

Solid State Relays 1-Phase with Integrated Current Monitoring Types RGS1S

CARLO GAVAZZI

- Product width ranging from 22.5mm to 35mm
- Partial load failure detection
- Zero cross switching
- Ratings up to 600VACrms & 90AACrms
- Up to 18000A²s for I²t and 1200Vp for blocking voltage
- Control voltage range: 4 - 32 VDC
- Local or remote current set-point
- LED indications for the different faults
- Alarm signal output for SSR or load circuit malfunction
- IP20 protection
- Integrated voltage transient protection with varistor
- RoHS compliant
- Short circuit current rating 100kArms

Product Description

This slim RG design is capable of detecting various failure modes occurring to the heaters and also to the product itself. Failures which can be detected include partial load failure, heater loss, open circuit SSR, short circuit SSR and SSR over temperature. A normally closed, potential free alarm, opens in the event of a system or power semiconductor fault.

A load current setpoint has to be TEACHed to the SSR either locally by the TEACH button

on the front of the device or remotely through the provided terminal.

This product is available either with integrated heatsink (RGC1S series) and also without heatsink (RGS1S series). The minimum product width is 22.5mm. The control and auxiliary terminals are double box clamps to facilitate safe looping whilst the power terminals are either screw terminals or box clamps depending on the model selected.

Note: Specifications stated at 25°C unless specified.

2	Open SSR / Heater	
3	SSR Overtemperature	
4	SSR Short Circuit	
50%	No TEACH setpoint	
100%	Partial Load Failure	

Mode of Operation

Introduction:

The RGS1S must have a stored current setpoint to operate as a Solid State Relay with a Sensing function. The current setpoint is the nominal operating current that is expected through the SSR when all heater loads are functioning properly. The SSR is shipped without having a stored setpoint. This current setpoint is to be stored upon a TEACH procedure as explained below. The wrong setpoint is stored if heater loads are faulty or mains supply voltage is not close to operating voltage during the TEACH procedure.

Caution: In case of a brand new RGS1S (i.e. an RGS1S that does not have a stored current set point), a TEACH procedure on no load (i.e., no load connected to the RGS1S load terminal 2/T1) will result in a stored current set point of 0A.

SSR Operation without the TEACH procedure

Line Voltage; 1L1						
Load Voltage; 2T1						
Load Current						
Control Voltage; IN 2						
Supply Voltage; A1, A2						
Green LED						
SSR Overtemperature						
TEACH; IN 1 (remote) or local						
Alarm Output (NC); 11, 12	Open	Open	Open	Open	Open	Open
Yellow LED						
Red LED						
	half intensity	Condition: Partial load failure; > 16.67% from stored setpoint		Condition: Overtemperature on SSR	Condition: Open circuit or Load loss	

