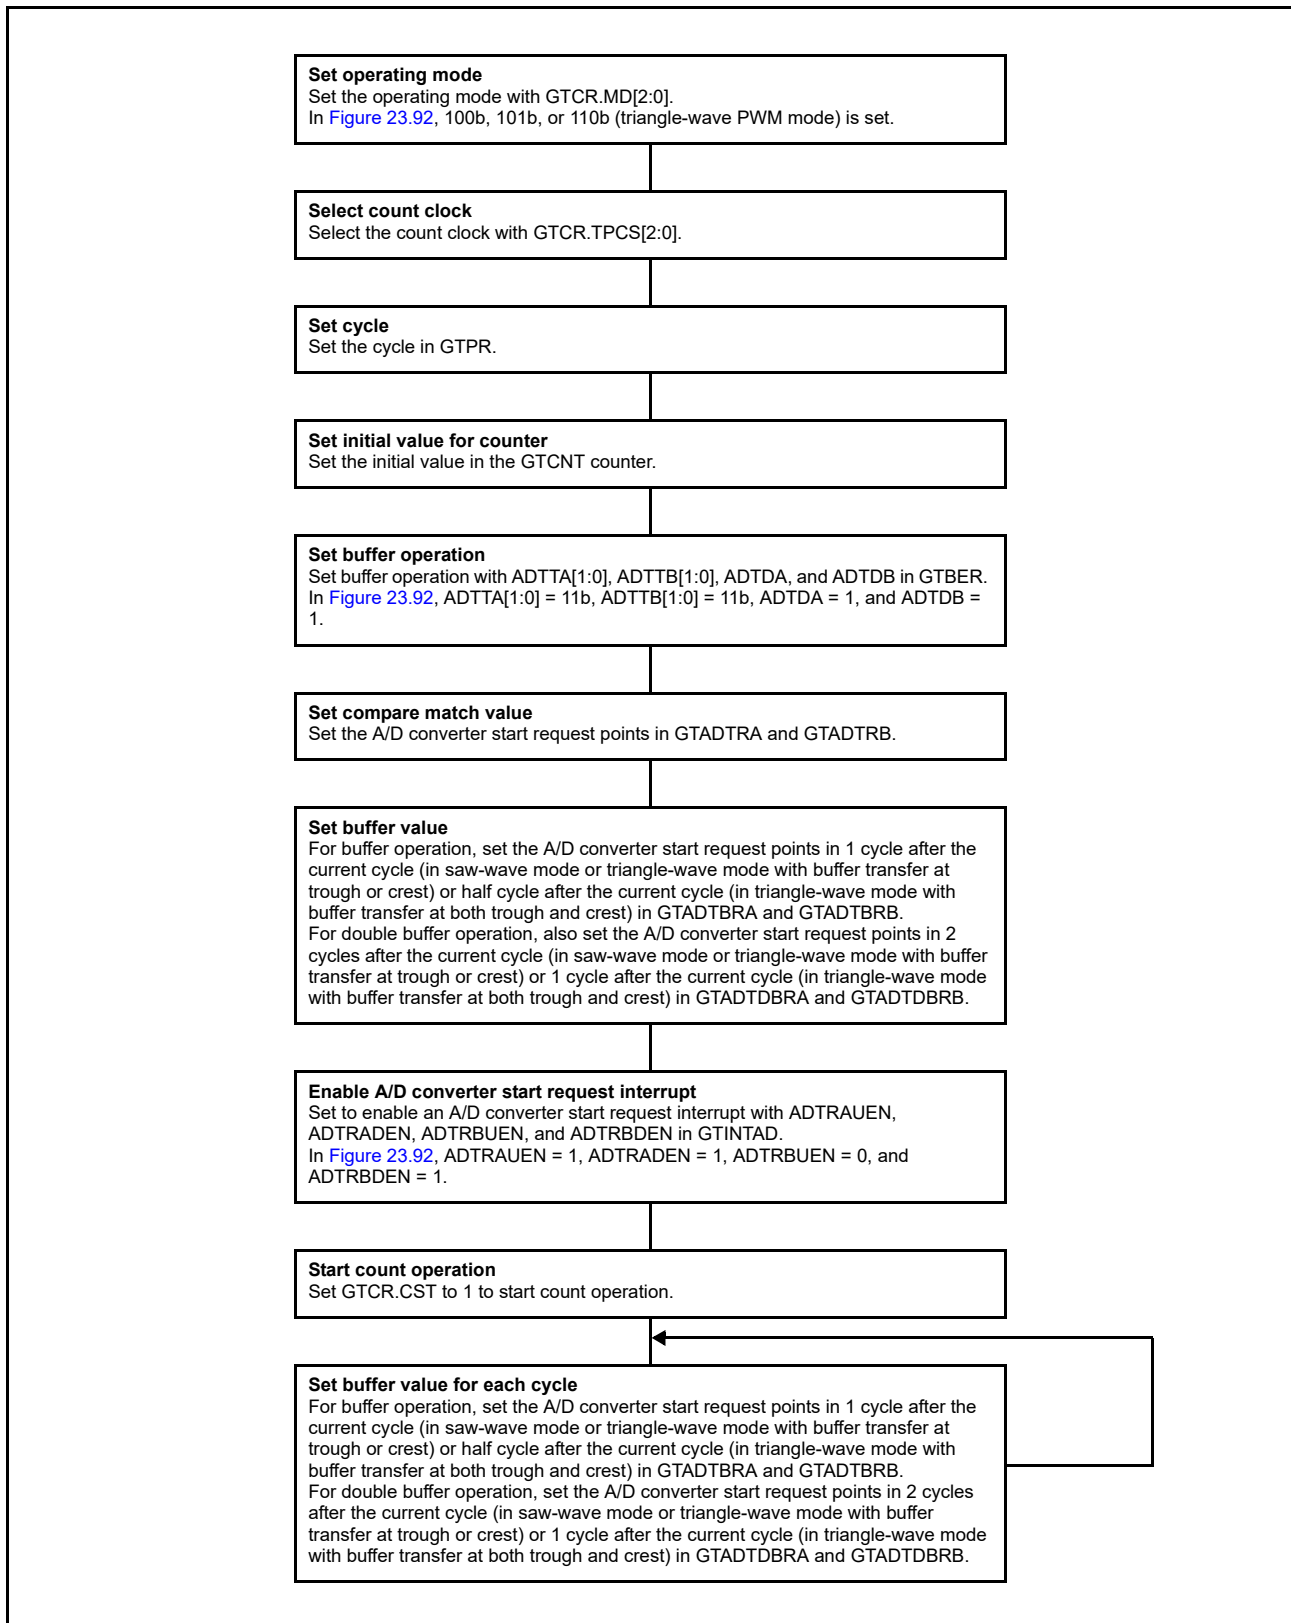

Figure 23.93 Example setting for A/D converter start request timing operation

## 23.6 Operations Linked by the ELC

### 23.6.1 Event Signal Output to the ELC

The GPT can perform operation linked with another module set in advance when its interrupt request signal is used as an event signal by the ELC.

A/D converter start requests can be enabled and disabled individually with each up-counting and down-counting for both interrupts and events output to ELC by enable bits of the interrupt request.

The GPT has the following ELC event signals:

- Generating of compare match A interrupt (GPTn\_CCMPA (n = 0 to 13))
- Generating of compare match B interrupt (GPTn\_CCMPB (n = 0 to 13))
- Generating of compare match C interrupt (GPTn\_CMPC (n = 0 to 13))
- Generating of compare match D interrupt (GPTn\_CMPD (n = 0 to 13))
- Generating of compare match E interrupt (GPTn\_CMPE (n = 0 to 13))
- Generating of compare match F interrupt (GPTn\_CMPF (n = 0 to 13))
- Generating of overflow interrupt (GPTn\_OVF (n = 0 to 13))
- Generating of underflow interrupt (GPTn\_UDF (n = 0 to 13))
- A/D converter start request A interrupt (GPTn\_ADTRGA (n = 0 to 7))
- A/D converter start request B interrupt (GPTn\_ADTRGB (n = 0 to 7)).

### 23.6.2 Event Signal Inputs from the ELC

The GPT can perform the following operations in response to a maximum of eight events from the ELC:

- Start counting, stop counting, clear counting
- Up-counting, down counting
- Input capture.

See [section 23.3, Operation](#) for detail on hardware resources.

## 23.7 Noise Filter Function

Each pin for use in input capture and Hall sensor input to the GPT is equipped with a noise filter. The noise filter samples input signals at the sampling clock and removes the pulses whose length is less than 3 sampling cycles.

The noise filter functionality includes enabling and disabling the noise filter for each pin and setting of the sampling clock for each channel.

[Figure 23.94](#) shows the timing of noise filtering.

**Figure 23.94** Timing of noise filtering

If noise filtering is enabled, the input capture operation or external trigger operation performs on the edges of the noise filtered signal after a delay of a sampling interval  $\times 3 + \text{PCLKD}$ . This is caused by the noise filtering for the input capture input or external trigger operation.

## 23.8 Protection Function

### 23.8.1 Write-Protection for Registers

To prevent registers from being accidentally modified, registers can be write-protected in channel units by setting `GTWP.WP`. Write-protection can be set for the following registers:

`GTSSR`, `GTCSR`, `GTUPSR`, `GTDNSR`, `GTICASR`, `GTICBSR`, `GTCR`, `GTUDDTYC`, `GTIOR`, `GTINTAD`, `GTST`, `GTBER`, `GTITC`, `GTCNT`, `GTCCRA`, `GTCCRB`, `GTCCRC`, `GTCCRD`, `GTCCRE`, `GTCCRF`, `GTPR`, `GTPBR`, `GTPDBR`, `GTADTRA`, `GTADTBRA`, `GTADTDDBRA`, `GTADTRB`, `GTADTDBRB`, `GTADTDBRB`, `GTDTCR`, `GTDVU`, `GTDVD`, `GTDBU`, `GTDBD`, `GTSOS`, `GTSOTR`.

### 23.8.2 Disabling of Buffer Operation

If the timing of buffer register write is delayed relative to the timing for the buffer transfer, buffer operation can be suspended with the `GTBER.BD` setting. Buffer transfer can be temporarily disabled even when a buffer transfer condition is generated during a buffer register write. This can be done by setting the associated `GTBER.BD` bit to 1 (buffer operation disabled) before a buffer register write and clearing the bit to 0 (buffer operation enabled) after completion of writing to all buffer registers. [Figure 23.95](#) shows an example of operation for disabling buffer operation.

**Figure 23.95** Example of operation for disabling buffer operation with triangle waves, double buffer operation, and buffer transfer at both troughs and crests

### 23.8.3 GTIOC Pin Output Negate Control

For protection from system failure, the output disable control that changes the GTIOC pin output value forcibly is provided for GTIOC pin output by the request of output disable from POEG.

When dead time error occurs or the GTIOCA pin output value is the same as the GTIOCB pin output value, output protection is required. The GPT detects this condition and generates output disable requests to POEG based on the settings in the output disable request permission bits, such as GTINTAD.GRPDTE, GTINTAD.GRPABH, and GTINTAD.GRPABL. After the POEG receives output disable requests from each channel and calculates external input using an OR operation, the POEG generates output disable requests to GPT.

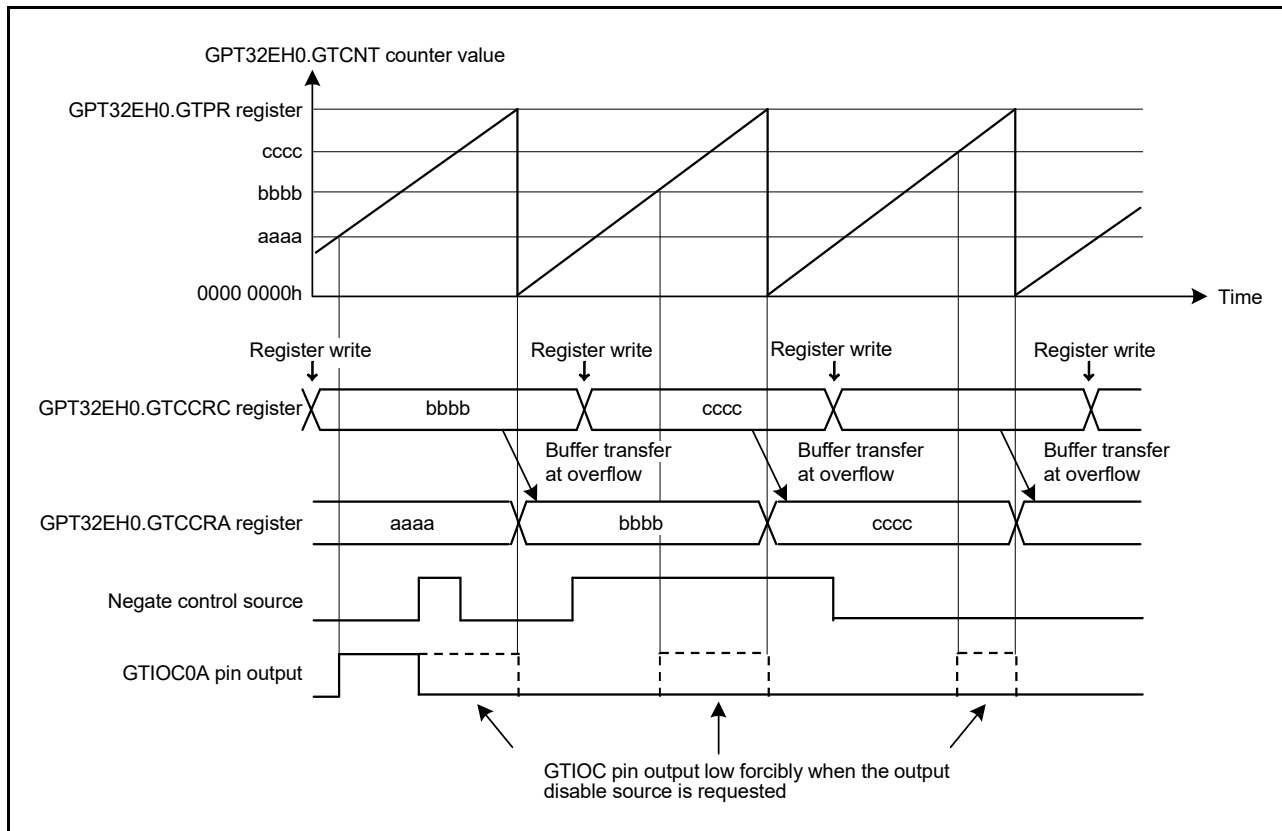

One output disable signal (representing the shared output disable request signal of the GTIOCA pin and the GTIOCB pin) out of four output disable requests generated by the POEG is selected by setting GTINTAD.GRP[1:0]. The status of the selected disable output request is monitored by reading the GTST.ODF bit. The output level during output disable is based on the GTIOR.OADF[1:0] setting for the GTIOCA pin and the GTIOR.OBDF[1:0] setting for the GTIOCB pin.

The change to the output disable state is performed asynchronously by generating the output disable request from the POEG. The release of the output disable state is performed at end of cycle by terminating the output disable request. The timing of release of the output disable state is a minimum of 3 PCLKD cycles after terminating the output disable request. To perform output disable control reliably, allow at least 4 PCLKD cycles after generating the output disable request (by clearing the output disable request flag in POEG) until the output disable request is terminated.

When event count is performed or when the output disable state is to be released immediately without waiting for an end

of cycle, GTIOR.OADF[1:0] must be set to 00b (for GTIOCA pin) or GTIOR.OBDF[1:0] must be set to 00b (for GTIOCB pin).

Figure 23.96 shows an example of the GTIOC pin output disable control operation.

**Figure 23.96** Example of GTIOC pin output disable control operation with saw-wave up-counting, buffer operation, active level 1, high output at GTCCRA compare match, low output at cycle end, and low output at output disable

### 23.8.4 Output Protection Function for GTIOC Pin Output

In preparation for incorrect settings of the GTCCRA register (settings outside the range of  $0 < GTCCRA < GTPR$ ), the output protection function for the GTIOC pin output (disabling function) is activated when the automatic dead time setting ( $GTDTCR.TDE = 1$ ) is made in triangle-wave mode. The status of the output protection function can be read from  $GTSOS.SOS[1:0]$ .

Figure 23.97 shows the output protection function state transition.

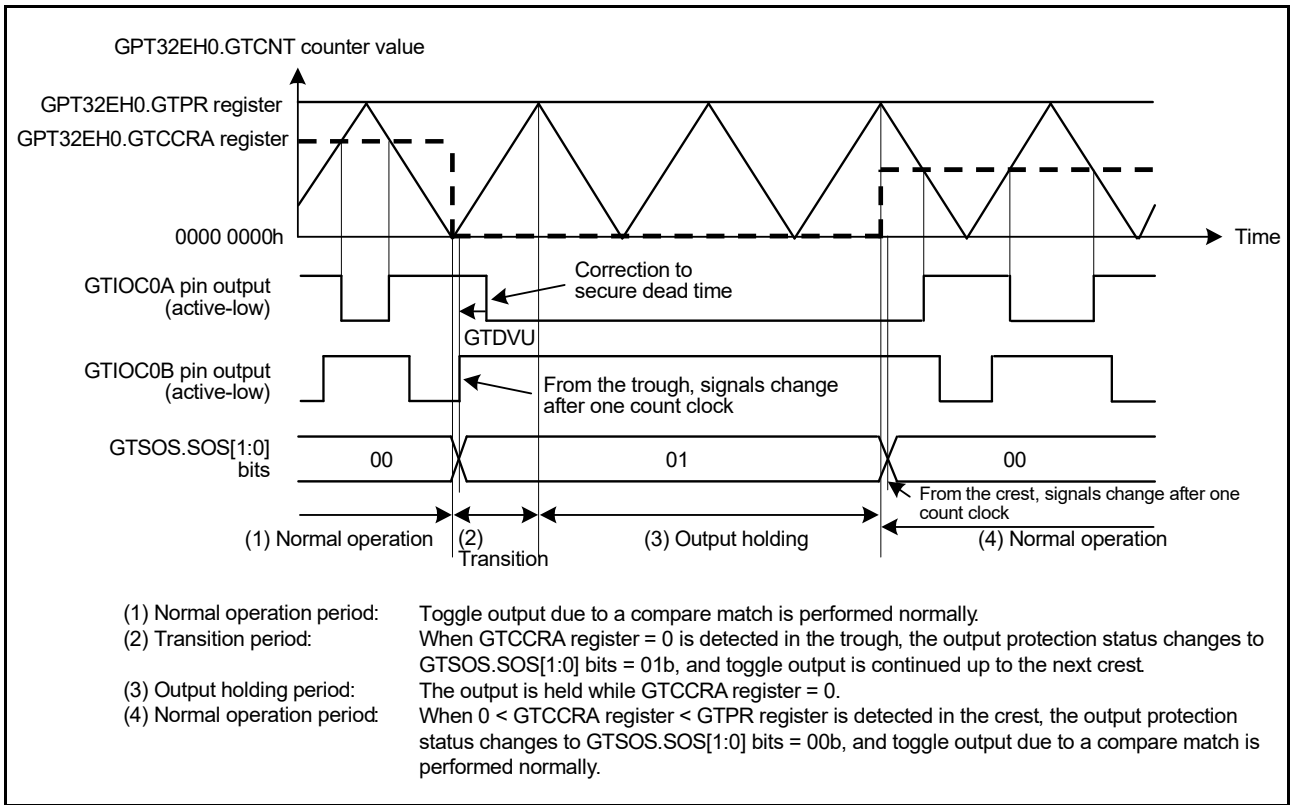

**Figure 23.97** Output protection function

**23.8.4.1** Output protection function when the GTCCRA register is set to 0 during buffer transfer

Figure 23.98 and Figure 23.99 show examples of output protection function operation when the GTCCRA register is set to 0 during buffer transfer at troughs, and Figure 23.100 and Figure 23.101 show examples when the GTCCRA register is set to 0 during buffer transfer at crests.

**Figure 23.98** Example of output protection operation when GTCCRA is set to 0 during buffer transfer at troughs, with  $0 < GTCCRA < GTPR$  restored during buffer transfer at troughs, and active-low

**Figure 23.99** Example of output protection operation when GTCCRA is set to 0 during buffer transfer at troughs, with  $0 < \text{GTCCRA} < \text{GTPR}$  restored during buffer transfer at crests, and active-low

**Figure 23.100** Example of output protection operation when GTCCRA is set to 0 during buffer transfer at crests, with  $0 < \text{GTCCRA} < \text{GTPR}$  restored during buffer transfer at troughs, and active-low

**Figure 23.101** Example of output protection operation when GTCCRA is set to 0 during buffer transfer at crests, with  $0 < \text{GTCCRA} < \text{GTPR}$  restored during buffer transfer at crests, and active-low

#### 23.8.4.2 Output protection function when $\text{GTCCRA} \geq \text{GTPR}$ is set during buffer transfer at troughs

Figure 23.102 and Figure 23.103 show examples of output protection function operation when  $\text{GTCCRA} \geq \text{GTPR}$  is set during buffer transfer at troughs.

**Figure 23.102 Example of output protection operation when  $GTCCRA \geq GTPR$  is set during buffer transfer at troughs, with  $0 < GTCCRA < GTPR$  restored during buffer transfer at troughs, and active-low**

**Figure 23.103 Example of output protection operation when  $GTCCRA \geq GTPR$  is set during buffer transfer at troughs, with  $0 < GTCCRA < GTPR$  restored during buffer transfer at crests, and active-low**

### 23.8.4.3 Output protection function when $GTCCRA \geq GTPR$ is set during buffer transfer at crests

Figure 23.104 and Figure 23.105 show examples of output protection function operation when  $GTCCRA \geq GTPR$  is set during buffer transfer at crests.

**Figure 23.104** Example of output protection operation when  $GTCCRA \geq GTPR$  is set during buffer transfer at crests, with  $0 < GTCCRA < GTPR$  restored during buffer transfer at crests, and active-low

**Figure 23.105 Example of output protection function operation when  $GTCCRA \geq GTPR$  is set during buffer transfer at crests, with  $0 < GTCCRA < GTPR$  restored during buffer transfer at troughs, and active-low**

#### 23.8.4.4 Restricted specification of output protection function

The value of the GTCCRA register must be set within the range of ( $0 < GTCCRA < GTPR$ ) at count start. If an incorrect value is set in the GTCCRA register during counting (a setting outside the range of  $0 < GTCCRA < GTPR$ ), the output protection function deactivates the level of one of the positive and negative outputs.

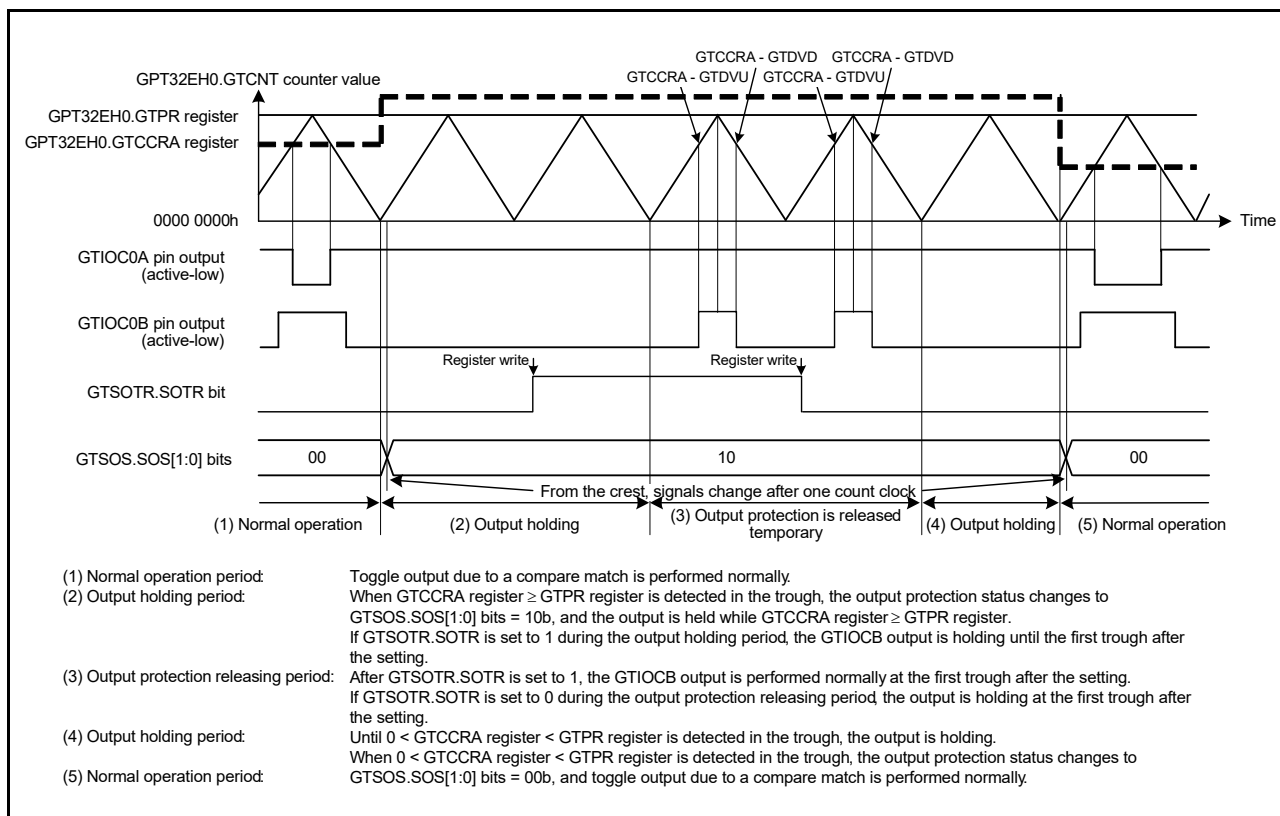

The function does not operate correctly if the following conditions are not satisfied:

- $GTCCRA$  is  $0 < GTCCRA < GTPR$  when counting starts
- The register conditions must be  $GTCCRA < GTPR + GTDVD - 1$  during buffer transfer at crests
- When  $GTCCRA$  is greater than or equal to  $GTPR$  during buffer transfer at troughs, the register conditions must be  $GTCCRA > GTDVU + 1$ .

