

Title	<i>Reference Design Report for a 1.44 W Non-Isolated Buck Converter Using LinkSwitch™-TN2 LNK3204D/P/G</i>
Specification	Input: 85 VAC – 265 VAC; Output: 12 V, 120 mA
Application	Small Appliance
Author	Applications Engineering Department
Document Number	RDR-506
Date	June 02, 2017
Revision	1.1

Summary and Features

- Highly integrated solution
- Lowest possible component count
- No optocoupler or Zener diode required for regulation
- Thermal overload protection with automatic recovery
- <30 mW no-load consumption
- >75% efficiency at full load
- <±3% load regulation

PATENT INFORMATION

The products and applications illustrated herein (including transformer construction and circuits external to the products) may be covered by one or more U.S. and foreign patents, or potentially by pending U.S. and foreign patent applications assigned to Power Integrations. A complete list of Power Integrations' patents may be found at www.powerint.com. Power Integrations grants its customers a license under certain patent rights as set forth at <http://www.powerint.com/ip.htm>.

Important Note:

Although this board is designed to satisfy safety isolation requirements, the engineering prototype has not been agency approved. Therefore, all testing should be performed using an isolation transformer to provide the AC input to the prototype board.

1 Introduction

This document is an engineering prototype report describing a non-isolated 12 V, 120 mA power supply utilizing a LNK3204D/P/G from Power Integrations.

The document contains the power supply specification, schematic, bill-of-materials, printed circuit layout, and performance data.

Figure 1– Populated Circuit Board Photograph, Top.

Figure 2 – Populated Circuit Board Photograph, Bottom.

2 Power Supply Specification

The table below represents the minimum acceptable performance of the design. Actual performance is listed in the results section.

Description	Symbol	Min	Typ	Max	Units	Comment	
Input							
Voltage	V_{IN}	85		265	VAC	2 Wire – no P.E.	
Frequency	f_{LINE}	47	50/60	64	Hz		
No-load Input Power (230 VAC)				<30	mW		
Output							
Output Voltage	V_{OUT}		12		V	± 5%. 20 MHz Bandwidth.	
Output Ripple Voltage	V_{RIPPLE}			150	mV		
Output Current	I_{OUT}		0.12		A		
Total Output Power							
Continuous Output Power	P_{OUT}		1.44		W		
Peak Output Power	P_{OUT_PEAK}				W		
Efficiency							
Full Load	η	75			%	Measured at P_{OUT} 25 °C.	
Environmental							
Conducted EMI		Meets CISPR22B / EN55022B					
Line Surge Differential Mode (L1-L2)			1		kV	1.2/50 μ s surge, IEC 1000-4-5, Series Impedance: Differential Mode: 2 Ω .	
Ambient Temperature	T_{AMB}	0		40	°C	Free Convection, Sea Level.	

3 Schematic

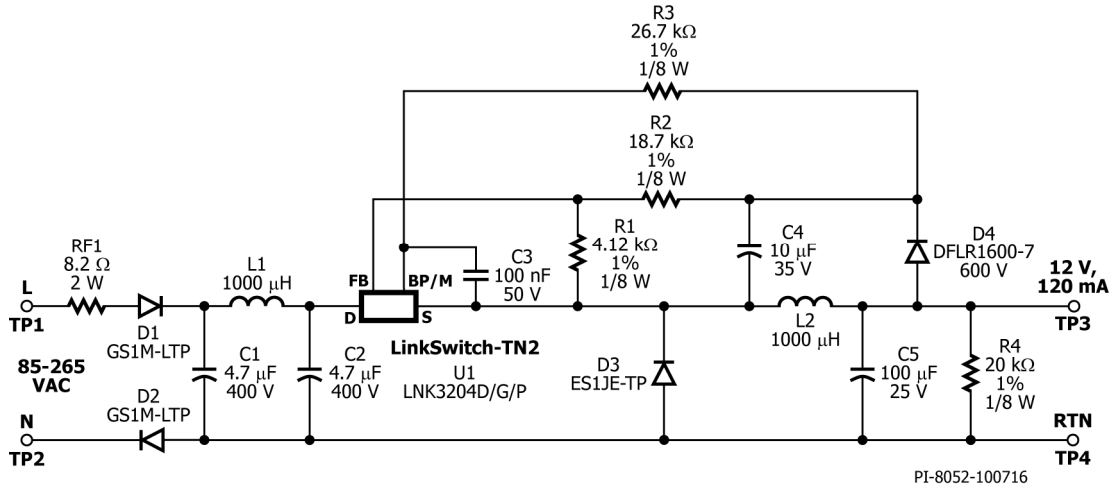

Figure 3 – Schematic.