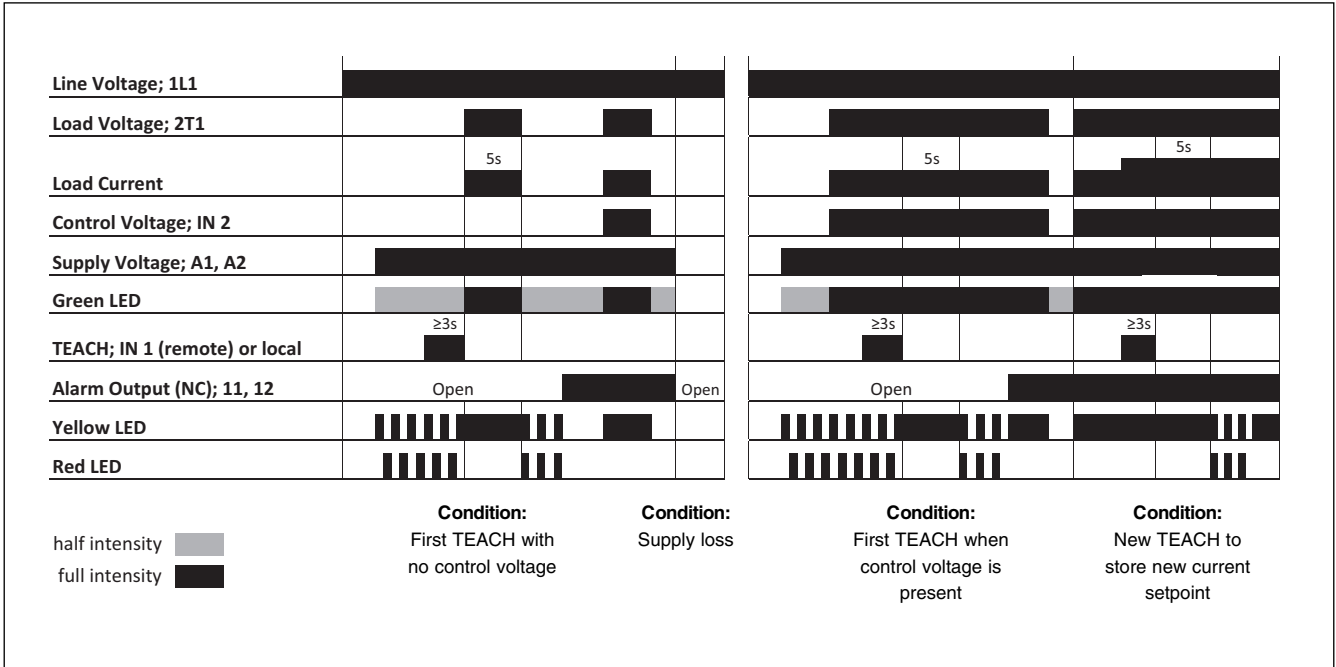

Upon application of supply voltage, the yellow and red LED will flash continuously in sequence (i.e., scroll) indicating that the device has no current setpoint stored. The green LED is ON at half intensity indicating the presence of supply voltage. As soon as control voltage is applied the green LED will be ON at full intensity. The alarm output, which is normally closed, is open to indicate that the SSR has no stored setpoint.

If mains supply is present upon application of control voltage the SSR will switch ON despite having no stored current setpoint. However, even though the SSR switches ON, the Sensing features associated with the RGS1S are disabled as shown in the above operations diagram. The Sensing features will be enabled ONLY once the TEACH procedure explained below is completed.

For SSR to switch ON upon application of control voltage, supply voltage has to be present across terminals A1, A2.

Mode of Operation (cont.)

The TEACH procedure

The TEACH procedure can be performed either locally or remotely. For local TEACH, the front 'TEACH' button on the SSR has to be pressed for at least 3 seconds (but less than 5 seconds). Remote TEACH can be performed by applying a high signal on terminal IN 1 for a duration of at least 3 seconds (but less than 5 seconds).

Supply voltage has to be present across terminals A1, A2 for the TEACH function to be performed and SSR to operate.

TEACH in the absence of a control signal

It is possible to TEACH the SSR without the presence of a control signal. In case of no previous stored setpoint (factory default), red and yellow LED will flash accordingly indicating this. The TEACH function will start as soon as the push button is released. The SSR will switch fully ON for 5 seconds (yellow LED ON during these 5 seconds) at the end of which, a load current setpoint is recorded. If TEACH procedure is successful the yellow and red LED will blink together for three times to indicate a successful setpoint measurement. The alarm output across terminals 11, 12 closes indicating a normal situation.

In case of an unsuccessful TEACH, the red & yellow LED will scroll continuously indicating that no current setpoint is stored. If load current does not stabilise during the 5 seconds TEACH sequence, it will not be possible to store setpoint. Another attempt to do a TEACH may be done until setpoint is recorded.

TEACH when control signal is present

In this case the TEACH procedure is identical to the TEACH procedure when there is no control signal. During the 5 seconds TEACH the status of the load switching will not be distinguished from unTEACHed state since load was ON before TEACH. Load remains ON as long as control voltage is present.

If SSR is in a LOCKed position (see below) it will not be possible to perform a new TEACH. SSR has to be unLOCKed first.

Mode of Operation (cont.)