#### 23.8.4.5 Temporary cancellation of output protection function

When the GTSOTR.SOTR bit is set to 1 with  $GTSOS.SOS[1:0]$  bits equal to 10b (showing output protection state by  $GTCCRA \geq GTPR$  during buffer transfer at troughs), the output protection function for GTIOCB pin is temporarily canceled.  $GTSOS.SOS[1:0]$  bits retain the value of 10b even when the output protection function is canceled. When the SOTR bit is set to 0, the output protection function for GTIOCB pin resumes.

Figure 23.106 shows examples of temporary cancellation of output protection function operation when the  $GTCCRA \geq GTPR$  is set during buffer transfer at troughs.

**Figure 23.106 Example of temporary cancellation of output protection function operation when  $GTCCRA \geq GTPR$  is set during buffer transfer at troughs, with  $0 < GTCCRA < GTPR$  restored during buffer transfer at troughs, and active-low**

## 23.9 Initialization Method of Output Pins

### 23.9.1 Pin Settings after Reset

The GPT registers are initialized at a reset. Start counting after selecting the port pin function with the PmnPFS register, setting GTIOR.OAE and GTIOR.OBE bits, and outputting the GPT function to external pins.

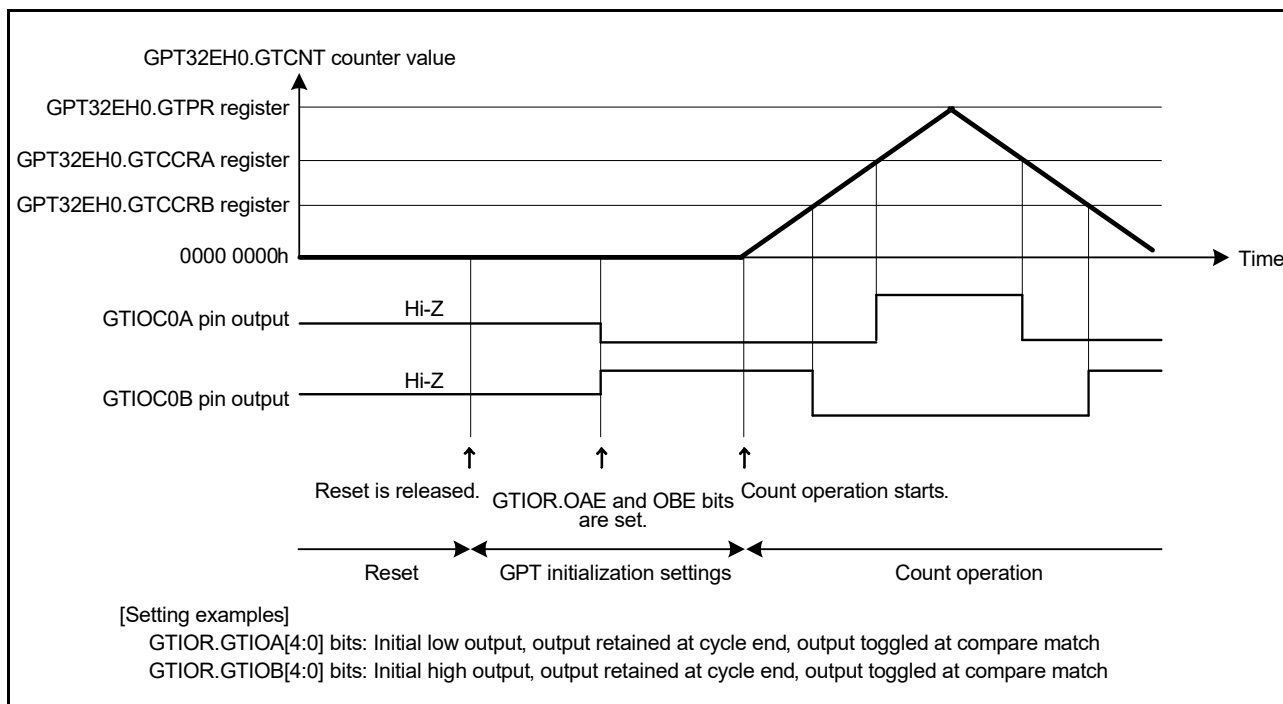

Figure 23.107 Example of pin settings after reset

### 23.9.2 Pin Initialization Caused by Error during Operation

If an error occurs during GPT operation, the following four types of pin processing can be performed before pin initialization:

- Set the OAHLD and OBHLD bits in GTIOR to 1 and retain the outputs at count stop
- Set the OAHLD and OBHLD bits in GTIOR to 0, specify arbitrary output values in OADFLT and OBDFLT in GTIOR, and output the arbitrary values on count stop
- Set the pin to output an arbitrary value as a general output port by setting the PDR, PODR, and PmnPFS registers of the I/O port in advance. Set the OAE and OBE bits in GTIOR to 0 and the control bit associated with the pin in the PmnPFS.PMR to 0 to allow arbitrary values to be output from the pin set as a general output port when an error occurs.
- Drive the output to a high impedance state using the POEG function.

When the automatic dead time setting is made, clear the GTDTCR.TDE bit to 0 after counting stops. When counting stops, only the values of registers that are changed by a GPT external source change. If counting resumes, operation continues from where it stopped. If counting stops, registers must be initialized before counting starts.

## 23.10 Usage Notes

### 23.10.1 Module-Stop Function Setting

The Module Stop Control Register can enable or disable GPT operation. The GPT module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 11, Low Power Modes](#).

### 23.10.2 GTCCRn Settings during Compare Match Operation (n = A to F)

#### (1) When automatic dead time setting is made in triangle-wave PWM mode

The GTCCRA register must satisfy the following conditions:  $GTDVU < GTCCRA$ ,  $GTDVD < GTCCRA$ , and  $GTCCRA < GTPR$ .

When the setting of  $GTCCRA = 0$  or  $GTCCRA \geq GTPR$  is made during count operation, the output protection function is activated.

However, the function does not operate correctly if the following conditions are not satisfied:

- GTCCRA is  $0 < GTCCRA < GTPR$  when counting starts
- The register conditions must be  $GTCCRA < GTPR + GTDVD - 1$  during buffer transfer at crests
- When GTCCRA is greater than or equal to GTPR during buffer transfer at troughs, the register conditions must be  $GTCCRA > GTDVU + 1$ .

For details, see [section 23.8.4, Output Protection Function for GTIOC Pin Output](#).

#### (2) When automatic dead time setting is not made in triangle-wave PWM mode

The GTCCRA register must be set within the range of  $0 < GTCCRA < GTPR$ . If  $GTCCRA = 0$  or  $GTCCRA = GTPR$  is set, a compare match occurs within the cycle only when  $GTCCRA = 0$  or  $GTCCRA = GTPR$  is satisfied. When  $GTCCRA > GTPR$ , no compare match occurs.

Similarly, GTCCRB must be set within the range of  $0 < GTCCRB < GTPR$ . If  $GTCCRB = 0$  or  $GTCCRB = GTPR$  is set, a compare match occurs within the cycle only when  $GTCCRB = 0$  or  $GTCCRB = GTPR$  is satisfied. When  $GTCCRB > GTPR$ , no compare match occurs.

#### (3) When automatic dead time setting is made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, correct output waveforms with secured dead time might not be obtained:

- In up-counting:  $GTCCRC < GTCCRD$ ,  $GTCCRC > GTDVU$ ,  $GTCCRD < GTPR - GTDVD$
- In down-counting:  $GTCCRC > GTCCRD$ ,  $GTCCRC < GTPR - GTDVU$ ,  $GTCCRD > GTDVD$ .

#### (4) When automatic dead time setting is not made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed:

- In up-counting:  $0 < GTCCRC < GTCCRD < GTPR$
- In down-counting:  $GTPR > GTCCRC > GTCCRD > 0$ .

Similarly, GTCCRE and GTCCRF must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed:

- In up-counting:  $0 < GTCCRE < GTCCRF < GTPR$
- In down-counting:  $GTPR > GTCCRE > GTCCRF > 0$ .

#### (5) In saw-wave PWM mode

The GTCCRA register must be set with the range of  $0 < GTCCRA < GTPR$ . If  $GTCCRA = 0$  or  $GTCCRA = GTPR$  is set, a compare match occurs within the cycle only when  $GTCCRA = 0$  or  $GTCCRA = GTPR$  is satisfied. If  $GTCCRA > GTPR$  is set, no compare match occurs.

Similarly, GTCCRB must be set with the range of  $0 < GTCCRB < GTPR$ . If  $GTCCRB = 0$  or  $GTCCRB = GTPR$  is set, a compare match occurs within the cycle only when  $GTCCRB = 0$  or  $GTCCRB = GTPR$  is satisfied. If  $GTCCRB > GTPR$  is set, no compare match occurs.

### 23.10.3 Setting Range for the GTCNT Counter

The GTCNT counter register must be set with the range of  $0 \leq GTCNT \leq GTPR$ .

### 23.10.4 Starting and Stopping the GTCNT Counter

The control timing of starting and stopping the GTCNT counter by the GTCR.CST bit synchronizes the count clock that is selected in GTCR.TPCS[2:0]. When GTCR.CST is updated, the GTCNT counter starts/stops after a count clock that is selected in GTCR.TPCS[2:0]. Therefore, an event generated before the GTCNT counter actually starts is ignored. On the other hand, there might be cases where an event is accepted or an interrupt occurs after GTCR.CST is set to 0.

### 23.10.5 Priority Order of Each Event

#### (1) GTCNT register

Table 23.24 shows a priority order of events updating GTCNT register.

**Table 23.24 Priority order of sources updating GTCNT**

| Source updating GTCNT                                     | Priority order   |
|---|--|
| Writing by CPU (Writing to GTCNT/GTCLR)                   | High<br><br>Low |
| Clear by hardware sources set in GTCSR                    |  |
| Count up or down by hardware sources set in GTUPSR/GTDNSR |  |
| Count operation   |  |

If up-counting and down-counting by hardware sources occur at the same time, the GTCNT counter value does not change. When there is a conflict between updating the GTCNT register and reading by the CPU, pre-update data is read.

#### (2) GTCR.CST bit

When there is a conflict between starting/stopping by hardware sources set in the GTSSR/GTPSR registers and writing by the CPU (writing to GTCR/GTSTR/GTSTP registers), writing by CPU has priority over starting/stopping by hardware sources.

When there is a conflict between starting by hardware sources set in the GTSSR register and stopping by hardware sources set in GTPSR register, the GTCR.CST bit value does not change. Where there is a conflict between updating the GTCR.CST bit and reading by the CPU, pre-update data is read.

#### (3) GTCCRm registers (m = A to F)

When there is a conflict between input capture/buffer transfer operation and writing to GTCCRm registers, writing to GTCCRm registers has priority over input capture/buffer transfer operation. When there is a conflict between input capture and writing to the counter register by the CPU or updating the counter register by hardware sources, the pre-update counter value is captured. Where there is a conflict between updating the GTCCRm registers and reading by the CPU, pre-update data is read.

#### (4) GTPR registers

When there is a conflict between buffer transfer operation and writing to the GTPR register, writing to GTPR register has priority over buffer transfer operation. When there is a conflict between updating GTPR register and reading by the CPU, pre-update data is read.

#### (5) GTADTRm registers (m = A, B)

When there is a conflict between buffer transfer operation and writing to the GTADTRm registers, writing to the GTADTRm registers has priority over buffer transfer operation. When there is a conflict between updating GTADTRm registers and reading by the CPU, pre-update data is read.

#### (6) GTDVM registers (m = U, D)

When there is a conflict between buffer transfer operation and writing to GTDVM registers, writing to GTDVM registers has priority over buffer transfer operation. When there is a conflict between updating GTDVM registers and reading by the CPU, pre-update data is read.

## 24. PWM Delay Generation Circuit

### 24.1 Overview

The MCU has 4 channel delay circuits that can connect to the General PWM Timer (GPT). [Table 24.1](#) lists the specifications for the PWM Delay Generation Circuit, [Figure 24.1](#) shows a block diagram, and [Table 24.2](#) lists the I/O pins.

**Table 24.1 Specifications of the PWM Delay Generation Circuit**

| Parameter | Specifications   |
|-----------|--|
| Function  | The circuit can control the timing with which signals on the two PWM output pins for channel 0/1/2/3 rise and fall to an accuracy of up to 1/32 times the period of the GPT clock (PCLKD). |

**Figure 24.1 PWM delay generation circuit block diagram**

**Table 24.2 PWM delay generation circuit I/O pins**

| I/O pin | I/O    | Function                                      |
|---------|--------|---|
| GTIOC0A | Output | Delayed output of GTIOCA pin of GPT channel 0 |
| GTIOC0B | Output | Delayed output of GTIOCB pin of GPT channel 0 |
| GTIOC1A | Output | Delayed output of GTIOCA pin of GPT channel 1 |
| GTIOC1B | Output | Delayed output of GTIOCB pin of GPT channel 1 |
| GTIOC2A | Output | Delayed output of GTIOCA pin of GPT channel 2 |
| GTIOC2B | Output | Delayed output of GTIOCB pin of GPT channel 2 |
| GTIOC3A | Output | Delayed output of GTIOCA pin of GPT channel 3 |
| GTIOC3B | Output | Delayed output of GTIOCB pin of GPT channel 3 |

## 24.2 Register Descriptions

### 24.2.1 PWM Output Delay Control Register (GTDLYCR)

Address(es): [GPT\\_ODC.GTDLYCR 4007 B000h](#)

|                    | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1     | b0   |

| b0        | <a href="#">DLEN</a>   | DLL Operation Enable               | 0: DLL operation disabled<br>1: DLL operation enabled. | R/W |
| b1        | <a href="#">DLYRST</a> | PWM Delay Generation Circuit Reset | 0: Normal operation<br>1: Reset.                       | R/W |
| b15 to b2 | —                      | Reserved                           | These bits are read as 0. The write value should be 0. | R/W |

The GTDLYCR register controls the PWM delay generation circuit, which applies delays to the PWM outputs. GTDLYCR register can be written when register write protection is disabled (GPT32EH0.GTWP.WP = 0).

#### [DLEN bit \(DLL Operation Enable\)](#)

The DLEN bit selects whether the on-chip DLL in the PWM delay generation circuit is activated or not.

#### [DLYRST bit \(PWM Delay Generation Circuit Reset\)](#)

The DLYRST bit resets the internal state of the PWM delay generation circuit.

### 24.2.2 PWM Output Delay Control Register 2 (GTDLYCR2)

| b11        | <a href="#">DLYEN3</a> | PWM Delay Generation Circuit enable for channel 3 | 0: Delay generation circuit of channel 3 enabled<br>1: Delay generation circuit of channel 3 disabled.      | R/W |
| b15 to b12 | —                      | Reserved  | These bits are read as 0. The write value should be 0.  | R/W |

The GTDLYCR2 register controls each channel of PWM delay generation circuit. GTDLYCR2 can be written when register write protection is disabled (GPT32EH0.GTWP.WP = 0).

#### **DLYBSn (n = 0 to 3) bit (PWM Delay Generation Circuit Bypass for channel n)**

The DLYBSn bit selects whether delays are applied to PWM output signals from the GTIOCnA and GTIOCnB pins (n = 0 to 3) by the PWM delay generation circuit or whether the circuit is bypassed.

A signal delayed in the PWM delay generation circuit is output 3 cycles of GPT operation clock (PCLKD) later than if it bypasses the PWM delay generation circuit.

#### **DLYENn (n = 0 to 3) bit (PWM Delay Generation Circuit Enable for channel n)**

The DLYENn bit selects whether channel n (n = 0 to 3) of PWM delay generation circuit is power on or off. If channel n of the PWM delay generation circuit is not used, set to 1.

### 24.2.3 GTIOCnA Rising Output Delay Register (GTDLYRnA) (n = 0 to 3)

| b15 to b5 | —                        | Reserved                                  | These bits are read as 0. The write value should be 0.   | R/W |

The GTDLYFnB register sets a delay to be applied to falling edges of output signals on the GTIOCnB pin. On the timing for the transfer of settings, see [section 24.3.2, Timing for Transfer of GTDLYRnA, GTLDYRnB, GTDLYFnA, and GTDLYFnB Register Settings](#).

GTDLFyFnB can be written when register write protection is disabled (GPT32EHn.GTWP.WP = 0).

## 24.3 Operation

### 24.3.1 Adjustments to the Timing of Rising and Falling Edges in PWM Waveforms

The timing of rising and falling edges in PWM waveforms which are output from the GTIOCnA and GTIOCnB pins, where n = channel number, can be delayed to an accuracy of 1/32 of the GPT operating clock (PCLKD) period.

If the timing of rising or falling edges in PWM waveforms output from the GTIOCnA and GTIOCnB pins must be adjusted, initialize the PWM generation circuit as shown in the procedure in [Figure 24.2](#).

**Figure 24.2 Example of initialization flow for the PWM delay generation circuit**

In the PWM delay generation circuit, delay can be applied to rising and falling edges of the PWM output to an accuracy of 1/32 of the period of the GPT operation clock (PCLKD). This is described in [section 23.3.3, PWM Output Operating Mode](#). Delays associated with the settings are reflected in the PWM output with the timing described in [section 24.3.2, Timing for Transfer of GTDLYRnA, GTLDYRnB, GTDLYFnA, and GTDLYFnB Register Settings](#). [Table 24.3](#) shows the association between the GTDLYRnA, GTLDYRnB, GTDLYFnA, and GTDLYFnB registers and the PWM outputs.

**Table 24.3 Association between PWM output pins and delay setting registers**

| PWM output pin | Rising-edge delay setting register | Falling-edge delay setting register |
|----------------|------------------------------------|-------------------------------------|
| GTIOC0A        | GTDLYR0A                           | GTDLYF0A                            |
| GTIOC0B        | GTDLYR0B                           | GTDLYF0B                            |
| GTIOC1A        | GTDLYR1A                           | GTDLYF1A                            |
| GTIOC1B        | GTDLYR1B                           | GTDLYF1B                            |
| GTIOC2A        | GTDLYR2A                           | GTDLYF2A                            |
| GTIOC2B        | GTDLYR2B                           | GTDLYF2B                            |
| GTIOC3A        | GTDLYR3A                           | GTDLYF3A                            |
| GTIOC3B        | GTDLYR3B                           | GTDLYF3B                            |

When the PWM delay generation circuit is in use, the timing with which a PWM output signal rises and falls can be controlled to an accuracy of 1/32 of the period of the GPT operation clock (PCLKD). When this option is not in use, the period of the PWM output waveform is controlled to an accuracy of one period of the input clock for the timer counter, which is PCLKD. With the PWM delay generation circuit, the output can be controlled to an accuracy 32 times better. Additionally, the delay settings also control the periods at high and low level for the PWM waveform to the given accuracy. PWM delay generation circuit channels can be individually enabled or disabled.

### 24.3.2 Timing for Transfer of GTDLYRnA, GTLDYRnB, GTDLYFnA, and GTDLYFnB Register Settings

Settings for the GTDLYRnA, GTLDYRnB, GTDLYFnA, and GTDLYFnB registers are initially transferred to temporary registers, and then reflected in the delay on the GTIOCnA and GTIOCnB (n = 0 to 3) outputs. Transfer of the settings takes place on overflows (in up-counting) or underflows (in down-counting) for saw waves, and in the troughs of triangle waves.

Figure 24.3 and Figure 24.4 show examples of the operation of the GTDLYR0A and GTDLYF0A registers.