*Note: U1 can be implemented as LNK3204D, LNK3204G or LNK3204P.

4 Circuit Description

The schematic in Figure 3 shows a buck converter using LNK3204D/P/G. The circuit provides a non-isolated 12 V, 120 mA continuous output. In metering applications this is used to supply the control circuits and micro controller. LinkSwitch-TN2 integrates a 725 V MOSFET and control circuitry into a single low cost IC. Regulation is achieved using a low cost resistor divider feedback network. The switching frequency jitter feature of the LinkSwitch-TN2 family and the 66 kHz switching frequency of operation helps reduce EMI.

4.1 Input EMI Filtering

The input stage is comprised of fusible resistor RF1, diode D1 and D2, capacitors C1 and C2, and inductor L1. Resistor RF1 is a flameproof, fusible, wire-wound resistor. It accomplishes several functions: (a) limits inrush current to safe levels for rectifiers D1, D2 (b) provides differential mode noise attenuation and (c) acts as an input fuse in the event any other component fails short circuit. As this component is used as a fuse, it should fail safely open-circuit without emitting smoke, fire or incandescent material to meet typical safety requirements. To withstand the instantaneous inrush power dissipation, wire wound types are recommended. Metal film resistors are not recommended in place of RF1.

4.2 LinkSwitch-TN2 IC Primary

LinkSwitch-TN2 integrates a 725 V power MOSFET and control circuitry into a single low cost IC. The device is self-starting from the DRAIN (D) pin with local supply decoupling provided by a small 100 nF capacitor C3 connected to the BYPASS (BP/M) pin when AC is first applied. During normal operation the device is powered from output via a current limiting resistor R3. Here, the device LNK3204D is used in a buck converter. The supply is designed to operate in mostly discontinuous conduction mode (MDCM), with the peak L1 inductor current set by the LNK3204D internal current limit. The control scheme used is similar to the ON/OFF control used in TinySwitch™. The on-time for each switching cycle is set by the inductance value of L2, LinkSwitch-TN2 current limit and the high voltage DC input bus across C2. Output regulation is accomplished by skipping switching cycles in response to an ON/OFF feedback signal applied to the FEEDBACK (FB) pin. This differs significantly from traditional PWM schemes that control the duty factor (duty cycle) of each switching cycle. Unlike TinySwitch, the logic of the FB pin has been inverted in LinkSwitch-TN. This allows a very simple feedback scheme to be used when the device is used in the buck converter configuration. Current into the FB pin greater than 49 μ A will inhibit the switching of the internal MOSFET, while current below this allows switching cycles to occur.

4.3 *Output Rectification*

During the ON time of U1, current ramps in L2 and is simultaneously delivered to the load. During the OFF time the inductor current ramps down via free-wheeling diode D3 into C5 and is delivered to the load. Diode D3 should be selected as an ultrafast diode (t_{RR} of 35 ns or better is recommended. Capacitor C5 should be selected to have an adequate ripple current rating (low ESR type)). Please see the spreadsheet output capacitor section.

4.4 *Output Feedback*

The voltage across L2 is rectified and smoothed by D4 and C4 during the off-time of U1. To a first order, the forward voltage drops of D3 and D4 are identical and therefore, the voltage across C3 tracks the output voltage. To provide a feedback signal, the voltage developed across C3 is divided by R1 and R2 and connected to U1's FB pin. The values of R1 and R2 are selected such that at the nominal output voltage, the voltage on the FB pin is 2 V. This voltage is specified for U1 at an FB pin current of 49 μ A with a tolerance of $\pm 1.3\%$ over a temperature range of -40 to 125 $^{\circ}$ C. This allows this simple feedback to meet the required overall output tolerance of $\pm 3\%$ at rated output current.

10.2 Output Ripple Measurements

11.2.1 Ripple Measurement Technique

For DC output ripple measurements, a modified oscilloscope test probe must be utilized in order to reduce spurious signals due to pick-up. Details of the probe modification are provided in the Figures below.

The 4987BA probe adapter is affixed with two capacitors tied in parallel across the probe tip. The capacitors include one (1) 0.1 $\mu\text{F}/50\text{ V}$ ceramic type and one (1) 1 $\mu\text{F}/50\text{ V}$ aluminum electrolytic. The aluminum electrolytic type capacitor is polarized, so proper polarity across DC outputs must be maintained (see below).

Figure 23 – Oscilloscope Probe Prepared for Ripple Measurement. (End Cap and Ground Lead Removed)

Figure 24 – Oscilloscope Probe with Probe Master (www.probemaster.com) 4987A BNC Adapter. (Modified with wires for ripple measurement, and two parallel decoupling capacitors added)