Fault Conditions

Line Voltage; 1L1	[Solid black bar]					
Load Voltage; 2T1	[Solid black bar]					
Load Current	[Solid black bar] >16.67%					
Control Voltage; IN 2	[Solid black bar]					
Supply Voltage; A1, A2	[Solid black bar]

Yellow LED	[Solid black bar]					
Red LED	[Solid black bar]		[4 pulses]		[2 pulses]	
	half intensity full intensity	Condition: Partial load failure	Condition: over- temperature	Condition: Short cct. across L1 - T1	Condition: Open cct. across L1-T1 or Load loss	Condition: Phase/ Line loss

Partial Load Failure

This occurs when the load current decreases by more than 16.67% as compared to the stored setpoint. During this failure mode the SSR remains ON but alarm output opens to indicate an alarm condition. The red LED is continuously ON during this condition. If current rises back to normal levels the alarm indications switch to the normal state.

Over Temperature

If the SSR derating curve is exceeded during normal operation, an over-temperature condition is detected and the SSR output switches OFF. A visual alarm is indicated by the red blinking LED (3 flashes - see details in ALARM LED INDICATIONS) and alarm signal opens. The alarm resets automatically when the overtemperature condition is no longer present.

SSR Short Circuit

This condition is detected in the absence of a control signal and load current (in the region of 800mA and over) still flowing through the SSR. A visual indication is given by the red blinking LED (4 flashes - see details in ALARM LED INDICATIONS) and open alarm across terminals 11, 12. The yellow LED stays ON even though the green LED is at half intensity (i.e. absence of control input voltage) to indicate status of load.

SSR Open Circuit / Heater Loss / Line Loss

SSR output remains OFF even after application of the control voltage on terminal IN 2. A visual indication is given by the red blinking LED (2 flashes - see details in ALARM LED INDICATIONS) and open alarm across terminals 11, 12.

Alarm auto reset

In all alarm conditions described above, the alarm LED and signal output from terminals 11, 12 reset automatically to the normal condition as soon as the alarm condition is no longer present. There is no need for an alarm reset.

Other functions: TEACH LOCK/UNLOCK

The device can be locked to prevent undesirable local TEACH. This can be done by sending a pulse with a duration between 1s and 1.5s to the remote TEACH terminal IN 1. To TEACH a LOCKED unit, a pulse with duration between 1s and 1.5s has to be applied first to terminal IN 1, before performing the TEACH. The initial condition of the unit after every power up (through A1, A2 terminals) is UNLOCKED.

Agency Approvals and Conformances

Conformance & Approvals	EN/IEC 60947-4-3 EN/IEC 62314 UL 508 Recognised (E172877) CSA 22.2 No. 14-13 (204075)

EMC Emission	EN 60947-4-3	Radio Interference Field Emission (Radiated)	IEC/EN 55011 Class A (industrial)
Radio Interference Voltage Emission (Conducted)	IEC/EN60947-4-3 Class A (no filtering needed) IEC/EN 55011 Class A (industrial) with filters - see filter information	30 - 1000MHz	
0.15 - 30MHz			

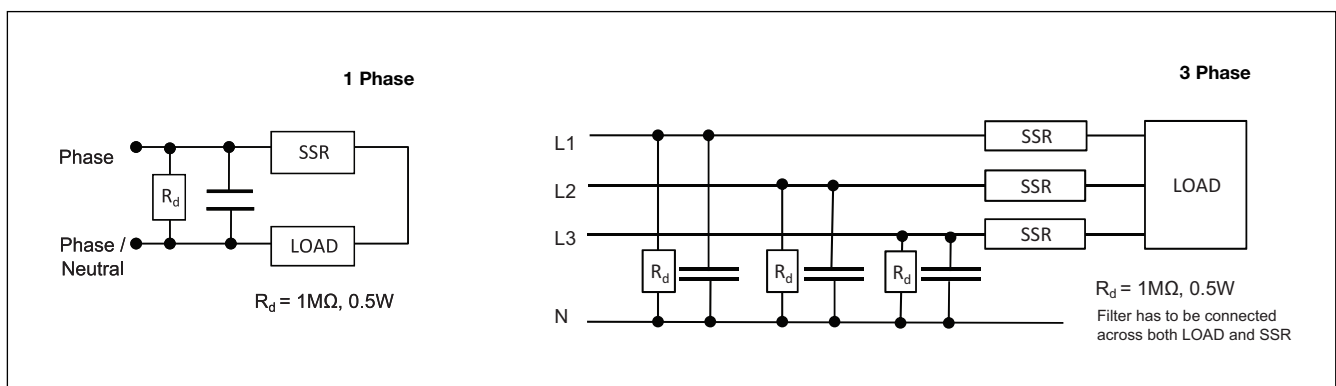

Note:

- Control input lines must be installed together to maintain products' susceptibility to Radio Frequency interference.
- Use of AC solid state relays may, according to the application and the load current, cause conducted radio interferences. Use of mains filters may be necessary for cases where the user must meet E.M.C requirements. The capacitor values given inside the filtering specification tables should be taken only as indications, the filter attenuation will depend on the final application.
- Performance Criteria 1: No degradation of performance or loss of function is allowed when the product is operated as intended.
- Performance Criteria 2: During the test, degradation of performance or partial loss of function is allowed. However when the test is complete the product should return operating as intended by itself.
- Performance Criteria 3: Temporary loss of function is allowed, provided the function can be restored by manual operation of the controls.

Filtering - EN / IEC 55011 Class A compliance (for class B compliance contact us)

Mounting Instructions for RGS1S

Thermal stress will reduce the lifetime of the SSR. Therefore it is necessary to select the appropriate heatsinks, taking into account the surrounding temperature, load current and the duty cycle.

A small amount of thermally conductive silicone paste must be applied to the back of the SSR. The RG Power Module should be first mounted on the heatsink with two M5 screws. Gradually tighten each screw (alternating between the two) until both are tightened with a torque of 0.75Nm. Then tighten both screws to their final mounting torque of 1.5Nm.

In case of a thermal pad attached to the back of the SSR, no thermal paste is required. The RG Power Module is gradually tightened (alternating between the 2 screws) to a maximum torque of 1.5Nm.

Once the power module is tightened to heatsink, the control module can be mounted on top of the power module and screwed with a torque of 0.3Nm to ensure good contact between the 2 units.

Short Circuit Protection

Protection Co-ordination, Type 1 vs Type 2:

Type 1 protection implies that after a short circuit, the device under test will no longer be in a functioning state. In type 2 co-ordination the device under test will still be functional after the short circuit. In both cases, however the short circuit has to be interrupted. The fuse between enclosure and supply shall not open. The door or cover of the enclosure shall not be blown open. There shall be no damage to conductors or terminals and the conductors shall not separate from terminals. There shall be no breakage or cracking of insulating bases to the extent that the integrity of the mounting of live parts is impaired. Discharge of parts or any risk of fire shall not occur.

The product variants listed in the table hereunder are suitable for use on a circuit capable of delivering not more than 100,000A rms Symmetrical Amperes, 600 Volts maximum when protected by fuses. Tests at 100,000A were performed with Class J fuses, fast acting; please refer to the table below for maximum allowed ampere rating of the fuse. Use fuses only.

Class CC fuses are represented by tests performed on Class J fuses.

Co-ordination type 1 (UL508)

Part No.	Max. fuse size [A]	Class	Current [kA]	Voltage [VAC]

9. Between MCB and Load (including return path which goes back to the mains).

Note: A prospective current of 6kA and a 230/400V power supply system is assumed for the above suggested specifications. For cables with different cross section than those mentioned above please consult Carlo Gavazzi's Technical Support Group.

Accessories

RG DIN Clip

Ordering Key

DIN clip accessory

RGS1DIN

This DIN Clip accessory can be mounted to any RGS model and will enable the RGS to be DIN rail mount. Current rating @ 40°C is 10AAC. Refer to 'Current Derating' section for Space Derating.

Mounting Instructions for RGS1DIN to RGS

The RG Power Module is gradually tightened (alternating between the 2 screws) to a maximum torque of 1.5Nm.

Once the power module is tightened to the RGS1DIN, the control module can be mounted on top of the power module and screwed with a torque of 0.3Nm to ensure good contact between the 2 units.