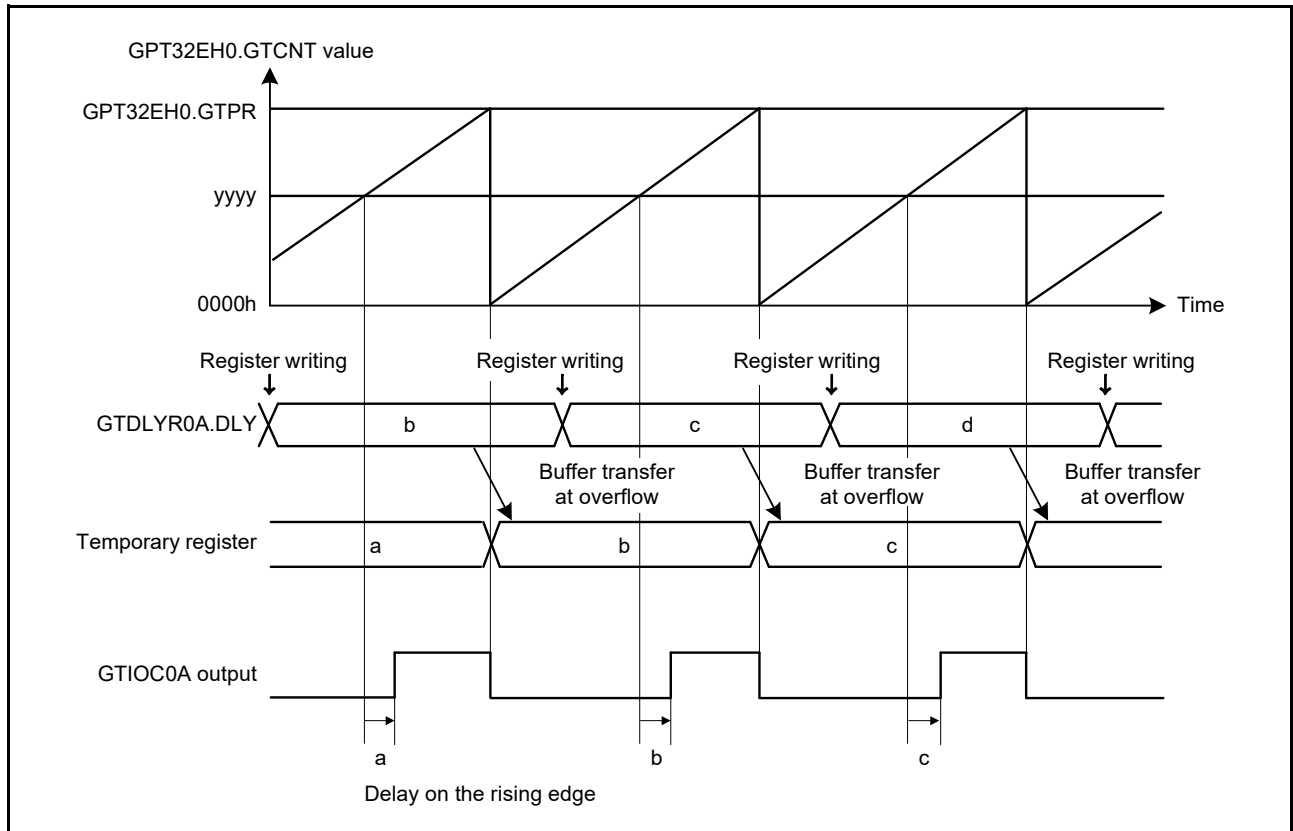

Figure 24.3 Example of GTLDYR0A register operation with PWM saw-wave generation

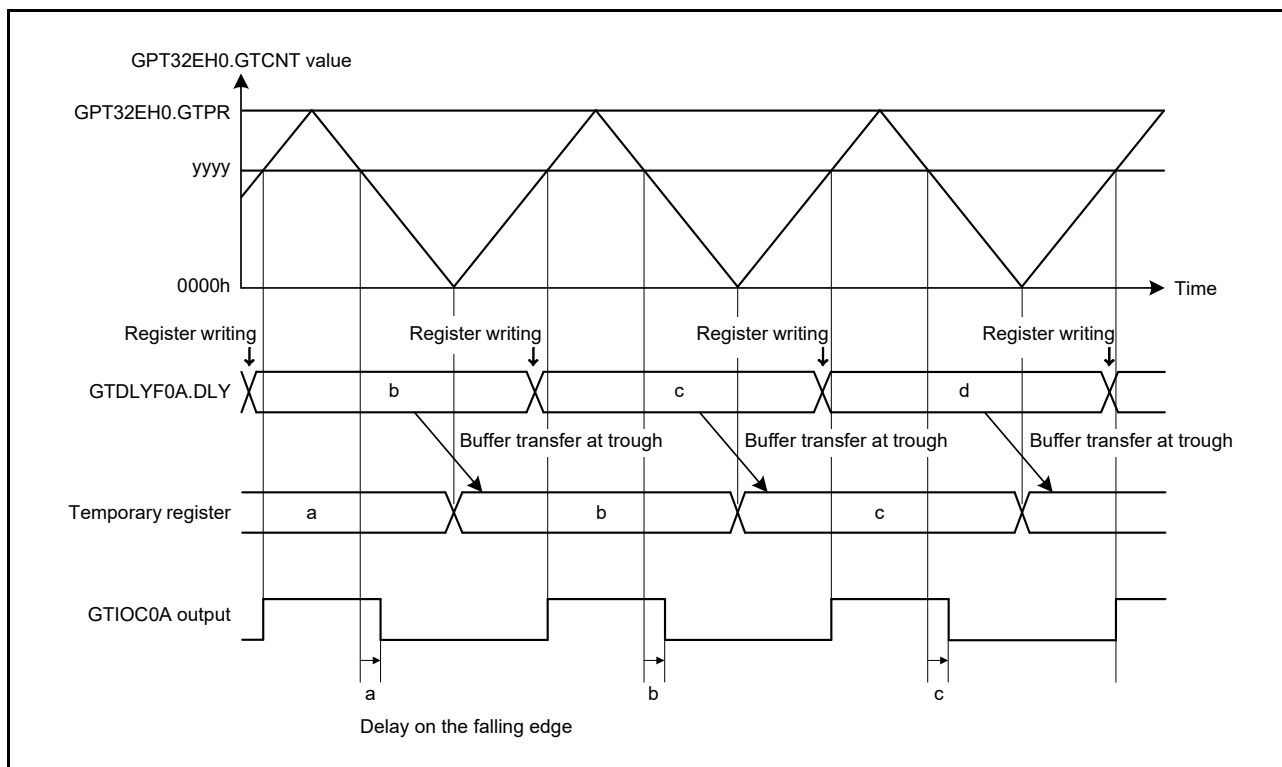

Figure 24.4 Example of GTDLYF0A register operation with PWM triangle-wave generation

## 24.4 Usage Notes

### 24.4.1 Module-Stop Function Settings

The Module Stop Control Register D (MSTPCRD) can enable or disable operation of the PWM delay generation circuit. The PWM delay generation circuit is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 11, Low Power Modes](#).

### 24.4.2 Notes on Delay Settings for PWM Delay Generation Circuit

When the PWM delay generation circuit generates delays for a PWM output waveform and the waveform is toggled in response to compare-matches, do not change the settings for delay while the compare-match value is within the ranges listed in [Table 24.4](#). This constraint applies to the GTDLYFnA, GTDLYRnA, GTDLFnB, and GTDLYRnB registers.

Table 24.4 Constraints on delay settings

| Mode               | Direction of counting | Compare-match value |
|--------------------|-----------------------|---------------------|
| Saw-wave mode      | Up                    | GTPR - 2 or above   |
|                    | Down                  | 2 or below          |
| Triangle-wave mode | Down                  | 2 or below          |

[Figure 24.5](#) shows an example of how the constraints apply to the timing of setting GTDLYFnA in saw-wave waveform one-shot pulse mode (counting up). Do not change the value set in GTDLYFnA while  $GTCCR \geq GTPR - 2$ .

**Figure 24.5 Constraints on the timing of GTDLYF0A register settings**

Changing the values in the GTDLYFnA, GTDLYRnA, GTDLYFnB, and GTDLYRnB registers during periods where changes to settings are not allowed, might lead to faulty output waveforms such as shifts in the timing of output waveform transitions from the expected values.

## 25. Asynchronous General-Purpose Timer (AGT)

### 25.1 Overview

The Asynchronous General-Purpose Timer (AGT) is a 16-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events.

This 16-bit timer consists of a reload register and a down counter. The reload register and the down counter are allocated in the same address, and can be accessed with the AGT register.

Table 25.1 lists the AGT specifications, Figure 25.1 shows a block diagram, and Table 25.2 lists the I/O pins.

**Table 25.1 AGT specifications**

| Parameter                              |                               | Specifications   |
|--|-------------------------------|--|
| Operating modes                        | Timer mode                    | The count source is counted  |
|  | Pulse output mode             | The count source is counted and the output is inverted at each timer underflow   |
|  | Event counter mode            | An external event is counted   |
|  | Pulse width measurement mode  | An external pulse width is measured  |
|  | Pulse period measurement mode | An external pulse period is measured   |
| Count source (Operating clock)*2       |                               | PCLKB, PCLKB/2, PCLKB/8, AGTLCLK, AGTLCLK/2, AGTLCLK/4, AGTLCLK/8, AGTLCLK/16, AGTLCLK/32, AGTLCLK/64, AGTLCLK/128, AGTSCLK, AGTSCLK/2, AGTSCLK/4, AGTSCLK/8, AGTSCLK/16, AGTSCLK/32, AGTSCLK/64, AGTSCLK/128, or underflow signal of AGT0*1 selectable.   |
| Interrupt/Event link function (Output) |                               | <ul style="list-style-type: none"> <li>• Underflow event signal or measurement complete event signal               <ul style="list-style-type: none"> <li>– When the counter underflows</li> <li>– When the measurement of the active width of the external input (AGTIO) is complete in pulse width measurement mode</li> <li>– When the set edge of the external input (AGTIO) is input in pulse period measurement mode</li> </ul> </li> <li>• Compare match A event signal               <ul style="list-style-type: none"> <li>– When the values of AGT and AGTCMA matched (Compare match A function enabled)</li> </ul> </li> <li>• Compare match B event signal               <ul style="list-style-type: none"> <li>– When the values of AGT and AGTCMB matched (Compare match B function enabled).</li> </ul> </li> </ul> |
| Selectable functions                   |                               | <ul style="list-style-type: none"> <li>• Compare match function</li> </ul> One or two of the compare match A and B registers is selectable.  |

Note 1. AGT0 cannot use the AGT0 underflow signal. AGT1 connects directly with the underflow event signal from the AGT0 timer.

Note 2. Satisfy the frequency of the peripheral module clock (PCLKB)  $\geq$  the frequency of the count source clock.

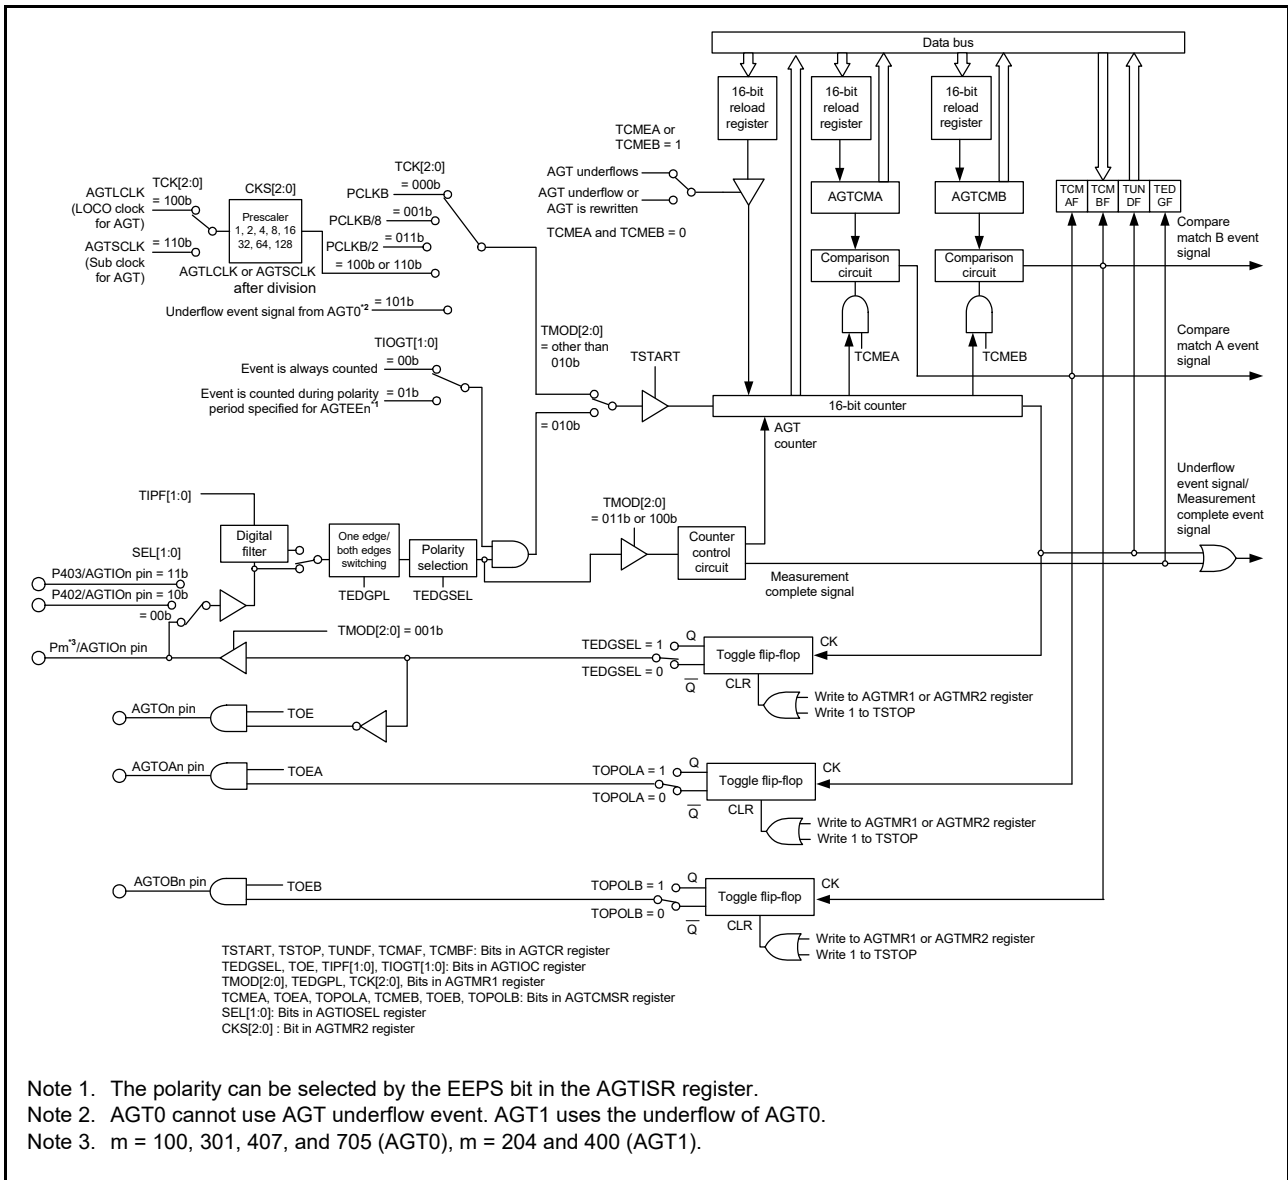

Figure 25.1 AGT block diagram

Table 25.2 AGT I/O pins

| Pin name              | I/O            | Function                                      |
|-----------------------|----------------|---|
| AGTEEn                | Input          | External event input for AGT                  |
| AGTIO <sup>n</sup> *1 | Input*1/output | External event input and pulse output for AGT |
| AGTOn                 | Output         | Pulse output for AGT                          |
| AGTOAn                | Output         | Output compare match A output for AGT         |
| AGTOBn                | Output         | Output compare match B output for AGT         |

Note: Channel number (n = 0, 1).

Note 1. AGTIO can also be used in Deep Software Standby mode.

AGTIO can be controlled by the VBTICTLR register.

For more information, see [section 12.2.2, VBATT Input Control Register \(VBTICTLR\)](#) and [section 20.5.5, I/O Buffer Specification](#).

## 25.2 Register Descriptions

### 25.2.1 AGT Counter Register (AGT)

Address(es): AGT0.AGT 4008 4000h, AGT1.AGT 4008 4100h

| Bit       | Description                               | Setting range  | R/W |
|-----------|---|----------------|-----|
| b15 to b0 | 16-bit counter and reload register *1, *2 | 0000h to FFFFh | R/W |

Note 1. When 1 is written to the TSTOP bit in the AGTCR register, the 16-bit counter is forcibly stopped and set to FFFFh.

Note 2. When the TCK[2:0] bit setting in the AGTMR1 register is other than 001b (PCLKB/8) or 011b (PCLKB/2), if the AGT register is set to 0000h, a request signal to the ICU, the DTC, and the ELC is generated once immediately after the count starts. The AGTOn and AGTIOOn outputs are toggled.

When the AGT register is set to 0000h in event counter mode, regardless of the value of TCK[2:0] bits, a request signal to the ICU, the DTC, and the ELC is generated once immediately after the count starts.

In addition, the AGTOn output toggles even during a period other than the specified count period. When the AGT register is set to 0001h or more, a request signal is generated each time AGT underflows.

AGT is a 16-bit register. The write value is written to the reload register and the read value is read from the counter.

The states of the reload register and the counter change according to the TSTART bit in the AGTCR register and TCMEA/TCMEB bit in the AGTCMSR register. For details, see [section 25.3.1, Reload Register and Counter Rewrite Operation](#). The AGT register can be set with a 16-bit memory manipulation instruction.

### 25.2.2 AGT Compare Match A Register (AGTCMA)

Address(es): AGT0.AGTCMA 4008 4002h, AGT1.AGTCMA 4008 4102h

| Bit       | Description                              | Setting range  | R/W |
|-----------|--|----------------|-----|
| b15 to b0 | 16-bit compare match A data is stored.*1 | 0000h to FFFFh | R/W |

Note 1. Set the AGTCMA register to FFFFh when the compare match A is not used.

The AGTCMA register is a read/write register to set a value for compare match with the AGT counter. The states of the reload register and compare register A change according to the TSTART bit in the AGTCR register. For details, see [section 25.3.2, Reload Register and Compare Register A/B Rewrite Operation](#). The AGTCMA register can be set by a 16-bit memory manipulation instruction.

### 25.2.3 AGT Compare Match B Register (AGTCMB)

Address(es): [AGT0.AGTCMB 4008 4004h](#), [AGT1.AGTCMB 4008 4104h](#)

| Bit       | Description                              | Setting range  | R/W |
|-----------|--|----------------|-----|
| b15 to b0 | 16-bit compare match B data is stored.*1 | 0000h to FFFFh | R/W |

Note 1. Set the AGTCMB register to FFFFh when compare match B is not used.

The AGTCMB register is a read/write register to set a value for compare match with the AGT counter. The states of the reload register and compare register B change according to the TSTART bit in the AGTCR register. For details, see [section 25.3.2, Reload Register and Compare Register A/B Rewrite Operation](#). The AGTCMB register can be set by a 16-bit memory manipulation instruction.

### 25.2.4 AGT Control Register (AGTCR)

Address(es): [AGT0.AGTCR 4008 4008h](#), [AGT1.AGTCR 4008 4108h](#)

| Bit | Symbol                 | Bit name                  | Description  | R/W     |
|-----|------------------------|---------------------------|--|---------|
| b0  | <a href="#">TSTART</a> | AGT Count Start*2         | 0: Count stops<br>1: Count starts.                         | R/W     |
| b1  | <a href="#">TCSTF</a>  | AGT Count Status Flag*2   | 0: Count stopped<br>1: Count in progress.                  | R       |
| b2  | <a href="#">TSTOP</a>  | AGT Count Forced Stop*1   | 0: Writing is invalid<br>1: The count is forcibly stopped. | W       |
| b3  | —                      | Reserved                  | The read value is 0. The write value should be 0.          | R/W     |
| b4  | <a href="#">TEDGF</a>  | Active Edge Judgment Flag | 0: No active edge received<br>1: Active edge received.     | R/(W)*3 |
| b5  | <a href="#">TUNDF</a>  | Underflow Flag            | 0: No underflow<br>1: Underflow.                           | R/(W)*3 |
| b6  | <a href="#">TCMAF</a>  | Compare Match A Flag      | 0: No match<br>1: Match.                                   | R/(W)*3 |
| b7  | <a href="#">TCMBF</a>  | Compare Match B Flag      | 0: No match<br>1: Match.                                   | R/(W)*3 |

Note 1. When 1 (count is forcibly stopped) is written to the TSTOP bit, the TSTART and TCSTF bits are initialized at the same time. The pulse output level is also initialized. The read value is 0.

Note 2. For information on using the TSTART and TCSTF bits, see [section 25.4.1, Count Operation Start and Stop Control](#).

Note 3. Only 0 can be written to clear the flag.

#### TSTART bit (AGT Count Start)

The count operation is started by writing 1 to the TSTART bit and stopped by writing 0. When this bit is set to 1, the TCSTF bit is set to 1 (count in progress) in synchronization with the count source. Also, after 0 is written to the TSTART bit, the TCSTF bit is set to 0 (count stopped) in synchronization with the count source. For details, see [section 25.4.1, Count Operation Start and Stop Control](#).

**TCSTF flag (AGT Count Status Flag)**

The TCSTF flag indicates the AGT count status.

[Setting condition]

- When 1 is written to the TSTART bit (the TCSTF flag is set to 1 in synchronization with the count source).

[Clearing conditions]

- When 0 is written to the TSTART bit (the TCSTF flag is set to 0 in synchronization with the count source)
- When 1 is written to the TSTOP bit.

**TSTOP bit (AGT Count Forced Stop)**

When 1 is written to the TSTOP bit, the count is forcibly stopped. The read value is 0.

**TEDGF flag (Active Edge Judgment Flag)**

The TEDGF flag indicates that an active edge was detected.

[Setting condition]

- When the measurement of the active width of the external input (AGTIO) is complete in pulse width measurement mode.
- When the set edge of the external input (AGTIO) is input in pulse period measurement mode

[Clearing condition]

- When 0 is written to this flag by a program.

**TUNDF flag (Underflow Flag)**

The TUNDF flag indicates that the counter underflowed.

[Setting condition]

- When the counter underflows.

[Clearing condition]

- When 0 is written to this flag by software.

**TCMAF flag (Compare Match A Flag)**

The TCMAF flag indicates that compare match A was detected.

[Setting condition]

- When the value in the AGT register matches the value in the AGTCMA register.

[Clearing condition]

- When 0 is written to this flag by software.

**TCMBF flag (Compare Match B Flag)**

The TCMBF flag indicates that compare match B was detected.

[Setting condition]

- When the value in the AGT register matches the value in the AGTCMB register.

[Clearing condition]

- When 0 is written to this flag by software.

## 25.2.5 AGT Mode Register 1 (AGTMR1)

Address(es): [AGT0.AGTMR1 4008 4009h](#), [AGT1.AGTMR1 4008 4109h](#)

| Bit      | Symbol                    | Bit name               | Description  | R/W |
|----------|---------------------------|------------------------|--|-----|
| b2 to b0 | <a href="#">TMOD[2:0]</a> | Operating Mode*3       | b2 b0<br>0 0 0: Timer mode<br>0 0 1: Pulse output mode<br>0 1 0: Event counter mode<br>0 1 1: Pulse width measurement mode<br>1 0 0: Pulse period measurement mode.<br>Other settings are prohibited.  | R/W |
| b3       | <a href="#">TEDGPL</a>    | Edge Polarity*4        | 0: Single-edge<br>1: Both-edge.  | R/W |
| b6 to b4 | <a href="#">TCK[2:0]</a>  | Count Source*1, *2, *5 | b6 b4<br>0 0 0: PCLKB<br>0 0 1: PCLKB/8<br>0 1 1: PCLKB/2<br>1 0 0: Divided clock AGTLCLK specified in CKS[2:0] bits in AGTMR2 register<br>1 0 1: Underflow event signal from AGT0*6<br>1 1 0: Divided clock AGTCLK specified in CKS[2:0] bits in AGTMR2 register.<br>Other settings are prohibited. | R/W |
| b7       | —                         | Reserved               | The read value is 0. The write value should be 0.  | R/W |

Note: Write access to the AGTMR1 register initializes the output from the AGTOn, AGTIO<sub>n</sub>, AGTOAn and AGTOB<sub>n</sub> pins of the AGT (n = 0, 1). For details on the output level at initialization, see the description of [section 25.2.7, AGT I/O Control Register \(AGTIOC\)](#).

Note 1. When event counter mode is selected, the external input (AGTIO<sub>n</sub>) is selected as the count source regardless of the setting of TCK[2:0] bits.

Note 2. Do not switch count sources during count operation. Only switch count sources when both the TSTART and TCSTF bits in the AGTCR register are set to 0 (count is stopped).

Note 3. The operating mode can only be changed when the count is stopped while both the TSTART and TCSTF bits in the AGTCR register are set to 0 (count is stopped). Do not change the operating mode during count operation.

Note 4. The TEDGPL bit is enabled only in event counter mode.

Note 5. When running AGT in Software Standby and Deep Software Standby modes, set AGTCLK or AGTLCLK (TCK[2:0] = 100b or 110b) as the count source.

Note 6. AGT0 cannot use AGT0 underflow (setting prohibited). AGT1 uses the AGT0 underflow.

### 25.2.6 AGT Mode Register 2 (AGTMR2)

Address(es): [AGT0.AGTMR2 4008 400Ah](#), [AGT1.AGTMR2 4008 410Ah](#)

| Bit      | Symbol                   | Bit name   | Description   | R/W |
|----------|--------------------------|--|---|-----|
| b2 to b0 | <a href="#">CKS[2:0]</a> | AGTCLK/AGTLCLK<br>Count Source Clock<br>Frequency Division<br>Ratio *1, *2, *3 | b2 b0<br>0 0 0: 1/1<br>0 0 1: 1/2<br>0 1 0: 1/4<br>0 1 1: 1/8<br>1 0 0: 1/16<br>1 0 1: 1/32<br>1 1 0: 1/64<br>1 1 1: 1/128. | R/W |
| b6 to b3 | —                        | Reserved   | These bits are read as 0. The write value should be 0.  | R/W |
| b7       | <a href="#">LPM</a>      | Low Power Mode   | 0: Normal mode<br>1: Low power mode.  | R/W |

Note 1. Do not rewrite CKS[2:0] during count operation. Only rewrite the CKS[2:0] bits when both the TSTART and TCSTF bits in the AGTCR register are set to 0 (count is stopped).

Note 2. When count source is AGTCLK/AGTLCLK, the switch of CKS[2:0] is valid.

Note 3. Do not switch the TCK[2:0] bits in the AGTMR1 register when CKS[2:0] are not 000b. Switch the TCK[2:0] bits in the AGTMR1 register after CKS[2:0] are set to 000b, and wait for 1 cycle of the count source.

#### LPM bit (Low Power Mode)

The LPM bit sets the low power operation, which impacts access to certain AGT registers. Set 1 to operate in low power. When this bit is 1, access to the following registers is prohibited:

- AGT/AGTCMA/AGTCMB/AGTCR.

After this bit is switched from 1 to 0, the first access to the register is constrained as follows:

- AGT: Read AGT register twice. Only the second reading of data is valid.
- AGT, AGTCMA, AGTCMB, and AGTCR: Allow at least 2 cycles of the count source clock when writing to the register.

### 25.2.7 AGT I/O Control Register (AGTIOC)

Address(es): [AGT0.AGTIOC 4008 400Ch](#), [AGT1.AGTIOC 4008 410Ch](#)

| Bit | Symbol                  | Bit name            | Description  | R/W |
|-----|-------------------------|---------------------|--|-----|
| b0  | <a href="#">TEDGSEL</a> | I/O Polarity Switch | Function varies depending on the operating mode. See <a href="#">Table 25.3</a> and <a href="#">Table 25.4</a> .<br>The TEDGSEL bit switches the AGTO output polarity and the AGTIO input/output edge and polarity. In pulse output mode, it only controls the polarity of AGTO output and AGTIO output. AGTO output and AGTIO output are initialized when the AGTMR1 register is written and the TSTOP bit in the AGTCR register is written with 1. | R/W |

| Bit    | Symbol     | Bit name                 | Description  | R/W |
|--------|------------|--------------------------|--|-----|
| b1     | —          | Reserved                 | This bit is read as 0. The write value should be 0.  | R/W |
| b2     | TOE        | AGTOn Output Enable      | 0: AGTOn output disabled<br>1: AGTOn output enabled.   | R/W |
| b3     | —          | Reserved                 | This bit is read as 0. The write value should be 0.  | R/W |
| b5, b4 | TIPF[1:0]  | Input Filter *3          | b5 b4<br>0 0: No filter<br>0 1: Filter sampled at PCLKB<br>1 0: Filter sampled at PCLKB/8<br>1 1: Filter sampled at PCLKB/32.<br>These bits specify the sampling frequency of the filter for the AGTIOOn input. If the input to the AGTIOOn pin is sampled and the value matches three successive times, that value is taken as the input value. | R/W |
| b7, b6 | TIOGT[1:0] | Count Control *1, *2, *4 | b7 b6<br>0 0: Event is always counted<br>0 1: Event is counted during polarity period specified for AGTEEn.<br>Other settings are prohibited.  | R/W |

Note 1. When AGTEEn pin is used, the polarity to count an event can be selected with the EEPS bit in the AGTISR register.

Note 2. TIOGT[1:0] bits are enabled only in event counter mode.

Note 3. When event counter mode operation is performed during Software Standby and Deep Software Standby modes, the digital filter function cannot be used.

Note 4. When using in Deep Software Standby mode, set TIOGT[1:0] = 00b (event is always counted).

**Table 25.3 AGTIOOn I/O edge and polarity switching**

| Operating mode                | Function  |
|-------------------------------|---|
| Timer mode                    | Not used  |
| Pulse output mode             | 0: Output is started at high (initialization level: high)<br>1: Output is started at low (initialization level: low). |
| Event counter mode            | 0: Count on rising edge<br>1: Count on falling edge.  |
| Pulse width measurement mode  | 0: Low-level width is measured<br>1: High-level width is measured   |
| Pulse period measurement mode | 0: Measure from one rising edge to the next rising edge<br>1: Measure from one falling edge to the next falling edge. |

**Table 25.4 AGTOn output polarity switching**

| Operating mode | Function  |
|----------------|---|
| All modes      | 0: Output is started at low (initialization level: low)<br>1: Output is started at high (initialization level: high). |

### 25.2.8 AGT Event Pin Select Register (AGTISR)

Address(es): AGT0.AGTISR 4008 400Dh, AGT1.AGTISR 4008 410Dh

| b7 | b6 | b5 | b4 | b3 | b2   | b1 | b0 |
|----|----|----|----|----|------|----|----|
| —  | —  | —  | —  | —  | EEPS | —  | —  |

Value after reset: 0 0 0 0 0 0 0 0

| Bit    | Symbol | Bit name                  | Description  | R/W |
|--------|--------|---------------------------|--|-----|
| b1, b0 | —      | Reserved                  | These bits are read as 0. The write value should be 0.   | R/W |
| b2     | EEPS   | AGTEEn Polarity Selection | 0: An event is counted during the low-level period<br>1: An event is counted during the high-level period. | R/W |

| Bit      | Symbol | Bit name | Description  | R/W |
|----------|--------|----------|--|-----|
| b7 to b3 | —      | Reserved | These bits are read as 0. The write value should be 0. | R/W |

### 25.2.9 AGT Compare Match Function Select Register (AGTCMSR)

Address(es): [AGT0.AGTCMSR 4008 400Eh](#), [AGT1.AGTCMSR 4008 410Eh](#)

| b7 | b6         | b5   | b4    | b3 | b2         | b1   | b0    |
|----|------------|------|-------|----|------------|------|-------|
| —  | TOPOL<br>B | TOEB | TCMEB | —  | TOPOL<br>A | TOEA | TCMEA |
| 0  | 0          | 0    | 0     | 0  | 0          | 0    | 0     |

Value after reset:

| Bit | Symbol | Bit name   | Description  | R/W |
|-----|--------|--|--|-----|
| b0  | TCMEA  | Compare Match A Register Enable* <sup>1</sup> , * <sup>2</sup> | 0: Compare match A register disabled<br>1: Compare match A register enabled. | R/W |
| b1  | TOEA   | AGTOAn Output Enable* <sup>1</sup> , * <sup>2</sup>            | 0: AGTOAn output disabled<br>1: AGTOAn output enabled.                       | R/W |
| b2  | TOPOLA | AGTOAn Polarity Select* <sup>1</sup> , * <sup>2</sup>          | 0: AGTOAn output is started on low<br>1: AGTOAn output is started on high.   | R/W |
| b3  | —      | Reserved   | This bit is read as 0. The write value should be 0.                          | R/W |
| b4  | TCMEB  | Compare Match B Register Enable* <sup>1</sup> , * <sup>2</sup> | 0: Compare match B register disabled<br>1: Compare match B register enabled. | R/W |
| b5  | TOEB   | AGTOBn Output Enable* <sup>1</sup> , * <sup>2</sup>            | 0: AGTOBn output disabled<br>1: AGTOBn output enabled.                       | R/W |
| b6  | TOPOLB | AGTOBn Polarity Select* <sup>1</sup> , * <sup>2</sup>          | 0: AGTOBn output is started on low<br>1: AGTOBn output is started on high.   | R/W |
| b7  | —      | Reserved   | This bit is read as 0. The write value should be 0.                          | R/W |

Note 1. Do not rewrite the AGTCMSR register during a count operation. Only rewrite the AGTCMSR register when both the TSTART and TCSTF bits in the AGTCR register are set to 0 (count is stopped).

Note 2. Do not set to 1 when in pulse width measurement mode or pulse period measurement mode.

### 25.2.10 AGT Pin Select Register (AGTIOSEL)

Address(es): [AGT0.AGTIOSEL 4008 400Fh](#), [AGT1.AGTIOSEL 4008 410Fh](#)

| b7 | b6 | b5 | b4   | b3 | b2 | b1       | b0 |

It cannot be used for output. | R/W |
| b3, b2 | —        | Reserved  | These bits are read as 0. The write value should be 0.  | R/W |

| Bit      | Symbol      | Bit name           | Description  | R/W |
|----------|-------------|--------------------|--|-----|
| b4       | <b>TIES</b> | AGTIO Input Enable | 0: External event input is disabled during Software Standby mode<br>1: External event input is enabled during Software Standby mode. | R/W |
| b7 to b5 | —           | Reserved           | These bits are read as 0. The write value should be 0.   | R/W |

- Note 1. P402/AGTIO and P403/AGTIO can be used as external event input pins for the AGT in Deep Software Standby mode. Pm\*2/AGTIO cannot be used as external event input pins for the AGT in Deep Software Standby mode. P402/AGTIO and P403/AGTIO are input only.  
When Pm/AGTIO is selected, you must set the Port mn Pin Function Select register. See [section 20, I/O Ports](#).
- Note 2. m = 100, 301, 407, and 705 (AGT0), m = 204 and 400 (AGT1).
- Note 3. When P402/AGTIO and P403/AGTIO are selected, you must set the VBTICTLR register. See [section 12, Battery Backup Function](#).

The AGTIOSEL register sets the AGTIO pin when using the AGTIO in Deep Software Standby mode and Software Standby mode. The AGTIOSEL register can be set with an 8-bit memory manipulation instruction.

### **SEL[1:0] bits (AGTIO Pin Select\*1,\*3)**

The SEL[1:0] bits select the AGTIO pin function.

### **TIES bit (AGTIO Input Enable)**

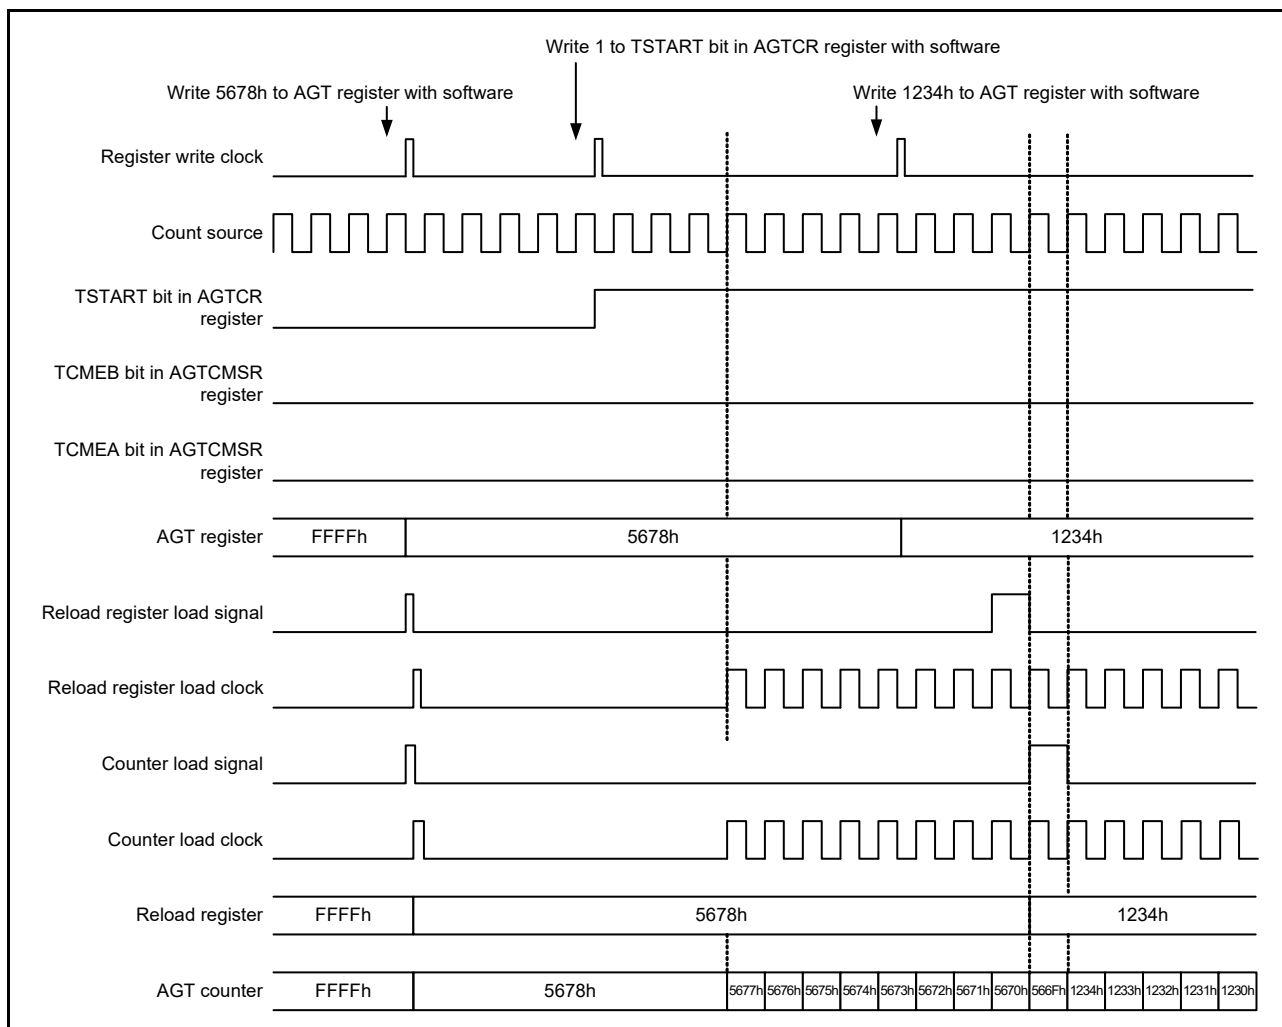

The TIES bit enables or disables an external event input.

## 25.3 Operation

### 25.3.1 Reload Register and Counter Rewrite Operation

Regardless of the operating mode, the timing of the rewrite operation to the reload register and the counter differs depending on the value of the TSTART bit in the AGTCR register and of the TCMEA and TCMEB bit in the AGTCMSR register. When the TSTART bit is 0 (count stops), the count value is directly written to the reload register and the counter. When the TSTART bit is 1 (count starts) and the TCMEA bit and TCMEB bit are 0 (compare match A/B registers are invalid), the value is written to the reload register in synchronization with the count source, and then to the counter in synchronization with the next count source. When the TSTART bit is 1 (count starts) and the TCMEA bit or TCMEB bit is 1 (compare match A register or compare match B register is valid), the value is written to the reload register in synchronization with the count source, and then to the counter in synchronization with the underflow of the counter.

[Figure 25.2](#) and [Figure 25.3](#) show the timing of rewrite operation with TSTART bit value and TCMEA/TCMEB bit value.

**Figure 25.2** Timing of rewrite operation with TSTART bit value and TCMEA/TCMEB bit value when compare match register A or B is invalid

**Figure 25.3** Timing of rewrite operation with TSTART bit value and TCMEA or TCMEB bit value when compare match register A or B is valid

### 25.3.2 Reload Register and Compare Register A/B Rewrite Operation

Regardless of the operating mode, the timing of the rewrite operation to compare register A/B depends on the value of the TSTART bit in the AGTCR register. When the TSTART bit is 0 (count stops), the count value is directly written to the reload register and compare register A/B. When the TSTART bit is 1 (count starts), the value is written to the reload register in synchronization with the count source, and then to the compare register in synchronization with the underflow of the counter.

Figure 25.4 shows the timing of rewrite operation with TSTART bit value for compare register A. Compare register B has the same timing as compare register A.

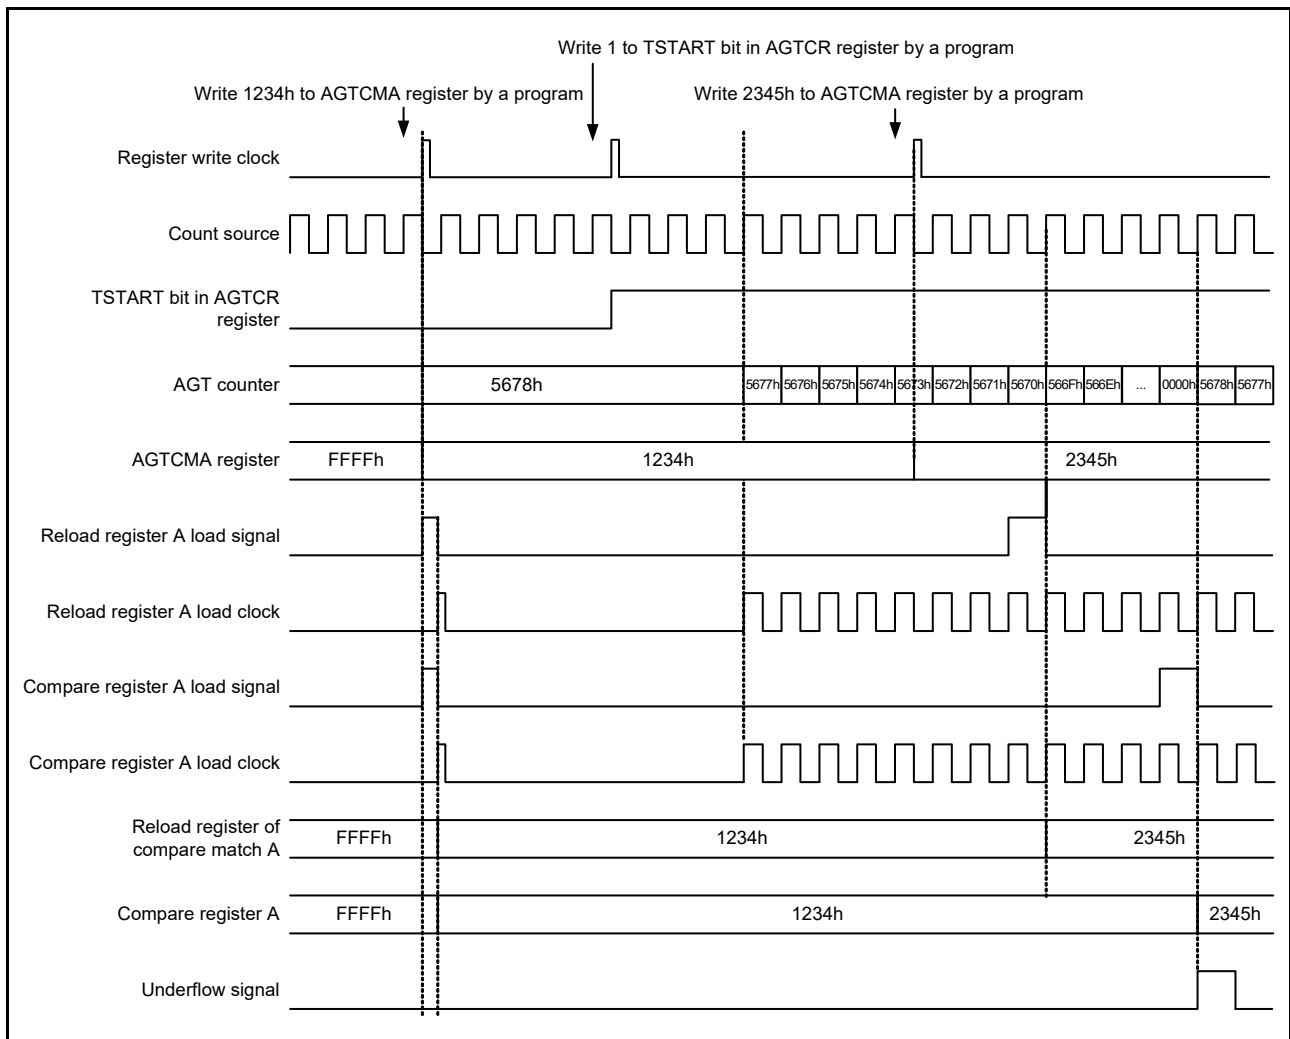

Figure 25.4 Timing of rewrite operation with TSTART bit value for compare register A

### 25.3.3 Timer Mode

In timer mode, the AGT counter is decremented by the count source selected with bits TCK[2:0] in the AGTMR1 register. In timer mode, the count value is decremented by 1 on each rising edge of the count source. When the count value reaches 0000h and the next count source is input, an underflow occurs and an interrupt request is generated.

Figure 25.5 shows the operation example in timer mode.

**Figure 25.5** Operation example in timer mode

### 25.3.4 Pulse Output Mode

In pulse output mode, the counter is decremented by the count source selected with bits TCK[2:0] in the AGTMR1 register, and the output level of pins AGTIO<sub>n</sub> and AGTON<sub>n</sub> pins is inverted each time an underflow occurs.

In pulse output mode, the count value is decremented by 1 on each rising edge of the count source. When the count value reaches 0000h and the next count source is input, an underflow occurs and an interrupt request is generated. In addition, a pulse can be output from the AGTIO<sub>n</sub> and AGTON<sub>n</sub> pins. The output level is inverted each time an underflow occurs. The pulse output from the AGTON<sub>n</sub> pin can be stopped with the TOE bit in the AGTIOC register. The output level can be selected with the TEDGSEL bit in the AGTIOC register.

Figure 25.6 shows the operation example in pulse output mode.

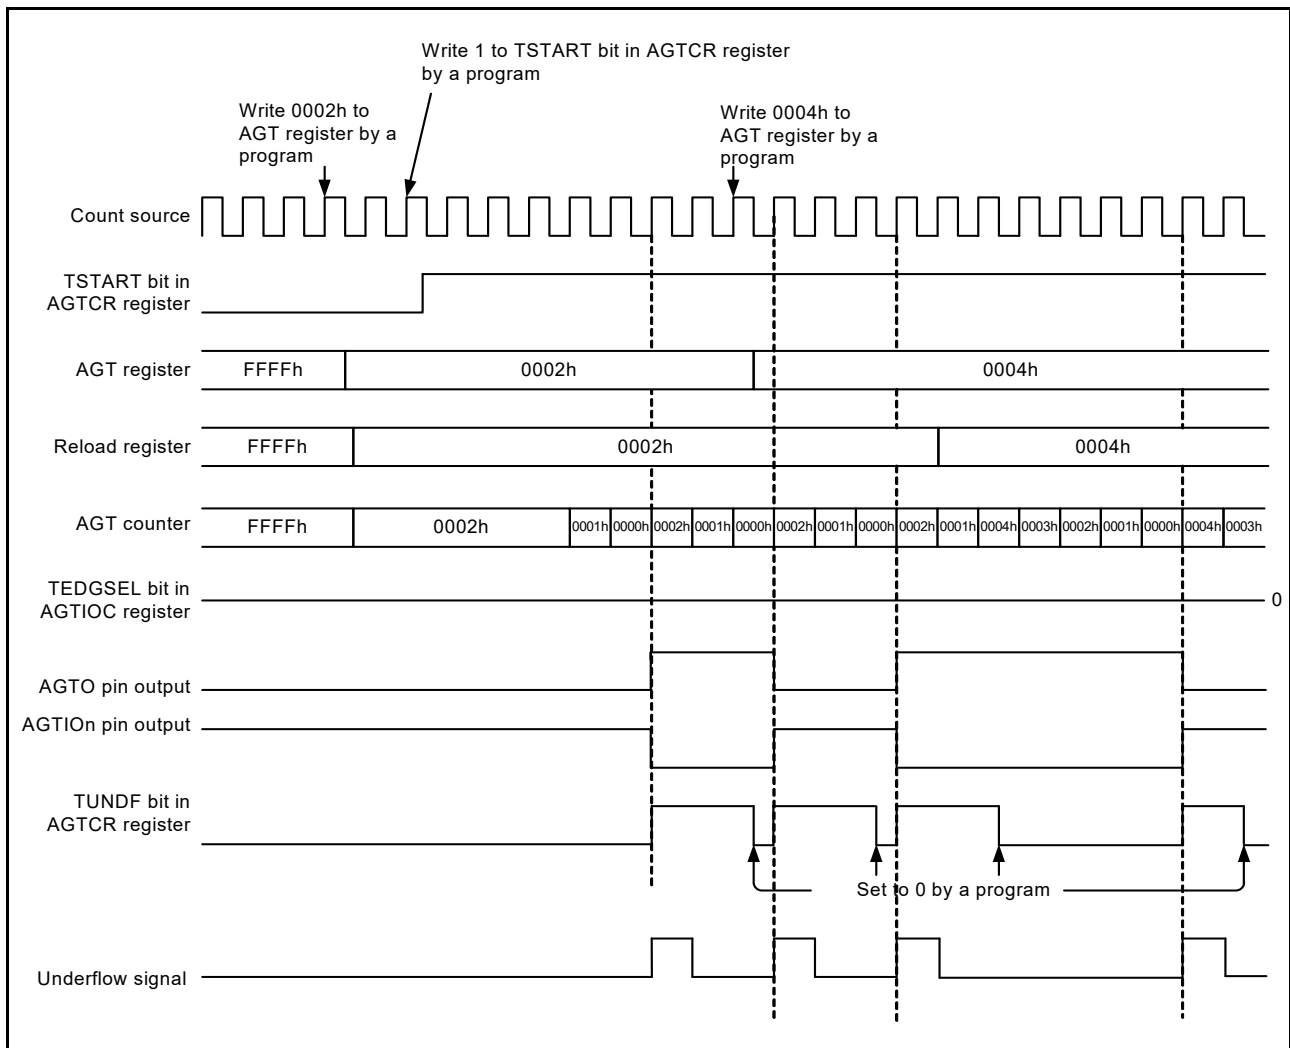

Figure 25.6 Operation example in pulse output mode

### 25.3.5 Event Counter Mode

In event counter mode, the counter is decremented by an external event signal input to the AGTIO pin. Various periods for counting events can be set with the TIOGT[1:0] bits in the AGTIOC and AGTISR registers. In addition, the filter function for the AGTIO input can be specified with bits TIPF[1:0] in the AGTIOC register. The output from the AGTIO pin can be toggled even in event counter mode.

Figure 25.7 shows the operation example in event counter mode.

Figure 25.7 Operation example 1 in event counter mode

Figure 25.8 shows an operation example for counting during the specified period in event counter mode (TIOGT[1:0] bits in the AGTIOC register are set to 01b).

Figure 25.8 Operation example 2 in event counter mode

- Note 1. To control synchronization, there is a delay of 2 cycles of the count source until count operation is affected. It is also possible that the count start timing is shifted by 1 cycle because of the phase difference between the AGTEEn and the sampling clock.
- Note 2. Count operation can be performed for 2 cycles of the count source immediately after the count starts, depending on the previous state before the count stops.  
To disable the count for 2 cycles immediately after the count starts, write 1 to the TSTOP bit in the AGTCR register to initialize the internal circuit, and then complete the operation settings before starting the count operation.

### 25.3.6 Pulse Width Measurement Mode

In pulse width measurement mode, the pulse width of an external signal input to the AGTIO pin is measured. When the level specified in the TEDGSEL bit in the AGTIOC register is input to the AGTIO pin, the counter is decremented by

the count source selected by TCK[2:0] bits in the AGTMR1 register. When the specified level on the AGTIO pin ends, the counter is stopped, the TEDGF bit in the AGTCR register is set to 1 (active edge received), and an interrupt request is generated. The measurement of pulse width data is performed by reading the count value while the counter is stopped. Also, when the counter underflows during measurement, the TUNDF bit in the AGTCR register is set to 1 and an interrupt request is generated.

Figure 25.9 shows the operation example in pulse width measurement mode.

Figure 25.9 Operation example in pulse width measurement mode

### 25.3.7 Pulse Period Measurement Mode

In pulse period measurement mode, the pulse period of an external signal input to the AGTIO pin is measured. The counter is decremented by the count source selected with bits TCK[2:0] in the AGTMR1 register. When a pulse with the level specified in the TEDGSEL bit in the AGTIOC register is input to the AGTIO pin, the count value is transferred to the read-out buffer on the rising edge of the count source. The value in the reload register is loaded to the counter at the next rising edge. Simultaneously, the TEDGF bit in the AGTCR register is set to 1 (active edge received) and an interrupt request is generated. The read-out buffer (AGT register) is read at this time and the difference from the reload value (see section 25.4.5, How to Calculate Event Number, Pulse Width, and Pulse Period) is the period data of the input pulse. The period data is retained until the read-out buffer is read. When the counter underflows, the TUNDF bit in the AGTCR register is set to 1 (underflow) and an interrupt request is generated.

Figure 25.10 shows the operation example in pulse period measurement mode.

Only input pulses with a period longer than twice the period of the count source are measured. Also, the low-level and high-level widths must both be longer than the period of the count source. If a pulse period shorter than these conditions

is input, the input might be ignored.

Figure 25.10 Operation example in pulse period measurement mode

### 25.3.8 Compare Match Function

The compare match function detects matches (compare match) between the content of the AGTCMA or AGTCMB register and the content of the AGT register. This function is enabled when the TCMEA bit or the TCMEB bit in the AGTCMSR register is 1 (compare match A register or compare match B register is valid). The counter is decremented by the count source selected with bits TCK[2:0] in the AGTMR1 register, and when the values of AGT and AGTCMA or AGTCMB match, the TCMAF/TCMBF bit in the AGTCR register is set to 1 (match), and an interrupt request is generated.

When compare match function is enabled, the timing of the rewrite operation to the reload register and the counter differs. See [section 25.3.1, Reload Register and Counter Rewrite Operation](#) for details. In addition, the output level of the AGTOAn and AGTOBn pins is inverted by the match and by the underflow. The output level can be selected with the TOPOLA or TOPOLB bit in the AGTCMSR register.

Figure 25.11 shows the operation example in compare match mode.

Figure 25.11 Operation example in compare match mode (TOPOLA = 0, TOPOLB = 0)

### 25.3.9 Output Settings for Each Mode

Table 25.5 to Table 25.8 list the states of pins AGTO<sub>n</sub>, AGTIO<sub>n</sub>, AGTOA<sub>n</sub>, and AGTOB<sub>n</sub> in each mode.

**Table 25.5 AGTOn pin setting**

| Operating mode | AGTIOC register |             | AGTOn pin output |
|----------------|-----------------|-------------|------------------|
|                | TOE bit         | TEDGSEL bit |                  |
| All modes      | 1               | 1           | Inverted output  |
|                |                 | 0           | Normal output    |
|                | 0               | 0 or 1      | Output disabled  |

**Table 25.6 AGTIO pin setting**

| Operating mode                | AGTIOC register |   | AGTIO pin I/O       |
|-------------------------------|-----------------|---|---------------------|
|                               | TEDGSEL bit     |   |                     |
| Timer mode                    | 0 or 1          |   | Input<br>(not used) |
| Pulse output mode             | 1               |   | Normal output       |
|                               |                 | 0 | Inverted output     |
| Event counter mode            | 0 or 1          |   | Input               |
| Pulse width measurement mode  |                 |   |                     |
| Pulse period measurement mode |                 |   |                     |

**Table 25.7 AGTOAn pin setting**

| Operating mode                | AGTCMSR register |            | AGTOAn pin output             |
|-------------------------------|------------------|------------|-------------------------------|
|                               | TOEA bit         | TOPOLA bit |                               |
| Timer mode                    | 1                | 1          | Inverted output               |
|                               |                  | 0          | Normal output                 |

### 25.3.10 Standby Mode

The AGT can operate in Software Standby and Deep Software Standby modes. Set it to Software Standby mode or Deep Software Standby mode with count operation start (TSTART = 1, TCSTF = 1).

[Table 25.9](#) and [Table 25.10](#) show the settings that can be used in Software Standby and Deep Software Standby modes.

**Table 25.9 Usable settings for AGT0 in Software Standby and Deep Software Standby modes**

| Operating mode                | TCK[2:0] bits of AGTMR1 register | Operating clock    | Resurgence factor of CPU |
|-------------------------------|----------------------------------|--------------------|--------------------------|
| Timer mode                    | 100b or 110b                     | AGTLCLK or AGTSCLK | —                        |
| Pulse output mode             | 100b or 110b                     | AGTLCLK or AGTSCLK | —                        |
| Event counter mode            | - (Invalid)                      | AGTIO <sub>n</sub> | —                        |
| Pulse width measurement mode  | 100b or 110b                     | AGTLCLK or AGTSCLK | —                        |
| Pulse period measurement mode | 100b or 110b                     | AGTLCLK or AGTSCLK | —                        |

**Table 25.10 Usable settings AGT1 in Software Standby and Deep Software Standby modes**

| Operating mode                | TCK[2:0] bits of AGTMR1 register   | Operating clock                      | Resurgence factor of CPU   |
|-------------------------------|------------------------------------|--------------------------------------|--|
| Timer mode                    | 100b or 110b or 101b <sup>*1</sup> | AGTLCLK or AGTSCLK or AGT0 underflow | <ul style="list-style-type: none"> <li>• Underflow</li> <li>• Compare match A/B</li> </ul> |
| Pulse output mode             | 100b or 110b or 101b <sup>*1</sup> | AGTLCLK or AGTSCLK or AGT0 underflow | <ul style="list-style-type: none"> <li>• Underflow</li> <li>• Compare match A/B</li> </ul> |
| Event counter mode            | - (Invalid)                        | AGTIO <sub>n</sub>                   | <ul style="list-style-type: none"> <li>• Underflow</li> <li>• Compare match A/B</li> </ul> |
| Pulse width measurement mode  | 100b or 110b or 101b <sup>*1</sup> | AGTLCLK or AGTSCLK or AGT0 underflow | <ul style="list-style-type: none"> <li>• Underflow</li> <li>• Active edge</li> </ul>       |
| Pulse period measurement mode | 100b or 110b or 101b <sup>*1</sup> | AGTLCLK or AGTSCLK or AGT0 underflow | <ul style="list-style-type: none"> <li>• Underflow</li> <li>• Active edge</li> </ul>       |

Note: Release of Software Standby mode or Deep Software Standby mode is only AGT1.

Note 1. Only when AGT0 operates in [Table 25.9](#).

### 25.3.11 Interrupt Sources

The AGT has three interrupt sources described in [Table 25.11](#).

**Table 25.11 AGT interrupt sources**

| Name         | Interrupt source  | DMAC/DTC activation |
|--------------|---|---------------------|
| AGTn_AGTI    | <ul style="list-style-type: none"> <li>When the counter underflows</li> <li>When measurement of the active width of the external input (AGTIO) is complete in pulse width measurement mode</li> <li>When the set edge of the external input (AGTIO) is input in pulse period measurement mode.</li> </ul> | Possible            |
| AGTn_AGTCMAI | When the values of AGT and AGTCMA match   | Possible            |
| AGTn_AGTCMBI | When the values of AGT and AGTCMB match   | Possible            |

Note: Channel number (n = 0 or 1).

### 25.3.12 Event Signal Output to ELC

The AGT uses the Event Link Controller (ELC) to perform a link operation to a specified module using the interrupt request signal as the event signal. The AGT outputs compare match A, compare match B, and underflow/measurement complete signals as event signals. For details, see [section 19, Event Link Controller \(ELC\)](#).

## 25.4 Usage Notes

### 25.4.1 Count Operation Start and Stop Control

- When the operating mode (see [Table 25.1](#)) is set to other than the event counter mode, or the count source is set to other than AGT0 underflow (TCK[2:0] = 101b):
  - After 1 (count starts) is written to the TSTART bit in the AGTCR register while the count is stopped, the TCSTF flag in the AGTCR register remains 0 (count stops) for 3 cycles of the count source. Do not access the registers associated with AGT\*<sup>1</sup> other than the TCSTF flag until this bit is set to 1 (count in progress).
  - After 0 (count stops) is written to the TSTART bit during a count operation, the TCSTF flag remains 1 for 3 cycles of the count source. When the TCSTF flag is set to 0, the count stops. Do not access the registers associated with AGT\*<sup>1</sup> other than the TCSTF flag until this bit is set to 0.
  - Clear the interrupt register before changing the TSTART bit from 0 to 1. See [section 14, Interrupt Controller Unit \(ICU\)](#) for details.

Note 1. Registers associated with AGT: AGT, AGTCMA, AGTCMB, AGTCR, AGTMR1, AGTMR2, AGTIOC, AGTISR, and AGTCMSR.

- When the operating mode (see [Table 25.1](#)) is set to event counter mode, or the count source is set to AGT0 underflow (TCK[2:0] = 101b)
  - After 1 (count starts) is written to the TSTART bit in the AGTCR register while the count is stopped, the TCSTF bit in the AGTCR register remains 0 (count stops) for 2 cycles of the PCLKB. Do not access the registers associated with AGT\*<sup>1</sup> other than the TCSTF bit until this bit is set to 1 (count in progress).
  - After 0 (count stops) is written to the TSTART bit during a count operation, the TCSTF bit remains 1 for 2 cycles of the PCLKB. When the TCSTF bit is set to 0, the count is stopped. Do not access the registers associated with AGT\*<sup>1</sup> other than the TCSTF bit until this bit is set to 0.
  - Clear the interrupt register before changing the TSTART bit from 0 to 1. See [section 14, Interrupt Controller Unit \(ICU\)](#) for details.

Note 1. Registers associated with AGT: AGT, AGTCMA, AGTCMB, AGTCR, AGTMR1, AGTMR2, AGTIOC, AGTISR, and AGTCMSR.

### 25.4.2 Access to Counter Register

When the TSTART and TCSTF bits in the AGTCR register are both 1 (count starts), allow at least 3 cycles of the count source clock between writes when writing to the AGT register successively.

### 25.4.3 When Changing Mode

The registers associated with AGT operating mode (AGTMR1, AGTMR2, AGTIOC, AGTISR, AGTCMSR and AGTIOIC) can be changed only when the count is stopped with both the TSTART and TCSTF bits set to 0 (count stops). Do not change these registers during count operation.

When the registers associated with AGT operating mode are changed, the values of bits TEDGF, TUNDF, TCMAF and TCMBF are undefined. Before starting the count, write 0 to the following bits:

- TEDGF (no active edge received)
- TUNDF (no underflow)
- TCMAF (no match)
- TCMBF (no match).

### 25.4.4 Digital Filter

When using the digital filter, do not start the timer operation for 5 cycles of the digital filter clock after setting bits TIPF[1:0] and when the TEDGSEL bit in the AGTIOC register changes.

### 25.4.5 How to Calculate Event Number, Pulse Width, and Pulse Period

- In event counter mode, event number is expressed mathematically as follows:  
Event number = initial value of counter [AGT register] - counter value of active event end
- In pulse width measurement mode, pulse width is expressed mathematically as follows:  
Pulse width = counter value of stopping measurement - counter value of next stopping measurement
- In pulse period measurement mode, input pulse period is expressed mathematically as follows:  
Period of input pulse = (initial value of counter [AGT register] - reading value of the read-out buffer) + 1

### 25.4.6 When Count Is Forcibly Stopped by TSTOP Bit

After the counter is forcibly stopped by the TSTOP bit in the AGTCR register, do not access the following I/O registers for 1 cycle of the count source:

- AGT
- AGTCMA
- AGTCMB
- AGTCR
- AGTMR1
- AGTMR2.

### 25.4.7 When Selecting AGT0 Underflow as the Count Source

Operate the AGT according to the procedures described in this section when selecting the underflow signal of AGT as the count source.

#### (1) Procedure for starting operation

1. Set AGT0 and AGT1.
2. Start the count operation of AGT1.
3. Start the count operation of AGT0.

## (2) Procedure for stopping operation

1. Stop the count operation of AGT0.
2. Stop the count operation of AGT1.
3. Stop the count source clock of AGT1 (write 000b in the AGT1.AGTMR1.TCK[2:0] bits).

### 25.4.8 Reset of I/O Register

The I/O register of AGT is not initialized by different types of resets. For details, see [section 6, Resets](#).

### 25.4.9 When Selecting PCLKB, PCLKB/8, or PCLKB/2 as the Count Source

When a reset is generated, the operation of AGT cannot be guaranteed. Set the registers associated with AGT again.

### 25.4.10 When Selecting AGTSCLK or AGTLCLK as the Count Source

The MSTPD2 bit in the MSTPCRD register must be set to 1 except when accessing the AGT1 registers. The MSTPD3 bit in the MSTPCRD register must be set to 1 except when accessing the AGT0 registers. When a reset occurs while MSTPD2 or MSTPD3 bit is 0, the operation of AGT1 or AGT0 cannot be guaranteed. Set the registers associated with AGT again.

### 25.4.11 When Switching Source Clock

When switching a clock source by changing SCKCR.CKSEL[2:0], the clock output from the selector stops for 4 cycles of the switched clock. Therefore, when using the AGTIO, AGTEE, or both input as external event input, the clock source should not be switched. If switching the clock source while using the external event input, extend the input pulse width by 4 clock cycles of the switched source clock cycles.

## 26. Realtime Clock (RTC)

### 26.1 Overview

The RTC has two counting modes, calendar count mode and binary count mode, these are used by switching register settings. For calendar count mode, the RTC has a 100 year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar.

The sub-clock oscillator or LOCO can be selected as the count source of the time counters. The RTC uses a 128-Hz clock acquired by dividing the count source by a prescaler. Year, month, date, day-of-week, a.m./p.m. (in 12-hour mode), hour, minute, second, or 32-bit binary is counted by 1/128 second.

[Table 26.1](#) lists the RTC specifications, [Figure 26.1](#) shows a block diagram, and [Table 26.2](#) lists the I/O pins.

**Table 26.1** RTC specifications

| Parameter                    | Specifications  |
|------------------------------|---|
| Count mode                   | Calendar count mode/binary count mode   |
| Count source*1               | Sub-clock oscillator (XCIN) or LOCO   |
| Clock and calendar functions | <ul style="list-style-type: none"> <li>• Calendar count mode<br/>Year, month, date, day of week, hour, minute, second are counted, BCD display<br/>12 hours/24 hours mode switching function<br/>30 seconds adjustment function (a number less than 30 is rounded down to 00 seconds, and 30 seconds or more are rounded up to 1 minute)<br/>Automatic adjustment function for leap years</li> <li>• Binary count mode<br/>Count seconds in 32 bits, binary display</li> <li>• Shared by both modes<br/>Start/stop function<br/>The sub-second digit is displayed in binary units (1 Hz, 2 Hz, 4 Hz, 8 Hz, 16 Hz, 32 Hz, or 64 Hz)<br/>Clock error correction function<br/>Clock (1-Hz/64-Hz) output</li> </ul>   |
| Interrupts                   | <ul style="list-style-type: none"> <li>• Alarm interrupt (RTC_ALM)<br/>As an alarm interrupt condition, selectable for comparison with the following:<br/>Calendar count mode: Year, month, date, day-of-week, hour, minute, or second can be selected<br/>Binary count mode: Each bit of the 32-bit binary counter.</li> <li>• Periodic interrupt (RTC_PRD)<br/>2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second can be selected as an interrupt period</li> <li>• Carry interrupt (RTC_CUP)<br/>An interrupt is generated at either of the following conditions:<br/>- When a carry from the 64-Hz counter to the second counter is generated<br/>- When the 64-Hz counter is changed and the R64CNT register is read at the same time</li> <li>• Return from Software Standby mode or Deep Software Standby mode can be performed by an alarm interrupt or periodic interrupt.</li> </ul> |
| Time capture function        | <ul style="list-style-type: none"> <li>• Times can be captured when the edge of the time capture event input pin is detected.<br/>For every event input, month, date, hour, minute, and second are captured or the 32-bit binary counter value is captured.</li> </ul>  |
| Event link function          | Periodic event output (RTC_PRD)   |

Note 1. The frequency of the peripheral module clock (PCLKB) must be  $\geq$  the frequency of the count source clock.

Figure 26.1 RTC block diagram

Table 26.2 RTC pin configuration

| Pin name | I/O    | Function  |
|----------|--------|---|
| XCIN     | Input  | Connect a 32.768-kHz crystal to these pins  |
| XCOU     | Output |   |
| RTCOUT   | Output | This pin is used to output a 1-Hz/64-Hz waveform, but not in Deep Software Standby mode                                   |
| RTCIC0   | Input  | Time capture event input pins.  |
| RTCIC1   | Input  | RTCIC0 to RTCIC2 can be controlled by the VBTICTLR register.  |
| RTCIC2   | Input  | For more information, see <a href="#">section 12, Battery Backup Function</a> and <a href="#">section 20, I/O Ports</a> . |

## 26.2 Register Descriptions

Write or read from the RTC registers as described in [section 26.6.5, Notes on Writing to and Reading from Registers](#).

If the value in an RTC register after a reset is given as x (undefined bits) in the list, it is not initialized by a reset. When RTC enters the reset state or a low power consumption state during counting operations, for example while the RCR2.START bit is 1, the year, month, day of the week, date, hours, minutes, seconds, and 64-Hz counters continue to operate.

Note: A reset generated while writing to a register might destroy the register value. In addition, do not allow the MCU to enter Software Standby mode or Deep Software Standby mode immediately after setting any of these registers. For details, see [section 26.6.4, Transitions to Low Power Modes after Setting Registers](#).

### 26.2.1 64-Hz Counter (R64CNT)

Address(es): RTC.R64CNT 4004 4000h

|                    | b7 | b6   | b5   | b4   | b3   | b2    | b1    | b0    |
|--------------------|----|------|------|------|------|-------|-------|-------|
|                    | —  | F1HZ | F2HZ | F4HZ | F8HZ | F16HZ | F32HZ | F64HZ |
| Value after reset: | 0  | x    | x    | x    | x    | x     | x     | x     |

x: Undefined

| Bit | Symbol | Bit name | Description   | R/W |
|-----|--------|----------|---|-----|
| b0  | F64HZ  | 64 Hz    | Indicate the state between 1 Hz and 64 Hz of the sub-second digit | R   |
| b1  | F32HZ  | 32 Hz    |   | R   |
| b2  | F16HZ  | 16 Hz    |   | R   |
| b3  | F8HZ   | 8 Hz     |   | R   |
| b4  | F4HZ   | 4 Hz     |   | R   |
| b5  | F2HZ   | 2 Hz     |   | R   |
| b6  | F1HZ   | 1 Hz     |   | R   |
| b7  | —      | Reserved | This bit is read as 0   | R   |

The R64CNT counter is used in both calendar count mode and in binary count mode. The 64-Hz counter (R64CNT) generates the period for a second by counting up periods of the 128-Hz clock. The state in the sub-second range can be confirmed by reading this counter.

This counter is cleared to 00h by an RTC software reset or an execution of a 30-second adjustment. To read this counter, follow the procedure in [section 26.3.5, Reading 64-Hz Counter and Time](#).

### 26.2.2 Second Counter (RSECCNT)/Binary Counter 0 (BCNT0)

#### (1) In calendar count mode

Address(es): RTC.RSECCNT 4004 4002h

|                    | b7 | b6         | b5 | b4 | b3        | b2 | b1 | b0 |
|--------------------|----|------------|----|----|-----------|----|----|----|
|                    | —  | SEC10[2:0] |    |    | SEC1[3:0] |    |    |    |
| Value after reset: | x  | x          | x  | x  | x         | x  | x  | x  |

x: Undefined

| Bit      | Symbol    | Bit name       | Description   | R/W |
|----------|-----------|----------------|---|-----|
| b3 to b0 | SEC1[3:0] | 1-Second Count | Counts from 0 to 9 every second. When a carry is generated, 1 is added to the tens place. | R/W |

| Bit      | Symbol                     | Bit name        | Description                                     | R/W |
|----------|----------------------------|-----------------|---|-----|
| b6 to b4 | <a href="#">SEC10[2:0]</a> | 10-Second Count | Counts from 0 to 5 for 60-second counting.      | R/W |
| b7       | —                          | Reserved        | Set this bit to 0. It is read as the set value. | R/W |

The RSECCNT counter sets and counts the BCD-coded second value. It counts the carries generated once per second in the 64-Hz counter.

The setting range is decimal 00 to 59. The RTC does not operate normally if any other value is set. Before writing to this register, be sure to stop the count operation using the START bit in RCR2.

To read this counter, follow the procedure in [section 26.3.5, Reading 64-Hz Counter and Time](#).

(2) In binary count mode

Address(es): [RTC.BCNT0 4004 4002h](#)

BCNT0 is a read/write 32-bit binary counter b7 to b0 that performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 26.3.5, Reading 64-Hz Counter and Time](#).

26.2.3 Minute Counter (RMINCNT)/Binary Counter 1 (BCNT1)

(1) In calendar count mode

Address(es): [RTC.RMINCNT 4004 4004h](#)

| Bit      | Symbol                     | Bit name        | Description   | R/W |
|----------|----------------------------|-----------------|---|-----|
| b3 to b0 | <a href="#">MIN1[3:0]</a>  | 1-Minute Count  | Counts from 0 to 9 every minute. When a carry is generated, 1 is added to the tens place. | R/W |
| b6 to b4 | <a href="#">MIN10[2:0]</a> | 10-Minute Count | Counts from 0 to 5 for 60-minute counting   | R/W |
| b7       | —                          | Reserved        | Set this bit to 0. It is read as the set value.   | R/W |

The RMINCNT counter sets and counts the BCD-coded minute value. It counts the carries generated once every minute in the second counter.

A value from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 26.3.5, Reading 64-Hz Counter and Time](#).

## (2) In binary count mode

Address(es): [RTC.BCNT1 4004 4004h](#)

x: Undefined

BCNT1 is a read/write 32-bit binary counter b15 to b8 that performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 26.3.5, Reading 64-Hz Counter and Time](#).

## 26.2.4 Hour Counter (RHRCNT)/Binary Counter 2 (BCNT2)

## (1) In calendar count mode

Address(es): [RTC.RHRCNT 4004 4006h](#)

x: Undefined

| Bit      | Symbol                    | Bit name      | Description  | R/W |
|----------|---------------------------|---------------|--|-----|
| b3 to b0 | <a href="#">HR1[3:0]</a>  | 1-Hour Count  | Counts from 0 to 9 once per hour. When a carry is generated, 1 is added to the tens place. | R/W |
| b5, b4   | <a href="#">HR10[1:0]</a> | 10-Hour Count | Counts from 0 to 2 once per carry from the ones place.                                     | R/W |
| b6       | <a href="#">PM</a>        | PM            | AM/PM select for time counter setting.<br>0: AM<br>1: PM.                                  | R/W |
| b7       | —                         | Reserved      | Set this bit to 0. It is read as the set value.  | R/W |

The RHRCNT counter sets and counts the BCD-coded hour value. It counts the carries generated once per hour in the minute counter. The specifiable time differs based on the setting in the hours mode bit (RCR2.HR24):

- When the RCR2.HR24 bit is 0 — from 00 to 11 (in BCD)
- When the RCR2.HR24 bit is 1 — from 00 to 23 (in BCD).

If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. The PM bit is only enabled when the RCR2.HR24 bit is 0. Otherwise, the setting in the PM bit has no effect. To read this counter, follow the procedure in [section 26.3.5, Reading 64-Hz Counter and Time](#).

## (2) In binary count mode

Address(es): [RTC.BCNT2 4004 4006h](#)

x: Undefined

BCNT2 is a read/write 32-bit binary counter b23 to b16 that performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, be sure to stop the count operation using the START bit in

RCR2. To read this counter, follow the procedure in [section 26.3.5, Reading 64-Hz Counter and Time](#).

### 26.2.5 Day-of-Week Counter (RWKCNT)/Binary Counter 3 (BCNT3)

(1) In calendar count mode

Address(es): [RTC.RWKCNT 4004 4008h](#)

| Bit      | Symbol                    | Bit name             | Description  | R/W |
|----------|---------------------------|----------------------|--|-----|
| b2 to b0 | <a href="#">DAYW[2:0]</a> | Day-of-Week Counting | b2 b0<br>0 0 0: Sunday<br>0 0 1: Monday<br>0 1 0: Tuesday<br>0 1 1: Wednesday<br>1 0 0: Thursday<br>1 0 1: Friday<br>1 1 0: Saturday<br>1 1 1: Setting prohibited. | R/W |
| b7 to b3 | —                         | Reserved             | Set these bits to 0. They are read as the set value.   | R/W |

The RWKCNT counter is used for setting and counting in the coded day-of-week value. It counts the carries generated once per day in the hour counter. A value from 0 through 6 can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 26.3.5, Reading 64-Hz Counter and Time](#).

(2) In binary count mode

Address(es): [RTC.BCNT3 4004 4008h](#)

BCNT3 is a read/write 32-bit binary counter b31 to b24 that performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 26.3.5, Reading 64-Hz Counter and Time](#).

### 26.2.6 Day Counter (RDAYCNT)

Address(es): RTC.RDAYCNT 4004 400Ah

| Bit      | Symbol      | Bit name     | Description   | R/W |
|----------|-------------|--------------|---|-----|
| b3 to b0 | DATE1[3:0]  | 1-Day Count  | Counts from 0 to 9 once per day. When a carry is generated, 1 is added to the tens place. | R/W |
| b5, b4   | DATE10[1:0] | 10-Day Count | Counts from 0 to 3 once per carry from the ones place                                     | R/W |
| b7, b6   | —           | Reserved     | These bits are read as 0. The write value should be 0.                                    | R/W |

The RDAYCNT counter is used in calendar count mode to set and count the BCD-coded date value. It counts the carries generated once per day in the hour counter. The count operation depends on the month and whether the year is a leap year. Leap years are determined according to whether the year counter (RYRCNT) value is divisible by 400, 100, and 4.

A value from 01 through 31 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. When specifying a value, the range of specifiable days depends on the month and whether the year is a leap year. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 26.3.5, Reading 64-Hz Counter and Time](#).

### 26.2.7 Month Counter (RMONCNT)

Address(es): RTC.RMONCNT 4004 400Ch

| Bit      | Symbol    | Bit name       | Description   | R/W |
|----------|-----------|----------------|---|-----|
| b3 to b0 | MON1[3:0] | 1-Month Count  | Counts from 0 to 9 once per month. When a carry is generated, 1 is added to the tens place. | R/W |
| b4       | MON10     | 10-Month Count | Counts from 0 to 1 once per carry from the ones place                                       | R/W |
| b7 to b5 | —         | Reserved       | These bits are read as 0. The write value should be 0.                                      | R/W |

The RMONCNT counter is used in calendar count mode to set and count the BCD-coded month value. It counts the carries generated once per month in the date counter.

A value from 01 through 12 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 26.3.5, Reading 64-Hz Counter and Time](#).

## 26.2.8 Year Counter (RYRCNT)

Address(es): [RTC.RYRCNT 4004 400Eh](#)

| Bit       | Symbol                    | Bit name      | Description   | R/W |
|-----------|---------------------------|---------------|---|-----|
| b3 to b0  | <a href="#">YR1[3:0]</a>  | 1-Year Count  | Counts from 0 to 9 once per year. When a carry is generated, 1 is added to the tens place.  | R/W |
| b7 to b4  | <a href="#">YR10[3:0]</a> | 10-Year Count | Counts from 0 to 9 once per carry from ones place. When a carry is generated in the tens place, 1 is added to the hundreds place. | R/W |
| b15 to b8 | —                         | Reserved      | These bits are read as 0. The write value should be 0.  | R/W |

The RYRCNT counter is used in calendar count mode to set and count the BCD-coded year value. It counts the carries generated once per year in the month counter.

A value from 00 through 99 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 26.3.5, Reading 64-Hz Counter and Time](#).

## 26.2.9 Second Alarm Register (RSECAR)/Binary Counter 0 Alarm Register (BCNT0AR)

### (1) In calendar count mode

Address(es): [RTC.RSECAR 4004 4010h](#)

| Bit      | Symbol                     | Bit name   | Description   | R/W |
|----------|----------------------------|------------|---|-----|
| b3 to b0 | <a href="#">SEC1[3:0]</a>  | 1 Second   | Value for the ones place of seconds   | R/W |
| b6 to b4 | <a href="#">SEC10[2:0]</a> | 10 Seconds | Value for the tens place of seconds   | R/W |
| b7       | <a href="#">ENB</a>        | ENB        | 0: The register value is not compared with the RSECCNT counter value<br>1: The register value is compared with the RSECCNT counter value. | R/W |

RSECAR is an alarm register associated with the BCD-coded second counter RSECCNT. When the ENB bit is set to 1, the RSECAR value is compared with the RSECCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR

- RYRAREN.

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. RSECAR values from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is cleared to 00h by an RTC software reset.

(2) In binary count mode

Address(es): [RTC.BCNT0AR 4004 4010h](#)

x: Undefined

BCNT0AR is a read/write alarm register associated with the 32-bit binary counter b7 to b0. This register is set to 00h by an RTC software reset.

26.2.10 Minute Alarm Register (RMINAR)/Binary Counter 1 Alarm Register (BCNT1AR)

(1) In calendar count mode

Address(es): [RTC.RMINAR 4004 4012h](#)

x: Undefined

| Bit      | Symbol                     | Bit name   | Description   | R/W |
|----------|----------------------------|------------|---|-----|
| b3 to b0 | <a href="#">MIN1[3:0]</a>  | 1 Minute   | Value for the ones place of minutes   | R/W |
| b6 to b4 | <a href="#">MIN10[2:0]</a> | 10 Minutes | Value for the tens place of minutes   | R/W |
| b7       | <a href="#">ENB</a>        | ENB        | 0: The register value is not compared with the RMINCNT counter value<br>1: The register value is compared with the RMINCNT counter value. | R/W |

RMINAR is an alarm register associated with the BCD-coded minute counter RMINCNT. When the ENB bit is set to 1, the RMINAR value is compared with the RMINCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN.

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. RMINAR values from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is cleared to 00h by an RTC software reset.

## (2) In binary count mode

Address(es): [RTC.BCNT1AR 4004 4012h](#)

x: Undefined

BCNT1AR is a read/write alarm register associated with the 32-bit binary counter from b15 to b8. This register is cleared to 00h by an RTC software reset.

26.2.11 [Hour Alarm Register \(RHRAR\)/Binary Counter 2 Alarm Register \(BCNT2AR\)](#)

## (1) In calendar count mode

Address(es): [RTC.RHRAR 4004 4014h](#)

x: Undefined

| Bit      | Symbol                    | Bit name | Description   | R/W |
|----------|---------------------------|----------|---|-----|
| b3 to b0 | <a href="#">HR1[3:0]</a>  | 1 Hour   | Value for the ones place of hours   | R/W |
| b5, b4   | <a href="#">HR10[1:0]</a> | 10 Hours | Value for the tens place of hours   | R/W |
| b6       | <a href="#">PM</a>        | PM       | Time alarm setting:<br>0: AM<br>1: PM.  | R/W |
| b7       | <a href="#">ENB</a>       | ENB      | 0: The register value is not compared with the RHCNT counter value<br>1: The register value is compared with the RHCNT counter value. | R/W |

RHRAR is an alarm register associated with the BCD-coded hour counter RHCNT. When the ENB bit is set to 1, the RHRAR value is compared with the RHCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN.

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24):

- When the RCR2.HR24 bit is 0 — From 00 to 11 (in BCD)
- When the RCR2.HR24 bit is 1 — From 00 to 23 (in BCD).

If a value outside of this range is specified, the RTC does not operate correctly. When the RCR2.HR24 bit is 0, be sure to set the PM bit. When the RCR2.HR24 bit is 1, the setting in the PM bit has no effect. This register is cleared to 00h by an RTC software reset.

| 1        | 1        | 0: Generate periodic interrupt every 1/4 second     |   |     |    |  |   |   |   |   |   |   |   |   |  |   |   |  |   |   |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |     |
| 1        | 1        | 0: Generate periodic interrupt every 1/2 second     |   |     |    |  |   |   |   |   |   |   |   |   |  |   |   |  |   |   |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |     |
| 1        | 1        | 1: Generate periodic interrupt every 1 second       |   |     |    |  |   |   |   |   |   |   |   |   |  |   |   |  |   |   |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |     |
| 1        | 1        | 1: Generate periodic interrupt every 2 seconds.     |   |     |    |  |   |   |   |   |   |   |   |   |  |   |   |  |   |   |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |     |

Note 1. When LOCO is selected (RCR4.RCKSEL = 1) while PES[3:0] = 0110b, a periodic interrupt is generated every 1/128 second.

The RCR1 register is used in both calendar count mode and in binary count mode. Bits AIE, PIE, and PES[3:0] are updated synchronously with the count source. When the RCR1 register is modified, check that all the bits are updated before proceeding.

#### AIE bit (Alarm Interrupt Enable)

The AIE bit enables or disables alarm interrupt requests.

If the times indicated in the counters and alarm settings match in Deep Software Standby mode, the MCU returns from the mode regardless of the AIE bit value.

#### CIE bit (Carry Interrupt Enable)

The CIE bit enables or disables interrupt requests when a carry to the RSECCNT/BCNT0 register occurs, or when a carry to the 64-Hz counter (R64CNT) occurs while reading the 64-Hz counter.

#### PIE bit (Periodic Interrupt Enable)

The PIE bit enables or disabled a periodic interrupt.

If the periods indicated in the counters and PES[3:0] settings match in Deep Software Standby mode, the MCU returns from the mode regardless of the PIE bit value.

#### RTCOS bit (RTCOUT Output Select)

The RTCOS bit selects the RTCOUT output period. The RTCOS bit must be rewritten while the count operation is stopped (the RCR2.START bit is 0) and the RTCOUT output is disabled (the RCR2.RTCOE bit is 0). When RTCOUT is output to an external pin, the RCR2.RTCOE bit must be enabled. For details on controlling the I/O ports, see [section 20.5.1, Procedure for Specifying the Pin Functions](#).

**PES[3:0] bits (Periodic Interrupt Select)**

The PES[3:0] bits specify the period for the periodic interrupt. A periodic interrupt is generated with the period specified in these bits.

| b7  | CNTMD  | Count Mode Select                    | 0: Calendar count mode<br>1: Binary count mode.  | R/W |

Note 1. R64CNT, RSECAR/BCNT0AR, RMINAR/BCNT1AR, RHRAR/BCNT2AR, RWKAR/BCNT3AR, RDAYAR/BCNT0AER, RMONAR/BCNT1AER, RYRAR/BCNT2AER, RYRAREN/BCNT3AER, RADJ, RTCCRY, RSECCPY/BCNT0CPY, RMINCPY/BCNT1CPY, RHRCPPY/BCNT2CPY, RDAYCPY/BCNT3CPY, RMONCPY, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP.

Note 2. When LOCO is selected, the setting of this bit is disabled.

The RCR2 register is related to hours mode, automatic adjustment function, enabling RTCOUT output, 30-second adjustment, RTC software reset, and controlling count operation.

**START bit (Start)**

The START bit stops or restarts the prescaler or time counter operation. This bit is updated in synchronization with the next cycle of the count source. When the START bit is modified, check that the bit is updated before proceeding.

**RESET bit (RTC Software Reset)**

The RESET bit initializes the prescaler and registers to be reset by RTC software.

When 1 is written to the RESET bit, initialization starts in synchronization with the count source. When the initialization is complete, the RESET bit is automatically set to 0. Check that this bit is 0 before proceeding.

**ADJ30 bit (30-Second Adjustment)**

The ADJ30 bit is for 30-second adjustment.

When 1 is written to the ADJ30 bit, the RSECCNT value of 30 seconds or less is rounded down to 00 second and the value of 30 seconds or more is rounded up to 1 minute.

The 30-second adjustment is performed in synchronization with the count source. When 1 is written to this bit, the ADJ30 bit is automatically set to 0 after the 30-second adjustment is complete. If 1 is written to the ADJ30 bit, check that the bit is 0 before proceeding. When the 30-second adjustment is performed, the prescaler and R64CNT are also reset. The ADJ30 bit is cleared to 0 by an RTC software reset.

**RTCOE bit (RTCOE Output Enable)**

The RTCOE bit enables output of a 1-Hz/64-Hz clock signal from the RTCOUT pin.

Use the START bit to stop counting before changing the value of the RTCOE bit. Do not stop counting (write 0 to the START bit) and change the value of the RTCOE bit at the same time.

When RTCOUT is to be output from an external pin, enable the RTCOE bit and set up the port control for the pin.

**AADJE bit (Automatic Adjustment Enable\*2)**

The AADJE bit controls (enables or disables) automatic adjustment.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit.

The AADJE bit is cleared to 0 by an RTC software reset.

**AADJP bit (Automatic Adjustment Period Select\*2)**

The AADJP bit selects the automatic-adjustment period.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit.

The AADJP bit is cleared to 0 by an RTC software reset.

**HR24 bit (Hours Mode)**

The HR24 bit specifies whether the RTC operates in 12- or 24-hour mode.

Use the START bit to stop counting before changing the value of the HR24 bit. Do not stop counting (write 0 to the START bit) and change the value of the HR24 bit at the same time.

**CNTMD bit (Count Mode Select)**

The CNTMD bit specifies whether the RTC count mode operates in calendar count mode or in binary count mode.

When setting the count mode, execute an RTC software reset and start again from the initial settings. This bit is updated synchronously with the count source, and its value is fixed before the RTC software reset is complete.

For details on initial settings, see [section 26.3.1, Outline of Initial Settings of Registers after Power On](#).

## (2) In binary count mode

Address(es): RTC.RCR2 4004 4024h

|                    | b7        | b6 | b5    | b4    | b3    | b2 | b1    | b0    |

| b7  | CNTMD  | Count Mode Select                    | 0: Calendar count mode<br>1: Binary count mode.  | R/W |

Note 1. R64CNT, RSECAR/BCNT0AR, RMINAR/BCNT1AR, RHRAR/BCNT2AR, RWKAR/BCNT3AR, RDAYAR/BCNT0AER, RMONAR/BCNT1AER, RYRAR/BCNT2AER, RYRAREN/BCNT3AER, RADJ, RTCCRY, RSECCPY/BCNT0CPy, RMINCPy/BCNT1CPy, RHRCpy/BCNT2CPy, RDAYCPy/BCNT3CPy, RMONCPy, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP.

Note 2. When LOCO is selected, the setting of this bit is disabled.

**START bit (Start)**

The START bit stops or restarts the prescaler or counter (clock) operation. This bit is updated in synchronization with the count source. When the START bit is modified, check that the bit is updated before proceeding.

**RESET bit (RTC Software Reset)**

The RESET bit initializes the prescaler and registers to be reset by RTC software.

When 1 is written to the RESET bit, initialization starts in synchronization with the count source. When the initialization is complete, the RESET bit is automatically set to 0. When 1 is written to the RESET bit, check that the bit is 0 before proceeding.

**RTCOE bit (RTCOU Output Enable)**

The RTCOE bit enables output of a 1-Hz/64-Hz clock signal from the RTCOUT pin.

Use the START bit to stop counting before changing the value of the RTCOE bit. Do not stop counting (write 0 to the START bit) and change the value of the RTCOE bit at the same time. When an RTCOUT signal is to be output from an external pin, enable the port control in addition to setting this bit.

**AADJE bit (Automatic Adjustment Enable\*2)**

The AADJE bit controls (enables or disables) automatic adjustment.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit. The AADJE bit is cleared to 0 by an RTC software reset.

**AADJP bit (Automatic Adjustment Period Select\*2)**

The AADJP bit selects the automatic-adjustment period.

Correction period can be selected from 32 second units or 8 second units in binary count mode.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit. The AADJP bit is cleared to 0 by an RTC software reset.

**CNTMD bit (Count Mode Select)**

The CNTMD bit specifies whether the RTC count mode operates in calendar count mode or in binary count mode.

When setting the count mode, execute an RTC software reset and start again from the initial settings. This bit is updated synchronously with the count source, and its value is fixed before the RTC software reset is complete.

For details on initial settings, see [section 26.3.1, Outline of Initial Settings of Registers after Power On](#).

**26.2.19 RTC Control Register 4 (RCR4)**

Address(es): [RTC.RCR4 4004 4028h](#)

| Bit      | Symbol                 | Bit name            | Description   | R/W |
|----------|------------------------|---------------------|---|-----|
| b0       | <a href="#">RCKSEL</a> | Count Source Select | 0: Sub-clock oscillator is selected<br>1: LOCO is selected. | R/W |
| b7 to b1 | —                      | Reserved            | These bits are read as 0. The write value should be 0.      | R/W |

The RCR4 register selects the count source and is used in both calendar count mode and binary count mode.

When the RCKSEL bit is set to 0, the time is counted with the sub-clock oscillator. When the bit is set to 1, the time is counted with LOCO.

**RCKSEL bit (Count Source Select)**

The RCKSEL bit selects the count source from the sub-clock oscillator and LOCO.

The count source must be selected only once before specifying the initial settings of the RTC registers at power on.

### 26.2.20 Frequency Register (RFRH/RFRL)

Address(es): RTC.RFRH.4004 402Ah

x: Undefined

| Bit       | Symbol | Bit name | Description  | R/W |
|-----------|--------|----------|--|-----|
| b0        | RFC16  | Reserved | Write 0 before writing to the RFRL register after a cold start | R/W |
| b15 to b1 | —      | Reserved | These bits are read as 0. The write value should be 0.         | R/W |

Address(es): RTC.RFRL.4004 402Ch

x: Undefined

| Bit       | Symbol    | Bit name                   | Description                                      | R/W |
|-----------|-----------|----------------------------|--|-----|
| b15 to b0 | RFC[15:0] | Frequency Comparison Value | Write 00FFh to this register when using the LOCO | R/W |

RFRL is a register for controlling the prescaler when LOCO is selected.

The RTC time counter operates on a 128-Hz clock signal as the base clock. Therefore, when LOCO is selected, LOCO is divided by the prescaler to generate a 128-Hz clock signal. Set the frequency comparison value in the RFC[15:0] bits to generate a 128-Hz clock from the LOCO frequency. Before writing to RFC[15:0] after a cold start, write 0000h to the RFRH register.

A value from 0007h through 01FFh can be specified as the frequency comparison value. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2. The operating frequency of the peripheral module clock and the LOCO should be such that the peripheral module clock is ≥ to the LOCO.

Calculation method of frequency comparison value:

$$RFC[15:0] = (LOCO \text{ clock frequency}) / 128 - 1$$

When the LOCO frequency is 32.768 kHz, the RFRL register should be set to 00FFh.

### 26.2.21 Time Error Adjustment Register (RADJ)

Address(es): RTC.RADJ 4004 402Eh

| Bit      | Symbol     | Bit name         | Description  | R/W |
|----------|------------|------------------|--|-----|
| b5 to b0 | ADJ[5:0]   | Adjustment Value | These bits specify the adjustment value from the prescaler   | R/W |
| b7, b6   | PMADJ[1:0] | Plus-Minus       | b7 b6<br>0 0: Adjustment is not performed<br>0 1: Adjustment is performed by the addition to the prescaler<br>1 0: Adjustment is performed by the subtraction from the prescaler<br>1 1: Setting prohibited. | R/W |

Adjustment is performed by the addition to or subtraction from the prescaler. If the automatic adjustment enable (RCR2.AADJE) bit is 0, adjustment is performed when writing to the RADJ. If the RCR2.AADJE bit is 1, adjustment is performed in the interval specified in the automatic adjustment period select (RCR2.AADJP) bit.

The current adjustment by software (disabling automatic adjustment) might be invalid if the following adjustment value is specified within 320 cycles of the count source after the register setting. To perform adjustment consecutively, wait for 320 cycles or more of the count source after the register setting, then specify the next adjustment value.

RADJ is updated in synchronization with the count source. When RADJ is modified, check that all the bits are updated before continuing with additional processing. This register is cleared to 00h by an RTC software reset. The setting of this register is enabled only when the sub-clock oscillator is selected. When LOCO is selected, adjustment is not performed.

#### ADJ[5:0] bits (Adjustment Value)

The ADJ[5:0] bits specify the adjustment value (number of sub-clock cycles) from the prescaler.

#### PMADJ[1:0] bits (Plus-Minus)

The PMADJ[1:0] bits select whether the clock is set ahead or back depending on the error-adjustment value set in the ADJ[5:0] bits.

### 26.2.22 Time Capture Control Register y (RTCCRy) (y = 0 to 2)

Address(es): RTC.RTCCR0 4004 4040h, RTC.RTCCR1 4004 4042h, RTC.RTCCR2 4004 4044h

| Bit    | Symbol    | Bit name             | Description  | R/W |
|--------|-----------|----------------------|--|-----|
| b1, b0 | TCCT[1:0] | Time Capture Control | b1 b0<br>0 0: No event is detected<br>0 1: Rising edge is detected<br>1 0: Falling edge is detected<br>1 1: Both edges are detected. | R/W |
| b2     | TCST      | Time Capture Status  | 0: No event is detected<br>1: An event is detected.*1  | R/W |
| b3     | —         | Reserved             | This bit is read as 0. The write value should be 0.  | R/W |

| Bit    | Symbol    | Bit name                            | Description  | R/W |
|--------|-----------|-------------------------------------|--|-----|
| b5, b4 | TCNF[1:0] | Time Capture Noise Filter Control   | b5 b4<br>0 0: Noise filter is off<br>0 1: Setting prohibited<br>1 0: Noise filter is on (count source)<br>1 1: Noise filter is on (count source by divided by 32). | R/W |
| b6     | —         | Reserved                            | This bit is read as 0. The write value should be 0.  | R/W |
| b7     | TCEN      | Time Capture Event Input Pin Enable | 0: The RTCICn pin is disabled as the time capture event input<br>1: The RTCICn pin is enabled as the time capture event input.<br>(n = 0 to 2).                    | R/W |

Note 1. Indicates that an event is detected. Writing 1 to this bit has no effect. Writing 0 sets this bit to 0.

The RTCCRY register is used both in calendar count mode and in binary count mode. RTCCR0, RTCCR1, and RTCCR2 control the RTCIC0, RTCIC1, and RTCIC2 pins, respectively.

RTCCRY is updated in synchronization with the count source. When RTCCRY is modified, check that all the bits except the TCST bit are updated before continuing with more processing. This register is cleared to 00h by an RTC software reset. When RTCICn is used as the time capture pin, VBTICTLR.VCHnIEN (n = 0 to 2) must be set to 1. For more information, see [section 12, Battery Backup Function](#).

### TCCT[1:0] bits (Time Capture Control)

The TCCT[1:0] bits control the edge detection of the time capture event input pins, RTCIC0, RTCIC1, and RTCIC2. The detection edge is selectable. The TCCT[1:0] bits must be set while the VBTICTLR.VCHnIEN bit is 1.

### TCST bit (Time Capture Status)

The TCST bit indicates that an event on the time capture event input pins, RTCIC0, RTCIC1, and RTCIC2, was detected. When the TCST bit is 0, no event is detected. When the TCST bit is 1, this bit indicates that an event was detected on the associated pin and the capture register is valid. When multiple events are detected, the capture time for the first event is retained.

If an event is detected while the count operation is stopped (the RCR2.START bit is 0), the captured value is not guaranteed. In this case, set the TCST bit to 0 to delete the captured value. Writing 0 sets the TCST bit to 0. Writing any value other than 0 has no effect.

Set the TCST bit while the TCCT[1:0] bits are 00b (no event is detected). The TCST bit is set to 0 in synchronization with the count source. When the TCST bit is set to 0, check that the bit is updated before continuing with additional processing.

### TCNF[1:0] bits (Time Capture Noise Filter Control)

The TCNF[1:0] bits control the noise filter of the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2).

When the noise filter is on, the count source divided by 1 or divided by 32 is selectable. In this case, when the input level on the time capture event input pin matches three consecutive times at the set sampling period, the input level is determined.

Set the TCNF[1:0] bits while the TCCT[1:0] bits are 00b (no event is detected). When the noise filter is used, set the TCNF[1:0] bits, wait for 3 cycles of the specified sampling period, then set the TCCT[1:0] bits. Set the TCNF[1:0] bits when the VBTICTLR.VCHnIEN bit is 1.

### TCEN bit (Time Capture Event Input Pin Enable)

The TCEN bit enables or disables the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2). When the functions of the time capture event input pins are multiplexed, VBTICTLR should be set first. If the TCEN bit is set to 0, also set the TCCT[1:0] bits to 00b.

### 26.2.23 Second Capture Register y (RSECCPy) (y = 0 to 2)/BCNT0 Capture Register y (BCNT0CPy) (y = 0 to 2)

#### (1) In calendar count mode

Address(es): [RTC.RSECCP0 4004 4052h](#), [RTC.RSECCP1 4004 4062h](#), [RTC.RSECCP2 4004 4072h](#)

| Bit      | Symbol                     | Bit name          | Description                                       | R/W |
|----------|----------------------------|-------------------|---|-----|
| b3 to b0 | <a href="#">SEC1[3:0]</a>  | 1-Second Capture  | Capture value for the ones place of seconds       | R   |
| b6 to b4 | <a href="#">SEC10[2:0]</a> | 10-Second Capture | Capture value for the tens place of seconds       | R   |
| b7       | —                          | Reserved          | This bit is read as 0 after an RTC software reset | R   |

RSECCPy is a read-only register that captures the RSECCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RSECCP0, RSECCP1, and RSECCP2 registers, respectively. This register is cleared to 00h by an RTC software reset. Before reading from this register, be sure to stop the time capture event detection using the RTCCRy.TCCT[1:0] bits.

#### (2) In binary count mode

Address(es): [RTC.BCNT0CP0 4004 4052h](#), [RTC.BCNT0CP1 4004 4062h](#), [RTC.BCNT0CP2 4004 4072h](#)

BCNT0CPy is a read-only register that captures the BCNT0 value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNT0CP0, BCNT0CP1, and BCNT0CP2 registers, respectively.

This register is cleared to 00h by an RTC software reset. Before reading from this register, be sure to stop the time capture event detection using the RTCCRy.TCCT[1:0] bits.

### 26.2.24 Minute Capture Register y (RMINCPy) (y = 0 to 2)/BCNT1 Capture Register y (BCNT1CPy) (y = 0 to 2)

#### (1) In calendar count mode

Address(es): [RTC.RMINCP0 4004 4054h](#), [RTC.RMINCP1 4004 4064h](#), [RTC.RMINCP2 4004 4074h](#)

| Bit      | Symbol                    | Bit name         | Description                                 | R/W |
|----------|---------------------------|------------------|---|-----|
| b3 to b0 | <a href="#">MIN1[3:0]</a> | 1-Minute Capture | Capture value for the ones place of minutes | R   |

| Bit      | Symbol     | Bit name          | Description                                       | R/W |
|----------|------------|-------------------|---|-----|
| b6 to b4 | MIN10[2:0] | 10-Minute Capture | Capture value for the tens place of minutes       | R   |
| b7       | —          | Reserved          | This bit is read as 0 after an RTC software reset | R   |

RMINCPy is a read-only register that captures the RMINCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RMINCP0, RMINCP1, and RMINCP2 registers, respectively.

This register is cleared to 00h by an RTC software reset. Before reading from this register, be sure to stop the time capture event detection using the RTCCRY.TCCT[1:0] bits.

## (2) In binary count mode

Address(es): [RTC.BCNT1CP0 4004 4054h](#), [RTC.BCNT1CP1 4004 4064h](#), [RTC.BCNT1CP2 4004 4074h](#)

x: Undefined

BCNT1CPy is a read-only register that captures the BCNT1 value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNT1CP0, BCNT1CP1, and BCNT1CP2 registers, respectively.

This register is cleared to 00h by an RTC software reset. Before reading from this register, be sure to stop the time capture event detection using the RTCCRY.TCCT[1:0] bits.

## 26.2.25 Hour Capture Register y (RHRCPy) (y = 0 to 2)/BCNT2 Capture Register y (BCNT2CPy) (y = 0 to 2)

### (1) In calendar count mode

Address(es): [RTC.RHRCP0 4004 4056h](#), [RTC.RHRCP1 4004 4066h](#), [RTC.RHRCP2 4004 4076h](#)

x: Undefined

| Bit      | Symbol    | Bit name        | Description                                       | R/W |
|----------|-----------|-----------------|---|-----|
| b3 to b0 | HR1[3:0]  | 1-Hour Capture  | Capture value for the ones place of hours         | R   |
| b5, b4   | HR10[1:0] | 10-Hour Capture | Capture value for the tens place of hours         | R   |
| b6       | PM        | PM              | 0: AM<br>1: PM.                                   | R   |
| b7       | —         | Reserved        | This bit is read as 0 after an RTC software reset | R   |

RHRCPy is a read-only register that captures the RHRCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RHRCP0, RHRCP1, and RHRCP2 registers, respectively. The PM bit is only enabled when the RCR2.HR24 bit is 0 (in 12-hour mode).

This register is cleared to 00h by an RTC software reset. Before reading from this register, be sure to stop the time capture event detection using the RTCCRY.TCCT[1:0] bits.

(2) In binary count mode

Address(es): [RTC.BCNT2CP0 4004 4056h](#), [RTC.BCNT2CP1 4004 4066h](#), [RTC.BCNT2CP2 4004 4076h](#)

x: Undefined

BCNT2CPy is a read-only register that captures the BCNT2 value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNT2CP0, BCNT2CP1, and BCNT2CP2 registers, respectively.

This register is cleared to 00h by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRy.TCCT[1:0] bits.

26.2.26 Date Capture Register y (RDAYCPy) (y = 0 to 2)/BCNT3 Capture Register y (BCNT3CPy) (y = 0 to 2)

(1) In calendar count mode:

Address(es): [RTC.RDAYCP0 4004 405Ah](#), [RTC.RDAYCP1 4004 406Ah](#), [RTC.RDAYCP2 4004 407Ah](#)

x: Undefined

| Bit      | Symbol      | Bit name       | Description  | R/W |
|----------|-------------|----------------|--|-----|
| b3 to b0 | DATE1[3:0]  | 1-Day Capture  | Capture value for the ones place of days             | R   |
| b5, b4   | DATE10[1:0] | 10-Day Capture | Capture value for the tens place of days             | R   |
| b7, b6   | —           | Reserved       | These bits are read as 0 after an RTC software reset | R   |

RDAYCPy is a read-only register that captures the RDAYCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RDAYCP0, RDAYCP1, and RDAYCP2 registers, respectively.

This register is cleared to 00h by an RTC software reset. Before reading from this register, be sure to stop the time capture event detection using the RTCCRy.TCCT[1:0] bits.

(2) In binary count mode

Address(es): [RTC.BCNT3CP0 4004 405Ah](#), [RTC.BCNT3CP1 4004 406Ah](#), [RTC.BCNT3CP2 4004 407Ah](#)

x: Undefined

BCNT3CPy is a read-only register that captures the BCNT3 value when a time capture event is detected.

The event detection times detected by the RTCTC0, RTCTC1, and RTCTC2 pins are stored in the BCNT3CP0, BCNT3CP1, and BCNT3CP2 registers, respectively.

This register is cleared to 00h by an RTC software reset. Before reading from this register, be sure to stop the time

capture event detection using the RTCCRy.TCCT[1:0] bits.

### 26.2.27 Month Capture Register y (RMONCPy) (y = 0 to 2)

(1) In calendar count mode:

Address(es): [RTC.RMONCP0 4004 405Ch](#), [RTC.RMONCP1 4004 406Ch](#), [RTC.RMONCP2 4004 407Ch](#)

| Bit      | Symbol                    | Bit name         | Description                                | R/W |
|----------|---------------------------|------------------|--|-----|
| b3 to b0 | <a href="#">MON1[3:0]</a> | 1-Month Capture  | Capture value for the ones place of months | R   |
| b4       | <a href="#">MON10</a>     | 10-Month Capture | Capture value for the tens place of months | R   |
| b7 to b5 | —                         | Reserved         | These bits are read as 0                   | R   |

RMONCPy is a read-only register that captures the RMONCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RMONCP0, RMONCP1, and RMONCP2 registers, respectively.

This register is cleared to 00h by an RTC software reset. Before reading from this register, be sure to stop the time capture event detection using the RTCCRy.TCCT[1:0] bits.

## 26.3 Operation

### 26.3.1 Outline of Initial Settings of Registers after Power On

After the power is turned on, perform the initial settings for the clock setting, count mode setting, time error adjustment, time setting, alarm, interrupt, and time capture control register.

**Figure 26.2** Outline of initial settings after a power on

### 26.3.2 Clock and Count Mode Setting Procedure

Figure 26.3 shows how to set the clock and the count mode.

Figure 26.3 Clock and count mode setting procedure

### 26.3.3 Setting the Time

Figure 26.4 shows how to set the time.

Figure 26.4 Setting the time

### 26.3.4 30-Second Adjustment

Figure 26.5 shows how to execute a 30-second adjustment.

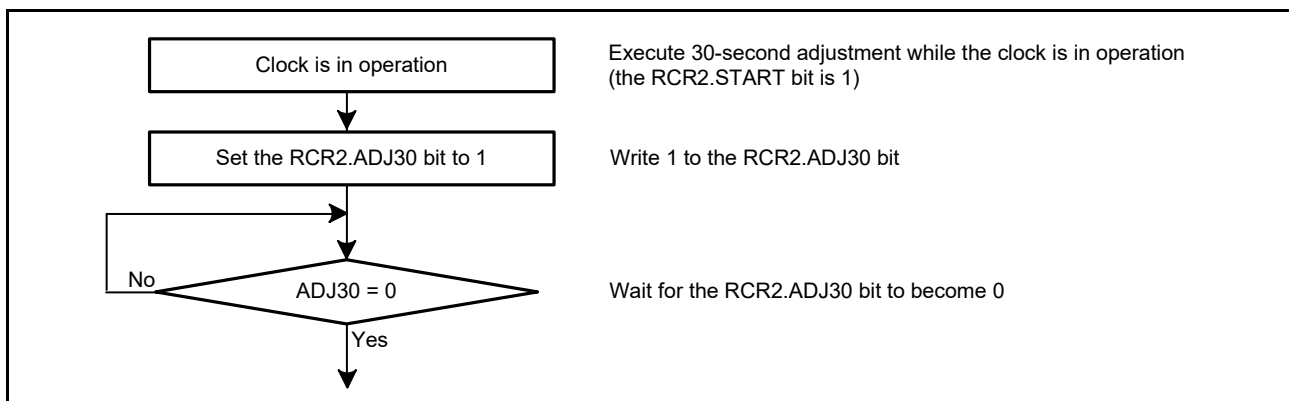

Figure 26.5 30-second adjustment

### 26.3.5 Reading 64-Hz Counter and Time

Figure 26.6 shows how to read a 64-Hz counter and time.

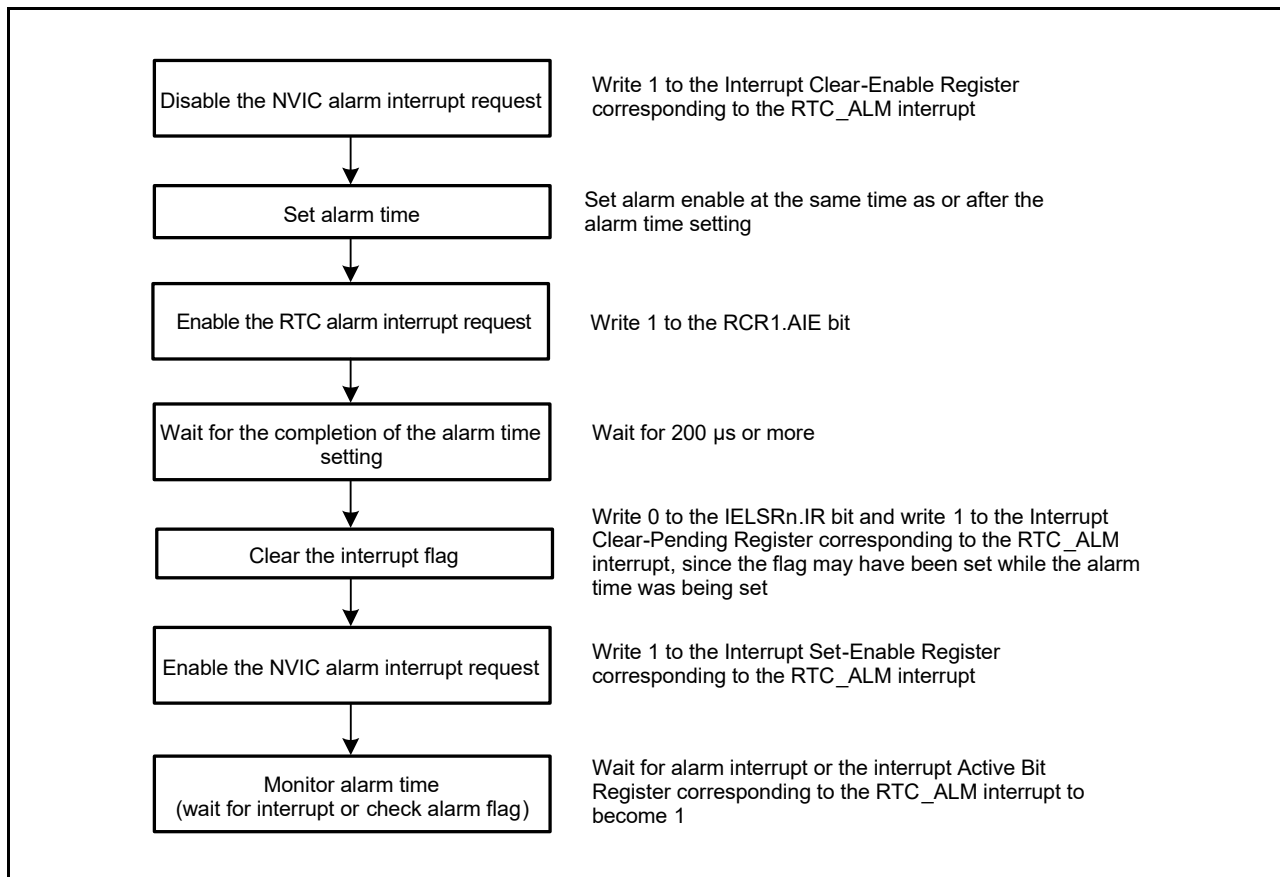

**Figure 26.6 Reading time**

If a carry occurs while the 64-Hz counter and time are being read, the correct time is not obtained, therefore they must be read again. The procedure for reading the time without using interrupts is shown in (a) in Figure 26.6, and the procedure

using carry interrupts is shown in (b). To keep the program simple, Renesas recommends using method (a) in most cases.

### 26.3.6 Alarm Function

Figure 26.7 shows how to use the alarm function.

**Figure 26.7 Using the alarm function**

In calendar count mode, an alarm can be generated by any one of year, month, date, day-of-week, hour, minute or second, or any combination of those. Write 1 to the ENB bit in the alarm registers involved in the alarm setting, and set the alarm time in the lower bits. Write 0 to the ENB bit in registers not involved in the alarm setting.

In binary count mode, an alarm can be generated in any bit combination of 32 bits. Write 1 to the ENB bit of the alarm enable register associated with the target bit of the alarm, and set the alarm time in the alarm register. For bits that are not the target of the alarm, write 0 to the ENB bit of the alarm enable register.

When the counter and the alarm time match, the IELSRn.IR bit and Interrupt Set-Pending/Clear-Pending Register associated with the RTC\_ALM interrupt are set to 1. Alarm detection can be confirmed by reading the interrupt Set-Pending Register associated with the RTC\_ALM interrupt, but an interrupt should be used in most cases. If 1 is set in the Interrupt Set-Enable Register associated with the RTC\_ALM interrupt, an alarm interrupt is generated in the event of the alarm, enabling the alarm to be detected.

Writing 0 sets the IELSRn.IR bit associated with the RTC\_ALM interrupt to 0. If interrupt is enabled, the Interrupt Set-Pending/Clear-Pending Register associated with the RTC\_ALM interrupt is cleared automatically after exiting the interrupt handler. Otherwise, write 1 to the Interrupt Clear-Pending Register associated with the RTC\_ALM interrupt to clear it.

When the counter and the alarm time match in a low power state, the MCU returns from the low power state. In Deep Software Standby mode, the MCU returns from the Deep Software Standby mode even when the alarm interrupt request is disabled.

### 26.3.7 Procedure for Disabling Alarm Interrupt

Figure 26.8 shows the procedure for disabling the enabled alarm interrupt request.

Figure 26.8 Procedure for disabling alarm interrupt request

### 26.3.8 Time Error Adjustment Function

The time error adjustment function is used to correct errors, running fast or slow, in the time caused by variation in the precision of oscillation by the sub-clock oscillator. Because 32,768 cycles of the sub-clock oscillator constitute 1 second of operation when the sub-clock oscillator is selected, the clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low.

The time error adjustment functions include:

- Automatic adjustment
- Adjustment by software.

Use the RCR2.AADJE bit to select automatic adjustment or adjustment by software.

#### 26.3.8.1 Automatic adjustment

Enable automatic adjustment by setting the RCR2.AADJE bit to 1. Automatic adjustment is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register every time the adjustment period selected by the RCR2.AADJP bit elapses.

##### (1) Example 1: Sub-clock oscillator running at 32.769 kHz

###### (a) Adjustment procedure

When the sub-clock oscillator is running at 32.769 kHz, 1 second elapses every 32,769 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs fast by 1 clock cycle every second. The time on the clock is fast by 60 clock cycles per minute, so adjustment can take the form of setting the clock back by 60 cycles every minute.

Register settings (when RCR2.CNTMD = 0):

- RCR2.AADJP = 0 (adjustment every minute)
- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler)

- $\text{RADJ.ADJ}[5:0] = 60$  (3Ch).

## (2) Example 2: Sub-clock oscillator running at 32.766 kHz

### (a) Adjustment procedure

When the sub-clock oscillator is running at 32.766 kHz, 1 second elapses every 32,766 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs slow by 2 clock cycles every second. The time on the clock is slow by 20 clock cycles every 10 seconds, so adjustment can take the form of setting the clock forward by 20 cycles every 10 seconds.

Register settings (when  $\text{RCR2.CNTMD} = 0$ ):

- $\text{RCR2.AADJP} = 1$  (adjustment every 10 seconds)
- $\text{RADJ.PMADJ}[1:0] = 01\text{b}$  (adjustment is performed by the addition to the prescaler)
- $\text{RADJ.ADJ}[5:0] = 20$  (14h).

## (3) Example 3: Sub-clock oscillator running at 32.764 kHz

### (a) Adjustment procedure

At 32.764 kHz, 1 second elapses on 32,764 clock cycles. Because the RTC operates for 32,768 clock cycles as 1 second, the clock is delayed for 4 clock cycles per second. In 8 seconds, the delay is 32 clock cycles, therefore correction can be made by advancing the clock 32 clock cycles every 8 seconds.

Register settings when the  $\text{RCR2.CNTMD}$  bit is 1:

- $\text{RCR2.AADJP} = 1$  (adjustment every 8 seconds)
- $\text{RADJ.PMADJ}[1:0] = 01\text{b}$  (adjustment is performed by the addition to the prescaler)
- $\text{RADJ.ADJ}[5:0] = 32$  (20h).

## 26.3.8.2 Adjustment by software

Enable adjustment by software by setting the  $\text{RCR2.AADJE}$  bit to 0. Adjustment by software is the addition or subtraction of the value counted by the prescaler to or from the value in the  $\text{RADJ}$  register on execution of a write instruction to the  $\text{RADJ}$  register.

### (1) Example 1: Sub-clock oscillator running at 32.769 kHz

#### (a) Adjustment procedure

When the sub-clock oscillator is running at 32.769 kHz, 1 second elapses every 32,769 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs fast by one clock cycle every second. The time on the clock is fast by one clock cycle per second, so adjustment can take the form of setting the clock back by 1 cycle every second.

#### (b) Register settings

- $\text{RADJ.PMADJ}[1:0] = 10\text{b}$  (adjustment is performed by subtraction from the prescaler)
- $\text{RADJ.ADJ}[5:0] = 1$  (01h).  
This is written to the  $\text{RADJ}$  register once per 1-second interrupt.

## 26.3.8.3 Procedure for changing the mode of adjustment

When changing the mode of adjustment, change the value of the  $\text{AADJE}$  bit in  $\text{RCR2}$  after setting the  $\text{RADJ.PMADJ}[1:0]$  bits to 00b (adjustment is not performed).

To change adjustment by software to automatic adjustment:

1. Set the  $\text{RADJ.PMADJ}[1:0]$  bits to 00b (adjustment is not performed).
2. Set the  $\text{RCR2.AADJE}$  bit to 1 (automatic adjustment is enabled).
3. Use the  $\text{RCR2.AADJP}$  bit to select the period of adjustment.

- In RADJ, set the PMADJ[1:0] bits for addition or subtraction and the ADJ[5:0] bits to the value for use in time error adjustment.

To change automatic adjustment to adjustment by software:

- Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
- Set the RCR2.AADJE bit to 0 (adjustment by software is enabled).
- Proceed with the adjustment by setting the RADJ.PMADJ[1:0] bits for addition or subtraction and the RADJ.ADJ[5:0] bits to the value for use in time error adjustment at the target time. After that, the time is adjusted every time a value is written to the RADJ register.

#### 26.3.8.4 Procedure for stopping adjustment

Stop the adjustment by setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

#### 26.3.8.5 Capturing the time

The RTC is capable of storing the month, date, hour, minute and second/binary counters 3 to 0 by detecting an edge of a signal on a time capture event input pin.

A noise filter can also be used on a time capture event input pin. If the noise filter is enabled, the TCST bit is set to 1 when the input level on the pin matches three times.

The noise filter can be switched on or off for each of the time capture event input pins. Set VBTICTLR.VCHnIEN (n = 0 to 2) to 1 to enable the RTCICn input. Operation when the noise filter is off is shown in [Figure 26.9](#) and operation when the noise filter is on is shown in [Figure 26.10](#).

**Figure 26.9** Timing of a time capture operation with the filter off

Figure 26.10 Timing of a time capture operation with the filter on

## 26.4 Interrupt Sources

The RTC has three interrupt sources and are listed in [Table 26.3](#).

Table 26.3 RTC interrupt sources

| Name    | Interrupt source   |
|---------|--------------------|
| RTC_ALM | Alarm interrupt    |
| RTC_PRD | Periodic interrupt |
| RTC_CUP | Carry interrupt    |

### (1) Alarm interrupt (RTC\_ALM)

This interrupt is generated based on the result of comparison between the alarm registers and RTC counters. For details, see [section 26.3.6, Alarm Function](#).

Because there is a possibility that the interrupt flag might be set to 1 when the settings of the alarm registers match the clock counters, wait for the alarm time settings to be confirmed and clear the IELSRn.IR bit and the interrupt Set-Pending Register associated with the RTC\_ALM interrupt to 0 again after modifying values of the alarm registers. After the interrupt flag for the alarm interrupt is set to 1 and the state is returned to mismatching of the alarm registers and clock counters, the flag is not set again until there is another match or the values of the alarm registers are modified again.

Figure 26.11 Timing diagram for the alarm interrupt (RTC\_ALM)

(2) Periodic interrupt (RTC\_PRD)

This interrupt is generated at intervals of 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second. The interrupt interval can be selected through the RCR1.PES[3:0] bits.

(3) Carry interrupt (RTC\_CUP)

This interrupt is generated when a carry to the second counter/binary counter 0 occurred or a carry to the R64CNT counter occurred during read access to the 64-Hz counter.

Figure 26.12 Timing diagram for the carry interrupt (RTC\_CUP)

26.5 Event Link Output

The RTC generates periodic event output (RTC\_PRD) event signal for the Event Link Controller (ELC) that can be used to initiate operations by other modules selected in advance.

The periodic event signal is output at the interval selected from 1/256, 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2, 1, and 2 seconds by setting the RCR1.PES[3:0] bits.

The event generation period immediately after the event generation is selected is not guaranteed.

Note: If event linking from the RTC is used, only set the ELC after setting the RTC, for example initialization and time settings. Setting the RTC after the ELC can lead to output of unexpected event signals.

### 26.5.1 Interrupt Handling and Event Linking

The RTC has a bit to enable or disable periodic interrupts. An interrupt request signal is output for the CPU when an interrupt source is generated while the associated enable bit is enabled.

In contrast, an event link output signal is sent to other modules as an event signal through the ELC when an interrupt source is generated, regardless of the setting of the associated interrupt enable bit.

Note: Although alarm and periodic interrupts can still be output during Software Standby mode or Deep Software Standby mode, the periodic event signals for the ELC are not output.

## 26.6 Usage Notes

### 26.6.1 Register Writing during Counting

The following registers must not be written to during counting, that is, while the RCR2.START bit is 1:

- RSECCNT/BCNT0
- RMINCNT/BCNT1
- RHRCNT/BCNT2
- RDAYCNT
- RWKCNT/BCNT3
- RMONCNT
- RYRCNT
- RCR1.RTCOS
- RCR2.RTCOE
- RCR2.HR24
- RFRL.

The counter must be stopped before writing to any of these registers.

### 26.6.2 Use of Periodic Interrupts

The procedure for using periodic interrupts is shown in [Figure 26.13](#).

The generation and period of the periodic interrupt can be changed by setting the RCR1.PES[3:0] bits. However, because the prescaler R64CNT and RSECCNT/BCNT0 are used to generate interrupts, the interrupt period is not guaranteed immediately after setting the RCR1.PES[3:0] bits. In addition, any of the following operation can affect the interrupt period:

- Stopping/restarting or resetting counter operation
- Reset by RTC software
- 30-second adjustment by changing the RCR2 value.

When the time error adjustment function is used, the interrupt generation period after adjustment is added or subtracted based on the adjustment value.

**Figure 26.13** Using the periodic interrupt function

### 26.6.3 RTCOUT (1-Hz/64-Hz) Clock Output

Stopping/restarting or resetting counter operation, reset by RTC software, and the 30-second adjustment by changing the RCR2 value affects the period of RTCOUT (1-Hz/64-Hz) output. When the time error adjustment function is used, the period of RTCOUT (1-Hz/64-Hz) output after adjustment is added or subtracted based on the adjustment value.

### 26.6.4 Transitions to Low Power Modes after Setting Registers

A transition to a low power state (Software Standby mode, Deep Software Standby mode, or battery backup) during a write to an RTC register might corrupt the value in the register. After setting the register, confirm that the setting is in place before initiating a transition to a low power state.

### 26.6.5 Notes on Writing to and Reading from Registers

- When reading a counter register such as the second counter after writing to the counter register, follow the procedure in [section 26.3.5, Reading 64-Hz Counter and Time](#)
- The value written to the count registers, alarm registers, year alarm enable register, bits RCR2.AADJE, AADJP, and HR24, RCR4 register, or frequency register is reflected when four read operations are performed after writing
- The values written to the RCR1.CIE, RCR1.RTCOS, and RCR2.RTCOE bits can be read immediately after writing
- To read the value from the timer counter after return from a reset, Software Standby mode, Deep Software Standby mode, or the battery backup state, wait for 1/128 second while the clock is operating (RCR2.START bit is 1)
- After a reset is generated, write to the RTC register after 6 cycles of the count source clock elapse.

### 26.6.6 Changing the Count Mode

When changing the count mode (calendar/binary), set the RCR2.START bit to 0, stop the counting operation, then restart it from the initial setting. For details on the initial setting, see [section 26.3.1, Outline of Initial Settings of Registers after Power On](#).

### 26.6.7 Initialization Procedure when the Realtime Clock Is Not To Be Used

Registers in the RTC are not initialized by a reset. Depending on the initial state, the generation of an unintentional interrupt request or operation of the counter might lead to increased power consumption.

For applications that do not require a realtime clock, initialize the registers by following the initialization procedure shown in [Figure 26.14](#).

Alternatively, when the sub-clock oscillator is not used as the system clock or realtime clock, the counter can be stopped by writing 0 (subclock oscillator is selected) to the RCR4.RCKSEL bit and stopping the sub-clock oscillator. To stop the sub-clock oscillator, write 1 to the SOSCCR.SOSTP bit.

For details on the setting of the SOSCCR.SOSTP bit, see [section 9, Clock Generation Circuit](#).

**Figure 26.14 Initialization procedure**

### 26.6.8 When Switching Source Clock

When switching a clock source by changing SCKCR.CKSEL[2:0], the clock output from the selector stops for 4 cycles of the switched clock. If the RTC periodical interrupt or RTC periodical event output was generated at this time, the interrupt or event is invalid.

## 27. Watchdog Timer (WDT)

The Watchdog Timer (WDT) is a 14-bit down-counter and can be used to reset the MCU when the counter underflows because the system has run out of control and become unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt. The refresh-permitted period can be set to refresh the counter and to detect when the system runs out of control.

### 27.1 Overview

Table 27.1 lists the WDT specifications and Figure 27.1 shows a block diagram.

**Table 27.1 WDT specifications**

| Parameter                                | Specifications   |
|--|--|
| Count source                             | Peripheral clock (PCLKB)   |
| Clock division ratio                     | Division by 4, 64, 128, 512, 2,048, or 8,192   |
| Counter operation                        | Counting down using a 14-bit down-counter  |
| Conditions for starting the counter      | <ul style="list-style-type: none"> <li>Auto start mode: Counting automatically starts after a reset, or after an underflow or refresh error occurs</li> <li>Register start mode: Counting is started by a refresh by writing to the WDTRR register.</li> </ul> |
| Conditions for stopping the counter      | <ul style="list-style-type: none"> <li>Reset (the down-counter and other registers return to their initial values)</li> <li>A counter underflows or a refresh error is generated.</li> </ul>   |
| Window function                          | Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods)   |
| WDT reset sources                        | <ul style="list-style-type: none"> <li>Down-counter underflows</li> <li>Refreshing outside the refresh-permitted period (refresh error).</li> </ul>  |
| Non-maskable interrupt/interrupt sources | <ul style="list-style-type: none"> <li>Down-counter underflows</li> <li>Refreshing outside the refresh-permitted period (refresh error).</li> </ul>  |
| Reading of the counter value             | The down-counter value can be read by the WDTSR register   |
| Event link function (output)             | <ul style="list-style-type: none"> <li>Down-counter underflow event output</li> <li>Refresh error event output.</li> </ul>   |
| Output signal (internal signal)          | <ul style="list-style-type: none"> <li>Reset output</li> <li>Interrupt request output</li> <li>Sleep mode count stop control output.</li> </ul>  |

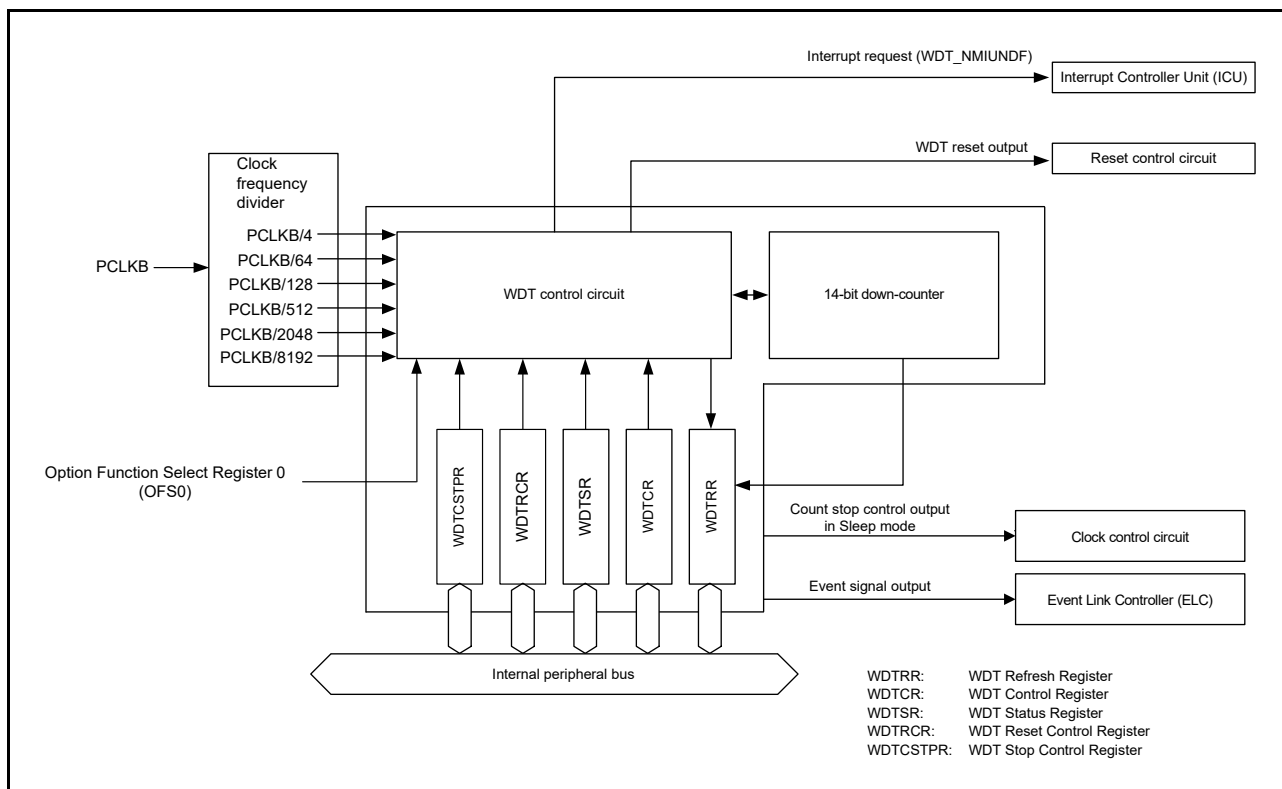

Figure 27.1 WDT block diagram

## 27.2 Register Descriptions

### 27.2.1 WDT Refresh Register (WDTRR)

Address(es): [WDT.WDTRR 4004 4200h](#)

| Bit      | Description  | R/W |
|----------|--|-----|
| b7 to b0 | The down-counter is refreshed by writing 00h and then writing FFh to this register | R/W |

The WDTRR register refreshes the down-counter of the WDT.

The down-counter of the WDT is refreshed by writing 00h and then writing FFh to WDTRR (refresh operation) within the refresh-permitted period.

After the down-counter is refreshed, it starts counting down from the value selected in the WDT Timeout Period Select bits (OFS0.WDTPS[1:0]) in the Option Function Select Register 0 in auto start mode. In register start mode, counting down starts from the value selected in the Timeout Period Select bits (WDTTCR.TOPS[1:0]) in the WDT Control Register.

When 00h is written, the read value is 00h. When a value other than 00h is written, the read value is FFh. For details on the refresh operation, see [section 27.3.3, Refresh Operation](#).

## 27.2.2 WDT Control Register (WDTCR)

Address(es): [WDT.WDTCR 4004 4202h](#)

| Bit      | Symbol                    | Bit name                     | Description   | R/W |
|----------|---------------------------|------------------------------|---|-----|
| b1, b0   | <a href="#">TOPS[1:0]</a> | Timeout Period Select        | b1 b0<br>0 0: 1,024 cycles (03FFh)<br>0 1: 4,096 cycles (0FFFh)<br>1 0: 8,192 cycles (1FFFh)<br>1 1: 16,384 cycles (3FFFh).   | R/W |
| b3, b2   | —                         | Reserved                     | These bits are read as 0. The write value should be 0.  | R/W |
| b7 to b4 | <a href="#">CKS[3:0]</a>  | Clock Division Ratio Select  | b7 b4<br>0 0 0 1: PCLKB/4<br>0 1 0 0: PCLKB/64<br>1 1 1 1: PCLKB/128<br>0 1 1 0: PCLKB/512<br>0 1 1 1: PCLKB/2048<br>1 0 0 0: PCLKB/8192.<br>Other settings are prohibited. | R/W |
| b9, b8   | <a href="#">RPES[1:0]</a> | Window End Position Select   | b9 b8<br>0 0: 75%<br>0 1: 50%<br>1 0: 25%<br>1 1: 0% (do not specify window end position).  | R/W |
| b11, b10 | —                         | Reserved                     | These bits are read as 0. The write value should be 0.  | R/W |
| b13, b12 | <a href="#">RPSS[1:0]</a> | Window Start Position Select | b13 b12<br>0 0: 25%<br>0 1: 50%<br>1 0: 75%<br>1 1: 100% (do not specify window start position).  | R/W |
| b15, b14 | —                         | Reserved                     | These bits are read as 0. The write value should be 0.  | R/W |

Some constraints apply to writes to the WDTCR register. For details, see [section 27.3.2, Controlling Writes to the WDTCR, WDTRCR, and WDTCSR Registers](#).

In auto start mode, the settings in the WDTCR register are disabled, and the settings in Option Function Select Register 0 (OFS0) are enabled. The settings for the WDTCR register can also be made for the OFS0 register. For details, see [section 27.3.7, Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

### **TOPS[1:0] bits (Timeout Period Select)**

The TOPS[1:0] bits select the timeout period, the period until the down-counter underflows, from 1,024, 4,096, 8,192, and 16,384 cycles, taking the divided clock specified in the CKS[3:0] bits as 1 cycle. After the down-counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the number of PCLKB cycles until the counter underflows.

[Table 27.2](#) lists the relationship between the CKS[3:0] and TOPS[1:0] bit settings, the timeout period, and the number of PCLKB cycles.

**Table 27.2** Timeout period settings

| CKS[3:0] bits |    |    |    | TOPS[1:0] bits |    | Clock division ratio | Timeout period<br>(number of cycles) | PCLKB clock cycles |
|---------------|----|----|----|----------------|----|----------------------|--------------------------------------|--------------------|
| b7            | b6 | b5 | b4 | b1             | b0 |                      |                                      |                    |
| 0             | 0  | 0  | 1  | 0              | 0  | PCLKB/4              | 1,024                                | 4,096              |
|               |    |    |    | 0              | 1  |                      | 4,096                                | 16,384             |
|               |    |    |    | 1              | 0  |                      | 8,192                                | 32,768             |
|               |    |    |    | 1              | 1  |                      | 16,384                               | 65,536             |
| 0             | 1  | 0  | 0  | 0              | 0  | PCLKB/64             | 1,024                                | 65,536             |
|               |    |    |    | 0              | 1  |                      | 4,096                                | 262,144            |
|               |    |    |    | 1              | 0  |                      | 8,192                                | 524,288            |
|               |    |    |    | 1              | 1  |                      | 16,384                               | 1,048,576          |
| 1             | 1  | 1  | 1  | 0              | 0  | PCLKB/128            | 1,024                                | 131,072            |
|               |    |    |    | 0              | 1  |                      | 4,096                                | 524,288            |
|               |    |    |    | 1              | 0  |                      | 8,192                                | 1,048,576          |
|               |    |    |    | 1              | 1  |                      | 16,384                               | 2,097,152          |
| 0             | 1  | 1  | 0  | 0              | 0  | PCLKB/512            | 1,024                                | 524,288            |
|               |    |    |    | 0              | 1  |                      | 4,096                                | 2,097,152          |
|               |    |    |    | 1              | 0  |                      | 8,192                                | 4,194,304          |
|               |    |    |    | 1              | 1  |                      | 16,384                               | 8,388,608          |
| 0             | 1  | 1  | 1  | 0              | 0  | PCLKB/2048           | 1,024                                | 2,097,152          |
|               |    |    |    | 0              | 1  |                      | 4,096                                | 8,388,608          |
|               |    |    |    | 1              | 0  |                      | 8,192                                | 16,777,216         |
|               |    |    |    | 1              | 1  |                      | 16,384                               | 33,554,432         |
| 1             | 0  | 0  | 0  | 0              | 0  | PCLKB/8192           | 1,024                                | 8,388,608          |
|               |    |    |    | 0              | 1  |                      | 4,096                                | 33,554,432         |
|               |    |    |    | 1              | 0  |                      | 8,192                                | 67,108,864         |
|               |    |    |    | 1              | 1  |                      | 16,384                               | 134,217,728        |

**CKS[3:0] bits (Clock Division Ratio Select)**

The CKS[3:0] bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from the peripheral clock (PCLKB) divided by 4, 64, 128, 512, 2048, and 8192. Combined with the TOPS[1:0] bit setting, this allows the WDT to be configured to a count period between 4,096 and 134,217,728 cycles of the PCLKB clock.

**RPES[1:0] bits (Window End Position Select)**

The RPES[1:0] bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. Set the window end position to a value less than the value for the window start position (window start position > window end position). If the window end position is greater than the window start position, only the window start position setting is enabled.

**RPSS[1:0] bits (Window Start Position Select)**

The RPSS[1:0] bits specify the window start position that indicates the refresh-permitted period. 100%, 75%, 50%, or 25% of the timeout period can be selected for the window start position. Set the window start position to a value greater than the value for the window end position. If the window start position is set to a value less than or equal to the window end position, the window end position is set to 0%.

Table 27.3 lists the counter values for the window start and end positions, and Figure 27.2 shows the refresh-permitted period set in the RPSS[1:0], RPES[1:0], and TOPS[1:0] bits.

**Table 27.3 Relationship between the timeout period and window start and end counter values**

| TOPS[1:0] bits |   | Timeout period |               | Window start and end counter value |       |       |       |
|----------------|---|----------------|---------------|------------------------------------|-------|-------|-------|
|                |   | Cycles         | Counter value | 100%                               | 75%   | 50%   | 25%   |

### 27.2.3 WDT Status Register (WDTSR)

Address(es): [WDT.WDTSR 4004 4204h](#)

| Bit       | Symbol                       | Bit name           | Description  | R/W        |
|-----------|------------------------------|--------------------|--|------------|
| b13 to b0 | <a href="#">CNTVAL[13:0]</a> | Down-Counter Value | Value counted by the down-counter                          | R          |
| b14       | <a href="#">UNDFE</a>        | Underflow Flag     | 0: No underflow occurred<br>1: Underflow occurred.         | R(W)<br>*1 |
| b15       | <a href="#">REFEF</a>        | Refresh Error Flag | 0: No refresh error occurred<br>1: Refresh error occurred. | R(W)<br>*1 |

Note 1. Only 0 can be written to clear the flag.

**CNTVAL[13:0] bits (Down-Counter Value)**

Read the CNTVAL[13:0] bits to confirm the value of the down-counter. The read value might differ from the actual count by 1.

**UNDF flag (Underflow Flag)**

Read the UNDF flag to confirm whether an underflow occurred in the down-counter. A value of 1 indicates that the down-counter underflowed. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the UNDF flag takes (N+1) PCLKB cycles. In addition, clearing of the flag is ignored for (N+1) PCLKB cycles after an underflow. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0001b, N = 4
- When WDTCR.CKS[3:0] = 0100b, N = 64
- When WDTCR.CKS[3:0] = 1111b, N = 128
- When WDTCR.CKS[3:0] = 0110b, N = 512
- When WDTCR.CKS[3:0] = 0111b, N = 2048
- When WDTCR.CKS[3:0] = 1000b, N = 8192

**REFEF flag (Refresh Error Flag)**

Read the REFEF flag to confirm whether a refresh error occurred, indicating that a refresh operation was performed during a prohibited period. A value of 1 indicates that a refresh error occurred. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the REFEF flag takes (N+1) PCLKB cycles. In addition, clearing of the flag is ignored for (N+1) PCLKB cycles after a refresh error. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0001b, N = 4
- When WDTCR.CKS[3:0] = 0100b, N = 64
- When WDTCR.CKS[3:0] = 1111b, N = 128
- When WDTCR.CKS[3:0] = 0110b, N = 512
- When WDTCR.CKS[3:0] = 0111b, N = 2048
- When WDTCR.CKS[3:0] = 1000b, N = 8192.

**27.2.4 WDT Reset Control Register (WDTRCR)**

Address(es): [WDT.WDTRCR 4004 4206h](#)

|             | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|-------------|----|----|----|----|----|----|----|----|
| RSTIR<br>QS | —  | —  | —  | —  | —  | —  | —  | —  |

Value after reset: 1 0 0 0 0 0 0 0

| Bit      | Symbol  | Bit name                       | Description   | R/W |
|----------|---------|--------------------------------|---|-----|
| b6 to b0 | —       | Reserved                       | These bits are read as 0. The write value should be 0.  | R/W |
| b7       | RSTIRQS | Reset Interrupt Request Select | 0: Non-maskable interrupt request or interrupt request output is enabled<br>1: Reset output is enabled. | R/W |

Some constraints apply to writes to the WDTRCR register. For details, see [section 27.3.2, Controlling Writes to the WDTCR, WDTRCR, and WDTCTPR Registers](#).

In auto start mode, the WDTRCR register settings are disabled, and the settings in Option Function Select Register 0 (OFS0) are enabled. The settings for the WDTCR register can also be made for the OFS0 register. For details, see [section](#)

27.3.7, Association between Option Function Select Register 0 (OFS0) and WDT Registers.

## 27.2.5 WDT Count Stop Control Register (WDTCSSTPR)

Address(es): WDT.WDTCSSTPR 4004 4208h

|                    |        |    |    |    |    |    |    |    |
|--------------------|--------|----|----|----|----|----|----|----|
|                    | b7     | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|                    | SLCSTP | —  | —  | —  | —  | —  | —  | —  |
| Value after reset: | 1      | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit      | Symbol | Bit name                      | Description   | R/W |
|----------|--------|-------------------------------|---|-----|
| b6 to b0 | —      | Reserved                      | These bits are read as 0. The write value should be 0.                          | R/W |
| b7       | SLCSTP | Sleep-Mode Count Stop Control | 0: Count stop is disabled<br>1: Count is stopped when transition to Sleep mode. | R/W |

The WDTCSSTPR register controls whether to stop the WDT counter in a low power mode. Some restrictions apply to writes to the WDTCSSTPR register. For details, see [section 27.3.2, Controlling Writes to the WDTCSR, WDTRCR, and WDTCSSTPR Registers](#).

In auto start mode, the WDTCSSTPR register settings are disabled, and the settings in Option Function Select register 0 (OFS0) are enabled. The settings for the WDTCSSTPR register can also be made for the OFS0 register. For details, see [section 27.3.7, Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

### SLCSTP bit (Sleep-Mode Count Stop Control)

The SLCSTP bit selects whether to stop counting when transition to Sleep mode.

## 27.2.6 Option Function Select Register 0 (OFS0)

For information on the OFS0 register, see [section 27.3.7, Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

## 27.3 Operation

### 27.3.1 Count Operation in Each Start Mode

The WDT has two start modes:

- Auto start mode, in which counting automatically starts after a release from the reset state
- Register start mode, in which counting is started with a refresh by writing to the register.

In auto start mode, counting automatically starts after release from the reset state in accordance with the settings in Option Function Select Register 0 (OFS0) in the flash.

In register start mode, counting starts with a refresh by writing to the register after the respective registers are set after a release from the reset state.
